With modern medical care, most persons with Down syndrome—except those with major heart defects that cannot be corrected by surgery—live into adulthood. They do have a shorter life expectancy (55) than normal adults, though, because they develop the degenerative conditions of old age prematurely. Because persons with Down syndrome are mentally retarded to varying degrees, some never become independently self-supporting. The majority can, however, be taught to contribute usefully in the home or in a sheltered working or living environment after they are grown.

downhill skiing, ski race for speed on an adjusted downhill track that is marked by gates

Skier in downhill race at Innsbruck, Austria, 1964

D P A —Pictorial Parade

formed by paired poles set at least 8 m (26 feet) apart through which the racer has to pass. Contestants make at least one practice run, then compete singly in an order set by previous performance. The one who completes the course in the shortest time is the winner.

For men's international championship events, the downhill course is 2.4 to 5 km (1.5 to 3 miles) long, with a vertical descent of up to 1,000 m (3,280 feet) and terrain of a steepness and difficulty appropriate to the skill and endurance of the competitors. For women the course is 1.6 to 2.5 km (2.5 to 4 miles) long. Courses are not in terms of length but of time—e.g., a two-minute downhill. The average winning speed is 64 to 80 km (40 to 50 miles) per hour. Speeds over 160 km (100 miles) per hour are achieved on special short courses, but these events are not rated as official downhill races. The downhill probably demands the most courage of all the Alpine events, which are so called since they originated in the rugged Alps range of Europe.

For world champions, see *Sporting Record: Skiing*. For Olympic champions, see *Olympic Games*.

Downing, Andrew Jackson (b. Oct. 30, 1815, Newburgh, N.Y., U.S.—d. July 28, 1852, vicinity of Yonkers, N.Y.), horticulturist, landscape gardener, and architect, the first great landscape designer in the United States.

Downing was born into horticulture, his father being a nurseryman. After finishing his schooling at 16, he worked in his father's nursery and gradually became interested in landscape gardening and architecture. He began writing on botany and landscape gardening and then undertook to educate himself thoroughly in these subjects.

His first book, *A Treatise on the Theory and Practice of Landscape Gardening, Adapted to North America* (1841), established him as a national authority on that subject and went through numerous editions (the last was printed in 1921). In *Cottage Residences* (1842) he applied the principles of landscape and architectural design to the needs of more modest homeowners. His *The Fruits and Fruit Trees of America* (1845), written with his brother Charles, was the most complete treatise of its kind yet written and led to Downing's becoming the editor of a new periodical, the *Horticulturist*, a post that he retained until his death. Downing's *The Architecture of Country Houses, Including Designs for Cottages, Farm Houses, and Villas* (1850) long remained in general use.

While traveling in Europe in 1850, Downing entered into a partnership with the English architect Calvert Vaux, and upon their return to the United States the two men designed a number of estates, both houses and grounds, in New York's Hudson River valley and Long Island. By now recognized as the foremost American landscape designer of his day, Downing was commissioned in 1851 to lay out the grounds for the Capitol, the White House, and the Smithsonian Institution in Washington, D.C. Downing's plans for this project had to be carried out by his successors, however, because he drowned in a steamboat accident in the vicinity of New York Harbour.

Downing, Sir George (b. 1623, Dublin, Ire.—d. July 1684, Cambridgeshire, Eng.), English diplomat and financial administrator who helped precipitate two wars with the Dutch and who instituted major reforms in public finance. Downing Street, London, where the residence of the British prime minister is located, is named for him.

The son of a Puritan lawyer, Downing was one of the first graduates of Harvard College, Cambridge, Mass. He served in the Parliamentary army during the English Civil Wars and was a member of Parliament during Oliver Cromwell's Protectorate, but in 1660 he supported the restoration of the Stuart

monarchy. In 1661 King Charles II made him envoy to Holland, England's commercial rival. The Second Dutch War of 1665–67 was partially the result of Downing's diplomatic intransigence. As a member of the House of Commons in 1665, he was responsible for a proviso to a subsidy bill (*i.e.*, a bill whereby Parliament granted funds to the king for special needs) which stipulated that the funds be used solely for the war—a case that marked the effective beginning of the process of using funds solely for the specific purposes stated in the legislative appropriation. Downing's appointment as secretary of the newly formed treasury commission in 1667 enabled him to introduce new accounting procedures that left a lasting mark on the British treasury. In 1671 Downing was sent to Holland with instructions to provoke another conflict. His behaviour so infuriated the Dutch that he fled for his life, but Charles had him imprisoned briefly for deserting his post. After his release he continued to hold high financial offices until his death.

Downpatrick, Irish DÚN PÁDRAIG, town and seat, Down district (established 1973), formerly in County Down, Northern Ireland. Downpatrick is located where the River Quoile broadens into its estuary in Strangford Lough (inlet of the sea). The town takes its name from *dún* (fortress) and from its association with St. Patrick. It is the Dun-da-leth-glas (Fortress of the Two Broken Fetters) of Irish chroniclers. Formerly a MacDunleary stronghold, it was seized in 1177 by the Anglo-Norman adventurer John de Courci and served as his headquarters until 1203. At nearby Saul, St. Patrick began his mission in Ireland in 432 and is reputedly buried in the grounds of the Church of Ireland Cathedral, which was built in 1790. The town is a market centre and has the county administrative offices. The remains of the Cistercian Inch Abbey, founded by De Courci in 1180, are 2 miles (3 km) north. Pop. (1991) 10,113.

Downs, rounded and grass-covered hills in southern England that are typically composed of chalk. The name comes from the Old English *dūn* ("hill"). The main areas of chalk downs lie in Berkshire, Wiltshire, and northern Hampshire, with spurs running eastward into West Sussex, Surrey, and Kent. Chalk hills of similar type are called Wolds in Lincolnshire and in Yorkshire.

Because of the porous nature of chalk, the Downs' summits are dry in summer, and tree growth is normally slow, even if undisturbed. Regeneration has been prevented by sheep grazing. The Downs were formerly well wooded, but now only scattered woodlands of beech, yew, juniper, and box are found.

The Downs are notable for their evidence of prehistoric occupation, including figures of horses cut out of turf; ridge and scarp-foot trackways that focus on megalithic monuments, such as Avebury and Stonehenge in Wiltshire; innumerable burial mounds or barrows; defensive earthworks; and ring encampments, such as Maiden Castle in Dorset.

The characteristic bare and rounded summits of the Downs, where uncultivated, have a springy turf of fescue grass with a distinctive vegetation, including rare orchids, and fauna of snails and insects. Mechanical plows have now made it possible to cultivate all but the steepest slopes of downs, however, and on many downs crops or manured leas have replaced the turf on which flocks of sheep used to graze.

downslope wind: see katabatic wind.

downy mildew, disease of plants, especially in cool humid regions, caused by several fungi, including species of *Basidiophora*, *Bremia*, *Perozonospora*, *Phytophthora*, *Plasmopara*, *Pseudoperonospora*, and *Sclerospora*. White, gray, bluish, or violet downy patches of mildew

form mostly on the undersides of leaves in damp weather. Pale-green to yellow or brown areas usually develop on the upper leaf surface opposite the downy growth. Affected leaves often wilt, wither, and die early. Stems, flowers, and fruits are sometimes infected. Seedlings may wilt and collapse. Garden plants, bush fruits, vegetables, and certain trees, shrubs, field crops, and weeds are susceptible.

Downy mildew can be avoided by rotating annual flowers and vegetables and by avoiding overwatering, overcrowding, and poorly drained soil. Other avoidance measures are growing resistant varieties, sowing disease-free seed, removing diseased parts and crop refuse, eliminating weeds, and maintaining balanced soil fertility. The application of copper, maneb, or zineb is effective against many downy mildews, but the amount of residue on vegetables must be considered.

dowry, the property that a wife or a wife's family give to her husband upon marriage. Dowries have a long history in Europe, India, Africa, and other parts of the world.

One of the basic functions of a dowry has been to serve as a form of protection for the wife against ill treatment by her husband. A dowry used in this way was actually a conditional gift to the husband that had to be restored to the wife or her family if the husband divorced his wife or committed some grave offense against her. Such dowries were frequently land or some other form of real property and were made inalienable by the husband, though he might otherwise use and profit from them during marriage.

A dowry can also serve to help a new husband discharge the responsibilities that go with marriage. This function assumed special importance in societies where marriages were regularly made between very young people; the dowry made it possible for the new husband to establish a household, which he otherwise would not have had the economic resources to do. Another function of a dowry in some societies has been to provide the wife with a means of support in case of her husband's death. In this latter case the dowry is a substitute for a compulsory share in the succession or the inheritance of the husband's landed property.

In many premodern societies the dowry serves as a reciprocal gesture by the bride's family to the groom's kin for the expenses incurred by the latter in payment of the bride-price (*q.v.*). These exchanges are not purely economic; they serve to ratify the marriage and consolidate friendship between the two families.

In Europe, the dowry has frequently served not only to enhance the desirability of a woman for marriage but also to build the power and wealth of great families and even to determine the frontiers and policies of states. The use of dowries has tended to disappear in industrial societies, however, as indeed it did in Europe in the 19th and 20th centuries.

dowsing, in occultism, use of a forked piece of hazel, rowan, or willow wood or of a Y-shaped metal rod or of a pendulum suspended by a nylon or silk thread, in an attempt to detect such hidden substances as water, minerals, treasure, archaeological remains, and even dead bodies. The practice seems to have first come into vogue in the European Middle Ages.

The dowser in his search grasps the rod (itself called a dowser) by its two prongs and appears to receive transmissions from the hidden object that cause involuntary muscular contractions, which in turn make the rod bend or quiver violently. Some dowsers claim to be able to detect buried substances merely by passing a dowsing rod over a map of the area where the substance lies hidden. The term divining rod, sometimes used to describe the forked instrument, is frowned upon by

Dowsing

dowsers because divination is not considered part of the process.

Dowson, Ernest (Christopher) (b. Aug. 2, 1867, Lee, Kent, Eng.—d. Feb. 23, 1900, Lewisham, London), one of the most gifted of the circle of English poets of the 1890s known as the Decadents.

As a boy Dowson lived an unsettled life. In 1886 he entered Queen's College, Oxford, but left in 1888 when a decline in his father's fortunes obliged him to work at his father's dock in the Limehouse district in London. Dowson was an active member of the Rhymers' Club, a group of "decadents" that included William Butler Yeats, Arthur Symons, and Aubrey Beardsley. In 1891 he met the woman of his life and the inspiration for most of his poetry, Adelaide Foltinowicz, a waitress in her parents' restaurant in Soho, near London. In that same year he published his best-known poem "Non Sum Qualis Eram Bonae sub Regno Cynarae," popularly known from its refrain as "I have been faithful to thee, Cynara, in my fashion." Adelaide, who was 12 years old

Dowson, portrait by Charles Conder; in the National Portrait Gallery, London

when they met, declined his offer of marriage, but he remained faithful to her, in his fashion, for the next six years, drowning the pain of his unrequited love with wine and women and demanding as love went on "madder music and stronger wine."

In 1894 his father died, his mother committed suicide, and Dowson discovered the symptoms of his tuberculosis. In 1897 Adelaide married one of her father's waiters; after that, Dowson lived mostly in France, supporting himself by ill-paid translations. He was discovered wretched and penniless, addicted to absinthe, and ill, by a friend, R.H. Sherard, who brought him back to London, where he died in Sherard's house.

Dowson published two novels in collaboration with Arthur Moore, *A Comedy of Masks* (1893) and *Adrian Rome* (1899), and a book of short stories, *Dilemmas* (1895), but his reputation rests on his poetry, *Verses* (1896) and *Decorations* (1899). His lyrics, marked by meticulous attention to melody and cadence, are polished and often charming. W.B. Yeats acknowledged that much of his own technical development was due to Dowson, whose influence can also be traced in the early work of Rupert Brooke.

doxology, an expression of praise to God. In Christian worship there are three common doxologies:

1. The greater doxology, or Gloria in Excelsis, is the Gloria of the Roman Catholic and Anglican masses, and in its hundreds of musical settings it is usually sung in Latin. It is used in the Roman Catholic liturgy in a contemporary translation and is used liturgically, often in older translations, in many Anglican, Lutheran, and other Protestant worship services. The modern Roman Catholic English version reads as follows:

Glorify to God in the highest, and peace to his people on earth.
 Lord God, heavenly King,
 almighty God and Father,
 we worship you, we give you thanks,
 we praise you for your glory.
 Lord Jesus Christ, only Son of the Father,
 Lord God, Lamb of God
 you take away the sin of the world:
 have mercy on us;
 you are seated at the right hand of the Father:
 receive our prayer.
 For you alone are the Holy One,
 you alone are the Lord,
 you alone are the Most High,
 Jesus Christ,
 with the Holy Spirit
 in the glory of God the Father. Amen.

2. The lesser doxology, or Gloria Patri, is used in most Christian traditions at the close of the psalmody:

Glorify to the Father, and to the Son, and to the Holy Spirit, as it was in the beginning, is now, and ever shall be, world without end. Amen.

3. Metrical doxologies are usually variations upon the Gloria Patri. The most familiar in English is one by the 17th-century Anglican bishop and hymn writer Thomas Ken:

Praise God, from whom all blessings flow;
 Praise him, all creatures here below;
 Praise him above, ye heavenly host;
 Praise Father, Son, and Holy Ghost. Amen.

Most Protestant churches use this form, often in conjunction with the presentation of tithes and offerings.

Doyle, Sir Arthur Conan (b. May 22, 1859, Edinburgh—d. July 7, 1930, Crowborough, Sussex, Eng.), Scottish writer best known for his creation of the detective Sherlock Holmes—one of the most vivid and enduring characters in English fiction.

The second of Charles Altamont and Mary Foley Doyle's 10 children, Arthur began seven years of Jesuit education in Lancashire, England, in 1868. After an additional year of schooling in Feldkirch, Austria, Doyle returned to Edinburgh. Through the influence of Dr. Bryan Charles Waller, his mother's lodger, he prepared for entry into the University of Edinburgh's Medical School. He received his Bachelor of Medicine and Master of Surgery qualifications from Edinburgh in 1881 and an M.D. in 1885, upon completing his thesis, "An Essay upon the Vasomotor Changes in *Tabes Dorsalis*."

While a medical student, Doyle was deeply impressed by the skill of his professor, Dr. Joseph Bell, in observing the most minute de-

tail regarding a patient's condition. This master of diagnostic deduction became the model for Doyle's literary creation, Sherlock Holmes, who first appeared in "A Study in Scarlet" in

Sir Arthur Conan Doyle, detail of a portrait by H.L. Gates, 1927; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Beeton's Christmas Annual of 1887. Other aspects of Doyle's medical education and experiences appear in his semiautobiographical novels, *The Firm of Girdlestone* (1890) and *The Stark Munro Letters* (1895), and in the collection of medical short stories *Round the Red Lamp* (1894). His creation of the logical, cold, calculating Holmes, the "world's first and only consulting detective," sharply contrasted with the paranormal beliefs Doyle addressed in a short novel of this period, *The Mystery of Cloombur* (1889). Doyle's early interest in both scientifically supportable evidence and certain paranormal phenomena exemplified the complex diametrically opposing beliefs he struggled with throughout his life.

Although public clamour prompted him to continue writing Sherlock Holmes adventures through 1926, Doyle claimed the success of Holmes overshadowed the merit he believed his other historical fiction deserved, most notably his tale of 14th-century chivalry, *The White Company* (1891), its companion piece, *Sir Nigel* (1906), and his adventures of the Napoleonic war hero Brigadier Gerard and the 19th-century skeptical scientist Professor George Edward Challenger.

When his passions ran high, Doyle also turned to nonfiction. His subjects include military writings, *The Great Boer War* (1900) and *The British Campaign in France and Flanders*, 6 vol. (1916–20), the Belgian atrocities in the Congo in *The Crime of the Congo* (1909), as well as his involvement in the actual criminal cases of George Edalji and Oscar Slater. Doyle was knighted in 1902 for his work with a field hospital in Bloemfontein, South Africa, and other services during the South African (Boer) War.

Doyle himself viewed his most important efforts to be his campaign in support of spiritualism, the religion and psychic research subject based upon the belief that spirits of the departed continued to exist in the hereafter and can be contacted by those still living on earth. He donated the majority of his literary efforts and profits later in his life to this campaign, beginning with *The New Revelation* (1918) and *The Vital Message* (1919). He later chronicled his travels in supporting the spiritualist cause in *The Wanderings of a Spiritualist* (1921), *Our American Adventure* (1923), *Our Second American Adventure* (1924), and *Our African Winter* (1929). He discussed other spiritualist issues in his *Case for Spirit Photography* (1922), *Pheneas Speaks* (1927), and a two-volume *The History of Spiritualism* (1926). Doyle became the world's most renowned proponent of spiritualism, but he faced considerable opposition for his conviction from the magician Harry Houdini and in a 1920 debate with the humanist Joseph McCabe. Even spiritualists joined in criticizing Doyle's article "The Evidence for Fairies," published in *The Strand*

Magazine in 1921, and his subsequent book *The Coming of the Fairies* (1922), in which he voiced support for the claim that two young girls, Elsie Wright and Frances Griffiths, had photographed actual fairies that they had seen in the Yorkshire village of Cottingley.

Doyle died in Windlesham, his home in Crowborough, Sussex, and at his funeral, his family and members of the spiritualist community celebrated rather than mourned the occasion of his passing beyond the veil. On July 13, 1930, thousands of people filled London's Royal Albert Hall for a séance during which Estelle Roberts, the spiritualist medium, claimed to have contacted Sir Arthur.

Doyle detailed what he valued most in life in his autobiography, *Memories and Adventures* (1924), and the importance that books held for him in *Through the Magic Door* (1907).

BIBLIOGRAPHY. Richard Lancelyn Green and John Michael Gibson, *A Bibliography of A. Conan Doyle* (1983), is a superlative, scrupulously detailed work. Jon L. Lellenberg (ed.), *The Quest for Sir Arthur Conan Doyle* (1987), reviews 13 major biographies of Doyle. Daniel Stashower, *Teller of Tales: The Life of Arthur Conan Doyle* (1999), is an accessible and readable life. Doyle's medical career is addressed in Ely Liebow, *Dr. Joe Bell: Model for Sherlock Holmes* (1982); and Alvin E. Rodin and Jack D. Key, *Medical Casebook of Doctor Arthur Conan Doyle* (1984). Kelvin I. Jones, *Conan Doyle and the Spirits: The Spiritualist Career of Sir Arthur Conan Doyle* (1989), details how his conviction of spiritualism expanded from a casual interest to the passion that engulfed his life. (P.K.W.)

Doyle, Richard (b. September 1824, London—d. Dec. 11, 1883, London), caricaturist, painter, and illustrator who, together with his father, John (1797–1868), introduced into British art a moderate style of caricature, opposed to the savage satire of James Gillray and Thomas Rowlandson.

A student of his father, Doyle regularly contributed (from 1843) decorations, theatre sketches, and political caricatures to *Punch*. The cover he designed for that publication was used for more than a century. Because of the magazine's anti-Catholic statements, he resigned in 1850, devoting himself to painting watercolours and to book illustrations (Thackeray's *New-comers*, 1854–55; Dickens' Christmas books). His best-known collections of cartoons are: *Manners and Customs of Ye Englyshe* (1849) and *Bird's Eye Views of Society* (1864).

Drabble, Margaret (b. June 5, 1939, Sheffield, Yorkshire, Eng.), English writer of novels that are skillfully modulated variations on the theme of a girl's development toward maturity through her experiences of love, marriage, and motherhood.

The daughter of a judge, Margaret Drabble began writing after leaving Cambridge University. The central characters of her novels—*The Summer Bird-cage* (1963), *The Garrick Year* (1964), *The Millstone* (1965), *The Needle's Eye* (1972), *The Reabns of Gold* (1973), *The Ice Age* (1977), *The Middle Ground* (1980)—although widely different in character and circumstance, are shown in situations of tension and stress that are the necessary conditions for their moral growth.

Drač (Albania): see Durrës.

Dracaena, genus of ornamental foliage plants in the family Agavaceae, consisting of about 50 to 80 species native primarily to the Old World tropics. Most species have short stalks and narrow, sword-shaped leaves, but some have taller stalks and resemble trees with crowns of leaves. The small flowers are red, yellow, or green. The berrylike fruit contains one to three seeds.

Dracaena
B. Aitken from the Natural History Photographic Agency

Dracaena sanderiana, with white-edged leaves, and *D. fragrans*, with yellow leaf edges or white stripes, are commonly cultivated as houseplants. The dragon tree (*D. draco*) of the Canary Islands, an ornamental tree with orange fruit, can grow 18 m (60 feet) tall and 6 m wide. The trunk contains a red gum, called dragon's blood, that was formerly used in medicines.

drachma, silver coin of ancient Greece and the former monetary unit of modern Greece. Its name derives from the Greek verb "to grasp," and its original value was equivalent to that of a handful of arrows. The early drachma had different weights in different regions. From the 5th century BC, Athens gained commercial preeminence, and the Athenian drachma became the foremost currency. One drachma equaled 6 oboli; 100 drachmas equaled 1 mine; and 60 mine equaled 1 Attic talent.

As a result of the conquests of Alexander the Great, the Athenian drachma came to be the monetary unit of the Hellenistic world. In time, silver coins of one drachma and its multiples were debased, and progressively higher proportions of copper were admixed. The drachma also became the prototype of an Islamic coin—the dirhem.

When Greece attained its independence from Turkey in 1828, the phoenix was introduced as the monetary unit, but it was replaced in 1833 by the drachma, divided into 100 lepta. In 2002 the drachma ceased to be legal tender after the euro, the monetary unit of the European Union, became the country's sole unit of currency.

Drachmann, Holger Henrik Herholdt (b. Oct. 9, 1846, Copenhagen, Den.—d. Jan. 14, 1908, Hornbæk), writer most famous for his lyrical poetry, which placed him in the front rank of late 19th-century Danish poets.

The son of a physician, Drachmann studied painting and also began to write. A visit to

Drachmann
Nordisk Pressefoto

London in 1871 awakened an interest in social problems, and after his return he joined the new radical movement of which Georg Brandes was the central figure. *Digte* (1872), collected poems, expressed his social theories.

Drachmann established his position as the greatest poet of the Danish modern movement of his time with such collections as *Dæmpede Melodier* (1875; "Muted Melodies"), *Sange ved Havet* ("Songs by the Sea") and *Venezia* (both 1877), and *Ranker og Roser* (1879;

"Weeds and Roses"). The prose *Derovre fra Grænsen* (1877; "From Over the Border") and the verse fairy tale *Prinsessen og det Halve Kongerige* (1878; "The Princess and Half the Kingdom"), demonstrated a patriotic and romantic trend that brought him into conflict with the Brandes group. About 1880 Drachmann adopted a conservative standpoint opposed to naturalism, but toward the end of the 1880s he returned to an individualist, anti-bourgeois position.

Drachmann's output was of great variety, including verse, short stories, novels, and plays, but his lyric verse is of major importance. He forsook classical prosody for a freer metre and a lively rhythm, reflecting the cadences of natural speech. Apart from his love poetry, his favourite subjects are the sea and its life. The best later collections are *Ganle guder og nye* (1881; "Old and New Gods"), *Sangen bog* (1889; "The Book of Songs"), and *Den hellige ild* (1899; "The Holy Flame"). His novels are often partly autobiographical, the characters being artists or writers, as in the most important, *Forskrevet*, 2 vol. (1890; "Pledged"), in which his own personality is seen split into its bourgeois and bohemian components. Among his plays the fantasy *Der var Engang* (1885; "Once upon a Time") was a favourite, chiefly because of Peter Lange-Müller's music.

Drachten, chief town of Smallingerland *gemeente* (commune), Friesland *provincie*, northwestern Netherlands. It lies along the Wijde Ee waterway, which is part of the canal system that flows into the larger Prinses Margriet Canal to the northwest. The surrounding area consists of lowlands; there are forests at nearby Beetsterwaag, and peat moors are found southwest of Drachten.

Formerly a village specializing in peat digging and dairy farming, Drachten has become an industrial centre producing electrical goods, transport equipment, machinery, chemicals, and furniture. Natural-gas reserves are found to the northeast. Historical features of the town include an 18th-century church and the Bleekerhús Museum, which contains sculptures and the first film projector used in The Netherlands. The Eenei (or Zwartendijster) is a defense works located near Drachten that Peter Stuyvesant (1610–72) supposedly used as a model for a fort that he built at New Amsterdam (New York). Drachten lies at the junction of highways extending between Groningen and Sneek. An airport is located near the town. Pop. (2001 est.) 53,010.

Draco, also spelled DRACON (fl. c. 7th century BC), Athenian lawgiver whose harsh legal code punished both trivial and serious crimes in Athens with death—hence the continued use of the word *draconian* to describe repressive legal measures.

The six junior archons (*thesmottetai*), or magistrates, are said by Aristotle to have been instituted in Athens after 683 BC to record the laws. If this is correct, Draco's code, which is generally dated to 621, was not the first reduction of Athenian law to writing, but it may have been the first comprehensive code or a revision prompted by some particular crisis. Draco's code was later regarded as intolerably harsh, punishing trivial crimes with death; it was probably unsatisfactory to contemporaries, since Solon, who was the archon in 594 BC, later repealed Draco's code and published new laws, retaining only Draco's homicide statutes. A decree of 409/408 BC orders the public inscription of this murder law, which is partly extant. Later authors refer to other laws of Draco, which may be genuine; but the constitution ascribed to Draco in chapter 4 of the *Constitution of Athens* by Aristotle is certainly a later fabrication.

Draco, genus of the lizard family Agamidae. Members of the genus are commonly referred to as flying lizards, because scaly membranes

between the forelegs and hindlegs allow them to glide from tree to tree. There are more than 15 species, which occur in the forests of Southeast Asia and the East Indies.

Draco species are usually green with dull-coloured cross bars, and their "wings" are brightly coloured. The membranes are supported by ribs that grow away from the body. At rest, the ribs and membranes fold against the sides of the body.

Dracontius, Blossius Aemilius (fl. 5th century AD), the foremost Christian Latin poet of Africa. He lived at the time of the literary revival that took place under Vandal rule in the latter part of the 5th century.

At Carthage Dracontius received the traditional rhetorical education and practiced as a lawyer. Though his family was initially favoured by the Vandals, he eventually suffered imprisonment and confiscation of his property on account of a poem in which he praised the Roman emperor rather than the Vandal king Gunthamund (484–496).

Dracontius' earlier verse is represented by the *Romulea*, a collection of nine pieces principally on mythological themes, forming the basis for philosophical argument. The highly rhetorical flavour of these poems reappears in his elegiac *Satisfactio*, a plea for pardon addressed to Gunthamund during his imprisonment, and is evident even in his most religious poem, *De laudibus dei*. This last poem, considered his most important work, comprises 2,327 hexameters in three books: Book I describes the Creation and Fall and the evidence for immortality; Book II treats the benevolence of God as shown by the preservation and redemption of the world; and Book III is concerned with the dealings of God with man. The account of the Creation was separately circulated during the Middle Ages under the title *Hexaëmeron*. Dracontius demonstrates wide familiarity with pagan Latin literature and with the Bible.

draft (armed forces): *see* conscription.

draft animal, any domesticated animal used in drawing heavy loads. Draft animals were in common use in Mesopotamia before 3000 BC for farm work and for pulling wheeled vehicles. Their use spread to the rest of the world over the following 2,500 years. While cattle, usually in teams, have been used most often as draft animals, horses and donkeys have supplanted them in many areas. Some horses—such as the Belgian horse, the Clydesdale, the Suffolk, the Shire, and the Percheron—have been bred to serve as draft animals; they weigh more than 725 kg (1,600 pounds) and stand at least 16 hands high. The Asian buffalo, however, is probably the most important draft animal in the world today. About 78 million of them, of many different species, do draft work. The role of draft animals in agriculture in less-developed regions of the world continues because of the advantages they offer: their feed is easily grown and commonly available; little maintenance of the animals is required; their manure is a valuable resource for the farmer; and the animal itself may become a source of food or other products at the end of its useful life.

A harness is necessary in using a draft animal efficiently. Such harnesses must allow the transfer of the animal's muscle power to the task at hand. With oxen and similar animals a yoke that rests on the back of the animal is used to attach the harness, while with horses and other equines a rigid, padded collar is used. The harness itself may be a simple arrangement of ropes connecting the yoke or collar to a plow, or it may be a complex arrangement of strapping to support the shafts of a cart, wagon, carriage, or sled

and to allow the animal to pull the vehicle in comfort, either singly or in concert with others. Long teams of draft animals, used in pairs and numbering as many as 24 animals, were common in the 19th century for pulling especially heavy loads.

In many places the use of mixed teams, as with one horse and one mule or one ox and one cow hitched in tandem, has been common among small farmers. Draft animal power has also been used to pump water, thresh grain, draw barges, and haul logs out of forests in lumbering operations. In addition to bovine and equine species, reindeer, elephants, camels, llamas, sheep, goats, and dogs have been used as draft animals.

Draft Riot of 1863, major four-day eruption of violence in New York City resulting from workers' deep discontent with the inequities of conscription during the American Civil War. Although labouring people in general supported the Northern war effort, they had no voice in Republican policy and occasionally deserted from the army or refused reenlistment. Because of their low wages, often less than \$500 a year, they were particularly antagonized by the federal provision allowing more affluent

Rioting in Lexington Avenue, New York City, following the first published draft call, 1863

By courtesy of the Library of Congress, Washington, D.C.

draftees to buy their way out of the Federal Army for \$300. Minor riots occurred in several cities, and when the drawing of names began in New York on July 11, 1863, mobs (mostly of foreign-born, especially Irish, workers) surged onto the streets assaulting residents, defying police, attacking draft headquarters, and burning buildings. Property damage eventually totalled \$1,500,000.

The New York draft riot was also closely associated with racial competition for jobs. Northern labour feared that emancipation of slaves would cause an influx of black workers from the South, and employers did in fact use black workers as strikebreakers during this period. Thus the white rioters eventually vented their wrath on the homes and businesses of innocent African Americans, and Civil War freedmen's associations were forced to send aid to their brethren in New York. (This racial ill feeling in the ranks of urban labour persisted into the 20th century.) The four-day draft riot was finally quelled by police cooperating with the 7th N.Y. Regiment, which had been hastily recalled from Gettysburg, and the drawing of names proceeded on August 19 without incident.

drafting, also spelled DRAUGHTING, also called ENGINEERING DRAWING or MECHANICAL DRAWING, graphical representation of structures, machines, and their component parts that communicates the engineering intent of a technical design to the craftsman or worker who produces the product.

A brief treatment of drafting follows. For full treatment, see MACROPAEDIA: Drafting.

Early drafting instruments included pencils, T-squares and triangles, compasses, protractors, and a drawing board. Although computer-aided engineering (CAE; *q.v.*) has generally replaced such tools, the standards for displaying information have changed little.

Typical are orthographic projection drawings, in which views of an object are placed on a drawing in sequence of adjacent sides of the object. The object is viewed with a point of sight (or vanishing point) set at infinity, making the visual rays, or lines of sight, from the eye to the object parallel. The principal views are the top (or bottom), front (or rear), and right side (or left side); auxiliary views can be taken from any direction. Views are most commonly arranged by the third-angle projection system, in which the top view is drawn in a location vertically above the front view, and the side view is placed horizontally in direct line with the front view.

Orthographic projections may contain conventional graphic symbols to represent standard features of objects, such as threads or machine parts. The drawings may show sectional views of an object, made by passing a cutting plane through the object's interior; and they may indicate the object's dimensions and tolerances.

In architectural and structural drawings a separate sheet is used for each plan view or building elevation, and the individual parts of a structure are shown in assemblage. Most architectural and structural drawings are third-angle projections.

drafting (fibre preparation): see drawing.

drag-gshed (in Buddhism): see dharmapāla.

drag racing, form of motor racing which originated in the United States and in which two contestants race from a standing start side by side on a drag strip—a flat, straight course, most commonly one-fourth mile (0.4 km) long. Both elapsed time (in seconds) and final speed (in miles per hour; mph) are recorded, although for most events the winner is simply the first to cross the finish line.

Contestants line up in parallel lanes with an electronic starting device known as a Christmas Tree between the lanes. Each driver interrupts a pair of infrared beams on his approach to the starting line; the first turns on the pre-staging light and the second turns on the staging light at the top of the Tree. Typically, when all four lights are lit and both vehicles are stationary, a starter flips a switch and a sequence of lights come on down the Tree at 0.5 second intervals (0.4 for professionals). On each driver's side three amber lights come on and then a green "go" light—leaving prematurely turns on a disqualifying red light. Each driver's elapsed time begins when his staging light goes out (after moving

away from the starting line)—not when the green lights come on—and ends when he interrupts a beam at the finish line. Another pair of beams, usually 66 or 132 feet before the finish line, are used to calculate final speeds.

Typically, tournament competitors race in elimination matches by special categories. However, mixed category races, known as bracket racing, exist under a handicap system where slower vehicles get a head start. The introduction of bracket racing reopened the sport to those without great wealth or corporate sponsorship and accounts for much of the present proliferation of the sport.

Drag racing as an organized sport began in the 1930s on dry lake beds in Southern California, and it gained greater respectability after Wally Parks helped organize the Southern California Timing Association (SCTA) in 1938. World War II brought a temporary hiatus to activities but gave California "hot rodders" the opportunity to proselytize fellow servicemen, and these new converts returned home with hot rod "fever."

In 1950 the first commercial drag strip was opened in Santa Ana, Calif., and in that same year Parks, as the editor of *Hot Rod* magazine, urged various local hot rod clubs to join together with the SCTA in a larger national organization to promote safety and sanctioned racing meets. In 1951 he became the first president of the National Hot Rod Association (NHRA), now in Glendora, Calif. Under Parks's leadership, the NHRA grew to encompass some 144 race tracks hosting nearly 4,000 events annually, with more than 85,000 members. Among the most prestigious drag racing events are the NHRA-sponsored Winter Nationals and the U.S. Nationals.

Along with smaller rival organizations, such as the International Hot Rod Association (IHRA), the NHRA sanctions events in dozens of categories with various complicated restrictions on chassis, body, engine, and fuel. The most familiar professional categories are Top Fuel (powered by nitromethane), Funny Cars (methanol or ethanol), Pro Stock (gasoline), Pro Stock Bikes (nitromethane-powered motorcycles), and Pro Stock Trucks (gasoline).

The fastest category cars (Top Fuel) can accelerate from 0 to 100 mph in less than one second (subjecting the driver to about five times the force of gravity) and reach more than 330 mph and have elapsed times under five seconds in the quarter mile. These vehicles are sometimes referred to as "rails" because of their long, narrow wheelbase. For driver safety and improved traction, most such vehicles use rear-engine designs, and their front wheels usually float a few inches above the ground for about the first 200 feet of the race. A special airfoil "wing" located at the rear produces a large downward force (between 4,000 and 8,000 pounds) that helps to maintain traction and stability. Top Fuel and Funny Car dragsters generally deploy one or two special parachutes to decelerate past the finish line.

In addition to Parks, the Motorsports Hall of Fame in Novi, Mich., includes drag-racing inductees Don ("Big Daddy") Garlits, Bob Glidden, Shirley Muldowney, and Don ("the Snake") Prudhomme.

Top Fuel dragsters

Chris Urso—AP Photo

"Funny" cars are highly modified dragsters covered by a fibreglass copy of a late-model production car body. They are restricted to one engine but are otherwise unlimited and are nearly as fast as Top Fuel racers.

Standard production cars, with varying degrees of modification, compete in most other classes, many of which are nonprofessional. For drag racing's place in the history of automobile racing; see automobile racing.

Drăgășani, Battle of (June 19, 1821), military engagement in which the Ottoman Turks defeated the forces of the Greek revolutionary society *Philikí Etairía* and ended the first insurrection of the Greek War of Independence. Intending to overthrow Ottoman rule in the Balkans and to establish an independent Greek state, *Philikí Etairía* sent the Sacred Battalion, under Alexander Ypsilantis, into the Danubian principalities to lead an uprising there. The Turkish Army, however, destroyed the Greek force at Drăgășani, 90 miles (145 kilometres) west of Bucharest, and Ypsilantis fled. The battle marked the end of his leadership but otherwise had little effect on the Greek independence movement, which had launched another rebellion in the Morea.

Drago, Luis María (b. May 6, 1859, Buenos Aires—d. June 9, 1921, Buenos Aires), statesman and author of the Drago Doctrine, which opposed the forcible collection of debts through military intervention in any South American republic.

A member of a distinguished Argentine family, Drago began his career as a newspaper editor. He later served as Argentine financial officer and then as minister of foreign affairs (1902). At that time, when Great Britain, Germany, and Italy were seeking to collect the public debt of Venezuela by force, he wrote to the Argentine minister in Washington setting forth his doctrine.

Drago represented Argentina at the Hague Peace Conference in 1907 and two years later served on the arbitration tribunal that decided the famous North Atlantic Coast Fisheries case (1910) between Britain and the U.S. He died shortly after he had been invited by the League of Nations to draft the statute of the Permanent Court of International Justice.

dragoman, Arabic *TARJUMĀN*, Turkish *TERCÜMAN*, official interpreter in countries where Arabic, Turkish, and Persian are spoken. Originally the term applied to any intermediary between Europeans and Middle Easterners, whether as a hotel tout or as a traveller's guide, but there developed the official dragomans of foreign ministries and embassies, whose functions at one time included the conduct of important political negotiations. In the latter sense the dragoman has, essentially, ceased to exist, especially since the passing of the Ottoman Empire, although in the latter part of the 20th century many embassies in the Arab world still employed an interpreter-courier known as a *kavass* (Turkish *kavas*; Arabic *qawwās*), used largely for ceremonial purposes.

The original employment of dragomans in the Ottoman government arose from religious scruples against the use of the language of a non-Muslim people. Ottoman political relations compelled the sultan's ministers to use interpreters, who rapidly acquired a very considerable political influence. The first chief dragoman of the Ottoman government was Panayotis Nikousia. Alexander Mavrokordatos, who succeeded Nikousia, negotiated the Treaty of Carlowitz (1699) for the Ottoman Empire and became very prominent in the development of Ottoman policy.

Similarly, foreign emissaries employed their own dragomans as confidential intermediaries between their missions and the Ottoman government. In 1877 Great Britain inaugurated a system for the selection and training of

British-born dragomans, and most European powers eventually followed.

The functions of the chief dragoman were essentially political in character. The subordinate dragomans transacted less important business, including, generally, all matters in which the interests of foreign citizens were involved. The high esteem in which the dragomans were held by most foreign powers was demonstrated by the fact that they were often elevated to the most important diplomatic posts. The more important consulates in the Ottoman provinces were also provided with dragomans, whose duties were of a similar if less important nature. Banks, railway companies, and financial institutions employed dragomans to facilitate their business relations with Ottoman officials.

dragon, legendary monster usually conceived as a huge, bat-winged, fire-breathing, scaly lizard or snake with a barbed tail. The belief in these creatures apparently arose without the

Dragon, detail of "Nine Dragons," handscroll, ink and slight colour on paper by Ch'en Jung, Chinese, 1244; in the Museum of Fine Arts, Boston

slightest knowledge on the part of the ancients of the gigantic, prehistoric, dragon-like reptiles. In Greece the word *drakōn*, from which the English word was derived, was used originally for any large serpent (see sea serpent), and the dragon of mythology, whatever shape it later assumed, remained essentially a snake.

In general, in the Middle Eastern world, where snakes are large and deadly, the serpent or dragon was symbolic of the principle of evil. Thus, the Egyptian god Apepi, for example, was the great serpent of the world of darkness. But the Greeks and Romans, though accepting the Middle Eastern idea of the serpent as an evil power, also at times conceived the *drakontes* as beneficent powers—sharp-eyed dwellers in the inner parts of the Earth. On the whole, however, the evil reputation of dragons was the stronger, and in Europe it outlived the other. Christianity confused the ancient benevolent and malevolent serpent deities in a common condemnation. In Christian art the dragon came to be symbolic of sin and paganism and, as such, was depicted prostrate beneath the heels of saints and martyrs.

The dragon's form varied from the earliest times. The Chaldean dragon Tiamat had four legs, a scaly body, and wings, whereas the biblical dragon of Revelation, "the old serpent," was many-headed like the Greek Hydra. Because they not only possessed both protective and terror-inspiring qualities but also had decorative effigies, dragons were early used as warlike emblems. Thus, in the *Iliad*, King Agamemnon had on his shield a blue three-headed snake, just as the Norse warriors in later times painted dragons on their shields and carved dragons' heads on the prows of their ships. In England before the Norman Conquest, the dragon was chief among the royal ensigns in war, having been instituted as such by Uther Pendragon, father of King Arthur. In the 20th century the dragon was officially incorporated in the armorial bearings of the prince of Wales.

In the Far East, the dragon managed to retain

its prestige and is known as a beneficent creature. The Chinese dragon, *lung* (q.v.), represented yang, the principle of heaven, activity, and maleness in the yin-yang (q.v.) of Chinese cosmology. From ancient times, it was the emblem of the Imperial family, and until the founding of the republic (1911) the dragon adorned the Chinese flag. The dragon came to Japan with much of the rest of Chinese culture, and there (as *ryū* or *tatsu*) it became capable of changing its size at will, even to the point of becoming invisible. Both Chinese and Japanese dragons, though regarded as powers of the air, are usually wingless. They are among the deified forces of nature in Taoism.

The term dragon has no zoological meaning, but it has been applied in the Latin generic name *Draco* to a number of species of small lizards found in the Indo-Malayan region. The name is also popularly applied to the giant monitor, *Varanus komodoensis*, discovered on Komodo, in Indonesia.

Dragon rug, any of the most numerous group of the Kuba carpets and a great favourite among rug fanciers because of striking design and colouring. The basic pattern—great, irregular, jagged bands that form an ogee lattice—is closely related to that of the Vase carpets of Kerman, upon which they were probably based.

Early examples are narrow for their length, with a single-stripe border, as in the Vase carpets. In the lattice, fantastic palmettes and other blossoms mask intersections; and in the spaces between the bands appear such figures as deformed Chinese dragons, flaming lions,

Dragon rug from the Caucasus, late 17th century; in the Philadelphia Museum of Art

and, in some cases, fawns, onagers (wild asses), ibex, and cranes. Upon the bands themselves may be distorted figures of pheasants and ducks, together with the Chinese *chi*, or cloud knot. The earliest rugs are drop repeats, but soon diagonal repeats and design offsets also appear. At first, the layouts were directional, but many later rugs have forms oriented to-

ward both ends. In later examples, all beasts but the dragon have disappeared or survive merely as indistinguishable bits of colour. All but the newest Dragon rugs are entirely of wool.

dragon worm: see guinea worm.

dragonet, any of about 40 species of exclusively marine fishes in the family Callionymidae (order Perciformes), found in warm temperate or tropical areas. Most species occur in the Indo-Pacific region, although representatives such as the spotfin dragonet (*Callionymus agassizi*) are also found in the Atlantic Ocean. This species has been taken from depths greater than 450 metres (1,500 feet).

The name dragonet is derived from the characteristically large and elongated fins, lips, and eyes of this relatively small fish (less than 20 centimetres [8 inches] long), giving it a formidable appearance. Dragonets are scaleless. The males may be brightly coloured during breeding season. Most species are bottom dwellers, frequently burying themselves in sand in shallow areas. Many are found in deep waters. The eggs are unusual in that they are pelagic, floating in the open water until they hatch.

dragonfish, also called SEA MOTH, any of about five species of small marine fishes com-

Dragonfish (*Pegasus papilio*)
Douglas Faulkner

prising the family Pegasidae and the order Pegasiformes. Dragonfish are found in warm Indo-Pacific waters. They are small (to about 16 centimetres [6½ inches] long), elongated fish encased in bony rings of armour. The armour is fused on the head and body but not on the tail, which is thus flexible. The pectoral fins are large, horizontal, and winglike; the pelvic fins consist of a few fingerlike rays. The mouth is small and toothless and is placed below an elongated, bony snout.

Little is known about the natural history of the dragonfish. Their relationships to other fish groups are in doubt. One of the best known dragonfish is *Pegasus volitans*, a blue-eyed, brown or deep-red fish found from India to Australia.

dragonfly, also called DARNER, DARNING NEEDLE, DEVIL'S ARROW, or DEVIL'S DARNING NEEDLE, any member of the insect suborder Anisoptera, order Odonata, characterized by four large, many-veined, membranous wings that, when at rest, are held horizontally and at right angles to the longitudinal body axis rather than vertically (as in members of the other suborder, Zygoptera, or damselflies). It is agile, with bulging eyes that often occupy most of the head, and has a wingspan of up to 16 centimetres (about 6 inches). It is one of the fastest flying and most predatory insects: in 30 minutes it can eat its own weight in food. It is also known as the devil's darning needle following the superstition that it may sew up the eyes, ears, and mouth of a sleeping child.

Dragonflies, along with damselflies, exhibit unusual mating behaviour. They differ from

Dragonfly (*Libellula forensis*)
E.S. Ross

most insects by having the male copulatory organs at the front part of the abdomen rather than at the end. Dragonflies often fly in tandem during the transfer of sperm; many pairs remain in this position until after the female has laid her eggs. The aquatic nymph, or naiad, propels itself by expelling water through gills in the rectum.

dragonhead, either of two genera of plants, *Dracocephalum* and *Physostegia*, both belonging to the mint family (Lamiaceae), order Lamiales. The about 45 species of *Dracocephalum*, all native in temperate Eurasia except for one in North America, have two-lipped flowers, lobed at the base and the upper lip, resembling fanciful heads of dragons. In North America *D. parviflorum* produces a dense spike of blue flowers at the top of its 60-centimetre- (2-foot-) high stem.

The related false dragonheads, or obedient plants (*Physostegia*), with 15 species are na-

Dragonhead (*Dracocephalum virginianum*)
B.M. Shaub

tive to North America. The best known is *P. virginiana*, which has large, pink, bell-like flowers on slender spikes.

dragon's blood, red resin obtained from the fruit of several palms of the genus *Daemonorops* and used in colouring varnishes and lacquers. Once valued as a medicine in Europe because of its astringent properties, dragon's blood now is used as a varnish for violins and in photoengraving for preventing undercutting of the printing surface during etching.

Daemonorops draco, a rattan palm native to Malaysia and Indonesia, produces much of the dragon's blood of commerce. Other sources are *Dracaena cinnabari* of the island of Socotra, east of Somalia; *Dracaena draco* of the Canary Islands; and *Croton draco* of Mexico, where it is used locally to heal wounds and as an astringent.

dragon's-mouth, also called BOG PINK, or WILD PINK, (*Arethusa bulbosa*), one of two plant species of the orchid genus *Arethusa*, family Orchidaceae. Dragon's-mouth is found only in North American bogs; the other species exists only in marshy areas of Japan.

A reddish-pink dragon's-mouth flower has

Dragon's-mouth (*Arethusa bulbosa*)

three erect sepals and a purplish-blotched lip that curves downward. The upper surface of the lip is covered with a thick tissue bearing many yellowish, purple-tipped hairs. A hood arches over the lip. The stem is about 30 centimetres (12 inches) tall and bears one long, sharp-pointed leaf after the flowering season.

Dragon's Mouths, Spanish BOCAS DEL DRAGÓN, channel of the southeastern Caribbean Sea, between Punta (point) Peñas, the eastern end of the Península de Paría, Venezuela, and the northwest extremity of the island of Trinidad. The channel, about 12 mi (20 km) wide, separates Trinidad from mainland South America at this point; to the south lies the broad Gulf of Paría. The channel is named from its many teeth-like rocky islets; both these islets and the strong current of the channel have long been dangers to navigation.

dragoon, in late 16th-century Europe, a mounted soldier who fought as a light cavalryman on attack and as a dismounted infantryman on defense. The terms derived from his weapon, a species of carbine or short musket called the dragoon. Dragoons were organized not in squadrons but in companies, and their officers and noncommissioned officers bore infantry titles. From the early wars of Frederick II the Great of Prussia in the 18th century, dragoon has referred to medium cavalry. The light cavalry of the British army in the 18th and early 19th centuries was for the most part called light dragoon. The term and function disappeared as the cavalry did in the 20th century.

drainage, in agriculture, the artificial removal of water from land; drainage is employed in the reclamation of wetlands, in the prevention of erosion, and as a concomitant of irrigation in the agriculture of arid regions.

A brief treatment of drainage follows. For full treatment, see MACROPAEDIA: Farming and Agricultural Technology.

Drainage is an ancient practice, but apparently until recent times it was regarded as less important than irrigation. The first drains were most likely ditches for channelling floodwaters back to the rivers. The addition of linings of less porous materials greatly improved drainage efficiency. The most significant 20th-century development in drainage technology was the application of land-grading techniques to facilitate uniform runoff.

Land may be smoothed with proper slopes and ditches so as to remove excess water before it enters the soil and thus prevent erosion, leaching of nutrients, and standing pools of water on the surface, and to permit early spring planting. If carefully planned, this smoothing also can prepare the land for surface irrigation, thus serving two purposes by one earth-moving operation. After excess water enters the soil, its removal is an expensive and specialized undertaking that is not directly connected with irrigation, although it sometimes may be necessary for irrigated land. Modern drainage systems may be divided into two categories, surface and subsurface. The typical surface system consists of field drains, field ditches, a main collection ditch, and an outlet. As the term implies, a surface system is designed to remove water that collects on top of the soil. Surface drainage is especially important for soils that absorb water slowly. The field drains vary in configuration according to topography, parallel drains being indicated for uniform surfaces and site-specific ones for areas of uneven accumulation.

Subsurface drainage systems consist of small conduits, a submain, a main, and an outlet. The conduits, equivalent to the field drains in a surface system, collect the water in the soil and drain it into the larger arteries.

Factors determining the most efficient drainage system design for a particular property include soil type, land configuration, amount and pattern of rainfall, and types of crops to be grown. Soils of high sand or silt content are generally suited to subsurface drainage, while soils of high clay content generally require surface systems.

drainage basin, also called CATCHMENT AREA, or WATERSHED, area from which all precipitation flows to a single stream or set of streams. For example, the total area drained by the Mississippi River constitutes its drainage basin, whereas that part of the Mississippi River drained by the Ohio River is the Ohio's drainage basin. The boundary between drainage basins is a drainage divide: all the precipitation on opposite sides of a drainage divide will flow into different drainage basins.

A drainage basin provides a limited surface area within which physical processes pertinent to the general hydrology may be considered. The climatic variables and the water and sediment discharge, water storage, and evapotranspiration may be measured; from these measurements, denudation rates and moisture and energy balances may be derived, each of which is useful in the consideration and understanding of landscape formation.

Drake, Edwin Laurentine (b. March 29, 1819, Greenville, N.Y., U.S.—d. Nov. 8, 1880, Bethlehem, Pa.), driller of the first productive oil well in the United States.

A railway conductor in New Haven, Conn., Drake bought a small amount of stock in the Pennsylvania Rock Oil Company, which gathered oil from ground-level seepages at Titusville, Pa., for medicinal uses. In Titusville on business, Drake studied the techniques of drilling salt wells. With the encouragement of George H. Bissell, a local landowner who was aware of the younger Benjamin Silliman's report of the potential value of petroleum, Drake persuaded the company to lease its land for drilling operations. He began drilling in 1858 and struck oil at a depth of 69 feet (21 metres) on Aug. 28, 1859. With the spread of Drake's drilling techniques, Titusville and other northwestern Pennsylvania communities became boom towns. Drake failed to

patent his drilling methods, however, and later lost his money in oil speculation. After 10 years of poverty, he was finally pensioned by the Pennsylvania legislature.

Drake, Sir Francis (b. c. 1540–43, Devonshire, Eng.—d. Jan. 28, 1596, at sea, off Puerto Bello, Panama), English admiral who circumnavigated the globe (1577–80) and was the most renowned seaman of the Elizabethan Age.

Sir Francis Drake, detail of an oil on panel, after an engraving attributed to Jodocus Hondius, 1583; in the National Portrait Gallery Archivio I G D A / © DeA Picture Library

Early life. Born on the Crowndale estate of Lord Francis Russell, 2nd earl of Bedford, Drake's father, Edmund Drake, was the son of one of the latter's tenant farmers. Edmund fled his native county after arraignment for assault and robbery in 1548. The claim that he was a refugee from Roman Catholic persecution was a later pious fiction. From even before his father's departure, Francis was brought up among relatives in Plymouth: the Hawkins family, who combined vocations as merchants and pirates.

When Drake was about 18, he enlisted in the Hawkins family fleet, which prowled for shipping to plunder or seize off the French coast. By the early 1560s, he had graduated to the African trade, in which the Hawkins family had an increasing interest, and by 1568 he had command of his own ship on a Hawkins venture of illicit slave-trading in the Spanish colonies of the Caribbean.

Voyages to the West Indies. Resenting the Spanish authorities' claims to regulate their colonies' trade and impound contraband, Drake later referred to some "wrongs" that he and his companions had suffered—wrongs that he was determined to right in the years to come. His second voyage to the West Indies, in company with John Hawkins, ended disastrously at San Juan de Ulúa off the coast of Mexico, when the English interlopers were attacked by the Spanish and many of them killed. Drake escaped during the attack and returned to England in command of a small vessel, the "Judith," with an even greater determination to have his revenge upon Spain and the Spanish king, Philip II.

Although the expedition was a financial failure, it brought Drake to the attention of Queen Elizabeth I, who had herself invested in the slave-trading venture. In the years that followed, he made two expeditions in small vessels to the West Indies, in order "to gain such intelligence as might further him to get some amend for his loss." In 1572—having obtained from the queen a privateering commission, which amounted to a license to plunder in the king of Spain's lands—Drake set sail for America in command of two small ships, the 70-ton "Pasha" and the 25-ton "Swan." He was nothing if not ambitious, for his aim was to capture the important town of Nombre de Dios, Panama. Although Drake was wounded in the attack, which failed, he and his men

managed to get away with a great deal of plunder by successfully attacking a silver-bearing mule train. This was perhaps the foundation of Drake's fortune. In the interval between these episodes, he crossed the Isthmus of Panama. Standing on a high ridge of land, he first saw the Pacific, that ocean hitherto barred to all but Spanish ships. It was then, as he put it, that he "besought Almighty God of His goodness to give him life and leave to sail once in an English ship in that sea."

He returned to England both rich and famous. Unfortunately, his return coincided with a moment when Queen Elizabeth and King Philip II of Spain had reached a temporary truce. Although delighted with Drake's success in the empire of her great enemy, Elizabeth could not officially acknowledge piracy. Drake saw that the time was inauspicious and sailed with a small squadron to Ireland, where he served under the earl of Essex and took part in a notorious massacre in July 1575. An obscure period of Drake's life follows; he makes almost no appearance in the records until 1577.

Circumnavigation of the world. In 1577 he was chosen as the leader of an expedition intended to pass around South America through the Strait of Magellan and to explore the coast that lay beyond. The expedition was backed by the queen herself. Nothing could have suited Drake better. He had official approval to benefit himself and the queen, as well as to cause the maximum damage to the Spaniards. This was the occasion on which he first met the queen face-to-face and heard from her own lips that she "would gladly be revenged on the king of Spain for divers injuries that I have received." The explicit object was to "find out places meet to have traffic." Drake, however, devoted the voyage to piracy, without official reproof in England. He set sail in December with five small ships, manned by fewer than 200 men, and reached the Brazilian coast in the spring of 1578. His flagship, the "Pelican," which Drake later renamed the "Golden Hind" (or "Golden Hinde"), weighed only about 100 tons. It seemed little enough with which to undertake a venture into the domain of the most powerful monarch and empire in the world.

Upon arrival in South America, Drake alleged a plot by unreliable officers, and its supposed leader, Thomas Doughty, was tried and executed. Drake was always a stern disciplinarian, and he clearly did not intend to continue the venture without making sure that all of his small company were loyal to him. Two of his smaller vessels, having served their purpose as store ships, were then abandoned after their provisions had been taken aboard the others, and on Aug. 21, 1578, he entered the Strait of Magellan. It took 16 days to sail through, after which Drake had his second view of the Pacific Ocean—this time from the deck of an English ship. Then, as he wrote, "God by a contrary wind and intolerable tempest seemed to set himself against us." During the gale, Drake's vessel and that of his second in command had been separated; the latter, having missed a rendezvous with Drake, ultimately returned to England, presuming that the "Hind" had sunk.

It was, therefore, only Drake's flagship that made its way into the Pacific and up the coast of South America. He passed along the coast like a whirlwind, for the Spaniards were quite unguarded, having never known a hostile ship in their waters. He seized provisions at Valparaíso, attacked passing Spanish merchantmen, and captured two very rich prizes that were carrying bars of gold and silver, minted Spanish coinage, precious stones, and pearls. He claimed then to have sailed to the north as far as 48° N, on a parallel with Vancouver

(Canada), to seek the Northwest Passage back into the Atlantic. Bitterly cold weather defeated him, and he coasted southward to anchor near what is now San Francisco. He named the surrounding country New Albion and took possession of it in the name of Queen Elizabeth.

In July 1579 he sailed west across the Pacific and after 68 days sighted a line of islands (probably the remote Palau group). From there he went on to the Philippines, where he watered ship before sailing to the Moluccas. There he was well received by a local sultan and succeeded in buying spices. Drake's deep-sea navigation and pilotage were always excellent, but in those totally uncharted waters his ship struck a reef. He was able to get her off without any great damage and, after calling at Java, set his course across the Indian Ocean for the Cape of Good Hope. Two years after she had nosed her way into the Strait of Magellan, the "Golden Hind" came back into the Atlantic with only 56 of the original crew of 100 left aboard.

On Sept. 26, 1580, Francis Drake took his ship into Plymouth Harbour. She was laden with treasure and spices, and Drake's fortune was permanently made. Despite Spanish protests about his piratical conduct while in their imperial waters, Queen Elizabeth herself went aboard the "Golden Hind," which was lying at Deptford in the Thames estuary, and personally bestowed knighthood on him.

Mayor of Plymouth. In the same year, 1581, Drake was made mayor of Plymouth, an office he fulfilled with the same thoroughness that he had shown in all other matters. He organized a water supply for Plymouth that served the city for 300 years. Drake's first wife, a Cornish woman named Mary Newman, whom he had married in 1569, died in 1583, and in 1585 he married again. His second wife, Elizabeth Sydenham, was an heiress and the daughter of a local Devonshire magnate, Sir George Sydenham. In keeping with his new station, Drake purchased a fine country house—Buckland Abbey (now a national museum)—a few miles from Plymouth. Drake's only grief was that neither of his wives bore him any children.

During these years of fame when Drake was a popular hero, he could always obtain volunteers for any of his expeditions. But he was very differently regarded by many of his great contemporaries. Such well-born men as the naval commander Sir Richard Grenville and the navigator and explorer Sir Martin Frobisher disliked him intensely. He was the parvenu, the rich but common upstart, with West

Country manners and accent and with none of the courtier's graces. Drake had even bought Buckland Abbey from the Grenvilles by a ruse, using an intermediary, for he knew that the Grenvilles would never have sold it to him directly.

It is doubtful, in any case, whether he cared about their opinions, so long as he retained the goodwill of the queen. This was soon enough demonstrated when in 1585 Elizabeth placed him in command of a fleet of 25 ships. Hostilities with Spain had broken out once more, and he was ordered to cause as much damage as possible to the Spaniards' overseas empire. Drake fulfilled his commission, capturing Santiago in the Cape Verde Islands and taking and plundering the cities of Cartagena in Colombia, St. Augustine in Florida, and San Domingo (now Santo Domingo, Dom.Rep.). Lord Burghley, Elizabeth's principal minister, who had never approved of Drake or his methods, was forced to concede that "Sir Francis Drake is a fearful man to the king of Spain."

Failure of the Spanish Armada. By 1586 it was known that Philip II was preparing a fleet for what was called "the Enterprise of England" and that he had the blessing of Pope Sixtus V to return the crown to the fold of Rome. Drake was given carte blanche by the queen to "impeach the provisions of Spain." In the following year, with a fleet of some 30 ships, he showed that her trust in him had not been misplaced. He stormed into the Spanish harbour of Cádiz and in 36 hours destroyed numerous vessels and thousands of tons of supplies, all of which had been destined for the Armada. This action, which he laughingly referred to as "singing the king of Spain's beard," helped to delay the invasion fleet for a further year. But the resources of Spain were such that by July 1588 the Armada was in the English Channel. Lord Howard had been chosen as English admiral to oppose it. Drake appropriated a prize—a Spanish galleon disabled in an accidental collision—but, although credited by legend with a heroic role, is not known to have played any part in the fighting.

Last years. Drake's later years, however, were not happy. An expedition that he led to Portugal proved abortive, and his last voyage, in 1596 against the Spanish possessions in the West Indies, was a failure, largely because the fleet was decimated by a fever to which Drake himself succumbed. He was buried at sea off the town of Puerto Bello (modern Portobelo, Panama). As the Elizabethan historian John Stow wrote:

He was more skilful in all points of navigation than any. . . . He was also of a perfect memory, great observation, eloquent by nature. . . . In brief he was as famous in Europe and America, as Timur Lenk [Tamerlane] in Asia and Africa.

At home his reputation was equivocal. Fellow captains found him unreliable and self-seeking. His Spanish victims, however, conceded grudging admiration: he was credited with diabolical powers as a navigator and became the antihero of works of literature, in which he was celebrated for courtesy to prisoners. But to the Spaniards he was also, as their ambassador to England remarked, "the master-thief of the unknown world." He was "low of stature, of strong limb, round-headed, brown hair, full-bearded, his eyes round, large and clear, well-favoured face and of a cheerful countenance." His life was dedicated to self-aggrandizement and revenge directed at Spain. But his legend influenced English self-perceptions, for he was credited with feats of sangfroid, unflappability, improvisation, tenacity, and fair play, most of which have little or no basis in fact.

(E.Br./F.F.-A.)
BIBLIOGRAPHY. Harry Kelsey, *Sir Francis Drake: The Queen's Pirate* (1998), is now the best study. John Sugden, *Sir Francis Drake* (1990), though superseded by Kelsey, can also be recommended, as can David Beers Quinn, with Burton Van Name Edwards (compiler), *Sir Francis Drake as Seen by His Contemporaries* (1996).

Drake, Joseph Rodman (b. Aug. 7, 1795, New York City—d. Sept. 21, 1820, New York City), Romantic poet who contributed to the beginnings of a U.S. national literature by a few memorable lyrics that were published before his early death.

Drake's father died while the boy was young, and his mother remarried and went to live in New Orleans, leaving her son with relatives in New York. He graduated from medical school there in 1816. While a student, he became friends with another poet, Fitz-Greene Halleck, with whom he began collaborating, in 1819, on topical satirical verses, the "Croaker Papers," published under a pseudonym in the *New York Evening Post*. These lampoons of public personages appeared in book form in 1860. Drake married an heiress, honeymooned in Europe, and returned to New York to open a pharmacy.

Although he had asked his wife to destroy his unpublished poems, she kept them, and a daughter saw to the publication of 19 of his verses in 1835 as *The Culprit Fay and Other Poems*. The title poem, considered his best, deals with the theme of the fairy lover in a Hudson River setting. The volume also contains two fine nature poems, "Niagara" and "Bronx." These and other poems and Drake's prose appeared in *The Life and Works of Joseph Rodman Drake (1795-1820)* (1935), edited by F.L. Pleadwell.

Drake Passage, deep waterway 600 miles (1,000 km) wide, connecting the Atlantic and Pacific oceans south of Tierra del Fuego, off which, on Hornos Island, stands the headland of Cape Horn, the southernmost point of South America. To the south, the waterway is bounded by the South Shetland Islands, situated about 100 miles (160 km) north of the Antarctic Peninsula. Across this stretch of ocean the climate changes from the cool, humid, subpolar type found at Tierra del Fuego to the frozen conditions of Antarctica.

The Drake Passage played an important part in the trade of the 19th and early 20th centuries before the opening of the Panama Canal in 1914. The stormy seas and icy conditions made the rounding of Cape Horn through the Drake Passage a rigorous test for ships and crews alike, especially for the sailing vessels of the day.

Though bearing the name of the famous 16th-century English seaman and explorer, the Drake Passage was, in fact, first traversed in 1616 by a Flemish expedition led by Willem Schouten. Drake did not sail through the passage but passed instead through the Straits of Magellan to the north of Tierra del Fuego, although he was blown back into the northern latitudes of the passage by a Pacific storm.

Drake's circumnavigation of the world

The passage has an average depth of about 11,000 feet (3,400 m), with deeper regions of up to 15,600 feet (4,800 m) near the northern and southern boundaries.

The sediments on the seafloor result from the interplay of glacial debris from Antarctica, material of biological origin, and eroded material from South America. As one proceeds southward, the sediments are first mainly sandy and clayey silts and then, later, silts with ice-rafted material (*i.e.*, material dropped from melting icebergs). Near 58° S is a zone of numerous manganese nodules.

The winds over the Drake Passage are predominantly from the west and are most intense in the northern half. The mean annual air temperature ranges from 41° F (5° C) in the north to 27° F (−3° C) in the south. The coldest temperatures, of −4° F (−20° C), occur in July. Cyclones (atmospheric low-pressure systems with winds that blow clockwise in the Southern Hemisphere) formed in the Pacific Ocean traverse the passage at the southern end. Surface water temperature varies from near 43° F (6° C) in the north to 30° F (−1° C) in the south, with the temperature altering sharply in a zone near 60° S. This transitional zone is known as the Antarctic Convergence; it separates the sub-Antarctic surface water from the colder and fresher Antarctic surface water. At depths of between approximately 1,600 and 10,000 feet (500 and 3,050 m) there occurs a layer of relatively warm and salty deep water.

The sea ice cover extending northward from Antarctica varies seasonally. In the late summer (February) the passage is ice-free. In September the maximum ice cover occurs; 25 percent to full cover extends to 60° S, with occasional ice floes reaching Cape Horn.

The water within the passage flows from the Pacific into the Atlantic, except for a small amount of water in the south that comes from the Scotia Sea. The general movement, known as the Antarctic Circumpolar Current, is the most voluminous in the world; its estimated rate of flow is between 3,400,000,000 and 5,300,000,000 cubic feet (95,000,000 and 150,000,000 cubic m) per second. The Antarctic Circumpolar Current, which is slightly accelerated by the passage, is strongest in the vicinity of the Antarctic Convergence. Near Cape Horn is a fairly swift coastal flow. After traversing the passage, a branch of the Circumpolar Current called the Falkland Current turns sharply to the north, while the vast majority of flow continues eastward and north-eastward.

There is a relatively high abundance of plankton in the Drake Passage. Krill (small shrimplike crustaceans) are very abundant in the south, where blue and fin whales feed on them. Squid also feed on krill and, in turn, form a basic food for the sperm whales. Krill are also important to the diet of the emperor penguin and the crabeater seal. Antarctic cods are the most common fish. Some of these fish and all of the cold-water Chaenichthyidae (icefish) are “bloodless”—*i.e.*, they have no detectable hemoglobin in their blood.

Where the same name denote a person, place, or thing, the articles will be found in that order

Drakensberg (Afrikaans: “Dragon Mountain”), the main mountain range of southern Africa. The Drakensberg rises to more than 11,400 feet (3,475 m) and extends roughly northeast to southwest for 700 miles (1,125 km) parallel to the southeastern coast of South Africa. Rock and cave art, several thousands of years old, have been found in the range. There are many game reserves and parks in the range. In 2000 uKhahlamba/Drakensberg Park was designated a UNESCO World Heritage site.

Segment of the Drakensberg known as Cathedral Peak, South Africa

Gerald Cubitt

The Drakensberg is part of the Great Escarpment and separates the high plateaus of the South African interior from the lower lands along the coast. The range extends from Limpopo and Mpumalanga provinces, through Lesotho, to Eastern Cape province. The range separates Mpumalanga and Free State provinces and Lesotho on the plateau from lower-lying Swaziland and KwaZulu-Natal province near the coast. The Drakensberg is the main watershed of South Africa and is the source of the Orange River.

The most elevated stretch of the Drakensberg, in Lesotho, is composed of severely eroded basalt capping a sandstone base. Its pinnacles and broken and fractured blocks present a steep eastern scarp (10,000 to more than 11,000 feet [3,000 to 3,300 m] in elevation) along the length of the border between Lesotho and KwaZulu-Natal; a steep southern scarp (8,000 to 10,000 feet [2,400 to 3,000 m] in elevation) lies along the length of the Lesotho–Eastern Cape province border. The local Zulu name for the eastern face, uKhahlamba, meaning “barrier of pointed spears,” accurately describes this part of the Drakensberg. Immediately below the steep scarps to the south and east are sandstone terraces with basalt outcrops and deep valleys running to the sea.

Northeast of the juncture of the Free State, KwaZulu-Natal, and Lesotho borders, the Drakensberg becomes progressively less elevated, with the steep eastern escarpment giving way to gentle slopes; north of the town of Belfast in Mpumalanga province, the range once again becomes more rugged, attaining heights of more than 7,600 feet (2,300 m). The western and northern sides of the Drakensberg shelve gradually into the interior plateau, though in Lesotho the range descends into a jumble of weathered basalt mountains, where waterfalls and deep gorges are commonplace.

The Drakensberg of Lesotho and KwaZulu-Natal is snowcapped in winter. Mountaineering is challenging, and some peaks remain unclimbed because of difficult access. The natural tussock steppe is not farmed or developed, and this area is dotted with mountain resorts and camping grounds.

dram, unit of weight in the apothecaries’ and avoirdupois systems. An apothecaries’ dram contains 3 scruples (3.888 grams) of 20 grains each and is equal to one-eighth apothecaries’ ounce of 480 grains. The avoirdupois dram contains 27.344 grains (1.772 grams) and is equal to one-sixteenth avoirdupois ounce of 437.5 grains. The term also refers to the fluid dram, a measure of capacity equal to one-eighth fluid ounce.

In England dram came to mean a small draught of cordial or alcohol; hence the term dram-house for the taverns where one could

purchase a dram. Dram is ultimately derived from Greek drachma, designating an ancient coin and weight that probably originated as the amount one could hold in one’s hands. The use of the dram as a measuring unit has largely been superseded by metric measures.

Dráma, town and *nomós* (department), Macedonia, northern Greece. It lies on a major tributary of the Angitis River, at the northern edge of the plain of Dráma. The town, a tobacco and agricultural (cotton and rice) centre, is served by several limestone springs issuing from the base of the nearby Falakrón Mountains. In the 18th century it replaced Philippi (modern Filippi) to the southeast as the chief town of the plain. After the departure of the Turkish inhabitants in 1922, during the war between Turkey and Greece, its population was almost doubled by the arrival of Greek refugees from Turkey. Dráma is the headquarters of an army corps and the seat of a metropolitan bishop. It has a tobacco research station, rail connections, and a direct road link to the port of Kavála. Pop. (2001) town, 43,485; *nomós*, 103,975.

dramatic literature, the texts of plays that can be read, as distinct from being seen and heard in performance.

A brief treatment of dramatic literature follows. For full treatment, see MACROPAEDIA: Literature, The Art of.

The relations between dramatic texts and the performances for which such writing was intended are neither simple nor regular. In the case of the Greek dramatists of the 5th century BC, the texts now available are a small selection made by later copying and preservation. There is no way of knowing how these relate, precisely, to the compositions made available for the original productions. The problem here, as in many later periods, is the relation between the words written to be spoken or sung by the performers and the many other elements of dramatic composition—in movement, in scene and costume, and occasionally in music—that the performance would include. Some of these can be inferred from the particular styles of writing, but most have to be studied from other kinds of surviving accounts.

In the drama of the English Renaissance, it was at first unusual to publish plays as if they were literary works, but the importance of the dramatic writing of the period eventually established many of the plays as texts. It is again necessary to infer other elements of the full dramatic composition from other kinds of information about theatres, audiences, and acting. In later periods, and especially from the 19th century onward, it became habitual to include in the written text of a play, and especially in its independently published form, details not only of scene and stage movement but also of the appearance of the characters and of the states of mind intended to accompany or to punctuate the spoken words. Some of these later texts of plays resemble, in part, the printed modes of novels or short stories.

There is no doubt that the printed texts of plays, in any of these forms, can be read as literature. Many of them are now regarded as being among the great works of literature of the world: *The Oresteia*, *King Lear*, *Peer Gynt*. Yet it is then easy to forget that they are always a particular form of writing, for several voices and for action. It can be reasonably claimed that one gains the essential meanings of a play from the printed text alone, but there are cases when a plain silent reading from the text may miss some significant points. It is possible, for example, to read the Greek plays, especially in translation, without realizing that this or that “speech” was in fact sung, by a

single actor or by the two halves of the chorus. In what are called the "soliloquies" of Shakespeare it is possible, from the printed text, to suppose that these are forms of "private thought," when in fact, within the well understood dramatic conventions of the period, they were spoken aloud, directly or indirectly, to audiences. In many other cases the physical movements and relations that were part of the essential composition may be missed altogether, or only vaguely apprehended, from the apparently self-sufficient text of the words spoken and its minimal "stage directions."

Most drama is a form of writing for oral and actual performance, and it is in the period when imaginative writing has been taken to be coterminous with "literature," and especially with printed literature, that some of its elements have been most persistently misunderstood. The phrase dramatic literature has elements in common with the phrase oral literature, when the condition of silent reading of print has come to seem the normal or even universal condition of the reception and study of imaginative writing. The name for work within these conditions—"literature"—was transferred to these other forms of writing intended primarily for oral communication. The need for understanding the conditions of oral performance is now more widely recognized. At the same time, given this recognition, the texts of the great plays are still read as dramatic literature, with a proper emphasis on the distinguishing features of the dramatic.

dramatic monologue, a poem written in the form of a speech of an individual character; it compresses into a single vivid scene a narrative sense of the speaker's history and psychological insight into his character. Though the form is chiefly associated with Robert Browning, who raised it to a highly sophisticated level in such poems as "My Last Duchess," "The Bishop Orders His Tomb at St. Praxed's Church," "Fra Lippo Lippi," and "Andrea del Sarto," it is actually much older. Many Old English poems are dramatic monologues—for instance, "The Wanderer" and "The Seafarer." The form is also common in folk ballads, a tradition that Robert Burns imitated with broad satiric effect in "Holy Willie's Prayer." Browning's contribution to the form is one of subtlety of characterization and complexity of the dramatic situation, which the reader gradually pieces together from the casual remarks or digressions of the speaker. The subject discussed is usually far less interesting than what is inadvertently revealed about the speaker himself. In "My Last Duchess," in showing off a painting of his late wife, an Italian aristocrat reveals his cruelty to her. The form parallels the novelistic experiments with point of view in which the reader is left to assess the intelligence and reliability of the narrator. Later poets who successfully used the form were Ezra Pound ("The River Merchant's Wife: A Letter"), T.S. Eliot ("Love Song of J. Alfred Prufrock"), and Robert Frost ("The Pauper Witch of Grafton"). See also soliloquy.

drame bourgeois, type of play that enjoyed brief popularity in France in the late 18th century. Written for and about the middle class and based upon the theories of the French essayist and encyclopaedist Denis Diderot (1713–84), the *drame bourgeois* was conceived of as occupying a place between tragedy and comedy; it was designed as a serious depiction of middle-class problems, especially social abuses, but usually included a conventional happy ending. Diderot wrote two *dramas* illustrating his theories, *Le Fils naturel* (published 1757; *Dorval; or, The Test of Virtue*) and *Le Père de famille* (published 1758; *The Father*), adapting them from the earlier *comédie larmoyante* ("tearful comedy") of Nivelle de La

Chaussée. Diderot's plays and those of his successors, Michel-Jean Sedaine and Louis-Sébastien Mercier, are regarded by critics today as sentimental and humourless, full of inflated dialogue and pompous sermonizing. *Drame bourgeois*, however, was important to the development of French acting, leading to more natural styles of speech and gesture, as well as being an attempt at greater historical accuracy in costumes and scenery. Diderot and his followers are also seen as promoting an aura congenial to the romanticism of the next century and as distant precursors of the earliest writers of problem plays, such as Émile Augier and Alexandre Dumas fils.

Drammen, city, seat of Buskerud fylke (county), southeastern Norway. Located at the junction of the Dram River with Dram Fjord, southwest of Oslo, the site was first settled in the 13th century as two separate communities, Bragernes and Stromsoy. Each was granted common town privileges in 1715. In 1811 they merged with Tangen to form the present city. Drammen is a seaport and a railroad terminus; its manufactures include wood products, plastics, abrasives, textiles, leather goods, and beer. Granite is quarried nearby. Pop. (1987 est.) mun., 51,497.

Dramselva, also called DRAMMENSELVA, English DRAM RIVER, or DRAMMEN RIVER, river, Buskerud fylke (county), southeastern Norway. After rising on the southern slopes of the Halling Mountains as the Halling River and flowing east-northeast to the town of Gol, it flows south-southeast to Kroderen (lake) and thence southward to enter Dram Fjord at the city of Drammen after a course of 192 miles (309 km). The name Drammen refers strictly to the lowest 30 miles (48 km) of the river (below Kroderen) but is also used for the whole river drainage system of 6,600 square miles (17,100 square km). Its flow is highly regulated by a series of hydroelectric facilities, and several paper and lumber mills adjoin the river.

Drancy, northeastern industrial suburb of Paris, Seine-Saint-Denis *département*, Paris region, France. It lies 3 miles (5 km) from the city limits of the capital. During the German occupation of France in World War II, buildings in the southeast of the locality were turned into a concentration camp. From 1941 to 1944, about 120,000 French and non-French Jews passed through Drancy on their way to extermination camps in Poland, where most of them perished. The French artist and poet Max Jacob died in the Drancy camp in 1944. Pop. (1982) 60,122.

Drang nach Osten (German: "Drive to the East"), German policy or disposition to colonize the Slavic lands east of Germany. The term originally referred to the eastward movement of German settlers in the 12th and 13th centuries but was resurrected by Adolf Hitler in the 20th century to describe his plans for acquiring *Lebensraum* ("living space") for Germans.

The medieval *Drang nach Osten* was part of a general German expansion and was particularly directed toward the territory between the rivers Elbe and Oder. Here peasants could settle land on more favourable terms than farther west, while many knights needed fiefs and lordships to uphold their rank. The great German princes won extensive lands in the region: the Welf duchy of Saxony was supreme in the later 12th century; by 1250 the Ascanian dynasty had large holdings in Brandenburg, while the Wettin margraves of Meissen were powerful farther south. In the 13th century the religious order of the Teutonic Knights won large territories in Prussia and farther north around the shores of the Baltic Sea.

During the 20th century, the German Nazis invoked the *Drang nach Osten* to glorify their territorial greed directed against Czechoslo-

vakia, Poland, and the Soviet Union. (The phrase occurred in Hitler's tirades against Czechoslovakia during the late 1930s.) After Germany's initial successes in World War II, the idea became submerged in more general schemes of world domination.

Draper, Charles Stark (b. Oct. 2, 1901, Windsor, Mo., U.S.—d. July 25, 1987, Cambridge, Mass.), American aeronautical engineer noted as a designer of navigational and guidance systems for ships, airplanes, and rockets.

Draper joined the faculty of the Massachusetts Institute of Technology (MIT), Cambridge, in 1935. Three years later he became a full professor and was placed in charge of the Instrumentation Laboratory. He immediately began the development of a gunsight for naval anti-aircraft guns, which was installed on most U.S. naval vessels during World War II.

Encouraged by the success of the gunsight, Draper started work on a gyroscopically controlled bombsight, and, with the advent of long-range rockets, he expanded his efforts to include inertial guidance systems.

In 1951 Draper became chairman of the aeronautical department at MIT. His inertial navigation system for aircraft, called spatial inertial reference equipment (SPIRE), was successfully tested in 1953. This system allows a plane to fly thousands of miles to its destination without reference to outside navigational aids, such as radio or the positions of celestial bodies. In 1954 Draper introduced an inertial navigation system that, in an improved and miniaturized form, was incorporated into many U.S. guided missiles, including the Polaris. His group at the Instrumentation Laboratory also developed the guidance systems for the spacecraft of the Apollo Project, which landed man on the Moon.

Draper, Henry (b. March 7, 1837, Prince Edward County, Va., U.S.—d. Nov. 20, 1882, New York City), American physician and amateur astronomer who made the first photograph of the spectrum of a star (Vega), in 1872. He was also the first to photograph a nebula, the Orion Nebula, in 1880. His father, John William Draper, in 1840 had made the first photograph of the Moon.

Henry Draper

By courtesy of the Lick Observatory Archives, Santa Cruz, Calif.

Henry Draper was appointed to the medical staff of Bellevue Hospital, New York City, in 1859 and in 1866 became dean of the medical faculty of the University of the City of New York. For his photography of the transit of Venus in 1874, Congress ordered a gold medal struck in his honour. His widow established the Henry Draper Memorial Fund at Harvard Observatory, financing the making of the great *Henry Draper Catalogue* of stellar spectra.

Draper, Ruth (b. Dec. 2, 1884, New York City—d. Dec. 30, 1956, New York City), American monologist and monodramatist whose art was acclaimed throughout the United States and Europe.

Draper began her career by writing sketches about people she knew or had observed and then by performing them at parties. She appeared only once in a full-length play, in 1916. She made her New York City debut as

Ruth Draper
EB Inc

a monologist in 1917, in a bill of one-acters, one of which, *The Actress*, she herself wrote. Her London debut in a program of her own sketches, in 1920, established her as a master of her craft. From then on she triumphed everywhere in the world, often playing at the behest of other artistic celebrities or political leaders, until her final performance at the Playhouse in New York City on Dec. 26, 1956. Her art was one of delicate suggestion; she played on a bare stage with few props, changed character with a single item of apparel, and created the illusion of crowds or intimate conversations by her subtle modulation of feature, gesture, and voice.

The Letters of Ruth Draper 1920-1956: A Self-Portrait of a Great Actress, edited by Neilla Warren, was published in 1979.

drapery, depiction in drawing, painting, and sculpture of the folds of clothing. Techniques of rendering drapery clearly distinguish not only artistic periods and styles but the work of individual artists. The treatment of folds often has little to do with the nature of the actual material; its significance stems largely from the fact that it presents to the spectator the main mass of the clothed human figure.

Early Renaissance drapery, detail of "The Primavera," painting on panel by Sandro Botticelli, 1477-78; in the Uffizi Gallery, Florence

Alinari—Art Resource

In classical art the treatment of drapery varied between tightly meticulous and free-flowing lines. In the Hellenistic period the main emphasis was on volume rather than line.

Christian iconographers of the Middle Ages adopted the Classical tradition of drapery and clothed Christ, the Virgin, and the Apostles in vaguely togalike garments, with little relation to historical accuracy. A gentle interplay of soft folds characterized the European Gothic style from the 13th century onward, and that tradition—modified by Classical influences such as the use of linear patterns—was taken over by artists of the Renaissance who painted diaphanous, figure-revealing garments. Mannerist and Baroque drapery emphasized the theatrical potentialities of drapery. At the same time, many painters began to employ in their studios specialists to draw and paint dress and drapery.

In the 19th century in France, the lavish dresses of the Second Empire made it inevitable that any painter concerned with contemporary life must pay considerable attention to drapery. With the advent of Art Nouveau this concern became even more emphatic. Also in the 19th century, the growth of popular fashion magazines and of the haute couture stimulated the development of fashion drawing as an art form evolved from drapery drawing.

draught (banking): *see* exchange, bill of.

draughting (technical design): *see* drafting.

Draughts (board game): *see* checkers.

Drava River, German DRAU, a major right-bank tributary of the Danube River, in south-central Europe. It rises in the Carnic Alps near Dobbiaco (Toblach), Italy, and flows eastward through the Austrian *Bundesländer* (federal states) of Tirol and Kärnten, where it forms the Drautal, the longest longitudinal valley of the Alps. From there it flows southeastward through Slovenia. Near Legrad, Croatia, it is joined by the Mura (Mur) River and forms part of the Croatian-Hungarian border.

The originally swift course of the Drava has been harnessed by hydroelectric power plants in Austria, Slovenia, and Croatia. It is navigable only by small boats in its upper reaches and by larger craft downstream from Donji Miholjac, Croatia. The Drava valley was the chief passage through which invaders from the east, such as the Huns and Slavs, penetrated the Alpine countries. The main towns of the Drava and its affluents are Klagenfurt and Graz in Austria, Maribor and Ptuj in Slovenia, and Varaždin and Osijek in Croatia.

Drāvīda style (Indian architecture): *see* South Indian temple architecture.

Dravidian languages, family of 23 languages spoken in South Asia. The major languages are Telugu, Tamil, Kannada, Malayalam, Gondi, Kurukh, and Tulu.

A brief treatment of the Dravidian languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World.

Speakers of Dravidian languages are found mainly in the Republic of India but also in parts of Sri Lanka, Southeast Asia, Africa, and Pakistan. The four major languages—Telugu, Tamil, Kannada, and Malayalam—possess independent scripts and literary histories dating from the pre-Christian era; they form the basis of the linguistic states of Andhra Pradesh, Tamil Nadu, Karnataka, and Kerala, respectively. Tamil has the greatest geographic extent and the richest literature, paralleled in India only by that of Sanskrit. In phonology and grammar, Tamil corresponds in many points to the ancestral parent language, Proto-Dravidian. The Dravidian languages have remained an isolated family, without demonstrable connections with the Indo-European tongues or other languages. They were first recognized as an independent family in 1816.

Tamil, whose earliest literary monuments date from roughly the 3rd and 2nd centuries BC, is divided into a number of dialects, into Brahmin and non-Brahmin speech forms, and

into formal and informal language. Malayalam possesses an independent script and a rich modern literature. In the Nilgiris and adjacent regions, minor tribes speak Kota, Toda, Badaga, and Irula. Kodagu is spoken in Coorg. Kannada, spoken in the state of Karnataka, has social dialects and a number of regional dialects. In the southern region of Karnataka are found speakers of Tulu. Telugu, the official language of Andhra Pradesh, has distinct written and spoken styles, as well as regional dialects and social dialects. Kolami is also spoken in Andhra Pradesh; Konda, Gadba, and Kui are spoken in Orissa; Gondi and Parji are spoken in Madhya Pradesh. Further to the north are found Kurukh speakers, and in the Bihār area there are Malto speakers. Brahui is spoken only in certain districts of Pakistan.

Although, in modern times, Dravidian has been found principally in the south of India, it is well established that Dravidian speakers must have once been more widespread. Features of the Dravidian languages appear in the Rigveda, the earliest known Indo-Aryan literary work. Scholars have shown that pre-Indo-Aryan and pre-Dravidian bilingualism can account for the influences of Dravidian on Indo-Aryan. The Aryan tongues in the northern parts of India entirely replaced the Dravidian languages before the Christian Era.

Virtually nothing is known about the immigration of Dravidian speakers into India. It is suggested that at one point they came into contact with the Ural-Altai speakers, which explains affinities between the two language groups. Between 2000 and 1500 BC, Dravidian speakers moved to the southeast of India; about 1500 BC, three distinct dialect groups probably existed—Proto-North Dravidian, Proto-Central Dravidian, and Proto-South Dravidian.

Progress in comparative Dravidian studies is still meagre, and the reconstruction of the Dravidian protolanguage must be tentative. Proto-Dravidian had five vowels, each having two quantities, short and long. A characteristic feature of the consonantal system was the six positions of articulation for obstruents (stops). Initial consonant clusters did not occur. All Proto-Dravidian roots were monosyllables; the language used only suffixes.

By the 5th century BC further divisions occurred within each of the three subfamilies. The Dravidian languages entered history in Sanskrit and Greco-Roman texts. The lands of Pāṇḍya, Cōla, and Kerala are mentioned by the great Buddhist leader Aśoka (3rd century BC). It is very probable that Western-language terms for rice and ginger arc cultural loans from Old Tamil *arici* and *iñcivēr*, respectively. Sometime during the reign of Aśoka, Tamil and Kannada developed into distinct idioms; a third major Dravidian linguistic and cultural unit, Telugu, appeared. About 250 BC, the Aśokan Southern Brāhmī script was adapted for Tamil and was used in cave inscriptions by Jain monks for several centuries. The earliest inscriptions in Kannada date from AD 450; in Telugu, from AD 633; in Malayalam, from the close of the 9th century.

Tamil, Malayalam, Kannada, and Telugu have been used continuously in administration and literature up to the present day. All of them developed features of diglossia, a dichotomy between formal language and informal speech; all of them have adapted quickly to economic, social, and political change; all of them are used for basic courses in science and the arts. Nothing is known of the history of the non-literary Dravidian languages before their "discovery" at the end of the 18th century. Structural and systemic balance is characteristic of the Dravidian group, as is a slow rate of change.

When compared to Proto-Dravidian, the var-

ious distinct languages show consonantal and vowel systems that have undergone a variety of sound changes. In grammar, the prevailing process is suffixation, the addition of suffixes; these suffixes attach to one another. The major word classes are nouns, adjectives, verbs, and indeclinables.

dravite, a brown, magnesium-rich variety of tourmaline. *See* tourmaline.

dravya (Sanskrit: "substance"), a fundamental concept of Jainism, a religion of India that is the oldest Indian school of philosophy to separate matter and soul completely. The Jains recognize the existence of five *astikāyas* (eternal categories of being), which together make up the *dravya* (substance) of existence. These five are *dharma*, *adharma*, *ākāśa*, *puḍgala*, and *jīva*. *Dharma* is both a moral virtue and, in a meaning unique to Jainism, the medium that allows beings to move. *Adharma*, the medium of rest, enables beings to stop moving. *Ākāśa*, the space in which everything exists, is separated in two categories, world space (*lokākāśa*) and nonworld space (*alokiākāśa*), which is infinitely larger than world space but empty. These three categories are unique and inactive. *Puḍgala* ("matter") and *jīva* ("soul") are active and infinite. Only *puḍgala* is perceptible, and only *jīva* has consciousness. Added later by the Digambara sect, a sixth category of *dravya*, *kāla* (time), is eternal but not universal, because it does not occur in the outermost layers of the world.

drawbridge, major type of movable bridge (*q.v.*) originating in medieval Europe.

drawing, the art or technique of producing images on a surface, usually paper, by means of marks, usually of ink, graphite, chalk, charcoal, or crayon. Drawing is distinguished from painting by an emphasis on form, or shape, rather than mass and colour and from other graphic arts such as etching by the direct relationship between production and result.

A brief account of drawing follows. For full treatment, *see* MACROPAEDIA: Drawing. For a description of the place of drawing among the visual arts and for a list of MICROPAEDIA articles on the subject, *see* PROPAEDIA: Part Six, Division II.

Line has at times been considered the essential ingredient of drawing. While many drawings are indeed pure outline and most are based on line, it cannot be considered the specific quality of drawing, for some drawings have no lines at all but only areas of tone, such as Georges Seurat's studies in chalk or John Constable's in sepia. Most drawings are monochromatic, but various media such as coloured crayon or colour washes may be employed.

Drawing is often a stage preliminary to work in a more substantial medium, such as painting, sculpture, or architecture. Full-size drawings or plans are a usual part of making artifacts, from furniture to machinery. Drawings of this preparatory sort are practically all that survive from before the Renaissance, and there are few even of them. Partly because of the perishable nature of most drawing materials, but also because, during the Middle Ages, preparatory drawings were commonly done to standard designs and collected in pattern books, there was no call for every artist to provide his own. The best known pattern book is by Villard de Honnecourt and shows how to design people and animals around geometrical shapes. Even the drawings that he notes as done from life are highly conventionalized.

Under the influence of Giotto's naturalism, drawing techniques changed; the stylized outlines of the pattern books gave way to drawings done from nature, in which forms within

the outline are given solidity by hatching (fine lines drawn close together, chiefly to give an effect of shading) and highlighting. Cennino Cennini, in *Il libro dell'arte* (1437; *The Craftsman's Handbook*, 1933), recommends drawing from nature as well as from the masters. Drawing, during the Italian Renaissance, started to become an independent technique and to acquire its importance in the theory of art. It is associated especially with Florentine art, in contrast to the more painterly style of Venice, and the dominance of fresco painting in Florence shaped Florentine ideas of drawing. Leon Battista Alberti, writing in 1435, identified drawing with circumscription, or outline, and although he allowed that "a good drawing is often very pleasing on its own account," he defined it in terms of painting, as the first of painting's "three parts": "Outline will be that which describes the going around of the edge in painting." Indeed, such outlines for fresco painting, sometimes pricked for tracing onto the wall, were a common type of drawing in the Renaissance. Alberti's "second part" of painting was composition, "that method by which the parts of the things seen are put together in the picture," and Piero della Francesca, writing about 50 years later, more or less encompassed both "parts" in his larger definition: "By drawing we mean profiles and outlines placed proportionately in their places." His younger contemporary, Leonardo da Vinci, writing in his notebooks, called for a fresh approach to drawings, likening them to rough drafts for a poem. His own are technically experimental and often independent of paintings—observations or flights of imagination that are an end in themselves. Raphael (who was influenced by Leonardo's drawings) and Michelangelo used drawing as a means of working out relations between figures and of modelling forms within them; Michelangelo developed a style of close hatching for this purpose that invites comparison with the chiselling methods of sculpture. His admirer Giorgio Vasari had the idea of collecting the drawings of the masters to demonstrate their different manners; it is in his writings that we find the meaning of drawing greatly elevated and extended. Vasari's word is *disegno*, which means design as well as drawing, and much else. It is, according to Vasari, the foundation of the three arts (painting, sculpture, and architecture), not only in the traditional sense of providing preparatory drawings for them but in a new Platonist sense of being the idea behind their creation, implanted in the artist's mind by God; it is the animating principle of all creative processes.

The adherents of this point of view naturally believed in using drawings at all stages of planning their compositions, and the gulf widened between them and the Venetians, who painted without reliance on outline or, apparently, on closely followed preliminary drawing. This divergence of opinion and practice regarding the role of drawing continued to surface between rival schools of painting during the following centuries. The insistence on drawing as the foundation of art came to be associated in the 16th century with the Academy of Annibale Carracci, where artists met to draw from life.

Meanwhile, drawing had achieved greater autonomy; it was recognized as a means of recording, for example, the features of the great, as in the portrait drawings by Albrecht Dürer, Hans Holbein, or the French court artists of the 16th century, some of which correspond to no known paintings. Rembrandt, a prolific draughtsman, seldom used his drawings for preparing paintings or etchings but treated them as an independent form. By the 17th century, drawings had definite market value; connoisseurs collected them, and forgers began to exploit the demand. The great collections of drawings in the British and the Ashmolean museums are based on those of

17th- and 18th-century artists and connoisseurs.

In the 18th and 19th centuries, the old debate about drawing and painting revived in the rivalry between Classical and Romantic schools of painting. Jean-Auguste-Dominique Ingres, the master of pure line drawing, maintained that "drawing is the probity of art; line drawing is everything." In England, later in the 19th century, John Ruskin and the Pre-Raphaelites had similar views; but the Impressionists, a generation later, used drawing side by side with painting, rather than as the basis of it. In the 20th century, the drawing became fully autonomous as an art form, figuring significantly among the works of virtually every major artist, and the line itself was exploited both for its representational and its purely expressive qualities.

drawing, also called DRAFTING, in yarn manufacture, process of attenuating the loose assemblage of fibres called sliver (*q.v.*) by passing it through a series of rollers, thus straightening the individual fibres and making them more parallel. Each pair of rollers spins faster than the previous one.

Drawing reduces a soft mass of fibre to a firm uniform strand of usable size. In the production of man-made fibres, drawing is a stretching process applied to fibres in the plastic state, increasing orientation and reducing size.

drawing, engineering; *see* drafting.

drawing and quartering, part of the grisly penalty anciently ordained in England (1283) for the crime of treason. Until 1867, when it was abolished, the full punishment for a traitor might include several parts. First he was drawn, that is, tied to a horse and dragged to the gallows. A so-called hurdle, or sledge, is sometimes mentioned in this context. Although such a device may have been a means of mercy, *The History of English Law Before the Time of Edward I* (2nd ed., 1898; reissued 1996) states that it was more likely a way to deliver a live body to the hangman. The remainder of the punishment might include hanging (usually not to the death), usually live disemboweling, burning of the entrails, beheading, and quartering. This last step was sometimes accomplished by tying each of the four limbs to a different horse and spurring them in different directions.

The above-mentioned source cites an incident in 1238 in which a man attempting to assassinate the king was drawn, hanged, beheaded, and quartered, but the first notorious sentence of drawing and quartering was inflicted in 1283 on the Welsh prince David ap Gruffudd (*q.v.*), whose punishment, one early source claims, was for myriad crimes. He was drawn for treason, hanged for homicide, disemboweled for sacrilege, and beheaded and quartered for plotting the king's death. Another infamous case is that of the Scottish patriot Sir William Wallace (*q.v.*), who died in 1305. According to the same early source, Wallace was drawn for treason, hanged for robbery and homicide, disemboweled for sacrilege, beheaded as an outlaw, and quartered for "divers depredations." In 1803 Edward Marcus Despard and his six accomplices were drawn, hanged, and quartered for conspiring to assassinate George III. The sentence was last passed (though not carried out) upon two Irish Fenians in 1867.

drawn thread work, Italian PUNTO TIRATO, in fabric, a method of producing a design by drawing threads out of the body of a piece of material, usually linen, and working stitches on the mesh thus created. In Italy it preceded the development, in the 16th century, of needle lace, and it continued to be practiced internationally even after. It appears on embroidery samplers from the 17th century onward and is a technique common to embroidery and lace.

dray, the heaviest type of dead-axle wagon used in conjunction with a team of draft animals. Drays were either of the two- or four-wheeled type and were employed most often in and about cities for the transport of heavy loads or objects such as large machines. Features of the dray included smaller wheels than those used on other wagons, a flat, level floor, and, usually, no sides. Some drays, however, did have box bodies or stake sides. Machinery trucks, floats, and transfer wagons were specialized varieties of drays.

Drayton, Michael (b. 1563, Hartshill, Warwickshire, Eng.—d. 1631, London), poet, the first to write English odes in the manner of Horace. . .

Drayton spent his early years in the service of Sir Henry Goodere, to whom he owed his education, and whose daughter, Anne, he celebrated as *Idea* in his poems. His first published work, *The Harmonie of the Church* (1591), contains biblical paraphrases in an antiquated style. His next works conformed more nearly to contemporary fashion: in pastoral, with *Idea, The Shepherds Garland* (1593); in sonnet, with *Ideas Mirror* (1594); in erotic idyll, with *Endimion and Phoebe* (1595); and in historical heroic poem, with *Robert, Duke of Normandy* (1596) and *Mortimeriados* (1596). The last, originally written in rhyme royal, was recast in Ludovico Ariosto's ottava rima verse as *The Barrons Wars* (1603).

Drayton, oil painting by an unknown artist, 1628; in the Dulwich College Picture Gallery, London

By courtesy of the College Governors of Alleyn's College of God's Gift, London

Drayton's most original poems of this period are *Englands Heroicall Epistles* (1597), a series of pairs of letters exchanged between famous lovers in English history.

Upon the death of Queen Elizabeth I, Drayton, like most other poets, acclaimed in verse the accession of King James I, but unlike them omitted any reference to the late queen. For this tactlessness he failed to receive any appointment or reward. The disappointment adversely affected his poetry of the next few years. He recovered himself with his first collected *Poems* (1605), and in *Poems Lyric and Pastoral* (1606) he introduced a new mode with the "odes," modeled on Horace. "The Ballad of Agincourt" shows Drayton's gift for pure narrative.

Further collected editions culminated in his most important book, *Poems* (1619). Here Drayton reprinted most of what he chose to preserve, often much revised, with many new poems and sonnets. He had also published the first part of his most ambitious work, *Poly-Olbion* (1612–22), in which he intended to record the Elizabethan discovery of England: the beauty of the countryside, the romantic fascination of ruined abbeys, its history, legend, and present life, but he was too eager to cram everything in, so that the poem becomes a catalog in alexandrines. He produced a second part in 1622.

In his old age he wrote some of his most delightful poetry, especially the fairy poem

Nymphidia (1627), with its mock-heroic undertones, and *The Muses Elizium* (1630). The *Elegies upon Sundry Occasions* (1627), addressed to his friends, often suggest, with their easy, polished couplets, the manner of the age of Alexander Pope.

Dreadnought, British battleship launched in 1906 that established the pattern of the turbine-powered, "all-big-gun" warship, a type that dominated the world's navies for the next 35 years.

The *Dreadnought* displaced 18,000 tons (more than 20,000 tons full load), was 526 feet (160 m) long, and carried a crew of about 800. Its four propeller shafts, powered by steam

HMS *Dreadnought*

By courtesy of the National Archives, Washington, D.C

turbines instead of the traditional steam pistons, gave it an unprecedented top speed of 21 knots. Because recent improvements in naval gunnery had made it unnecessary to prepare for short-range battle, *Dreadnought* carried no guns of secondary calibre. Instead, it mounted a single-calibre main armament of 10 12-inch guns in five twin turrets. In addition, 24 3-inch quick-firing guns, 5 Maxim machine guns, and 4 torpedo tubes were added for fighting off destroyers and torpedo boats.

The *Dreadnought* immediately made all preceding battleships obsolete, but by World War I it was obsolescent itself, having been outclassed by faster "superdreadnoughts" carrying bigger guns. The *Dreadnought*'s only notable engagement of the war was the ramming and sinking of a German U-boat near the Pentland Firth, Scot., in March 1915. Placed in reserve in 1919, the ship was sold for scrap the following year and broken up in 1923.

dream, a hallucinatory experience that occurs during sleep.

A brief treatment of dreams follows. For full treatment, see MACROPAEDIA: Sleep and Dreams.

Although the visual aspect of dreams is usually most vivid, in some cases dreams are primarily auditory. Dream reports range from the very ordinary and the realistic to the fantastic and the surreal. Mankind has always attached great importance to dreams; however, conceptions of their source and significance have changed tremendously over the centuries.

In the ancient world, the belief was prevalent that dreams were sent by the gods, and they were considered as a means to predict the future and devise cures for the ill. Nearly four thousand years ago, the Egyptians catalogued interpretations of dreams, and prophetic dreams are mentioned in many Middle Eastern and Asian texts, including the Bible. While the ancient Greeks generally shared the belief in the predictive power of dreams, it is notable that Aristotle discussed dreams in a more scientific manner, stressing the roles of sense impressions and the emotions. However, it was not until the 19th century that widespread belief in the divine source of dreams began to ebb. At that time, Alfred Maury made an exhaustive study of dreams and concluded that they resulted from the misinterpretation of sense impressions during sleep (e.g., a loud sound during the night stimulating a dream of a thunderstorm). Modern theories of dreams have stressed that they are extensions of the waking state.

In the late 20th century, the study of dreams has focused on two topics: the physiologi-

cal process of dreaming and the content of dreams. Researchers have found physiological clues as to when a dream is actually taking place. The principal dream period, marked by a combination of rapid eye movement (REM), a brain-wave pattern similar to that produced during wakefulness, and increased physiological activity, is called REM sleep (or the D-[Dream-] state). Since its discovery in the mid-1950s, researchers have conducted experiments in which they awaken subjects who show signs of REM sleep—in most cases the subjects report intensely the experience of vivid visual dreams. Subjects awakened while not in REM sleep report dreams less frequently and have more difficulty remembering them. Thus, the evidence supports a close association between REM sleep and the experience of vivid, spontaneously recalled dreams. Extreme behavioral manifestations such as night terrors, nightmares, enuresis (bed-wetting), and sleepwalking have been found to be generally unrelated to ordinary dreaming.

REM sleep recurs about every 90 minutes throughout the time spent asleep, in periods that successively grow in duration from an initial length of 10 minutes. Between the ages of 10 and the mid-60s people spend about a quarter of their time asleep in REM sleep. If this amount is temporarily lowered owing to the ingestion of certain drugs or by waking a sleeper in REM sleep, as soon as permitted the person will recover by increasing his or her REM sleep percentage, accompanied by an increase in dreaming.

Although the presence of REM sleep indicates a high probability that a person is dreaming, the content of his or her dream is directly available only to the dreamer. Thus, to study the contents of dreams, researchers must rely on reports made by dreamers after they awaken. Unpleasant feelings in dreams are reported almost twice as often as pleasant ones. The contents of most dreams seem to consist of fairly direct representations of people and settings familiar to the dreamer. The sense of strangeness that accompanies dreams is thought to result from the sharp discontinuities in time and place occurring in dream events.

Dreams have provided creative solutions to intellectual and emotional problems and have offered ideas for artistic pursuits. A famous example is drawn from science: the German chemist August Kekule, while struggling to find the structure of the benzene molecule, dreamed of a snake biting its tail and, on waking, realized that benzene has the form of a ring. It seems that a type of cognitive synthesis occurs subconsciously during dreaming, which facilitates conscious insight.

Perhaps the most famous theory of the significance of dreams is the psychoanalytic model developed by Sigmund Freud in *The Interpretation of Dreams* (German: *Die Traumdeutung*; 1900). In Freud's view, the events of a dream (the manifest content) are produced by the so-called dreamwork, whose task is to give disguised expression to unconscious desires (the latent content). These desires are ordinarily kept out of consciousness (repressed), because they represent forbidden impulses, often of a sexual nature. During sleep, the force of repression is reduced, hence repressed desires can be safely expressed. But to prevent these unacceptable desires from emerging in an explicit form into the dreamer's consciousness, the dreamwork transforms them into acceptably disguised or symbolic images by drawing on sensory stimuli, waking experiences, and deep-seated memories. A central therapeutic technique employed in psychoanalysis is the interpretation of a patient's dreams, in the effort to understand the workings of his or her unconscious mind.

dream allegory, also called DREAM VISION, allegorical tale presented in the narrative framework of a dream. Especially popular in the Middle Ages, the device made more acceptable the fantastic and sometimes bizarre world of personifications and symbolic objects characteristic of medieval allegory. Well-known examples of the dream allegory include the first part of *Roman de la rose* (13th century); Chaucer's *Book of the Duchess* (1369/70); *Pearl* (late 14th century); *Piers Plowman* (c. 1362–c. 1387), attributed to William Langland; William Dunbar's *The Thissil and the Rois* and *The Goldyn Targe* (early 16th century); and Bunyan's *Pilgrim's Progress* (1678).

Dream of the Red Chamber, Wade-Giles romanization HUNG LOU MENG, Pinyin HONG LOU MENG, novel written by Ts'ao Chan (1715?–63), generally considered to be the greatest of all Chinese novels. The work, published in English as *Dream of the Red Chamber* (1929), first appeared in manuscript form in Peking during Ts'ao Chan's lifetime. In 1791, almost 30 years after Ts'ao's death, the novel was published in a complete version of 120 chapters prepared by Ch'eng Wei-yuan and Kao E. Controversy still goes on as to whether the final 40 chapters were actually forged by Kao E, substantially written by Ts'ao Chan and simply discovered and put into final form by Ch'eng and Kao, or perhaps composed by an unknown author.

The novel is a blend of realism and romance, psychological motivation and fate, daily life and supernatural occurrences. A series of episodes rather than a strongly plotted work, it details the decline of the Chia family, composed of two main branches, with a proliferation of kinsmen and servants. There are 30 main characters and more than 400 minor ones. The major focus, however, is on young Pao-yü, the gifted but obstinate heir of the clan. Spoiled by his mother and grandmother, he is continually reprimanded by his strict Confucian father, who especially abhors Pao-yü's intimacy with his numerous female cousins and maidservants. Most notable among these relations are the melancholy Tai-yü (Black Jade), Pao-yü's ill-fated love, and the vivacious Pao-ch'ai (Precious Clasp), Pao-yü's eventual wife. The work and the character Pao-yü himself are generally thought to be semi-autobiographical creations of Ts'ao Chan. Its portrait of the extended family reflects a faithful image of upper-class life in the early Ch'ing dynasty (1644–1911/12), while the variety of individual character portraits reveals a psychological depth considered not previously approached in Chinese literature.

Dream of the Rood, The, Old English lyric, the earliest dream poem and one of the finest religious poems in the English language, once, but no longer, attributed to Caedmon or Cynewulf. In a dream the unknown poet beholds a beautiful tree—the rood, or cross, on which Christ died. The rood tells him its own story. Forced to be the instrument of the saviour's death, it describes how it suffered the nail wounds, spear shafts, and insults along with Christ to fulfill God's will. Once blood-stained and horrible, it is now the resplendent sign of mankind's redemption. The poem was originally known only in fragmentary form from some 8th-century runic inscriptions on the Ruthwell Cross, now standing in the parish church of Ruthwell, now Dumfries District, Dumfries and Galloway Region, Scot. The complete version became known with the discovery of the 10th-century Vercelli Book in northern Italy in 1822.

dream vision (allegorical tale): see dream allegory.

Dreaming, the, also called DREAM-TIME, or WORLD DAWN, Australian Aboriginal languages ALTJIRA, ALTJIRANGA, ALCHERINGA, WONGAR, or DJUGURBA, mythological period of time that had a beginning but no foreseeable end, during which the natural environment was shaped and humanized by the actions of mythic beings. Many of these beings took the form of human beings or of animals ("totemic"); some changed their forms. They were credited with having established the local social order and its "laws." Some, especially the great fertility mothers, but also male genitors, were responsible for creating human life—i.e., the first people.

Mythic beings of the Dreaming are eternal. Though in the myths some were killed or disappeared beyond the boundaries of the people who sang about them, and others were metamorphosed as physiographic features (for example, a rocky outcrop or a waterhole) or manifested as or through ritual objects (see *tjurunga*), their essential quality remained undiminished. In Aboriginal belief, they are spiritually as much alive today as they ever were. The places where the mythic beings performed some action or were "turned into" something else became sacred, and it was around these that ritual was focussed.

The Dreaming, as a coordinated system of belief and action, includes totemism. Together, they express a close relationship: man is regarded as part of nature, not fundamentally dissimilar to the mythic beings or to the animal species, all of which share a common life force. The totem serves as an agent, placing man within the Dreaming and providing him with an indestructible identity that continues uninterrupted from the beginning of time to the present and into the future.

Drebbel, Cornelis (Jacobszoon) (b. 1572, Alkmaar, Neth.—d. Nov. 7, 1633, London), Dutch inventor who built the first navigable submarine.

An engraver and glassworker in Holland, Drebbel turned to applied science and in 1604 went to England, where King James I became his patron. He devised an ingenious "perpetual motion clock," actuated by changes in atmospheric pressure and temperature, which greatly enhanced his reputation. In 1620 he completed his "diving boat." Propelled by oars and sealed against the water by a covering of greased leather, the wooden vessel travelled the River Thames at a depth of 12 to 15 feet (about 4 metres) from Westminster to Greenwich. Air was supplied by two tubes with floats to maintain one end above water.

Drebbel also discovered the use of tin compounds as mordants for cochineal, a scarlet dye, and suggested a method of making sulfuric acid by the oxidation of sulfur. Among many other inventions attributed to him are the compound microscope, an improved thermometer, and self-regulating ovens.

Dred Scott decision (March 6, 1857), ruling of the U.S. Supreme Court that made slavery legal in all the territories, thereby adding fuel to the sectional controversy and pushing the nation along the road to civil war.

The decision—only the second time in the nation's history that the Supreme Court declared an act of Congress unconstitutional—was a clear victory for the slaveholding South. Southerners had argued that both Congress and the territorial legislature were powerless to exclude slavery from a territory. Only a state could exclude slavery, they maintained.

Dred Scott was a slave whose master in 1834 had taken him from Missouri (a slave state) to Illinois (a free state), then into the Wisconsin Territory (a free territory under the provisions of the Missouri Compromise), and finally back to Missouri. In 1846, with the help of anti-slavery lawyers, Scott sued for his freedom in the Missouri state courts on the

grounds that his residence in a free state and a free territory had made him a free man.

The Missouri Supreme Court overturned an initial ruling by a lower court which had declared Scott free, and the case, then, began a long sojourn up to the U.S. Supreme Court. The court announced its decision on March 6, 1857, just two days after the inauguration of Pres. James Buchanan. Though each justice wrote a separate opinion, Chief Justice Roger B. Taney's opinion is most often cited on account of its far-reaching implications for the sectional crisis.

Taney, one of the seven justices denying Scott his freedom (two dissented), declared that a Negro could not be entitled to rights as a U.S. citizen, such as the right to sue in federal courts. In fact, Taney wrote, Negroes had "no rights which any white man was bound to respect."

The decision might have ended there, with the dismissal of Scott's appeal. But Taney and the other justices in the majority went on to declare that the Missouri Compromise of 1820 (which had forbidden slavery in that part of the Louisiana Purchase north of the latitude 36°30', except for Missouri) was unconstitutional because Congress had no power to prohibit slavery in the territories. Slaves were property, and masters were guaranteed their property rights under the Fifth Amendment. Neither Congress nor a territorial legislature could deprive a citizen of his property without due process of law. As for Scott's temporary residence in a free state, Illinois, the majority said that Scott had still been subject then to Missouri law.

The Dred Scott decision seemed a mortal blow to the newly created Republican Party, formed to halt the extension of slavery into the western territories. It also forced Stephen A. Douglas, advocate of popular sovereignty (*q.v.*), to come up with a method (the "Freeport Doctrine") whereby settlers could actually ban slavery from their midst. President Buchanan, the South, and the majority of the Supreme Court hoped that the Dred Scott decision would mark the end of antislavery agitation. Instead, the decision increased antislavery sentiment in the North, strengthened the Republican Party, and fed the sectional antagonism that burst into war in 1861.

dredge, large floating device for underwater excavation. Dredging has four principal objectives: (1) to develop and maintain greater depths than naturally exist for canals, rivers, and harbours; (2) to obtain fill to raise the level of lowlands and thus create new land areas and improve drainage and sanitation;

Several types of dredges
(Top) Dipper dredge; (centre) grab dredge; (bottom) ladder dredge

(3) to construct dams, dikes, and other control works for streams and seashore; and (4) to recover subaqueous deposits or marine life having commercial value.

Dredges are classed as mechanical and hydraulic. Many special types in both classes, and combinations of the two, have been devised. All types of dredges may have living quarters on board. Though dredges have been constructed to remove many kinds of deposits, the bulk of material removed has consisted of sand and mud.

A dipper dredge is essentially a power shovel mounted on a barge for marine use. Distinctive features are the bucket and its arm, the boom that supports and guides the arm and is mounted to work around a wide arc, and the mechanism that gives excavating movement to the bucket. A grab, or clamshell, dredge lowers, closes, and raises a single bucket by means of flexible cables. In operation the bucket is dropped to the bottom, where it bites because of its weight and the action of the bucket-closing mechanism. A grab dredge can work at virtually unlimited depths. A ladder dredge employs a continuous chain of buckets rotating around a rigid adjustable frame called a ladder. When the ladder is lowered to the bottom at a slant, the empty buckets descend along the underside to the bottom, where they dig into the mud; the loaded buckets return along the ladder's upper side and dump at the top. The scraper dredge, also called a dragline, handles material with a scoop suspended from a swinging boom. The scoop is drawn forward by a line attached to the front, while a second line attached to the rear holds the scoop at the proper angle to slice the earth away as the device is pulled along. A hydraulic dredge makes use of a centrifugal pump. In the pump casing, an impeller expels by centrifugal action a mixture of solids, water, and gases. As a partial vacuum is created within the pump, atmospheric pressure on the outside water surface and the weight of the water itself (hydrostatic pressure) both act to force water and suspended solids from the bottom through the suction pipe into the pump. The materials emerging from the pump are conveyed into barges or through another pipe to the shore. Long stakes, called spuds, are frequently used to pinion a dredge to the bottom.

Drees, Willem (b. July 5, 1886, Amsterdam, Neth.—d. May 14, 1988, The Hague), statesman and socialist leader who was the prime minister of The Netherlands from 1948 to 1958. His four successive governments augmented his country's comprehensive welfare state, continued the postwar abandonment of the traditional Dutch neutrality in favour of military and economic alliances, and unsuccessfully tried to retain the Republic of Indonesia as an autonomous state under the Dutch crown.

Educated at Commercial School, Amsterdam, Drees was appointed stenographer to the Netherlands States General (Parliament) in 1907. A member of the Labour (Social Democratic) Party, he was elected to the Hague city council in 1913 and to the Second (principal) Chamber of the States-General in 1933. From 1939 he was chairman of the Labour group in the Second Chamber. When the Germans occupied his country during World War II, Drees was imprisoned for trying to organize resistance. Released in 1941, he rejoined the resistance movement and presided over the Fatherland Committee, which prepared the first governmental measures after the liberation of The Netherlands in 1945.

Drees served (1945–48) as minister of social affairs in the governments of Willem Schermerhorn and Louis Beel. In 1946 Drees and Schermerhorn, a left-wing Liberal, had formed a new socialist party, the Partij van Arbeid ("Party of Labour"). As prime minister from Aug. 6, 1948, Drees formed ministries

that were coalitions of his own party and the Katholieke Volkspartij ("Catholic People's Party"). When the latter party dissolved the coalition in a dispute over new tax proposals, Drees resigned on Dec. 12, 1958, and retired from politics.

Under Drees's leadership The Netherlands joined the North Atlantic Treaty Organization (NATO), the Western European Union (WEU), the European Economic Community (EEC), and other international associations. In December 1948, war broke out in Indonesia between the Dutch and the Indonesians, but in 1949 Drees's government acknowledged the United States of Indonesia (later the Republic of Indonesia) as a partner in a federation. Drees was in office when, in 1954, Indonesia terminated this union.

Dreikaiserbund, English THREE EMPERORS' LEAGUE, an alliance in the latter part of the 19th century of Germany, Austria-Hungary, and Russia, devised by German chancellor Otto von Bismarck. It aimed at neutralizing the rivalry between Germany's two neighbours by an agreement over their respective spheres of influence in the Balkans and at isolating Germany's enemy, France.

The first Dreikaiserbund was in effect from 1873 to 1875. A second one, formal and secret, was established June 18, 1881, and lasted for three years. It was renewed in 1884 but lapsed in 1887. Both alliances ended because of continued strong conflicts of interest between Austria-Hungary and Russia in the Balkans. The second treaty provided that no territorial changes should take place in the Balkans without prior agreement and that Austria could annex Bosnia and Hercegovina when it wished; in the event of war between one party and a great power not party to the treaty, the other two parties were to maintain friendly neutrality.

Bismarck was able temporarily to preserve the tie with Russia in the Reinsurance Treaty (*q.v.*) of 1887; but, after his dismissal, this treaty was not renewed, and a Franco-Russian alliance developed.

Dreikurs, Rudolf (b. Feb. 8, 1897, Vienna, Austria—d. May 25, 1972, Chicago, Ill., U.S.), American psychiatrist and educator who developed the Austrian psychologist Alfred Adler's system of individual psychology into a pragmatic method for understanding the purposes of reprehensible behaviour in children and for stimulating cooperative behaviour without punishment or reward.

After training at the University of Vienna (M.D., 1923), Dreikurs developed, in collaboration with Adler, clinics for child guidance, alcoholics, and psychopaths, as well as doing mental-hygiene and welfare work. Emigrating to the United States in 1937, he taught psychiatry and founded the Alfred Adler Institutes of individual psychology in Chicago and Tel Aviv, Israel.

Dreiser, Theodore (b. Aug. 27, 1871, Terre Haute, Ind., U.S.—d. Dec. 28, 1945, Hollywood, Calif.), novelist who was the outstanding American practitioner of naturalism. He was the leading figure in a national literary movement that replaced the observance of Victorian notions of propriety with the unflinching presentation of real-life subject matter. Among other themes, his novels explore the new social problems that had arisen in a rapidly industrializing America.

Life. Dreiser was the ninth of 10 surviving children in a family whose perennial poverty forced frequent moves between small Indiana towns and Chicago in search of a lower cost of living. His father, a German immigrant, was a mostly unemployed millworker who subscribed to a stern and narrow Roman Catholicism. His mother's gentle and compassionate outlook sprang from her Czech Mennonite background. In later life Dreiser would bitterly

associate religion with his father's ineffectuality and the family's resulting material deprivation, but he always spoke and wrote of his mother with unswerving affection. Dreiser's

Theodore Dreiser
The Granger Collection, New York City

own harsh experience of poverty as a youth and his early yearnings for wealth and success would become dominant themes in his novels, and the misadventures of his brothers and sisters in early adult life gave him additional material on which to base his characters.

Dreiser's spotty education in parochial and public schools was capped by a year (1889–90) at Indiana University. He began a career as a newspaper reporter in Chicago in 1892 and worked his way to the East Coast. While writing for a Pittsburgh newspaper in 1894, he read works by the scientists T.H. Huxley and John Tyndall and adopted the speculations of the philosopher Herbert Spencer. Through these readings and his own experience, Dreiser came to believe that human beings are helpless in the grip of instincts and social forces beyond their control, and he judged human society as an unequal contest between the strong and the weak. In 1894 Dreiser arrived in New York City, where he worked for several newspapers and contributed to magazines. He married Sara White in 1898, but his roving affections (and resulting infidelities) doomed their relationship. The couple separated permanently in 1912.

Dreiser began writing his first novel, *Sister Carrie*, in 1899 at the suggestion of a newspaper colleague. Doubleday, Page and Company published it the following year, thanks in large measure to the enthusiasm of that firm's reader, the novelist Frank Norris. But Doubleday's qualms about the book, the story line of which involves a young kept woman whose "immorality" goes unpunished, led the publisher to limit the book's advertising, and consequently it sold fewer than 500 copies. This disappointment and an accumulation of family and marital troubles sent Dreiser into a suicidal depression from which he was rescued in 1901 by his brother, Paul Dresser, a well-known songwriter, who arranged for Theodore's treatment in a sanitarium. Dreiser recovered his spirits, and in the next nine years he achieved notable financial success as an editor in chief of several women's magazines. He was forced to resign in 1910, however, because of an office imbroglio involving his romantic fascination with an assistant's daughter.

Somewhat encouraged by the earlier response to *Sister Carrie* in England and the novel's republication in America, Dreiser returned to writing fiction. The reception accorded his second novel, *Jennie Gerhardt* (1911), the story of a woman who submits sexually to rich and powerful men to help her poverty-stricken family, lent him further encourage-

ment. The first two volumes of a projected trilogy of novels based on the life of the American transportation magnate Charles T. Yerkes, *The Financier* (1912) and *The Titan* (1914), followed. Dreiser recorded his experiences on a trip to Europe in *A Traveler at Forty* (1913). In his next major novel, *The 'Genius'* (1915), he transformed his own life and numerous love affairs into a sprawling semi-autobiographical chronicle that was censured by the New York Society for the Suppression of Vice. There ensued 10 years of sustained literary activity during which Dreiser produced a short-story collection, *Free and Other Stories* (1918); a book of sketches, *Twelve Men* (1919); philosophical essays, *Hey-Rub-a-Dub-Dub* (1920); a rhapsodic description of New York, *The Color of a Great City* (1923); works of drama, including *Plays of the Natural and Supernatural* (1916) and *The Hand of the Potter* (1918); and the autobiographical works *A Hoosier Holiday* (1916) and *A Book About Myself* (1922).

In 1925 Dreiser's first novel in a decade, *An American Tragedy*, based on a celebrated murder case, was published. This book brought Dreiser a degree of critical and commercial success he had never before attained and would not thereafter equal. The book's highly critical view of the American legal system also made him the adopted champion of social reformers. He became involved in a variety of causes and slackened his literary production. A visit to the Soviet Union in 1927 produced a skeptical critique of that communist society entitled *Dreiser Looks at Russia* (1928). His only other significant publications in the late 1920s were collections of stories and sketches written earlier, *Chains* (1927) and *A Gallery of Women* (1929), and an unsuccessful collection of poetry, *Moods, Cadenced and Declaimed* (1926).

The Great Depression of the 1930s ended Dreiser's prosperity and intensified his commitment to social causes. He came to reconsider his opposition to communism and wrote the anticapitalist *Tragic America* (1931). His only important literary achievement in this decade was the autobiography of his childhood and teens, *Dawn* (1931), one of the most candid self-revelations by any major writer. In the middle and late '30s his growing social consciousness and his interest in science converged to produce a vaguely mystical philosophy.

In 1938 Dreiser moved from New York to Los Angeles with Helen Richardson, who had been his mistress since 1920. There he set about marketing the film rights to his earlier works. In 1942 he began belatedly to rewrite *The Bulwark*, a novel begun in 1912. The task was completed in 1944, the same year he married Helen. (Sara White Dreiser had died in 1942.) One of his last acts was to join the American Communist Party. Helen helped him complete most of *The Stoic*, the long-postponed third volume of his Yerkes trilogy, in the weeks before his death. Both *The Bulwark* and *The Stoic* were published posthumously (1946 and 1947, respectively). A collection of Dreiser's philosophical speculations, *Notes on Life*, appeared in 1974.

Works. Dreiser's first novel, *Sister Carrie* (1900), is a work of pivotal importance in American literature despite its inauspicious launching. It became a beacon to subsequent American writers whose allegiance was to the realistic treatment of any and all subject matter. *Sister Carrie* tells the story of a rudderless but pretty small-town girl who comes to the big city filled with vague ambitions. She is used by men and uses them in turn to become a successful Broadway actress while George Hurstwood, the married man who has run away with her, loses his grip on life and

descends into beggary and suicide. *Sister Carrie* was the first masterpiece of the American naturalistic movement in its grittily factual presentation of the vagaries of urban life and in its ingenuous heroine, who goes unpunished for her transgressions against conventional sexual morality. The book's strengths include a brooding but compassionate view of humanity, a memorable cast of characters, and a compelling narrative line. The emotional disintegration of Hurstwood is a much-praised triumph of psychological analysis.

Dreiser's second novel, *Jennie Gerhardt* (1911), is a lesser achievement than *Sister Carrie* owing to its heroine's comparative lack of credibility. Based on Dreiser's remembrance of his beloved mother, Jennie emerges as a plaster saint with whom most modern readers find it difficult to empathize. The novel's strengths include stinging characterizations of social snobs and narrow "religionists," as well as a deep sympathy for the poor.

The Financier (1912) and *The Titan* (1914) are the first two novels of a trilogy dealing with the career of the late-19th century American financier and traction tycoon Charles T. Yerkes, who is cast in fictionalized form as Frank Cowperwood. As Cowperwood successfully plots monopolistic business coups first in Philadelphia and then in Chicago, the focus of the novels alternates between his amoral business dealings and his marital and other erotic relations. *The Financier* and *The Titan* are important examples of the business novel and represent probably the most meticulously researched and documented studies of high finance in first-rate fiction. Cowperwood, like all of Dreiser's major characters, remains unfulfilled despite achieving most of his apparent wishes. The third novel in the trilogy, *The Stoic* (1947), is fatally weakened by Dreiser's diminished interest in his protagonist.

The 'Genius' (1915) is artistically one of Dreiser's least successful novels but is nonetheless indispensable to an understanding of his psychology. This book chronicles its autobiographical hero's career as an artist and his unpredictable pursuit of the perfect woman as a source of ultimate fulfillment.

Dreiser's longest novel, *An American Tragedy* (1925), is a complex and compassionate account of the life and death of a young anti-hero named Clyde Griffiths. The novel begins with Clyde's blighted background, recounts his path to success, and culminates in his apprehension, trial, and execution for murder. The book was called by one influential critic "the worst-written great novel in the world," but its questionable grammar and style are transcended by its narrative power. Dreiser's labyrinthine speculations on the extent of Clyde's guilt do not blunt his searing indictment of materialism and the American dream of success.

Dreiser's next-to-last novel, *The Bulwark* (1946), is the story of a Quaker father's unavailing struggle to shield his children from the materialism of modern American life. More intellectually consistent than Dreiser's earlier novels, this book also boasts some of his most polished prose.

Assessment. Dreiser's considerable stature, beyond his historic importance as a pioneer of unvarnished truth-telling in modern literature, is due almost entirely to his achievements as a novelist. His sprawling imagination and cumbersome style kept him from performing well in the smaller literary forms, and his nonfiction writing, especially his essays, are marred by intellectual inconsistency, a lack of objectivity, and even bitterness. But these latter traits are much less obtrusive in his novels, where his compassion and empathy for human striving make his best work moving and memorable. The long novel gave Dreiser the prime form through which to explore in depth the possibilities of 20th-century American life, with its material profusion and spir-

itual doubt. Dreiser's characters struggle for self-realization in the face of society's narrow and repressive moral conventions, and they often obtain material success and erotic gratification while a more enduring spiritual satisfaction eludes them. Despite Dreiser's alleged deficiencies as a stylist, his novels succeed in their accumulation of realistic detail and in the power and integrity with which they delineate the tragic aspects of the American pursuit of worldly success. *Sister Carrie* and *An American Tragedy* are certainly enduring works of literature that display a deep understanding of the American experience around the turn of the century, with its expansive desires and pervasive disillusionments. (L.E.Hu.)

Drenewydd (Wales): see Newtown.

Drenthe, also spelled DRENTE, *provincie*, northeastern Netherlands. It extends westward from the German border, between the provinces of Groningen and Friesland (north and northwest) and Overijssel (south). Drained by many shallow streams and short canals, it has an area of 1,025 square miles (2,654 square km). Its capital is Assen. More than 50 megalithic funerary monuments (*hunebedden*, "huns' graves") attest to prehistoric settlement of the area. It was part of the bishopric of Utrecht from 1046 to 1522 but passed to the Holy Roman emperor Charles V in 1536 and was incorporated in the Habsburg dominions. It took part in the Dutch revolt against Spain but was not made a province until 1796.

The province's soils are mostly sandy with large areas of bogs; alluvium covers the valley floors. Some of the lowland regions are planted in market gardens and orchards. In the 19th century, settlements of paupers and criminals were established to reclaim the heathlands for agricultural use. Much of the heathland has been laid to grass, and reclamation continues. Rye and potatoes remain the chief crops, but dairying and cattle and pig raising have become important. Afforestation, begun privately before 1800 and under provincial control since 1905, has been considerable. Peat has been cut for fuel since medieval times. Beginning in the 17th century, there have been efforts to cut all the peat from a bog area and convert it to agricultural use.

Drenthe has a long tradition of cottage industries, such as spinning, weaving, and rope making. Agricultural processing is the chief economic activity, including the production of potato flour and strawboard. There are diversified industries at Meppel (the port of Drenthe), Hoogeveen, Assen, and Emmen. The oil industry near Schoonebeek has been developed since World War II. Pop. (1988 est.) 436,586.

Drepanius, Latinius Pacatus: see Pacatus Drepanius, Latinius.

Dresden, city and capital of Saxony *Land* (state), eastern Germany. Dresden is the traditional capital of Saxony and the third largest city in eastern Germany after Berlin and Leipzig. It lies in the broad basin of the Elbe River between Meissen and Pirna, 19 miles (30 km) north of the Czech border and 100 miles (160 km) south of Berlin. Sheltering hills north and south of the Elbe valley contribute to the mild climate enjoyed by Dresden.

It originated as the Slav village of *Dřežd'ane*, meaning "Forest Dwellers on the Plain," on the Elbe's north bank. The town on the south bank was founded at a ford by Margrave Dietrich of Meissen as a German colony, first recorded in 1216. The Slav settlement on the north bank, although older, was known as Neustadt ("New Town") and the later German town on the south bank as Altstadt ("Old Town").

In 1270 Dresden became the capital of Margrave Henry the Illustrious, and after his death it belonged to the king of Bohemia and the Margrave of Brandenburg until it was restored about 1319 to the margraves of Meissen, who chartered it in 1403. On the division of Saxony in 1485 it became the residence and capital of the Albertine line of Wettin rulers, later electors and kings of Saxony. Dresden accepted the Protestant Reformation in 1539. After a disastrous fire in 1491, the city was rebuilt and fortified. The electors Augustus I and Augustus II modernized the city in the Baroque and Rococo styles in the late 17th and 18th centuries, rebuilding Neustadt (burned in 1685) and founding Friedrichstadt, northwest of Altstadt. The Treaty of Dresden (1745), among Prussia, Saxony, and Austria, ended the second Silesian War and confirmed Silesia as Prussian. Two-thirds destroyed in the Seven Years' War (1756–63), Dresden's fortifications were later dismantled. In 1813 Napoleon I made the town a centre of military operations and there won his last great battle on August 26 and 27. Dresden's prosperity grew rapidly during the 19th century, accelerated by the completion of railways connecting the city to Berlin and Leipzig. Industrial suburbs began to grow up, mostly on the south bank.

Before World War II, Dresden was called "the Florence on the Elbe" and was numbered among the world's most beautiful cities owing to its architecture and art treasures. During the war, however, it was almost completely destroyed by massive bombing raids that took place on the night of Feb. 13–14, 1945, by 800 aircraft of an Anglo-American force. The city continued to be bombarded in raids lasting until April 17. The raids succeeded in obliterating the greater part of one of Europe's most beautiful cities, killing between 35,000 and

135,000 people, but achieved little militarily. Dresden was so badly damaged that it was suggested that the best approach might be to level the site. After the war a compromise was reached by rebuilding the Zwinger and the Baroque buildings around the castle and creating a new city in the area outside. Much of the city was subsequently reconstructed with modern (though rather plain) buildings, broad streets and squares, and green open spaces, with the aim of preserving as far as possible the character of the Altstadt.

The heart of Dresden is still a cluster of Baroque churches and the Rococo-style Zwinger on the south bank of the Elbe, in the Altstadt. These churches suffered severely during World War II: the Frauenkirche (1726–43; "Church of Our Lady") was destroyed, but its ruins have been kept as a memorial; while the Hofkirche (1738–55; "Court Church") and the Kreuzkirche (restored 1491, 1764–92, and 1900; "Church of the Holy Cross") have been restored. The Georgenschloss, the former royal palace (1530–35, restored 1889–1901) in the Altstadt, was also heavily damaged by bombing.

Dresden has several major museums and art galleries. The famous Zwinger (1711–32), which was originally planned as the forecourt for a castle, has been restored and its numerous collections (including pewter and porcelain) and museums (zoology, mineralogy, mathematical and scientific instruments) reopened. In the open space north of the Zwinger, the Semper Gallery (1846) was destroyed in 1945 but was reopened in 1960. This gallery has important Renaissance and Baroque paintings by Italian, Dutch, and Flemish masters, including Raphael's "Sistine Madonna." The Japanese Palace, formerly housing a manuscript and map library, has been rebuilt and is now a museum of anthropology and ethnography.

Dresden is also a city of music with a great operatic tradition, where Carl Maria von Weber and Richard Wagner conducted and where operas by Richard Strauss and others had their first performances. The Opera House (1878), destroyed in the war, was reconstructed. The city is the home of the Dresden State Theatre and the Dresden Philharmonic Orchestra (founded 1870). There is a music college and colleges of medicine, plastic arts, transport, and teachers' training, as well as a celebrated Academy of Art. Dresden is also a major centre for scientific education and research, particularly in the atomic field. The city is the site of a Technical University (1828), with a library containing more than one million volumes, the Central Institute for Nuclear Physics, and the German Museum of Hygiene, internationally known for its manufacture of transparent plastic anatomical models. There are several historic parks, notably the Grosse Garten (1676), which lies southeast of the Altstadt and has botanical and zoological gardens.

Manufacturing in Dresden expanded greatly after World War II. Owing to the paucity of raw materials in the vicinity, the city traditionally eschewed heavy industry in favour of high value-added manufacturing. Its industries currently produce precision and optical instruments, radio and electrical equipment, electrical transformers and hydroelectric generators, X-ray and photographic apparatus, and machinery. Market gardening is also extensive, and flowers and shrubs are grown for export. The Dresden china industry originated in Dresden but was moved to Meissen, 15 miles (24 km) northwest, in 1710. Dresden lies at the centre of an extensive railway system, has an airport, and is connected by the Elbe River with the inland waterway system as far as Hamburg and into the Czech Republic. Pop. (1999 est.) 477,700.

Dresden, Battle of (Aug. 26–27, 1813), Napoleon's last major victory in Germany.

It was fought on the outskirts of the Saxon capital of Dresden, between Napoleon's 120,000 troops and 170,000 Austrians, Prussians, and Russians under Prince Karl Philipp Schwarzenberg.

The allies had hoped to capture Dresden, Napoleon's major base of operations and supply depot. On August 23 Napoleon learned that the Dresden garrison of fewer than 20,000 men—commanded by Laurent Gouvion-Saint-Cyr—was threatened by the allied advance, and he rushed reinforcements there. In one of history's great marches, the Imperial Guard covered 90 miles (145 km) in three days, and two corps of conscripts covered 120 miles (190 km) in four days, giving Napoleon 70,000 troops on the first day of the battle and 120,000 on the second. Meanwhile, Gouvion-Saint-Cyr constructed many fortifications.

On August 26 Schwarzenberg attacked in a great semicircle around the city, his flanking troops resting on the Elbe River. Gouvion-Saint-Cyr's defenders yielded ground slowly, at great cost to the attackers. Napoleon arrived and in the late afternoon drove the allies back to their original positions. On the morning of the 27th he took the offensive. The superior mobility of his artillery decided the issue, when rain and mud made it almost impossible for infantry or cavalry to function effectively. The allies were forced to retire, with losses of 38,000 to French losses of 10,000. Napoleon became ill, and the pursuit of the allies was left to the corps commanders. They were seriously beaten, on August 30 and September 6, negating the value of the victory at Dresden.

Dresden Codex, Latin *CODEX DRESDENSIS*, one of several pre-Columbian Mayan hieroglyphic writings to survive the book burnings by the Spanish clergy. It contains astronomi-

A modified detail of the Dresden Codex showing astronomical data; in the Saxon State Library, Dresden, Ger.

cal calculations—eclipse-prediction tables, the synodical period of Venus—of exceptional accuracy. The Maya's reputation as astronomers is based largely on these figures. The codex was acquired by the Sächsische Landesbibliothek ("Saxon State Library"), Dresden, Saxony, and was published by Edward King, Viscount Kingsborough, in *Antiquities of Mexico* (1830–48). King erroneously attributed the codex to the Aztecs. The first scientific edition of the codex was made by E. Förstemann (Leipzig, 1880). See also Madrid Codex; Paris Codex.

Dresdner Bank AG, major German commercial bank, acquired by German insurance conglomerate Allianz AG in 2001 as a means of expanding its retail marketing operations.

Dresdner's headquarters are in Frankfurt am Main.

It was established in 1872 as Dresdner Bank in Dresden, and in 1884 the main office was relocated to Berlin. In 1952 the bank was split into three: Rhein-Main Bank AG, Hamburger Kreditbank AG, and Rhein-Ruhr Bank AG. The three were reunited into the present Dresdner Bank in 1957.

In addition to providing commercial banking and financial services, the bank and its associated companies also offer services in money markets, foreign exchange, and issuing of securities.

By 2002, difficulties with the commercial side of the banking business, stemming primarily from weakness in investment banking, caused parent company Allianz to reduce activity in the corporate markets division.

dress, covering, or clothing and accessories, for the human body. The variety of dress is immense, varying with different sexes, cultures, geographic areas, and historic eras.

A brief treatment of dress follows. For full treatment, see *MACROPAEDIA: Dress and Adornment; Industries, Manufacturing.*

The term dress encompasses not only such familiar garments as shirts, skirts, trousers, jackets, and coats but also footwear, caps and hats, sleepwear, sports clothes, corsets, and gloves. Hairstyles and the wearing of beards, mustaches, and wigs at different times and in various forms are all linked to the history of fashion and dress. The same is true of the use of cosmetics and jewelry and other forms of body decoration.

Dress functions and fashion. Some of the most basic functions of dress are to provide warmth and protection, to beautify or enhance sexual appeal, and to supply information about the wearer (*i.e.*, age, sex, social status, occupation). Dress serves many purposes, however, and is not defined solely by such relatively straightforward and practical roles. Indeed, throughout the history of costume, many styles of clothing have been worn that do not satisfy any one of these functions. Furthermore, people's perceptions of which garments or styles best serve such functions are not universal or constant. For example, even though women in other parts of the world had been wearing trousers for centuries, in Europe and North America pants were considered inappropriate and unattractive wear for women until the 20th century.

One of the most prevalent theories for explaining the periodic changes in fashion in Western dress up to the modern era is that fashion functions as a reflection of social and economic standing. Thus, in relatively static societies with limited movement between classes, as in many parts of Asia until modern times or in Europe before the Middle Ages, styles generally did not undergo major or rapid change. In contrast, when lower classes have the ability to copy the upper classes, the latter quickly instigate fashion changes that demonstrate their authority and high social position. During the 20th century, improved communications and manufacturing technologies enabled new styles to trickle down from the elite to the general population at ever-faster speeds, with the result that more styles were introduced than at any other time.

The idea that fashion is a reflection of wealth and prestige can be used to explain the popularity of many styles throughout costume history. For example, clothes that are difficult to obtain and expensive to maintain have frequently been at the forefront of fashion. For the same reason, when fabrics or materials are costly, styles that require them in excessive or extravagant amounts become particularly fashionable—as can be seen in the 16th-cen-

tury vogue for slashing outer garments to reveal a second layer of luxurious fabric underneath.

Similarly, impractical fashions which clearly demonstrate that the wearer does not need to work, and indeed would find it difficult to do so dressed as he (or she) is, have often been considered beautiful. One example is the recurrent popularity in Europe of styles that limited a woman's ability to maneuver or move by confining her into corsets and weighting her down with excessive layers of petticoats and skirts. The fact that a woman was dressed in such a manner was proof not only that she did no domestic work but also that her husband or father could afford to hire servants to do such work for her.

Status or relative power have also influenced fashions in dress on a larger, nationwide scale; a dominant political state can affect not only the national policies of weaker or dependent countries but their fashions as well. For example, many styles of traditional Japanese and Korean dress reflect Chinese influences. The same principle can be seen at work in 16th-century Europe, in which Spain was the strongest, richest country for a time. The Spanish vogue for ruffs and codpieces thus spread throughout the European continent, but, as Spain's power began to wane late in the century, other styles began to take precedence. Similarly, during the 19th century, when Great Britain was firmly established as the world's foremost industrial and economic power, Britain took the lead in setting men's fashions. The three-piece lounge suit introduced in Britain in the 1850s for informal wear became popular in other industrializing nations as well. It gradually became accepted for city wear in Britain and was then adopted by men as a sort of business uniform throughout the rest of the world. The determining role of the West in 20th-century culture and technology throughout the world is clearly evident in the adoption of Western styles of dress by educated urban elites virtually worldwide. Non-Western styles of dress continue to be important among substantial segments of the population in such regions as the Indian subcontinent, East Asia, the Middle East, and West Africa, however.

The influence wielded by dominant social groups within a particular society can be seen in the effects that the generation of Americans born after World War II (commonly known as "baby boomers") had on fashion. Until the 1950s, children had basically worn the same types of clothes as their parents. The large population of postwar teenagers, however, and their unprecedented purchasing power, spurred the establishment of new styles specifically for the young. In the late 1960s and early '70s, as the baby boomers reached adulthood, the emphasis on youth spread into the fashion mainstream. Long, unstyled hair, short dresses, vivid colours, blue jeans, and other childlike looks permeated all levels of fashion. The gradual replacement of these styles with the tailored business look of the 1980s and '90s reflected the aging of the dominant baby boom population.

Clothing technology. Over the centuries, advances in technology took place very slowly. The iron needle did not come into use until the Middle Ages. Until the 18th century all tailoring operations were performed by hand. Finally in the 1700s the invention of foot- and water-powered machinery for spinning and weaving made factory production of cloth possible. This breakthrough stimulated the development of the sewing machine. Barthélemy Thimonnier of Paris patented the first practical machine in 1830. Improved versions soon followed, including one by Isaac M. Singer of Pittstown, N.Y., in 1851.

The next major mechanical achievement in the industry came in 1860 with the introduction of the band-knife machine that could

cut several thicknesses of cloth at one time. Twentieth-century advances in the manufacturing process have included the computerized grader machine (1967), which grades and cuts patterns directly from an original set automatically; a computer-controlled laser beam that burns or vaporizes fabric rather than cutting it; and high-speed sewing machines capable of sewing up to 8,000 stitches per minute.

The raw materials used by the apparel and allied industries are classified according to construction: strand, matted, molecular mass, and cellular. With strand construction, yarns are converted into woven, knitted, and braided fabrics. Matted construction converts fibres into felts, paper, and padding yardage; molecular-mass construction produces plastic film, metal foil, and rubber sheetings. Cellular construction is the building block for skins, furs, hides, and synthetic foam.

Textile fabrics are created by weaving, braiding, or knitting. In weaving, two or more yarns are interfaced perpendicularly to each other. In braiding, two or more yarns are interlaced diagonally to each other. In knitting, yarns are interlooped. Yarns are strands spun either from natural fibres such as cotton, linen, or wool, or from synthetic fibres such as rayon and nylon.

Most leathers are made from skins of sheep, goats, kids, calves, pigs, horses, and cattle, and to a lesser degree from the skins of lizards, snakes, alligators, elk, buffalo, ostriches, kangaroos, chamois, walrus, elephants, and seals.

There are three basic steps in the modern manufacturing process: cutting, sewing, and pressing. In addition, there are five other processes used in assembling, decorating, and finishing the components. These are baking or curing, cementing, fusing, molding, and riveting. The last-mentioned process includes nailing and the insertion of grommets.

dressage (French "training"), systematic and progressive training of riding horses to execute precisely any of a wide range of maneuvers, from the simplest riding gaits to the most intricate and difficult airs and figures of *haute école* ("high school"). Dressage achieves balance, suppleness, and obedience with the purpose of improving and facilitating the horse's performance of normal tasks. If the advanced training stage is reached, dressage may become an objective in itself. Competitions in dressage have been regularly included in the Olympic Games since 1912. For winners of this event, see *Olympic Games*.

Of great importance to dressage is collection, in which the horse's gaits are shortened and raised by bringing the balance rearward to lighten the forehead, thus giving special agility in a limited space. This change is made without sacrificing ability to move freely. The desired result is that the horse will be keen but submissive and support the weight of the rider without undue strain on any set of joints or muscles. The overall objectives are to enable the horse to comply easily and willingly with the demands of the rider and at the same time to improve the horse's pace and bearing.

Dressage is generally divided into elementary training (*campagne*) and the much more advanced *haute école*. Elementary training consists of teaching the young horse obedience, balance, and relaxation. Starting with the horse on a longe line, or training rope, and then under the saddle, the horse is taught basic and natural movements, especially on a straight line, with some collection and extension of gaits, half and full halts, backing, and turns. The more capable horses may learn movements on two tracks (moving diagonally to the side and forward), basic figures, and variations of the canter. In *haute école*, prac-

ticed most eminently at the Spanish Riding School of Vienna, the horse's natural movements are developed to the greatest perfection. It moves in almost perfect balance and precision; it walks, trots, and canters in highest collection and extension, all in response to barely perceptible movements of its rider's hands, legs, and weight. Typical *haute école* movements include the pirouette, a turn on the haunches in four or five strides at a collected canter; the piaffe, a trot in place; the passage, a very collected, cadenced, high-stepping trot; the levade, in which the horse raises and draws in its forelegs, standing balanced on its bent hind legs; the courbette (curvet), a jump forward at the levade; and the capriole, in which the horse jumps straight upward, with its forelegs drawn in, kicking back with its hind legs horizontal, and lands again in the same spot from which it took off.

dresser, a cupboard used for the display of fine tableware, such as silver, pewter, or earthenware. Dressers were widely used in England beginning in Tudor times, when they were no more than a side table occasionally fitted with a row of drawers. The front stood on three or five turned (shaped on a lathe) legs linked by stretchers and by corner posts. The front of the top and the drawer fronts were decorated with matching molding. A low backboard, often with narrow shelves or drawers on it, was introduced about 1690, and, soon afterward, a decorative shelf beneath the main drawers was added. Shelves without backs were added later to display English delftware. Dressers of this type became essential features of every middle-class kitchen up to the 19th century.

In France the dresser was in use from the early years of the 16th century. Decorated with more elaborate carving than the English,

Colonial American dresser, 1775–1800, with Pennsylvania German sgraffito ware displayed on the shelves; in The Henry Francis du Pont Winterthur Museum, Delaware

Courtesy, The Henry Francis du Pont Winterthur Museum

it adopted architectural forms such as Gothic crockets (ornaments in the form of curved and bent foliage) and panels, reeded strapwork (design of narrow fillets or bands folded, crossed, or interlaced), cornices, and entablatures. Unlike the English dresser, it was basically a cupboard with two doors and a pot board below. A similar form was made in Germany, the lower portion enclosed by doors, the upper portion by recessed cupboards with a heavy cornice.

In modern usage, the term “dresser” can denote either a cupboard to hold dishes and cooking utensils or, in the United States, a chest of drawers or bureau topped by a mirror.

Dresser, Christopher (b. July 4, 1834, Glasgow, Scot.—d. Nov. 24, 1904, Mulhouse, Fr.), British designer, one of the first professional

industrial designers and a leader in the 19th-century vogue for Japanese-influenced design.

Dresser studied for two years at the School of Design at Somerset House, London, and then taught botany. After publication of his *Unity in Variety* (1859), he became a fellow of the Linnean Society. His *Art of Decorative Design* (1862) appeared just before he began work as a designer. He visited Japan as a representative of the British government in 1876 and thereafter adapted Japanese motifs and design principles for his own uses.

Dresser's work was strongly influenced by his scientific outlook, which some authorities claim led to overtheorization and reduced the aesthetic interest of his designs. His work, however, showed a genuine understanding of materials, especially metal and glass.

Other works by Dresser include *The Development of Ornamental Art in the International Exhibition* (1862) and *Japan, Its Architecture, Art and Art Manufactures* (1882).

dressing table, also called TOILET TABLE, a table used for the toilet. The term originally was applied in the 17th century to small tables with two or three drawers. It soon became

French 18th-century dressing and writing table by Jean-François Oeben or Jean-François Leleu; in the Wallace Collection, London

Reproduced by permission of the Trustees of the Wallace Collection, London; photograph John R. Freeman & Co Ltd

common practice to conceal the fittings of the dressing table when they were not in use, and great ingenuity was exercised by 18th-century cabinetmakers to combine the most convenient fittings with a handsome piece of furniture. In the *Cabinet-Makers' London Book of Prices* (1788), Thomas Shearer included a design for a dressing stand “with folding tops. . . . The top and bottom fronts are shams, in the back part of the stand is a cistern which receives water from the bason drawer. . . . The inside included “A glass hung to a sliding piece, 3 powder boxes, a lift-out to hold 4 razors, hone and oil bottle, a ditto for combs, and partition'd off for tooth brushes, a shallow ditto for tweezers, knives etc. . . .”

Some dressing tables were combined with writing tables, a hybrid at which the French excelled. In the 19th century the dressing table, like other cabinet furniture, assumed heavier proportions and eventually became a matching part of the bedroom suite.

Dressler, Marie, original name LEILA MARIE KOERBER (b. Nov. 9, 1869, Coburg, Ont., Can.—d. July 28, 1934, Santa Barbara, Calif., U.S.), Canadian-born American actress whose heartwarming portrayals of strongly self-sufficient, humorous old women established her as one of Hollywood's most popular screen personalities during the early 1930s.

After appearing with a roving light-opera troupe at the age of 14, Dressler eventually became a featured vaudeville comedienne, known throughout the United States and Great Britain. She made her film debut at Mack Sennett's Keystone Studio in *Tillie's Punctured Romance* (1914) in which Charlie Chaplin and Mabel Normand also appeared.

Following World War I, Dressler was almost lost sight of as an actress.

With the coming of sound to motion pictures in 1927, Dressler's career revived, and she regained public notice in slapstick comedies with Polly Moran. She met with great success as Marthy in *Anna Christie* (1930), in which she played a worldly wise, waterfront drunk and was typed in such roles in many pictures, such as *Politics* (1931), *Prosperity* (1932), *Dinner at Eight* (1933), and *Tugboat Annie* (1933). She won the Academy Award for best actress for her performance in *Min and Bill* (1931) in which she costarred with Wallace Beery.

Dreux, town, Eure-et-Loir département, Centre région, north-central France. It lies along the Blaise River, northwest of Chartres. Known to the Romans as Drocae, it was held by the Durocasses, a Gallic tribe. It gave its name to a medieval family of counts. François, Duke de Guise, defeated the Huguenots there in 1562, marking the beginning of the Wars of Religion. The town's monuments include Le Beffroi, or old town hall (1512–37); the Gothic Church of Saint-Pierre (13th–17th century); and the 19th-century Chapel of Saint-Louis (a mausoleum for the princes of the Orléans family).

Dreux's manufactures include chemicals and railroad and agricultural equipment. Pop. (1990) 35,230.

Drew, Charles Richard (b. June 3, 1904, Washington, D.C., U.S.—d. April 1, 1950, near Burlington, N.C.), black American physician and surgeon who was an authority on the preservation of human blood for transfusion.

Drew was educated at Amherst College (graduated 1926), McGill University, Montreal (1933), and Columbia University (1940). While earning his doctorate at Columbia in the late 1930s, he conducted research into the properties and preservation of blood plasma. He soon developed efficient ways to process and store large quantities of blood plasma in “blood banks.” As the leading authority in the field, he organized and directed the blood-plasma programs of the United States and Great Britain in the early years of World War II, while also agitating the authorities to stop excluding the blood of blacks from plasma-supply networks.

Drew resigned his official posts in 1942 after the armed forces ruled that the blood of blacks would be accepted but would have to be stored separately from that of whites. He then became a surgeon and professor of medicine at Freedmen's Hospital, Washington, D.C., and Howard University (1942–50). He was fatally injured in an automobile accident in 1950.

Drew, Daniel (b. July 29, 1797, Carmel, N.Y., U.S.—d. Sept. 18, 1879, New York, N.Y.), American railway financier of the 19th-century “robber baron” era.

Daniel Drew, engraving by J.C. Buttre after a photograph by M. Brady

By courtesy of the Library of Congress, Washington, D.C.

After a successful career as a cattle trader, Drew bought an interest in a New York-to-Peekskill steamboat in 1834 and six years later established the People's Line. He also bought control of the Stonington Line on Long Island Sound and operated a steamship service on Lake Champlain. His growing capital enabled him in 1844 to open the Wall Street brokerage firm of Drew, Robinson, and Company, which became one of the principal traders in railroad stocks in the United States. Drew's association with the Erie Railroad began in 1853. The "Erie War" of 1866-68, in which Drew joined Jay Gould and James Fisk in opposing Cornelius Vanderbilt, who sought to buy control of the Erie Railroad, eventually led to his ruin.

In the panic of 1873 his losses were considerable, and in March 1876 he filed for bankruptcy. An avowed Methodist, Drew had contributed some of his earlier wealth to the founding of Drew Theological Seminary at Madison, N.J., and a smaller women's seminary at his birthplace.

Drew, Georgiana Emma: see Barrymore, Georgiana.

Drew, Jane: see Fry, E. Maxwell; and Drew, Jane.

Drew, John, Jr. (b. Nov. 13, 1853, Philadelphia, Pa., U.S.—d. July 9, 1927, San Francisco, Calif.), American actor noted for his roles in Shakespearean comedy, society drama, and light comedies.

Drew was the eldest son of John and Louisa Lane Drew, who were actors and managers. He first appeared on the stage in 1873 under his mother's management. In 1875 Drew made his New York debut as Bob Ruggles in Augustin Daly's comedy *The Big Bonanza*. He continued his association with Daly, making his first popular success as Alexander Sprinkle in Daly's *Arabian Night; or Haroun al Raschid and His Mother-in-law* in November 1879. He left Daly in 1892 to join Charles Frohman's company and for the next 20 years appeared, under Frohman's direction, in such plays as *A Marriage of Convenience*, *One Summer's Day*, *Richard Carvel*, *Much Ado About Nothing*, *The Will*, *The Circle*, *The School for Scandal*, and *Trelawny of the "Wells."* When Frohman died in the *Lusitania* disaster of 1915, Drew's career began to ebb. So esteemed was he by his fellow actors, however, that he was chosen lifetime president of the Players' club, an honour previously accorded only to Edwin Booth, founder of the club, and Joseph Jefferson. His memoirs, *My Years on the Stage*, were published in 1922.

Drew, John, Sr. (b. Sept. 3, 1827, Dublin, Ire.—d. May 21, 1862, Philadelphia, Pa., U.S.), theatrical manager and leading American actor of Irish romantic comedy. One of his best roles was as Gerald Pepper in Samuel Lover's *White House of the Peppers*.

After a brief career as a seaman, Drew turned to the stage, making his New York debut sometime between 1842 and 1846. With the juvenile actor William Wheatley, he assumed management of the Arch Street Theatre in Philadelphia, probably in 1853, though some accounts place this event 10 years earlier. In 1850 he married the actress and theatrical manager Louisa Lane, who assumed management of the theatre in 1861. Drew toured widely, visiting England and Ireland in 1855, California and Australia in 1857, Australia and England again in 1858, and returned home in 1862, a few months before his death.

Drew, Louisa Lane, née LOUISA LANE (b. Jan. 10, 1820, London, Eng.—d. Aug. 31, 1897, Larchmont, N.Y., U.S.), noted American actress and manager of Mrs. John Drew's

Arch Street Theatre company in Philadelphia, which was one of the most brilliant in American theatre history. As was the custom during the 19th century, she often played "breeches" roles, e.g., Romeo, Mark Antony, and other Shakespearean roles.

Drew was the daughter of a British acting couple. She began her stage career at the age of eight, achieving success almost immediately. In 1850 she married the Irish comic actor and manager John Drew, Sr., and 11 years later took over the lease that Drew and the juvenile actor William Wheatley had been managing. She directed the company until 1892, toured for 11 seasons, and continued her stage appearances up until the time of her death, winning acclaim in such roles as Lady Teazle, Peg Woffington, Lydia Languish, and, most memorably, Mrs. Malaprop.

Drexel, Anthony Joseph (b. Sept. 13, 1826, Philadelphia, Pa., U.S.—d. June 30, 1893, Carlsbad, Bohemia [now Karlovy Vary, Czech Republic]), American banker and philanthropist who founded the Drexel Institute of Technology in Philadelphia.

Upon inheriting their father's banking house of Drexel and Company in Philadelphia, Anthony and his brothers transformed it into an investment-banking concern. In 1871 they organized Drexel, Morgan and Company of New York City and Drexel, Harjes and Company in Paris. Anthony specialized in flotation of government bonds, railroad organization, mining development, and urban real estate. From 1864 he was co-owner with George W. Childs of the *Philadelphia Public Ledger*. Various churches, hospitals, and charities, as well as the Drexel Institute of Technology, benefited from his philanthropy.

Drexel, Katharine, SAINT (b. Nov. 26, 1858, Philadelphia, Pa., U.S.—d. March 3, 1955, Cornwells Heights, Pa.; canonized Oct. 1, 2000; feast day [U.S.] March 3), American founder of the Blessed Sacrament Sisters for Indians and Colored People (now Sisters of the Blessed Sacrament), a congregation of missionary nuns dedicated to the welfare of American Indians and blacks.

Drexel was the daughter of the American financier and philanthropist Francis Anthony Drexel, from whom she inherited a vast fortune. When the vicar apostolic of Dakota Territory appealed for the Christian education of Indians, she responded by financing mission schools in South Dakota, Minnesota, New Mexico, and Wyoming. She later visited these establishments, touring by burro and stagecoach. In Rome (January 1887), she had a private audience with Pope Leo XIII, who asked that she become a missionary.

In 1889 she entered the novitiate of the Sisters of Mercy, Pittsburgh, where, eventually, companions joined her. In 1891 she founded her congregation at the Drexel homestead. The following year they moved to the motherhouse, St. Elizabeth's Convent, Cornwells Heights, Pa., with Drexel, then known as Mother Drexel, as the first superior general; the community received papal approbation from Pope Pius X in 1913.

Mother Drexel began a vast building campaign with the founding of St. Catherine's Boarding School for Pueblo Indians, Santa Fe, N.M., in 1894, followed by another school at Rock Castle, Va., in 1899, for black girls. She opened more schools in Arizona and Tennessee (1903) and in 1915 founded Xavier University in New Orleans, La., for black girls. By 1927 she had established convents for her congregation at Columbus (Ohio), Chicago, Boston, and New York City. She received high commendation from Pope Pius XII on her golden jubilee in 1941. At the time of her death, she had used more than \$12,000,000 of her inheritance for her charitable and apostolic missions, working in conjunction with the U.S. Indian Office, through which she

helped found the Society for the Preservation of the Faith Among Indian Children (or Preservation Society). She was canonized on Oct. 1, 2000.

Dreyer, Carl Theodor (b. Feb. 3, 1889, Copenhagen, Den.—d. March 20, 1968, Copenhagen), motion-picture director whose most famous films were explorations of religious experience, executed in the Danish "static" style.

Carl Dreyer

By courtesy of the Museum of Modern Art Film Stills Archive, New York

Dreyer was a pianist, a clerk, a journalist, and a theatre critic before entering the cinema in 1913 as a writer of subtitles. He eventually became a well-known scriptwriter and editor. His first film as a director was *Praesidenten* (1919; "The President"), followed by *Blade af satans bog* (1920; *Leaves from Satan's Book*); *Præstänkan* (1920; *The Parson's Widow*); *Die Gezeichneten* (1922; *Love One Another*); *Der var engang* (1922; *Once upon a Time*); *Mikaël* (1924), filmed in Germany; *Du skal aere din hustru* (1925; *Master of the House*); and *Glomsdalsbruden* (1925; "The Bride of Glomsdal").

La Passion de Jeanne d'Arc (1928; "The Passion of Joan of Arc"), Dreyer's most famous silent film, was based on the official records of her trial and execution for witchcraft. Filmed in France, it starred Maria Falconetti as the mystically inspired heroine. Dreyer created a new kind of historical drama by using sustained close-ups to establish an intimate relationship between the audience and the characters.

Dreyer's distinctive directorial style was based on his use of authentically detailed settings and extensive close-ups. The action of his films, centring on an individual who separates himself from the group and thus becomes an object of persecution, usually takes place within a limited geographic area and a short span of time. Slow in tempo with an aura of sombre grimness, his pictures often deal with witchcraft and the supernatural and with the tension between good and evil in even the most ordinary human situations.

Dreyer also directed outstanding sound pictures. *Vampyr* (1932), filmed in France, is based on a story of vampirism by Sheridan Le Fanu; *Vredens dag* (1943; *Day of Wrath*) is a drama of witch-hunting and religious persecution, set in 17th-century Denmark, that won international recognition and substantially contributed to the revival of the Danish cinema; *Två människor* (1945; *Two People*); and *Ordet* (1955; *The Word*), winner of the Grand Prize at the Venice Film Festival, dramatizes the complex relationship between social good and spiritual good in an ambiguous story of a hardworking, down-to-earth farm family who are burdened by the younger son's

insane delusion that he is Christ. Dreyer's last film *Gertrud* (1964), is a subtle character study of a woman to whom love is all important.

Dreyer, Johan Ludvig Emil (b. Feb. 13, 1852, Copenhagen, Den.—d. Sept. 14, 1926, Oxford, Eng.), Danish astronomer who compiled the *New General Catalogue of Nebulae and Clusters of Stars*, published in 1888, and its supplements, published in 1895 and 1908.

Johan Dreyer, c. 1910
Archiv für Kunst und Geschichte, West Berlin

This work, together with the supplements, was republished in 1953; it still remains one of the standard reference catalogs.

In 1874 Dreyer was appointed assistant at the earl of Rosse's observatory in Parsonstown, County Offaly. Four years later he moved to Dunsink Observatory in Dublin. In 1882 he became director of the observatory at Armagh, Ire.; he retired from this post in 1916. That same year he was awarded the Gold Medal of the Royal Astronomical Society. He later served as the society's president (1923–24).

In addition to his catalog of nebulae and star clusters, Dreyer published a number of other astronomical works. He wrote a biography of his illustrious countryman, *Tycho Brahe* (1890), and collected and edited all of Tycho's works and correspondence in 15 volumes (published between 1913 and 1929).

Dreyfus, Alfred (b. Oct. 19, 1859, Mulhouse, France—d. July 12, 1935, Paris), French army officer whose trial for treason began a 12-year controversy, known as the Dreyfus Affair, that deeply marked the political and social history of the French Third Republic.

Dreyfus, before 1894
H. Roger-Viollet

Dreyfus was the son of a wealthy Jewish textile manufacturer. In 1882 he entered the École Polytechnique and decided on a military career. By 1889 he had risen to the rank of captain.

Dreyfus was assigned to the War Ministry when, in 1894, he was accused of selling military secrets to the German military attaché. He was arrested on October 15, and on December 22 he was convicted and sentenced to life imprisonment on the infamous penal colony of Devils Island, off the coast of French Guiana.

The legal proceedings, which were based on insufficient evidence, were highly irregular. Although he denied his guilt and although his family consistently supported his plea of innocence, public opinion and the French press as a whole, led by its virulently anti-Semitic sec-

tion, welcomed the verdict and the sentence. In particular, the newspaper *La Libre Parole*, edited by Édouard Drumont, used Dreyfus to symbolize the supposed disloyalty of French Jews.

But doubts began to grow. Lieut. Col. Georges Picquart found evidence that Maj. C.F. (Walsin-)Esterhazy was engaged in espionage and that it was Esterhazy's handwriting found on the letter that had incriminated Dreyfus. When Picquart was removed from his post, it was believed that his discovery was too inconvenient for his superiors. The pro-Dreyfus side slowly gained adherents (among them, journalists Joseph Reinach and Georges Clemenceau—the future World War I premier—and a senator, Auguste Scheurer-Kestner).

The affair was made absurdly complicated by the activities of Esterhazy in inventing evidence and spreading rumours and of Maj. Hubert Joseph Henry, discoverer of the original letter attributed to Dreyfus, in forging new documents and suppressing others. When Esterhazy was brought before a court martial, he was acquitted, and Picquart was arrested. This precipitated an event that was to crystallize the whole movement for revision of Dreyfus' trial. On Jan. 13, 1898, the novelist Émile Zola (*q.v.*) wrote an open letter published on the front page of *Aurore*, Clemenceau's paper, under the headline "J'accuse." By the evening of that day, 200,000 copies had been sold. Zola accused the army of covering up its mistaken conviction of Dreyfus and of acquitting Esterhazy on the orders of the Ministry of War.

By the time of the Zola letter, the Dreyfus case had attracted widespread public attention and had split France into two opposing camps. The issues were regarded as far exceeding the personal matter of the guilt or innocence of Dreyfus. The anti-Dreyfusards (those against reopening the case), nationalist and authoritarian, viewed the controversy as an attempt by the nation's enemies to discredit the army and saw it as a case of national security against international socialism and Jewry, of France against Germany. The Dreyfusards (those seeking exoneration of Captain Dreyfus) saw the issue as the principle of the freedom of the individual subordinated to that of national security and as republican civilian authority pitted against a military authority that acted independently of the state.

Amid uproar in Parliament, the government was pressed by the nationalists to bring Zola to justice, while anti-Semitic riots broke out in the provinces. A petition demanding revision of the Dreyfus trial was signed by some 3,000 persons, including Anatole France, Marcel Proust, and a host of intellectuals. The trial of Zola began on February 7; he was found guilty of libel and sentenced to a year's imprisonment and a fine of 3,000 francs.

From 1898 to 1899 the Dreyfusard cause gained in strength. Major Henry committed suicide at the end of August 1898, after confessing his forgeries. Esterhazy, in panic, fled to Belgium and London. The confession of Henry opened a new phase in the affair, for it ensured that the appeal of the Dreyfus family for a retrial would now be irresistible.

A new ministry, led by René Waldeck-Rousseau (*q.v.*), took office in June 1899 and resolved to bring the affair to an end. Dreyfus, brought back from Devils Island, appeared before a new court martial in Rennes (Aug. 7–Sept. 9, 1899). It found him guilty, but the president of the republic, in order to resolve the issue, pardoned him. Dreyfus accepted the act of clemency but reserved the right to do all in his power to establish his innocence.

In 1904 a retrial was granted and in July 1906 a civilian court of appeals (the Cour d'Appel) cleared Dreyfus and reversed all previous convictions. Parliament passed a bill reinstating Dreyfus. On July 22 he was formally

reinstated and decorated with the Legion of Honour. After further short service in the army, in which he attained the rank of major, he retired to the reserves. He was recalled to active service during World War I and, as a lieutenant colonel, commanded an ammunition column. After the war he retired into obscurity. The army did not publicly declare his innocence until 1995.

The Dreyfus case—or *l'Affaire*, as it came to be called—was an important landmark in the history of the Third Republic and of modern France. From the turmoil of which it was the centre emerged a sharper alignment of political and social forces, leading to such drastic anticlerical measures as the separation of church and state in 1905 and to a cleavage between right-wing nationalists and left-wing antimilitarists that haunted French life until 1914 and even later. On each side were mobilized France's most eminent literary men, and the violent controversy destroyed the cohesion of French life for more than a generation after. A conjunction of mistaken loyalties, repeated stupidities, base forgeries, and excited extremists inflamed the situation into a national crisis. At best, it evoked a passionate repudiation of anti-Semitism, which did France honour; at worst, it revealed and intensified a chronic internal division that was to be a major source of national weakness.

Dreyfuss, Henry (b. March 2, 1904, New York, N.Y., U.S.—d. Oct. 5, 1972, South Pasadena, Calif.), American industrial designer noted for the number and variety of his pioneering designs for modern products.

At the age of 17 Dreyfuss was designing sets for stage presentations at a Broadway motion-picture theatre. In 1927 a store commissioned him to study its merchandise from the standpoint of attractiveness and to make drawings indicating improvements that the manufacturers could make. He made the study but refused to undertake the design because he felt that the proper way to approach design was to work directly with the manufacturer from the start rather than to try to improve a design after the product had been made.

He opened his first industrial design office in 1929. At the same time, he was an active and successful designer of sets for the Broadway theatre. In 1930 he began designing for Bell Telephone Laboratories, an association that resulted in the design of a series of telephones. Other notable designs include the interior of Super G Constellation aircraft for the Lockheed Aircraft Corporation and the interior of the ocean liner "Independence."

Dreyfuss designs stress the user of the product. He said that "when the point of contact between the product and people becomes a point of friction, then the industrial designer has failed." His book *The Measure of Man* (1960, rev. ed. 1967) contained extensive data on the human body and its movements. His approach to industrial design is described in his book *Designing for People* (1955, 2nd ed. 1967). From 1963 to 1970 he was associated with the University of California at Los Angeles. On Oct. 5, 1972, Dreyfuss, along with his wife, Doris, died of carbon monoxide poisoning in a car in the garage of their home.

Dreyschock, Alexander (b. Oct. 15, 1818, Zack, Bohemia—d. April 1, 1869, Venice, Italy), Bohemian pianist and composer, often compared to Liszt for technical prowess.

Dreyschock, who gave his public debut at the age of eight, went to Prague in 1833 to study with Václav Tomášek. In 1838 he began extensive tours throughout Europe. He became professor of piano at the St. Petersburg Conservatory in 1862, but, unable to bear the climate, he left Russia for Italy in 1868. He died there the following spring.

Dreyschöck was particularly known for his brilliant octaves, double sixths and thirds, and solos played by his left hand alone. J.B. Cramer, an English composer and virtuoso, is reported to have exclaimed, "The man has no left hand! Here are two right hands!" He mainly performed his own works but did include many classical pieces in his repertoire.

Dreyse, Nikolaus von, original name JOHANN NIKOLAUS DREYSE (b. Nov. 20, 1787, Sömmerda, Thuringia [now in Germany]—d. Dec. 9, 1867, Sömmerda), German firearms inventor and manufacturer.

The son of a locksmith, Dreyse worked from 1809 to 1814 in the Parisian gun factory of Jean-Samuel Pauly, a Swiss who designed several experimental breech-loading military rifles. Returning to Sömmerda, he in 1824 founded a company to manufacture percussion caps. There he designed a series of "needle-firing guns," rifles in which a needle-like pin pierced a percussion cap in the centre of a paper cartridge to strike the detonating material (usually mercury fulminate) that fired the bullet. A muzzle-loading model of 1827 was followed in 1836 by a bolt-action breechloader, which the Prussian army began to purchase in 1841. The high rate of fire of Dreyse's weapon overwhelmed enemy troops in the 1864 German-Danish War for the territories of Schleswig and Holstein, earning Dreyse papers of nobility from the emperor. The Dreyse rifle was the standard Prussian infantry weapon until the ascendancy of the Mauser rifle in the 1870s and '80s.

The factory founded by Dreyse and continued by his son Franz (1822–94) became, in 1901, part of the giant Rheinische Metallwaren- und Maschinenfabrik AG of Düsseldorf (now Rheinmetall GmbH), a major supplier of weapons to the German military.

Driesch, Hans Adolf Eduard (b. Oct. 28, 1867, Bad Kreuznach, Prussia [now in Germany]—d. April 16, 1941, Leipzig, Ger.), German experimental embryologist and philosopher who was the last great spokesman for vitalism, the theory that life cannot be explained as physical or chemical phenomena.

Driesch
By courtesy of the Ruprecht-Karls-Universität,
Heidelberg, Ger.

Driesch was the son of a well-to-do Hamburg gold merchant. For his early education, his father sent him to a prominent humanistic gymnasium that had been founded by a friend of Martin Luther. Driesch's interest in zoology was aroused while he was still a child by the unusual live animals his mother kept in their home.

Driesch attended several universities (at Hamburg, Freiburg, and Jena), studying zoology, chemistry, and physics. He did his doctoral work at Jena under Ernst Heinrich Haeckel, whose main interest was in phylogeny, a special branch of evolutionary theory. Driesch's doctoral dissertation in 1887 dealt with factors controlling the growth of colonial hydroids.

For the next 10 years Driesch traveled exten-

sively; he also experimented during this period with marine eggs, often at the international Zoological Station in Naples. In 1891 he separated the first two cells formed by a dividing sea urchin egg and discovered that each would form a whole larva. A similar experiment had been performed on the frog's egg by Wilhelm Roux in 1888, but with quite different results; each of the first two cells formed only half an embryo, and Roux concluded that the parts of an organism are determined at the two-cell stage. Driesch, however, concluded that the fate of a cell is not determined at the two-cell stage, but by its position in the whole organism. He published his first wholly theoretical monograph that year and, in 1892, speculated that vitalistic interpretations of biological data might be reasonable. His experimental results gave strong impetus to the then new science of experimental embryology.

Driesch made many other less well-known but equally important contributions to embryology. He produced a giant larva by fusing two embryos. By compressing dividing eggs he caused an abnormal distribution of nuclei, thereby proving that the nuclei are all equivalent; this experiment was an important forerunner of modern genetics. He recognized that nuclei and cytoplasm interact and postulated that the nucleus exerts its influence on the cytoplasm by means of ferments, or enzymes. In 1896 he shook sea urchin larvae to displace their skeleton-forming cells and observed the displaced cells return to their original positions. This experiment was the first demonstration of embryonic induction—that is, the interaction between two embryonic parts resulting in differentiation that would not have occurred otherwise—the theoretical aspects of which he had speculated upon in a monograph published in 1894.

By 1895 Driesch was a convinced vitalist. He felt himself driven to this position by his inability to interpret the results of his cell-separation experiments in mechanistic terms; he could not envisage a machine that could divide into two identical machines. Driesch applied the Aristotelian term *entelechy* to denote a vital agent that could regulate organic development. Although such an agent could not be explained by physical science, he believed that its actions were related to the activity of enzymes, which he recognized as important in development.

Settling in Heidelberg, Driesch continued to perform embryological experiments until 1909, when he was at last habilitated—the procedure then required to enter the German university hierarchy—in natural philosophy. As a member of the faculty of natural sciences, he held successive professorships of philosophy at Heidelberg beginning in 1912 and transferred to Cologne in 1919 and to Leipzig in 1921. As a philosopher he was strongly influenced by Immanuel Kant, and metaphysics was one of his specialties; logic was another. Perhaps because of his leanings toward vitalism, he also became interested in parapsychology.

Driesch's work was of immediate importance in stimulating the progress of experimental embryology. His studies on embryonic induction, enzyme action, and nuclear and cytoplasmic interaction led to work that continues today, but in a less vitalistic framework. In 1935 Driesch was forced into early retirement by the Nazis, but he continued to write until his death. (J.M.O./Ed.)

Drieu La Rochelle, Pierre (b. Jan. 3, 1893, Paris, France—d. March 16, 1945, Paris), French writer of novels, short stories, and political essays whose life and works illustrate the malaise common among European youth after World War I.

Drieu, the brilliant son of a middle-class family, attended the *École des Sciences Politiques* with the intention of entering diplomatic

Drieu La Rochelle, 1934
H. Rogier-Vollet

service. His plans, however, were interrupted by World War I, in which he fought and was wounded. He—like many others of his generation—emerged from the war disillusioned, and he began a lifelong search for a sound moral and philosophical approach to life. He briefly became involved in the Surrealist movement. Characteristic novels of this period include his first novel, *L'Homme couvert de femmes* (1925; "The Man Covered With Women"), and *Le Feu follet* (1931; *The Fire Within, or Will o' the Wisp*; filmed by Louis Malle in 1963). *Le Feu follet* is the story of the last hours in the life of a young bourgeois Parisian addict who kills himself. In one fashion or another, the subject of decadence and the general loss of moral fibre in postwar French society was to remain a subject of major concern throughout his life.

His later works include *La Comédie de Charleroi* (1934; *The Comedy of Charleroi and Other Stories*), a memoir of the war; *Rêveuse bourgeoise* (1937; "Dreamworld Bourgeoisie"); and, perhaps his best known novel, *Gilles* (1939). Having worked through several political ideologies, Drieu eventually settled on fascism. He collaborated with the Vichy government during World War II, and, shortly after the liberation of France, he committed suicide. His *Récit secret* (1961; *Secret Journal and Other Writings*) and *Mémoires de Dirk Raspe* (1966) were among a number of his works that were published posthumously.

drill (*Mandrillus leucophaeus*), large, short-tailed monkey, family Cercopithecidae, formerly found from Nigeria to Cameroon. As a result of hunting and deforestation, the drill is an endangered species restricted to remote forest regions of Cameroon. The drill, like the related mandrill (*q.v.*), is sometimes placed in the baboon genus, *Papio*. Like the man-

Drill (*Mandrillus leucophaeus*)
J. Kohler—Bavaria-Verlag

drill, the drill is a stout-bodied, quadrupedal monkey with vividly coloured buttocks. It is, however, smaller (the male is about 82 centimetres [32 inches] long) and has a black face. The lower lip is crimson; the hairs around the face and a tuft behind the ears are yellowish white; and the rest of the fur is olive-brown. The drill is also like the mandrill in being diurnal, omnivorous, mainly terrestrial, and, apparently, gregarious. A powerful animal, it can fight ferociously if molested.

drill, preparation of soldiers for performance of their duties in peace and war through the practice and rehearsal of prescribed movements. In a practical sense, drill consolidates soldiers into battle formations and familiarizes them with their weapons. Psychologically, it develops a sense of teamwork, discipline, and self-control; it promotes automatic performance of duties under disturbing circumstances and instinctive response to the control and stimulus of leaders.

Modern drill is essentially of two types: close-order and extended-order, or combat drill. Close-order drill comprises the formal movements and formations used in marching, parades, and ceremonies. Combat drill trains a small unit in the looser, extended formations and movements of battle.

Rudimentary drill appeared in ancient Egypt with the dawn of formal warfare because of the need to assemble and move large numbers of men for battle. Drill in the modern sense was introduced by the Greeks, who periodically practiced the maneuvers of the phalanx; the Spartans carried disciplined drill to an extreme unequalled by their contemporaries. Philip II of Macedonia and Alexander III the Great further improved the phalanx and its drill. The careful training of the legions contributed largely to Roman domination of the Mediterranean world for almost a thousand years. After Rome's decline, military drill almost disappeared as warfare degenerated into undisciplined melees and individual dueling. Two notable exceptions were the well-trained professional armies of Byzantium and the disciplined cavalry formations of Genghis Khan and his successors.

Gustavus II Adolphus of Sweden accelerated a gradual revival of skill in European warfare early in the 17th century. His introduction of simplified drill techniques for the use of improved weapons was copied by all Europe. By the end of the 17th century, France led in the development of modern standing armies, largely because of a drill system devised by Louis XIV's inspector general of infantry, Jean Martini, whose name became a synonym for drillmaster. To make effective use of inaccurate muskets, concentrated volleys had to be delivered at short range. Troops advanced in rigidly maintained battle lines, all firing simultaneously on command. Through ceaseless drill, the Prussian Army of Frederick II the Great achieved a mechanical perfection in these tactics. At Valley Forge during the American Revolution, Baron von Steuben, a German officer who helped train American troops, adapted Prussian techniques into a less rigid drill system fitted to the American character and to conditions of warfare in the New World.

Exact parade ground maneuvers on the battlefield disappeared in the 19th century because of improvements in the range and accuracy of weapons. This trend began during the American Civil War, when soldiers had to be trained to spread out, take cover, and dig entrenchments. It was hastened later by the introduction of the machine gun and quick-firing artillery. Close-order drill, however, was retained not only because it had value for ceremonies and for moving large bodies of men on foot but also because it provided a psychological foundation of teamwork and discipline without which combat drill is impossible.

drill, cylindrical end-cutting tool used to originate or enlarge circular holes in solid material.

Usually, drills are rotated by a drilling machine and fed into stationary work, but on other types of machines a stationary drill may be fed into rotating work or drill and work may rotate in opposite directions. To form the two cutting edges and to permit the admission of a coolant and the ejection of chips, two longitudinal or helical grooves or flutes

Parts of a twist drill

are provided. The point, or tip, of a drill is usually conical in shape, and it has cutting edges where the flutes end. The angle formed by the tapering sides of the point determines how large a chip is taken off with each rotation of the drill. The degree of twist of the helical flutes also affects the drill's cutting and chip-removal properties. For general-purpose twist drills the helix angle is about 32°. The angle formed by the two sides of the tapering point is 118° for standard drills, while for drilling tough metals, a flatter point with a 135° angle is recommended. The peripheral portion of the drill body not cut away by the flutes is called the land, and to reduce friction and prevent the land from rubbing against the sides of the hole, most of the land is cut away, leaving a narrow ridge called the margin that follows the edge of the side of the flute that forms the cutting edge. The fluted part, or body, of a drill is either hardened high-carbon steel or high-speed steel; other drills have inserts of cemented carbide to form cutting edges or are made from sintered-carbide rods. The shanks of twist drills are either straight or tapered and when not integral with the body are made from low-carbon steel and welded to the body. Straight-shank drills must be gripped in a chuck; tapered shanks fit with a sticking taper in matching holes in the machine and are driven partly by the taper and partly by a tang that fits in a slot in the machine. For enlarging cored, punched, or drilled holes, core drills are particularly suited. These have three or four flutes, and because the cutting edges do not extend to the centre of the drill, they cannot originate holes in solid materials. Cutting is accomplished by a chamfered edge at the end of each flute. *See also* auger.

drill press, also called DRILLING MACHINE, device for producing holes in hard substances. The drill is held in a rotating spindle and is fed into the workpiece, which is usually clamped in a vise resting on a table. The drill may be gripped in a chuck with three jaws that move radially in unison, or it may have a tapered shank that fits into a tapered hole in the spindle. Means are always provided for varying the spindle speed and on some machines for automatically feeding the drill into the workpiece.

Drill presses for occasional use in general-purpose machine shops usually have only one spindle. For drilling several holes successively or simultaneously in a workpiece, machines with multiple spindles are available. When large quantities of identical mechanical components are required, special-purpose drilling machines, with spindles arranged in a variety of positions relative to the workpiece, can be constructed. Although drill presses are used

mainly for drilling holes, they can also be used for enlarging holes with a boring tool or finishing holes with a reamer. With the aid of a special tapping attachment and a tap, they can produce threads in a hole. *See also* boring machine.

drilling machinery, equipment used to drill holes in the ground for such activities as prospecting, well sinking (petroleum, natural gas, water, and salt), and scientific explorations. Drilling holes in rock to receive blasting charges is an operation in tunneling, mining, and other excavating.

Most modern drilling machines are either percussive (chipping rock or ground intermittently by impact) or rotary (involving a cutting or grinding action). A combined rotary-percussive drill uses both types of action when the hardness of the stratum warrants it.

The simplest rotary drill is the earth auger, which is hand-operated and resembles the wood auger used in carpentry. The earth auger, used principally for drilling holes in relatively soft earth, is armed with either a spiral drill or a pod-type drill and is attached to a shaft by a socket joint. Successive sections are added to the shaft as the hole deepens.

Rotary drilling may be adapted for use at any angle and is suitable for underground mining. In most rotary drilling, hollow rods of steel provide circulation of cooling water or other fluid. There are three kinds of rotary drill bits: (1) drag bits, which cut the rock with two, three, or four wings, sometimes tipped with tungsten carbide, and are used mostly in soft rock; (2) roller bits, which operate with a crushing action by means of wedge-shaped teeth and are used for harder rock; (3) diamond bits, which grind away the rock. The coring-type diamond bit makes an annular hole, the core of which provides a sample cross section of the strata penetrated, and is used for prospecting.

Percussive drilling is slower than rotary drilling but has a number of special applications, such as for shallow holes. In percussive drilling, blows are applied successively to a tool attached to rods or a cable, and the tool is rotated so that a new portion of the face is attacked at each blow.

Another simple percussive drill consists of one or more lengths of wrought-iron pipe open at both ends, driven by a heavy hammer or, for larger holes, a light pile driver. A second cylinder is sunk inside the first, and water is pumped down the inner pipe to loosen soil and raise debris. For deep boring, rotary drilling has replaced these methods.

Long after the rock drill was invented, manual drilling by two men was still usual in mining operations. One man turned the drill, while the second swung the hammer. Most advances in drilling machinery have been developed by tunnelers. The driving of two particular tunnels, the Mont Cenis (Fréjus) tunnel, between France and Italy, and the Hoosac tunnel, in Massachusetts, U.S.—both driven during the 1850s and '60s—produced a great number of innovations in rock-drilling equipment, most notably the compressed-air drill.

The first patented rock drill was invented in 1849 by J.J. Couch of Philadelphia. Its drill rod passed through a hollow piston and was thrown like a lance against the rock; caught on the rebound by a gripper, it was again hurled forward by the stroke of the piston. A notable development was a hammering-type rock drill for overhead drilling devised by C.H. Shaw, a Denver machinist, before 1890. Cuttings dropped out by gravity. This machine was called a stoper when it was used in Colorado and California mines. A pneumatic feed held the machine in place and fed the steel into

the rock. These two developments, hammering action and air-leg feed, became important in modern machines. The problem of removing the cuttings from horizontal drill holes was eventually solved by the invention of the hollow drill with an air channel for blowing compressed air into the bottom of the hole.

Modern rock drills are commonly mounted on large rigs to bore many holes at one time; the Mont Blanc Tunnel between France and Italy (1960s) was the first tunnel the entire diameter of which was drilled and blasted in a single operation. At the opposite end of the scale, lightweight pneumatic rock drills have also found wide favour in mining and certain tunneling operations. The chief prototype is that designed by Eric Ryd of Sweden, employing a tungsten carbide bit.

drilling mud, mixture of clay, usually bentonite, and water used primarily in oil, gas, and water-drilling operations to carry rock cuttings to the surface and also to lubricate and cool the drilling bit. Special chemicals are added to the mud to compensate for the varying composition of the water and the formation being drilled and to increase the weight of the column. The drilling mud, by hydrostatic pressure, also helps prevent the collapse of unstable strata into the hole and the intrusion of water from water-bearing strata that may be encountered.

Drina River, river in the central Balkans, southeastern Europe, originating with the confluence of the Tara and Piva rivers and following a northerly course 215 mi (346 km) to enter the Sava. Its upper course is through canyons and gorges, while its lower course is wider. The Drina constitutes a large part of the boundary that separates Bosnia and Herzegovina from Serbia and Montenegro. Two large man-made lakes, at Bajina Bašta and Zvornik, supply the power for hydroelectric stations. The Drina Basin, taking in 7,556 sq mi (19,570 sq km), has considerable hydroelectric potential. The upper Drina and tributaries are noted for freshwater fishing. Major cities are Višegrad and Zvornik, site of a hydroelectric plant; the former is the locale of the historical novel *Na Drini ćuprija* (1945; *The Bridge on the Drina*, 1959) by the Serbo-Croatian writer Ivo Andrić, winner of the Nobel Prize for Literature in 1961.

drinking horn, ceremonial vessel usually made from the horn of an ox or a buffalo or

Silver drinking horn of the Guild of St. George, 1566; in the Rijksmuseum, Amsterdam
By courtesy of the Rijksmuseum, Amsterdam

the tusk of an elephant, with mounts of metal. The earliest drinking horns date from around the early 7th century. The drinking horn was largely replaced by other, more suitable vessels in the 16th century, but isolated examples were made later.

drinking song, song on a convivial theme composed usually for singing in accompaniment to drinking. The form became a standard element in certain types of 19th-century opera and operetta, frequently involving not only a soloist but also a chorus joining in with choral repeats or refrains. In Italy the drinking song is known as *brindisi* (Italian: "toast"). In Giuseppe Verdi's operas drinking songs range from the cheerful "Libiamo" ("Let Us Drink") in *La traviata* (1853), to Iago's foreboding toast in *Otello* (1887).

As a result of the European example of Johann Strauss, Jr., and other composers of light opera and operetta, the drinking song became a staple item in American musical plays to the point where in the 1920s John Philip Sousa testified before the United States Congress against prohibition on the grounds that it adversely affected the American musical theatre because it deprived the drinking song of its traditional social motivation.

Georgian age of the 1910s and 1920s. He was a successful promoter of repertory theatre in England and the author of popular chronicle dramas. In 1907 he became manager and producer for the Pilgrim Players, which developed into the Birmingham Repertory Theatre Company. He published several volumes of verse (including *The Collected Poems*, 2 vol., 1923); critical studies (*William Morris*, 1912; *Swinburne*, 1913; and others); and several historical plays, of which *Abraham Lincoln* (1918) was produced with great success both in London and in the U.S. His autobiography appeared in *Inheritance*, 2 vol. (1931) and *Discovery* (1932).

dripstone (architecture): see hoodmold.

drive, in psychology, an urgent basic need pressing for satisfaction, usually rooted in some physiological tension, deficiency, or imbalance (e.g., hunger and thirst) and impelling the organism to action. Some researchers have used the term need synonymously, although others distinguish between need as the deprived state and drive as its psychological manifestations (e.g., tension and restless or goal-directed activity). Psychologists also distinguish between drives that are innate and directly related to basic physiological needs (e.g., food, air, and water) and drives that are learned (e.g., drug addiction). Among the other drives or needs that have been proposed are achievement, activity, affection, affiliation, curiosity, elimination, exploration, manipulation, maternity, pain avoidance, sex, and sleep.

In the 1940s U.S. psychologist Clark Hull proposed a drive-reduction theory of learning. In its simplest form, the theory claimed that no learning occurred unless a drive produced tension and impelled the organism into activity to procure a reward that would reduce the drive and satisfy its related physiological need. Later research suggests, however, that learning may also occur in the absence of any drive. See also motivation.

driver ant, African member of the insect subfamily Dorylinae (family Formicidae; order Hymenoptera) characterized by a nomadic existence alternating with quiet, egg-laying periods. These ferocious ant colonies, when in the nomadic stage, move to a new spot each day.

Using their powerful cutting jaws, driver ants attack everything in their path, including snakes, birds, mammals, and even human beings. Their systematic search for prey involves climbing into trees and shrubs. The African driver ant is similar to the New World army ant (*Eciton*). See ant.

driving and coaching, art or sport of controlling and directing draft animals from a coach or other conveyance to which they are harnessed. The animal most commonly employed is the horse, but the mule, ass, ox, reindeer, and dog have been, and still are, used in some areas of the world.

Only at the end of the 18th century did the construction of better roads and the invention of springs for carriages make driving at all pleasurable. By the beginning of the 19th century the art of coachbuilding had reached a high degree of perfection, and driving as a pastime became fashionable. Even up to World War I there were stagecoaches running in and out of London. On July 13, 1888, J. Selby performed the celebrated feat of driving the "Old Times" coach from London to Brighton and back in 7 hours 50 minutes, averaging 13.79 miles per hour (with 8 teams and 14 changes). A number of driving clubs existed in England in the 19th century: the Benson Driving club from 1807 to 1854; the Richmond club from 1838 to 1845; and the Four-in-Hand Driving Club from 1850 to 1926. The Coaching Club was founded in 1870 and survives; in 1958 the British Driving Society was formed to encourage people who wish to drive horses for pleasure. In the United States, the Coaching Club, founded in 1875, held its last extended drive in 1916 but continued in existence, establishing the Coaching Club American Oaks, an annual stake race for three-year-old fillies, at Belmont Park, first held in 1917. Driving and coaching exhibitions are included in many horse shows such as the Richmond Royal and Royal International horse shows in England, and in some of the larger U.S. shows.

The number of horses driven is usually one, two, or four. When two horses are used they may either be placed side by side in double harness, or, less commonly, one following the other in a tandem. Four horses, or a four-in-hand, are harnessed in two pairs, one following the other, and called, respectively, the leaders and the wheelers. Three horses, two wheelers and a single leader, are known as a unicorn team. In Russia and Hungary three horses are driven abreast, the centre horse trotting and the outside horses galloping; such a team is known as a troika.

driving wagon: see bike wagon.

drizzle, very small, numerous water drops that may appear to float while being carried by air currents; drizzle drops generally have diameters between about 0.2 and 0.5 millimetre (0.008 and 0.02 inch). Smaller ones are usually cloud or fog droplets, while larger drops are called raindrops. Drizzle often is accompanied by fog but differs from it because drizzle drops fall to the ground. Drizzle commonly falls from stratus clouds. See also rain.

Drobeta-Turnu Severin, city, capital of Mehedinți *județ* (county), southwestern Romania. It is an important inland port on the Danube near the point where the river leaves the Iron Gate gorge.

The original settlement was mentioned by the 2nd-century Greek geographer Ptolemy of Alexandria as Drobeta, a Dacian town made into a castrum (fortified place) by the Romans. The name Turnu Severin, meaning "Tower of Severus," came from a tower built to commemorate a victory by the 2nd- and 3rd-century emperor Septimius Severus. The vestigial piers of the Roman bridge—built across the Danube for Emperor Trajan by Apollodoros of Damasus in the 2nd century—can be seen at low water. The Iron Gates Museum contains a model of the bridge. Other architectural ruins are those of the castrum built to guard the bridge, the baths and palaestra, and the remains of a 13th-century church and citadel. The town lapsed until 1833, when the inhabitants of nearby Cerneți were permitted to evacuate their village, which had been burned by the Turks in 1828, and move to Turnu Severin. The city was joined with Drobeta in the 1970s.

After World War II the city grew rapidly. A small prewar shipyard was expanded and merged with the railway shops to form the Mechanical Works for Naval Engineering and Railway Wagons. Meat- and food-processing factories and timber mills were constructed. The city is also the centre for tourist excursions to the Iron Gate and Cazane gorges. Pop. (1997 est.) 117,882.

Droeshout, Martin (b. c. April 1601, London, Eng.—d. c. 1650), English engraver, primarily remembered for his engraved portrait of William Shakespeare, which appeared in the First Folio edition of Shakespeare's plays (1623).

Droeshout was probably the pupil of his father, Michael, and of his elder brother John, both engravers. The Shakespeare engraving was eulogized by Ben Jonson and called true to life. Since the engraver was only 15 years old at the time of Shakespeare's death, the portrait was probably not done from life. In addition to portraiture, Droeshout engraved allegorical, mythological, and satiric subjects.

Drogheda, Irish DROICHEAD ÁTHA ("Bridge of the Ford"), urban district and seaport on the southern border of County Louth, Ireland. Drogheda lies along the River Boyne about 4 miles (6.5 km) from its mouth. Drogheda was a stronghold and trading post of the Norsemen in the 8th–11th century and of the Anglo-Normans in the 12th century. Two towns grew up, one on either side of the river; they received separate incorporation in 1228 but were combined by charter in 1412. In the reign of Edward III it was a staple town (by royal fiat, a trade and export centre), and several medieval parliaments met there. In 1649 it fell to Oliver Cromwell, and its inhabitants were massacred. It ceased to be a parliamentary borough in 1885 and a county of itself in 1898.

The remains of the ancient fortifications comprise the St. Lawrence Gate and the West Gate. Other remains are the tower of a Dominican friary (founded 1224) and the arch of an Augustinian abbey (founded 1206). In St. Peter's Church, a shrine contains the embalmed head of the archbishop of Armagh, St. Oliver Plunket, who was martyred in London in 1681. The district's industry includes linen and cotton mills, coach-building works, flour mills and sawmills, a brewery, a large cement works, and the manufacture of pipes, fats, soaps, medical equipment, and agricultural machinery.

Drogheda is the centre for salmon fishing on the River Boyne, and agricultural produce and coal are traded by sea. Pop. (1991 prelim.) 23,845.

Drogo DE HAUTEVILLE, Italian DROGO, or DROGONE, D'ALTAVILLA, French DREU DE HAUTEVILLE (b. Hauteville-la-Guichard, Normandy [France]—d. Aug. 10, 1051, Monte Ilario, Salerno [Italy]), Norman count of Apulia (1046–51), half brother of the conqueror Robert Guiscard. He led the Norman conquest of southern Italy after the death of his older brother William Iron Arm, whom he succeeded as count of Apulia.

Arriving in Italy about 1035 with William and his younger brother Humphrey, Drogo fought first for the Byzantines against the Muslims in Sicily, then in alliance with the Lombards in Apulia against the Byzantines. In 1042 the Lombard prince Gaimar V of Salerno made William count of Apulia and distributed the territories of Apulia among the Normans, giving Venosa, 80 miles (130 km) east of Naples, to Drogo. When William died in 1046, Drogo succeeded him as count of Apulia, marrying Gaimar's daughter. Drogo's title was confirmed four years later by the Holy Roman emperor Henry III. Drogo was assassinated, along with several of his followers, in an anti-Norman conspiracy as he entered the chapel of his castle at Monte Ilario to attend a mass on St. Lawrence's Day, 1051.

Drohobych, Russian DROGOBYCH, city, Lviv oblast (province), western Ukraine, and until 1959 the administrative centre of its own oblast. It was known in the 11th and 12th centuries for its salt. It is now a mining centre for petroleum, natural gas, potassium, and magnesium, and there are oil-refining, machine-building, and diverse light industries. Drohobych has a teacher-training institute. Pop. (1998 est.) 80,400.

Droichead Átha (Ireland): see Drogheda.

Droichead na Bandan (Ireland): see Bandon.

Droichead na Banna (Northern Ireland): see Banbridge.

Droim Mór (Northern Ireland): see Dromore.

droit du seigneur: see seigneur, droit du.

Droitwich, town (parish), Wychavon district, administrative and historic county of Worcestershire, England. The older portion of the town lies along the River Salwarpe, a tributary of the River Severn; the modern town lies on higher ground.

Droitwich is famous for the salt obtained from its brine springs, or wycles, to which it probably owes its name and pre-Norman origin. In medieval times the springs belonged to the kings; the town's first royal charter (1215) was granted in return for a yearly rental of £100 for the springs. The health resort became more important than salt manufacturing in 1830, when the brine was used to treat rheumatic diseases. The salt industry finally left in 1922. In addition to the St. Andrew's Brine Baths with their clinics, there are hospitals and convalescent homes.

Droitwich's light industries produce heating appliances, metal and plastic goods, and food products. Pop. (1991) 20,966.

droll, in full DROLL-HUMOUR, or DROLLERY, short comic scene or farce adapted from an existing play or created by actors, performed in England during the period of the Civil Wars and the Commonwealth (1642–60) while the London theatres were closed down by the Puritans. Because stage plays were prohibited at this time, actors developed other, shorter means of entertainment to circumvent the restrictions, performing drolls in inns and at fairs on improvised stages.

Robert Cox was the leading performer of drolls, and his repertoire included "The Merry Conceits of Bottom the Weaver" from *A Midsummer Night's Dream* and "The Bouncing Knight, or The Robbers Rob'd" from *Henry*

IV, Part I. Other subjects of drolls were Falstaff, the grave-diggers' scene in *Hamlet*, and, occasionally, biblical adaptations. Francis Kirkman published a collection of 26 drolls in 1662 titled *The Wits; or, Sport upon Sport*.

dromaeosaur, any member of a family (Dromaeosauridae) of theropod dinosaurs that flourished in Asia and North America during the Cretaceous Period (from 144 to 66.4 million years ago). The special bodily features that characterized the dromaeosaurs have led to their being grouped in their own infraorder, the Deinonychosauria, meaning "terrible-clawed lizards."

Dromaeosaurs were medium-sized, lightly built, agile, fast-running carnivores that were among the most effective predators of their time. They were bipedal, and the second toe of each foot was extremely flexible and bore a specialized killing claw, or talon; those of *Deinonychus* measured 13 cm (5 inches) in length. Dromaeosaurs had large heads equipped with many sharp, slashing teeth, and their long arms ended in long, three-clawed hands that were useful for grasping. Their tails were also unusually long and could be held rigid with the help of bundles of slim bony rods growing out of the tail vertebrae.

Dromaeosaurs' hunting technique appears to have involved running down their prey (probably small- to medium-sized herbivores) and grasping it with the front claws while delivering slashing kicks with the killing talon on one of the hind legs. Dromaeosaurs may have held this pose on one foot by using the rigidly outstretched tail as a counterbalance, or they may have attacked using both feet, in a single leaping action. Their relatively large brains enabled them to carry out these complex movements with a degree of coordination unusual among reptiles.

The largest species of dromaeosaur, *Deinonychus*, averaged 3 m (10 feet) in length, stood about 1.8 m tall, and weighed up to 70 kg (150 pounds). *Dromaeosaurus* and *Velociraptor* were smaller species reaching a length of 1.8 m.

Drôme, *département*, Rhône-Alpes *région*, southeastern France, formerly part of the historic provinces of Dauphiné and Provence (*qq.v.*). It is bordered on the west for more than 70 miles (111 km) by the Rhône River, on which Valence (*q.v.*), its capital, is situated. Drôme has an area of 2,521 square miles (6,530 square km). The Drôme and Isère rivers and other tributaries of the Rhône flow through the *département*. The eastern part of the *département* is mountainous and well wooded and contains the farthest outliers of the Pre-Alps of Vercors (bordered by an abrupt ridge of limestone), Diois, and Baronnies. In the west, plains extend to the Rhône River's sheltered valley. France's main motorway, the Autoroute of the South, passes through Drôme along the east bank of the Rhône.

The *département's* lowlands have sunny, warm summers despite the winds of the mistral (a cold seasonal wind blowing from the north), and there is cultivation of grains and of fruits. The raising of silkworms and the spinning of silk, once major industries, ceased about the beginning of the 20th century because of competition with Chinese and Italian suppliers. Nevertheless, natural silk is still imported for weaving, both alone and with synthetic fibres, in some of the small cities of the *département*. Good wines (Côtes-du-Rhône, Hermitage) are produced in the region's vineyards, and Montélimar is famous for its nougat. France's most important nuclear-generating station is situated in Pierrelatte in the Rhône valley south of Montélimar. Drôme is noted for its picturesque towns and villages including Grignan, Dieulefit, and La Garde-

Adhémar. In Nyons a 14th-century bridge crosses the Aigues. The *département* has three *arrondissements*—Valence, Die, and Nyons—and is in the educational division of Grenoble. Pop. (1999) 437,817.

Dromore, Irish DROIM MÓR, town, Banbridge district (established 1973), formerly in County Down, Northern Ireland, on the River Lagan, just southwest of Belfast. A bishopric developed from an abbey reputedly founded there by a St. Colman about 600. The town and cathedral were destroyed in an insurrection (1641). The present structure was built by the Anglican bishop Jeremy Taylor in 1661. The town's chief industries are bleaching, cloth dyeing, and hemstitching. The 8th- or 9th-century Cross of Dromore, formerly in the marketplace, was restored and reerected beside the Lagan Bridge in 1887. Pop. (1991) 3,434.

drone, French BOURDON, in music, a sustained tone, usually rather low in pitch, providing a sonorous foundation for a melody or melodies performed at a higher pitch level; also an instrumental string or pipe producing such a sustained sonority—*e.g.*, the drone strings of a hurdy-gurdy or the three drone pipes of a bagpipe. A drone may be continuous or intermittent, and an interval, as a rule the fifth, frequently replaces the single-pitch drone.

Use of drone instruments was popular in antiquity. Drones occur widely both in vocal and in instrumental folk music, particularly European. Balkan singers frequently sustain a drone against a sung melody. Various instruments have drones built into them, contributing to the characteristic sound of the instrument—*e.g.*, the launeddas, a Sardinian triple clarinet; the Appalachian dulcimer; the five-string banjo; and the vielle, the medieval troubadours' fiddle. Twentieth-century folk fiddlers often bow open strings to drone beneath the melody played on a neighbouring string. In the art music of India, the drone played on the tamboura sounds the two predominant notes of the raga (the melodic pattern developed by the soloist), producing a framework in which the raga is heard.

A pedal point (*q.v.*) is a drone that was used in European harmony of the 17th to the 19th century. French music favoured the bourdon as early as the Notre-Dame organa of the 12th and early 13th centuries. In the France of Louis XIV and his immediate successors, a nobility alienated from manual labour and the soil fancied itself closer to nature as it practiced the quasi-rural musette, a bagpipe made of velvet and ivory; the composers François Couperin and Jean-Philippe Rameau, among others, wrote a number of drone pieces for the harpsichord.

As for the organ, bourdon stops sounding an octave below the notated pitch soon became standard for the pedal board. Thus, the term bourdon is sometimes used to denote the kind of pedal point that, in the context of 18th- and 19th-century functional harmony, seemed particularly suited to harnessing polyphonic energies, especially as generated in the fugues of J.S. Bach.

drongo, any of 20 species of Old World woodland birds constituting the family Dicruridae (order Passeriformes). Drongos frequently attack much larger birds (*e.g.*, hawks and crows) that might hurt their eggs or young; innocuous birds (such as doves and orioles) nest near drongos to gain protection.

Most drongos are 18 to 63.5 cm (7 to 25 inches) long and glossy black, sometimes with white on the head or underparts (sexes alike); the eyes, in most, are fiery red. Some are crested or have head plumes, and the tail is

African drongo (*Dicrurus adsimilis*)
A.J. Deane

usually long and forked, with out-turned corners. The tail of the Southeast Asian racket-tailed drongo (*Dicrurus paradiseus*) bears 30-centimetre (12-inch) "wires"—outer feathers that are unbranched for most of their length and carry rather large vanes at the ends.

Drongos range from Africa to Central Asia, Australia, and western Pacific islands, inhabiting forests, open country, and gardens. They feed like flycatchers or shrikes, taking large insects and termites. Their voices are loud mixtures of harsh and sweet sounds; some species, like the racket-tail, are good mimics. The nest is a flimsy basket that seems too small for the brooding bird.

One of the most common birds of southern Asia is the 33-centimetre black drongo (*D. macrocerus*), also called king crow because it can intimidate the true crow. The 24-centimetre African drongo (*D. adsimilis*; perhaps the same as *D. macrocerus*) is common throughout sub-Saharan Africa.

drop cut, method of faceting gemstones into a pear shape suitable for pendants, earrings, and other jewelry. A pendeloque is a pear-shaped modification of the round brilliant cut used for diamonds. A briolette is an elongated, pear-shaped stone covered with bands of triangular or rectangular facets, usually with a pointed end and without a girdle.

drop-leaf table, table with one or two hinged leaves supported by hinged legs, arms, or brackets. An early 17th-century form is the gateleg table, which was followed by two later English forms—the Pembroke table and its more elongated version, the sofa table, which dates from about the 1790s. The sofa table could be drawn up to a sofa and was long enough for two people to sit at, side by side. It had a flap at either end, each supported

Mahogany drop-leaf dining table, New York, third quarter of the 18th century, in the Albany Institute of History and Art, Albany, N.Y.

By courtesy of the Albany Institute of History and Art, Albany, N.Y.

on a hinged bracket. The top rested on a pair of decorative trestles, or braced frames, composed, for example, of two uprights on a horizontal support, terminating in a pair of outward-curving feet.

Regency sofa tables were often supported on a single centre pedestal resting on a platform that had four outward-curving feet terminating in brass lions' paws. The butterfly table is a late 17th-century American type whose name derives from its shape when fully extended. The simplest form of drop-leaf table is the bracket table, a small side table fixed to the wall and supported by a bracket.

Droseraceae, family of perennial and sometimes annual flowering plants commonly known as sundews (*see* sundew family), within the order Nepentales. The leaves are usually in a basal rosette, and both leaf surfaces are generally covered with sticky gland-tipped hairs and sensitive tentacles that entrap insects. About 100 species, worldwide in distribution, are known.

Drosophila, genus of flies commonly known as vinegar flies but also misleadingly called fruit flies. *See* vinegar fly.

Drost, Aernout (b. March 15, 1810, Amsterdam, Kingdom of Holland [now in The Netherlands]—d. Nov. 5, 1834, Amsterdam), Dutch writer whose historical novels were the first important works of the 19th-century Romantic movement in The Netherlands. His passion for history influenced many of his contemporaries and successors.

Drost's first novel, *Hermingard van de Eikenterpen* (1832), portraying the conversion of a Germanic woman to Christianity in 4th-century Holland, gave him scope for the development of his Romantic ideals and religious concepts. Drost's career was short; he died at the age of 24. Of his other main works, published posthumously under the title *Schetsen en verhalen* (1835–36; "Sketches and Stories"), the most important is *De pestilentie te Katwijk* ("The Plague at Katwijk"), in which the influence of the Baroque masters Joost van den Vondel and Pieter Corneliszoon Hooft is evident. The dialogue is full of 17th-century expressions, and the story as a whole shows Drost's intense admiration of his country's "great forefathers." Drost's founding of the journal *De muzen* (1832; "The Muses"), precursor of *De nieuwe gids* ("The New Guide"), was a significant step toward the later Dutch literary revival.

Droste-Hülshoff, Annette, Baroness (Freiin) von, original name ANNA ELISABETH FRANZISKA ADOLPHINE WILHELMINE LOUISE MARIA, FREIIN VON DROSTE ZU HÜLSHOFF (b. Jan. 10, 1797, Schloss Hülshoff, near Münster, Westphalia [Germany]—d. May 25, 1848, Meersburg, Baden), one of the great women poets of Germany, author of prose tales that are considered the forerunner of the 19th-century realistic short story.

Born into a family of Roman Catholic aristocracy, she was educated by tutors and lived most of her life in isolation. She owed her introduction to literature to a young novelist, Levin Schücking (1814–83), for whom, despite their difference in age, she developed a deep, suppressed, and unreciprocated passion. Her first collection of poetry, *Gedichte* (1838; "Poems"), included poems of a deeply religious nature. Between 1829 and 1839 she wrote a cycle of religious poems, *Das geistliche Jahr* (1851; "The Spiritual Year"), which contains some of the most earnest religious poetry of the 19th century and reflects the inner turbulence and doubt of her spiritual life.

Her fame rests chiefly on her poetry dealing with her native Westphalian landscape. An extremely sensitive and acute observer, she created detailed and evocative descriptions of extraordinary poetic beauty, capturing the atmosphere of her homeland, particularly its gloomy heaths and moorlands. Her only complete prose work, a novella, *Die Judenbuche* (1842; *The Jew's Beech*), is a psychological study of a Westphalian villager who murders a Jew. For the first time in German literature,

the fate of the hero is portrayed as arising from his social environment; the crime becomes understandable within the context of the life in the village.

Drottningholm Theatre, Swedish, DROTTNINGHOLMSTEATER, 18th-century court theatre of the Royal Palace of Drottningholm, near Stockholm, Swed. It is preserved with its original sets and stage machinery as a theatrical museum. Built in the 1760s by the architect Carl Fredrik Adelcrantz, it was the home of several French and Swedish acting companies and prospered especially during the enlightened reign of the playwright-king Gustav III (reigned 1771–92). After the king's death it was used as a storeroom. This fortunate neglect resulted in its preservation. In

Interior view of the Drottningholm Theatre, built by Carl Fredrik Adelcrantz, 1766, depicted after its restoration in 1921

By courtesy of the Drottningholms Teatermuseum, Sweden

1921 it was cleaned and restored. Among the items preserved are Baroque scenery designed by Carlo Bibiena and Louis-Jean Desprez and some stage machinery in working condition, such as a device for simulating waves designed according to Nicola Sabbatini's theatre manual of 1638. The theatre is now used for operas in the summertime.

Drouais, Jean-Germain (b. Nov. 25, 1763, Paris, Fr.—d. Feb. 13, 1788, Rome, Papal States [Italy]), historical painter who was one of the leading early Neoclassicists in France.

Drouais's father, François-Hubert Drouais (1727–75), and his grandfather, Hubert Drouais (1699–1767), were well-known portrait painters. Jean studied first under his father, then under N.-G. Brenet, and finally under Jacques-Louis David, whom he accompanied to Rome. There he was influenced by ancient art and by Raphael. J.W. von Goethe, who was at Rome when Drouais's "Marius at Minturno" was finished, has recorded the deep impression made by the picture. The last picture he completed was "Philoctetes on the Island of Lemnos."

Drouet, Jean-Baptiste (b. 1763, Sainte-Menehould, Fr.—d. April 11, 1824, Mâcon), French revolutionary, chiefly remembered for his part in the arrest of Louis XVI at Varennes.

Drouet grew up and lived in the town of Sainte-Menehould in Champagne, where his father had been postmaster. There, the carriages conveying Louis XVI and his family on their flight to the frontier stopped at his door on the evening of June 21, 1791. The passengers were recognized by Drouet, who took steps which led to their arrest on reaching Varennes. For this service he declined a reward. In September 1792 he was elected deputy of the Convention. He voted the death

of the king without appeal, showed implacable hostility to the Girondins and proposed the slaughter of all English residents in France. He was captured by the Austrians at the siege of Maubeuge in Hainault (1793) and imprisoned at Spielberg in Austria until the close of 1795. He then became a member of the Council of Five Hundred and was named secretary. Drouet was implicated in the conspiracy of Babeuf (1796) and was imprisoned, but he escaped to Switzerland and then to Tenerife, the largest of the Canary Islands. There he took part in the resistance to Horatio Nelson's attempt on the island in 1797. He later visited India.

The first empire found in him a docile subprefect of Sainte-Menehould. After the second

Restoration he had to leave France (1816). Returning secretly, he settled at Mâcon under the name of Merger.

Drouet, Jean-Baptiste, COMTE (count) D'ERLON (b. July 29, 1765, Reims, Fr.—d. Jan. 25, 1844, Paris), French soldier whose long career raised him from the ranks of both Louis XVI's and Napoleon's armies to be the first governor-general of Algeria and a marshal of France under Louis-Philippe.

A volunteer in the regiment of Beaujolais from 1782, Drouet had reached the rank of corporal in 1792, before the fall of the monarchy. Elected captain in 1793, he became aide-de-camp to General P. Lefebvre in 1794 and thenceforward enjoyed rapid promotion. General of division in 1803, he was created count d'Erlon by Napoleon in January 1809. He served in Bavaria and Spain and was promoted lieutenant general in 1813. Under the first Restoration he was made commander of the 16th military division but conspired against the regime. Joining Napoleon during the Hundred Days in 1815, he was made a peer of France and given command of an army corps, but in the Waterloo campaign he spent June 16 between Ney at Quatre-Bras and Napoleon at Ligny and failed to support either as required.

On the second Restoration, Drouet fled to Bavaria, where, as Baron Schmidt, under King Maximilian I's protection, he set up a brewery near Munich. The death sentence passed on him in France in 1816, was, however, canceled in 1825. Returning to France in 1830, he was reinstated on the active list by the regime of Louis-Philippe.

In July 1834 Drouet was appointed governor-general of Algeria. Ignorant of the country, he at first let himself be guided by his chief-

of-staff, General C.A. Trézel, but on Trézel's being posted to Oran he fell under the influence of a scheming emissary of Abdelkadar ('Abd al-Qâdir). He disavowed Trézel after the latter's defeat by Abdelkadar at La Macta. Drouet was recalled to France in July 1835. After some years at Nantes, he was made marshal of France in April 1843.

drought, also spelled DROUTH, lack or insufficiency of rain for an extended period that causes a considerable hydrologic (water) imbalance and, consequently, water shortages, crop damage, streamflow reduction, and depletion of groundwater and soil moisture. It occurs when evaporation and transpiration (the movement of water in the soil through plants into the air) exceed precipitation for a considerable period. Drought is the most serious physical hazard to agriculture in nearly every part of the world. Efforts have been made to control it by seeding clouds to induce rainfall, but these experiments have had only limited success.

There are four basic kinds of drought:

1. Permanent drought characterizes the driest climates; the sparse vegetation is adapted to aridity, and agriculture is impossible without continuous irrigation.

2. Seasonal drought occurs in climates that have well-defined annual rainy and dry seasons; for successful agriculture, planting must be adjusted so that the crops develop during the rainy season.

3. Unpredictable drought involves an abnormal rainfall failure; it may occur almost anywhere but is most characteristic of humid and subhumid climates. Usually brief and irregular, it often affects only a relatively small area.

4. Invisible drought can also be recognized: in summer, when high temperatures induce high rates of evaporation and transpiration, even frequent showers may not supply enough water to restore the amount lost; the result is a borderline water deficiency that diminishes crop yields.

Drouyn de Lhuys, Edmond (b. Nov. 19, 1805, Paris, Fr.—d. March 1, 1881, Paris), French statesman and foreign minister under Napoleon III.

Drouyn de Lhuys was a brilliant student and entered the diplomatic service early. From 1833 to 1836 he distinguished himself as chargé d'affaires at The Hague. He went next to Madrid as first secretary in the embassy, where he became an indispensable agent of French diplomacy.

He ran for office in 1842 and was elected deputy, as he was in 1846 and 1849. When Louis-Napoléon Bonaparte became president, he made Drouyn de Lhuys foreign minister (1848) and then ambassador to London (1849). As ambassador, he averted a rupture with the British over the Don Pacifico affair. In 1851 he was again made foreign minister, but stepped down to become a senator (1852). Later that year Napoleon III once more appointed Drouyn de Lhuys foreign minister, and although he played a part in the conferences of Vienna (1854–55), his term as foreign minister was frustrating. Napoleon III would not accept his advice to form an alliance with Austria; he resigned in 1855. In 1862 Drouyn de Lhuys accepted for the fourth time the ministry of foreign affairs—a term filled with disappointments, owing more to external factors than to any bungling on his part. He tried in vain to reconcile the opposing demands for papal and secular states in Italy and tried without success to limit the growing power of Prussia. Napoleon III did not feel that Prussia was any menace, however, and in disagreement over the problem, Drouyn de Lhuys resigned in 1866. With the outbreak of the Franco-German War (1870), Drouyn de

Lhuys left for Jersey. He returned to France but from then on lived a strictly private life.

drowning, suffocation by immersion in a liquid, usually water. Water closing over the victim's mouth and nose cuts off the body's supply of oxygen. Deprived of oxygen the victim stops struggling, loses consciousness, and gives up the remaining tidal air in his lungs. The heart may continue to beat feebly for a brief interval, but eventually it ceases. Until recently, the oxygen deprivation that occurs with immersion in water was believed to lead to irreversible brain damage if it lasted beyond three to seven minutes. It is now known that victims immersed for an hour or longer may be totally salvageable, physically and intellectually, although they lack evidence of life, having no measurable vital signs—heartbeat, pulse, or breathing—at the time of rescue. A fuller appreciation of the body's physiological defenses against drowning has prompted modification of traditional therapies and intensification of resuscitative efforts, so that many people who once would have been given up for dead are being saved.

Although asphyxiation (lack of oxygen that causes unconsciousness) is common to all immersion incidents, actual aspiration of water into the lungs may or may not occur. Up to 15 percent of fatal drownings are "dry," presumably because the breath is held or because a reflex spasm of the larynx seals off the airway inlet at the throat. When aspiration does occur, the volume of fluid entering the lungs rarely exceeds a glassful; the lungs "fill with water" chiefly because of an abnormal accumulation of body fluids (pulmonary edema) that is a secondary complication of oxygen deprivation. Commonly, also, quantities of water are swallowed and later vomited spontaneously or during resuscitative procedures; vomiting after the protective laryngeal spasm has subsided can lead to aspiration of stomach contents.

A natural biological mechanism that is triggered by contact with extremely cold water, known as the mammalian diving reflex, enhances survival during submersion, thus permitting seagoing mammals to hunt for long periods underwater. Scientists have recently determined that vestiges of the reflex persist in humans. The mechanism is powerful in children. It diverts blood from the limbs, abdomen, and surface areas of the body to the heart and the brain. It also causes an interruption of respiratory efforts and reduces the rate of the heartbeat. Even though the heart functions at a slower rate, in other respects it performs normally; actual arrest of circulatory processes is a relatively late development in the drowning sequence. In this suspended state, intracranial blood retains sufficient oxygen to meet the brain's reduced metabolic needs, despite a total absence of respiratory gas exchange.

In warm water the body's need for oxygen is increased; therefore, the oxygen deprivation caused by immersion is rapidly lethal or permanently damaging to the brain. Such warm-water drownings occur commonly in domestic bathtubs.

Immersion in icy water causes body temperature and metabolism to fall rapidly (the thermal conductivity of water is 32 times greater than that of air). Immersion hypothermia—below normal body temperature—reduces cellular activity of tissues, slows the heart rate, and promotes unconsciousness. None of these effects is imminently life-threatening; survival following hypothermic coma is almost 75 percent.

Rescue teams now continue the benefits of cold-water protection with "therapeutic hypothermia." "Lifeless" immersion victims with

core temperatures as low as 62.6° F (17° C) have survived. See also lifesaving.

Droysen, Johann Gustav (b. July 6, 1808, Treptow, Pomerania [Germany]—d. June 19, 1884, Berlin), historian and politician, whose belief in Prussia's destiny to lead Germany influenced German unification, which he lived to see. Ironically, his ardent Prussian patriotism did not save him from falling into disfavor after the revolutionary events of 1848, because his other views were generally liberal and individualistic.

Droysen, engraving, 1884

By courtesy of the Staatsbibliothek, Berlin

Droysen's devotion to Prussia began in his boyhood, during the War of Liberation against Napoleonic rule. While professor of classical philology at Berlin (1835–40), he wrote on Alexander the Great and used the term Hellenism to describe the diffusion of Greek culture over the eastern Mediterranean and Middle East in the 4th–1st centuries BC.

After the revolution of 1848 Droysen became a member of the Frankfurt Parliament and secretary of its constitutional committee. After the Prussian king Frederick William IV refused the German imperial crown in 1849, Droysen, disappointed, retired from politics.

As professor of history at Kiel (1840–51), however, he collaborated in 1850 with Carl Samwer in writing a history of relations between Denmark and the duchies of Schleswig and Holstein from 1806, a work that affected the opinions of many Germans on the then-acute dispute with Denmark. He supported the rights of the duchies so prominently that in 1851, after Holstein passed to Denmark, he prudently left Kiel to teach at Jena, where he finished a biography (1851–52) of Graf Yorck von Wartenburg, Prussian general in the War of Liberation. He spent his remaining years on his great work, *Geschichte der preussischen Politik*, 14 vol. (1855–86; "History of Prussian Politics"). This history, unfinished at Droysen's death, ends at the year 1756.

Droz, Numa (b. Jan. 27, 1844, La Chaux-de-Fonds, Switz.—d. Dec. 15, 1899, Bern), prominent Swiss politician and twice federal president, who is best-remembered for his stand against the German chancellor Otto von Bismarck in the Wohlgenut affair (1889).

As director of the department of public instruction and religious affairs in the canton of Neuchâtel (1871–75), Droz composed a controversial ecclesiastical law (1873) that led to local religious schism. Elected in 1872 to the federal Ständerat (council of cantons), he entered the federal executive (Bundesrat) three years later and served twice as president of the confederation (1881, 1887). As head of the federal department of commerce and industry (1886), he authorized new factory and patent legislation; and from 1887 until 1892 he headed the federal political department, a position hitherto reserved for the confederation president. In the affair of August Wohlgenut, a German spy expelled by Switzerland, he firmly opposed Bismarck's threatened infringements of Swiss sovereignty and neutrality. He was named director of the International Bureau of Railways (1893).

Drucker, Peter F(erdinand) (b. Nov. 19, 1909, Vienna—d. Nov. 11, 2005, Claremont, Calif., U.S.), Austrian-born American management consultant, educator, and author, whose writings contributed to the philosophical and practical foundations of the modern business corporation. He was also a leader in management education and invented the concept known as management by objectives.

Drucker, who received a doctoral degree in law at the University of Frankfurt (1931), worked as a journalist in Germany but fled to England when Adolf Hitler rose to power in 1933. In 1938 he moved to the United States and in 1943 became a citizen. Drucker later taught at New York University (1950–71) and at Claremont Graduate University (1971–2005).

Through consulting Drucker wielded the greatest influence, starting with his 1943 invitation to analyze the organizational structure of the General Motors Corp. The resulting book, *Concept of the Corporation* (1946), offered the first complete assessment of a large corporation as a social institution. Drucker later served as a consultant to a number of corporations, organizations, and governments.

Some observers divide Drucker's numerous books and articles into four categories. His early works—such as *The End of Economic Man* (1939) and *The New Society* (1950)—discuss the nature of industrial society. A second line of books—including *The Practice of Management* (1954)—explains general ideas about modern business management. A third, later body of work—including *America's Next Twenty Years* (1957)—offers speculation on the future impact of such developments as technological change. Finally, there are writings that address questions of practical corporate management, notably *Managing in Turbulent Times* (1980) and *The Changing World of the Executive* (1982).

drug, any chemical agent that affects the functions of living things. Drugs are used in treating, diagnosing, and preventing disease.

A brief treatment of drugs follows. For full treatment, see MACROPAEDIA: Drugs and Drug Action.

Commonly used types of drugs include antibiotics, stimulants, tranquilizers, sedatives and hypnotics, antidepressants, analgesics, narcotics, anesthetics, hormones, and a variety of preparations for specific purposes, such as laxatives, heart stimulants, and antihistamines. Vaccines, which are preparations of killed or weakened bacteria or viruses used to stimulate resistance to subsequent infections, are sometimes also considered drugs. Vaccination has proved particularly effective in preventing viral diseases. While bacterial infections have largely succumbed to antibiotics and other drugs, viral diseases still remain largely impossible to treat with drugs because it is difficult to find chemical agents that can selectively destroy viral nucleic acids or enzymes without harming those of the infected cells.

Drugs employed in cancer therapy are among the more recent advances in drug research. Every drug that has been developed to kill cancer cells, however, also affects rapidly dividing normal cells. Because each drug exerts its effects at different phases of the cell cycle, complex regimens of anticancer drugs may be used to reduce the incidence of cellular resistance and side effects.

Drugs can be given by enteral or parenteral administration. Enteral administration involves the alimentary tract and includes such methods as oral and rectal administration. Parenteral methods encompass all other routes, including injection, inhalation, and percutaneous administration (absorption through the skin).

Drugs are able to affect the functioning of living things by interrupting the extensive chemical system of communications that reg-

ulates the integrated functioning of the cells of the organism. The effects of drugs mimic those of endogenous substances of the body, and thus they do not impart new activities to the cells. In order for a drug molecule of a certain molecular configuration to be effective, it must bind with a specific, complementary site that is often located on the membrane of the cell and that is called a receptor. The drug-receptor complex thus formed triggers certain biochemical changes within the cell to bring about specific biochemical effects.

Drugs that bind to receptors and actively bring about biochemical changes are called agonists. Drugs that compete with agonists (which can be other drugs or endogenous molecules) but do not in themselves bring about an effect are called antagonists. Regardless of whether a drug is an agonist or an antagonist, it will not exert its influence on target molecules or cells if the receptor configuration is not complementary.

The oldest existing catalogue of drugs (called pharmacopoeia) is a stone tablet from ancient Babylonia (c. 1700 BC). The development of modern pharmacology began in the 19th century, when chemicals with drug action were first isolated from plants containing them.

Drug research made another leap forward with the discovery of antibiotics in 1928. Most drugs today are products of chemical synthesis, but numerous drugs of plant, animal, mineral, and microbial origin are still important. Recently, genetic engineering has provided a new source of compounds that are too complex to synthesize economically.

drug abuse, the excessive, maladaptive, or addictive use of drugs for nonmedical purposes despite social, psychological, and physical problems that may arise from such use. Abused substances include such agents as anabolic steroids, which are used by some athletes to accelerate muscular development and increase strength and which can cause heart disease, liver damage, and other physical problems; and psychotropic agents, substances that affect the user's mental state and are used to produce changes in mood, feeling, and perception. The latter category, which has a much longer history of abuse, includes opium (and such derivatives as heroin), hallucinogens, barbiturates, cocaine, amphetamines, tranquilizers, the several forms of cannabis, and alcohol. *See also* steroid.

A brief treatment of drug abuse follows. For full treatment, *see* MACROPAEDIA: Alcohol and Drug Consumption.

The history of nonmedical drug consumption is ancient. The discovery of the mood-altering qualities of fermented fruits and substances such as opium has led to their use and, often, acceptance into society. Just as alcohol has a recognized social place in the West, so many other psychotropics have been accepted in different societies.

The major problem that arises from the consumption of psychotropic drugs is dependence, the compulsion to use the drug despite any deterioration in health, work, or social activities. Dependence varies from drug to drug in its extent and effect; it can be physical or psychological or both. Physical dependence becomes apparent only when the drug intake is decreased or stopped and an involuntary illness called withdrawal occurs. Drugs known to produce physical dependence are the opiates (*i.e.*, opium and its derivatives) and central-nervous-system depressants such as barbiturates and alcohol. Psychological dependence is indicated when the user relies on a drug to produce a feeling of well-being. This type of dependence varies widely with both substance and user. In its most intense form the user becomes obsessed with the drug and focuses virtually all his interest and activity on obtaining and using it.

Another related phenomenon is tolerance, a

gradual decrease in the effect of a certain dose as the drug is repeatedly taken; increasingly larger doses are needed to produce the desired effect. Tolerance does not always develop. The term addiction is often used synonymously with dependence but should probably be reserved for drugs known to cause physical dependence.

Other hazards of drug abuse include general risks, such as the danger of infection by the AIDS virus and other diseases that can be communicated by use of nonsterile needles or syringes when drugs are taken by injection. Some hazards are associated with the specific effects of the particular drug—paranoia with high doses of stimulants, for example. In addition, adverse social effects stemming from drug abuse are numerous.

Heroin, an opiate that is not used medically in the United States, is one of the drugs most associated with abuse and addiction. In general, opiates are called narcotics because they are used medically to relieve pain and produce sleep. Other opiates that have been abused are opium, morphine, pethidine, codeine, dipipanone, and methadone. Methadone is often used in substitution therapy as a less-addictive opiate that can be used to wean the user off heroin and eventually off opiates altogether.

Drugs that either depress or stimulate the central nervous system have long been used for nonmedical reasons. Depressants include all sedatives and hypnotics such as barbiturates and benzodiazepines (minor tranquilizers). These are usually taken by mouth but can be injected. The main stimulants are amphetamines or their derivatives and cocaine, a natural component of the leaves of the coca plant. Amphetamines can be taken by mouth or injected; cocaine is either injected or inhaled through the nose. One form of cocaine (free-base, or crack) is generally smoked.

Other drugs that are frequently abused include cannabis (marijuana, hashish, etc.), from the hemp plant *Cannabis sativa*), PCP, and such hallucinogens, or psychedelics, as LSD and mescaline.

The purchase, sale, and nonmedical consumption of all the aforementioned drugs are illegal, and these psychotropic drugs can be obtained only on the black market. However, this is not the only route to drug abuse. Alcohol, for instance, can be legally purchased throughout much of the world, despite its high potential for abuse. Also, dependence on prescribed drugs is not uncommon, especially with tranquilizers and hypnotics. What was once a serious social problem of dependence on prescribed barbiturates has been overtaken largely by the widespread use of benzodiazepine tranquilizers such as diazepam (Valium) and chlordiazepoxide (Librium). Millions of legal prescriptions for these drugs are issued every year.

Problems relating to drug abuse can also occur with substances not normally thought of as drugs, as in the case of glue sniffing. The inhalation of volatile solvents produces temporary euphoria but can lead to death by respiratory depression, asphyxiation, or other causes.

In the 1990s, use of so-called designer drugs (*q.v.*) such as ecstasy and GHB (gamma hydroxybutyrate), often consumed by young people at dances known as "raves," became a major component of youth subcultures.

drug allergy, hypersensitivity reaction to therapeutic agents that occasionally occurs on second exposure to a drug against which an individual has already produced antibodies. Some drugs rarely cause allergic reactions (*e.g.*, tetracyclines, digitalis), while others frequently provoke allergy (*e.g.*, penicillin). Symptoms vary with the drug and the sensitivity of the affected person but include, as separate reactions, hives (urticaria), serum sickness, and, rarely, anaphylaxis (collapse of

the circulatory system with accompanying respiratory symptoms). Several drugs can successfully counteract these allergic symptoms; after drug allergy has been established, lifelong avoidance of the offending drug, and often of its derivatives, must be observed.

drug poisoning: *see* medicinal poisoning.

Druid (Celtic: "Knowing [or Finding] the Oak Tree"), member of the learned class among the ancient Celts. They seem to have frequented oak forests and acted as priests, teachers, and judges. The earliest known records of the Druids come from the 3rd century BC.

According to Julius Caesar, who is the principal source of information about the Druids, there were two groups of men in Gaul that were held in honour, the Druids and the noblemen (equites). Caesar related that the Druids took charge of public and private sacrifices, and many young men went to them for instruction. They judged all public and private quarrels and decreed penalties. If anyone disobeyed their decree, he was barred from sacrifice, which was considered the gravest of punishments. One Druid was made the chief; upon his death, another was appointed. If, however, several were equal in merit, the Druids voted, although they sometimes resorted to armed violence. Once a year the Druids assembled at a sacred place in the territory of the Carnutes, which was believed to be the centre of all Gaul, and all legal disputes were there submitted to the judgment of the Druids.

Caesar also recorded that the Druids abstained from warfare and paid no tribute. Attracted by those privileges, many joined the order voluntarily or were sent by their families. They studied ancient verse, natural philosophy, astronomy, and the lore of the gods, some spending as much as 20 years in training. The Druids' principal doctrine was that the soul was immortal and passed at death from one person into another.

The Druids offered human sacrifices for those who were gravely sick or in danger of death in battle. Huge wickerwork images were filled with living men and then burned; although the Druids preferred to sacrifice criminals, they would choose innocent victims if necessary.

Caesar is the chief authority, but he may have received some of his facts from the Stoic philosopher Posidonius, whose account is often confirmed by early medieval Irish sagas. Caesar's description of the annual assembly of the Druids and their election of an arch-Druid is also confirmed by an Irish saga.

In the early period, Druidic rites were held in clearings in the forest. Sacred buildings were used only later under Roman influence. The Druids were suppressed in Gaul by the Romans under Tiberius (reigned AD 14–37) and probably in Britain a little later. In Ireland they lost their priestly functions after the coming of Christianity and survived as poets, historians, and judges (*filid*, *seanchaidi*, and *brithemain*). Many scholars believe that the Hindu Brahman in the East and the Celtic Druid in the West were lateral survivals of an ancient Indo-European priesthood.

drum, also called CROAKER, in biology, any of about 160 species of fishes of the family Sciaenidae (order Perciformes); drums are carnivorous, generally bottom-dwelling fishes. Most are marine, found along warm and tropical seashores. Comparatively few inhabit temperate or fresh waters. Most are noisemakers and can "vocalize" by moving strong muscles attached to the air bladder, which acts as a resonating chamber, amplifying the sounds.

Drums have two dorsal fins and are usually silvery in colour. The weakfishes, sea-

trouts, and squeteagues (*Cynoscion*) have large mouths, jutting lower jaws, and canine teeth, but most drums have underslung lower jaws and small teeth. Some have whiskerlike barbels on the chin. The largest member of the family, weighing up to 100 kg (225 pounds), is the totuava (*C. macdonaldi*) of the Gulf of California; other species are much smaller.

Many members of the family are food or game fishes. Among the better-known species are the channel bass, or red drum (*Sciaenops ocellatus*), a large, reddish species of the western Atlantic Ocean; the freshwater drum (*Aplodinotus grunniens*), a silvery, lake-and-river fish of the Americas; the kingfish, or whiting (*Menticirrhus saxatilis*), of the Atlantic, notable among drums in that it lacks an air bladder; and the sea drum, or black drum (*Pogonias cromis*), a gray or coppery red, western Atlantic fish.

drum, musical instrument, the sound of which is produced by the vibration of a stretched membrane (it is thus classified as a membranophone within the larger category of percussion instruments). Basically, a drum is either a tube or a bowl of wood, metal, or pottery (the "shell") covered at one or both ends by a membrane (the "head"), which is usually struck by hand or stick. Friction drums, a class apart, are sounded by rubbing.

Tubular drums assume many shapes (goblet, hourglass, barrel, etc.) and are considered

(Left) Barrel drum from India with cord-tensioned construction, in the Metropolitan Museum of Art, New York City; (right) tubular drum from Borneo

By courtesy of (left) the Metropolitan Museum of Art, New York City, gift of Alice E. Getty, 1946, (right) M. Morrow

shallow if the height is less than the diameter. If the drum is so shallow that the shell cannot act as a resonator for the sound (as in a tambourine), it is considered a frame drum.

Drums appear with wide geographic distribution in archaeological excavations from Neolithic times onward; one excavated in Moravia is dated at 6000 BC. Early drums consisted of a section of hollowed tree trunk covered at one end with reptile or fish skin and were struck with the hands. Later, the skin was taken from hunted game or cattle, and sticks were used. The double-headed drum came later, as did pottery drums in various shapes. The heads were fastened by several methods, some still in use. The skin might be secured to single-headed drums by pegs, nails, glue, buttoning (through holes in the membrane), or neck lacing (wrapping a cord around the mem-

brane overlap). Double-headed drums were often directly cord-tensioned (*i.e.*, through holes in the skin). Modern European orchestral drums often combine two hoops pressing against each head (one rolled in the skin, the other outside) with indirect lacing (*i.e.*, to the hoops).

Drums typically have conspicuous extra-musical functions—civil, message transmitting, and, particularly, religious. Credited with magical powers, they are frequently held sacred. In many societies their manufacture involves ritual. In East Africa, offerings such as cattle are made to the royal kettledrums, which not only symbolize the king's power and status but also offer him supernatural protection.

Giant frame drums were used in the temples of ancient Sumer, and Mesopotamian objects from about 3000 BC depict frame drums and small cylindrical drums played horizontally and vertically. Early Egyptian artifacts (*c.* 4000 BC) show a drum with skins stretched by a network of thongs. A waisted, or hourglass, drum is seen on one of the Bhārhut reliefs, the oldest Indian temple reliefs (2nd century BC). The modern Indian *ḍamaru* is an hourglass-shaped clapper drum—when it is twisted its heads are struck by the ends of one or two cords attached to the shell. Barrel and shallow-nailed drums are particularly associated with India and East Asia; notable are the *taiko* drums of Japan, made in various sizes.

Frame drums were played in the ancient Middle East (chiefly by women), Greece, and Rome and reached medieval Europe through Islāmic culture. Possibly of different origin are the frame drums used in the magico-religious ceremonies of shamans (medicine men) in Central Asia, the Arctic regions, and North America. Double-headed frame drums with enclosed pellets (found in India and Tibet) are known as rattle drums.

Shallow kettledrums are first depicted about 600 in Persia. Larger ones, mentioned with the smaller type in the 10th century, are not pictured alone until the 12th. Though originally of clay and cord braced, kettledrums were later made of metal (or sometimes wood). They spread with Islāmic culture through Europe, Africa, and Asia.

Little is known about medieval European drums and drumming, the only evidence being pictures and written references; no medieval drums survive. Written percussion parts (in instruction books only) date from the 16th century, as drummers were expected to extemporize their parts. By the 13th century, three types of drum appear to have been established: the *nakers*, small paired kettledrums; the *tab*, a small cylindrical drum, often with snares; and the *tambourine*. They apparently served only as time beaters and, except for the *tambourine*, were beaten with sticks. Only from about the 14th century were drums built to produce loud, carrying sounds, a result of the introduction of mercenary infantry troops, in whose regiments fifes were soon paired with drums. Large kettledrums were associated with royalty and nobility. They entered the orchestra as a purely musical instrument in the mid-17th century, the bass drum (derived from the long drums of Turkish Janissary troops) during the 18th century, and the military-derived side, or snare, drum during the 19th.

Drums figure prominently in the 20th century in orchestral, military, popular dance, jazz, and rock groups. The word drum is sometimes used for nonmembrane struck instruments, such as steel drums, bronze drums, and slit drums (made of hollowed wood).

drum, in packaging, cylindrical container commonly made of metal or fibreboard. Steel drums with capacities ranging up to 100 U.S. gallons (379 litres) have been produced since about 1903; the sizes less than 12 gallons (45 litres) are called pails. The most common

drums are made of 18-gauge (0.048-inch, or 1.2-millimetre, thick) steel and contain 55 gallons (208 litres); they become the property of the buyer of the contents. Heavier drums or those made of more expensive metals (aluminum, Monel, stainless steel, or nickel) commonly remain the property of the vendor. Provided with a protective interior coating, in most cases a synthetic resin, steel drums or pails can be used for packaging most liquid and solid substances, and they have largely replaced wooden barrels and kegs.

Fibreboard drums have been produced since early in the 20th century. They are made with ends of steel or paperboard in sizes up to 75 gallons and are cheap and lightweight. They are commonly resin-coated or lined with loose plastic bags for packaging solid materials.

drum, in architecture, any of the cylindrical stone blocks composing a column that is not a monolith. The term also denotes a circular or polygonal wall supporting a dome, cupola, or lantern (*qq.v.*).

drum table, heavy circular table with a central support, which was introduced in the late 18th century. The deep top, commonly covered with tooled leather, was fitted with bookshelves or drawers, some of which were imitation. The support was sometimes in the form of a pillar resting on four elegantly tapering legs terminating in claw feet. In other examples, the supports rested on a platform with four concave sides, the platform in turn resting on claw feet.

Drum table, English, early 19th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

An alternative name for the drum table was a *loo table*. A variant of the drum table, called a *rent table*, had a circular or polygonal top, the drawers in the frieze (horizontal band beneath the top) being labeled with the days of the week and constituting a filing system for the rent collector.

Drumheller, city, southern Alberta, Canada, on the Red Deer River, 86 miles (138 km) northeast of Calgary. A grain-shipping point, it is surrounded by extensive coal, gas, and oil fields and by wheat fields. It was founded in 1910 by Samuel Drumheller, a coal-mining pioneer who helped launch Alberta's great coal industry. The circular 28-mile (45-kilometre) Dinosaur Trail into the Red Deer valley badlands begins at the Dinosaur Fossil Museum in Drumheller; it advances past the Homestead Antique Museum (with pioneer and Indian relics) and the picturesque Little Church and through oil and wheat fields before entering ancient seabeds of fossilized oysters, the Dinosaur Burial Grounds, and petrified forests. Inc. village, 1913; town, 1916; city, 1930. Pop. (1991) 6,277.

drumlin, oval or elongated hill believed to have been formed by the streamlined movement of glacial ice sheets across rock debris, or till. The name is derived from the Gaelic word *drum* ("rounded hill," or "mound") and first appeared in 1833.

Drumlins are generally found in broad lowland regions, with their long axes roughly parallel to the path of glacial flow. Although they come in a variety of shapes, the glacier side is always high and steep, while the lee side is

Drumlin in Yorkshire, Eng., formed by glaciers that approached the steep stoss end, at right, and moved along the gently sloping lee end, at left

© Ken Gardner/Landform Slides

smooth and tapers gently in the direction of ice movement. Drumlins can vary widely in size, with lengths from 1 to 2 km (0.6 to 1.2 miles), heights from 15 to 30 m (50 to 100 feet), and widths from 400 to 600 m.

Most drumlins are composed of clayey till; some, however, have deep layers of rock underlying the surface till (rock drumlins), while others are almost solid bedrock (roches moutonnées). Drumlins are often covered with grass in hot arid regions. In areas of higher rainfall, the soil can support thick forests and pastures; in humid climates, drumlins may even be cultivated.

Drumlins are commonly found in clusters numbering in the thousands. Often arranged in belts, they disrupt drainage so that small lakes and swamps may form between them. Large drumlin fields are located in central Wisconsin and in central New York; in northwestern Canada; in southwestern Nova Scotia; and in northern Ireland.

Drummond, Henry (b. Dec. 5, 1786, the Grange, near Alresford, Hampshire, Eng.—d. Feb. 20, 1860, Albury, Surrey), British banker, writer, and member of Parliament who helped found the Catholic Apostolic Church.

Drummond studied at the University of Oxford for two years but did not take a degree. He became a partner in Drummond's Bank, London, and served in Parliament for Plympton Erle, Devonshire (1810–13), and for West Surrey (1847–60).

While traveling in 1817 he met the Scottish theologian Robert Haldane in Geneva and became a polemical and monetary supporter of the evangelical clergy who were opposed to the Socinian, or rationalist, tendencies then prevalent in Geneva. In 1826 he and several clergymen and laymen held the first of five annual conferences on the prophetic Scriptures at his Albury home. From these meetings the Catholic Apostolic Church evolved.

Henry Drummond
BBC Hulton Picture Library

Drummond was ordained an angel (bishop) for Scotland in 1834. He built a chapel and chapter house at Albury, which became a centre of the movement, and continued his financial and spiritual activities for the Catholic Apostolic Church. He published voluminously on such questions as the interpretation of prophecy, the circulation of the Apocrypha, and the principles of Christianity.

Drummond (of Hawthornden), William (b. Dec. 13, 1585, Hawthornden, near Edinburgh, Scot.—d. Dec. 4, 1649, Hawthornden), first notable poet in Scotland to write deliberately in English. He also was the first to use the canzone, a medieval Italian or Provençal metrical form, in English verse.

Drummond studied at Edinburgh and spent a few years in France, ostensibly studying law at Bourges and Paris. On the death of his father, first laird of Hawthornden, in 1610, he settled down on his Hawthornden estate, leaving law for literature and devoting himself to the life of a cultured and rather detached man of means. There was a certain natural reticence in Drummond's character, but he had many friends, including the poets Michael Drayton and Sir William Alexander and the playwright Ben Jonson.

Drummond adapted and translated poems from French, Italian, and Spanish, in addition to borrowing from such English poets as Sir Philip Sidney. Apart from his *Poems* (1614,

William Drummond, oil painting by an unknown artist; in the Scottish National Portrait Gallery, Edinburgh

By courtesy of the Scottish National Portrait Gallery, Edinburgh

1616) and *Flowres of Sion* (1623), Drummond wrote *Forth Feasting* (1617), a poem celebrating James I's visit to Scotland in that year, and he was apparently the author of *Polemnia Medinia inter Vitarvam et Nebemam* (1645?), a macaronic piece intermingling Scots and Latin. His prose writings include a group of Royalist political pamphlets; *The History of Scotland, from the year 1423 until the year 1542* (1655); and *A Cypress Grove* (1623; earlier version, *A Midnight's Trance*, 1619), a meditation on death and mutability.

Drummond, William Henry (b. April 13, 1854, Mohill, County Leitrim, Ire.—d. April 6, 1907, Cobalt, Ont., Can.), Irish-born Canadian writer of humorous dialect poems conveying a sympathetic but sentimentalized picture of the habitants, or French-Canadian farmers.

Drummond immigrated to Canada about 1864, left school at the age of 15 to help support his family, but at 30 took a degree in medicine at Bishop's College in Quebec. After

four years in country practice he moved to Montreal, where he gave public readings of his poems with great success. His verses, mingling humour and pathos, are written in a synthetic patois and from the viewpoint of a British imperialist but are redeemed by his evident goodwill and genuine fondness for his subject.

William Henry Drummond

By courtesy of the Public Archives of Canada

His first collection, *The Habitant* (1897), was followed by several others, all of which were published together as *The Poetical Works of William Henry Drummond* (1912).

Drummond de Andrade, Carlos (b. Oct. 31, 1902, Itabira, Brazil—d. Aug. 17, 1987, Rio de Janeiro), poet, journalist, author of *crônicas* (a short fiction-essay genre widely cultivated in Brazil), and literary critic, considered one of the most accomplished poets of modern Brazil and a major influence on mid-20th-century Brazilian poetry. His experiments with poetic form (including laying the foundation of what later developed into concrete poetry) and his often ironic treatment of realistic themes reflect his concern with the plight of modern man, especially Brazilian urban man, in his struggle for freedom and dignity.

After receiving his degree in pharmacy (1925), Drummond de Andrade turned to poetry and joined the new group of Brazilian Modernists who were introducing colloquial language and unconventional syntax in their free-verse forms. He helped to found the literary magazine *A Revista* ("Review") in 1925. The first of his numerous collections of poetry, *Alguma poesia* (1930; "Some Poetry"), demonstrates both his affinity with the Modernist movement and his own strong poetic personality.

Drummond de Andrade voiced the frustrations of rural immigrants to anonymous and crushing urban centres and of bored middle-class city residents trapped in meaningless routines. His *crônicas* reveal a special concern for children and the urban poor.

At the time of his retirement from a career of government service, in 1962, Drummond de Andrade was director of the historical section of the National Historical and Artistic Heritage Service of Brazil. He was the author of approximately 15 volumes of poetry and a half dozen collections of *crônicas*. His best-known single poem is perhaps "Josc" (published in 1942 in *Poesias*), which depicts the boredom of an urban apartment dweller.

Drummondville, city, Mauricie-Bois-Francs region, southern Quebec province, Canada, on the Saint-François River. Founded in 1815 by Major General Frederick George Heriot and named after Sir Gordon Drummond, then commander in chief of Canada, it became an important textile-milling town after the 1920s, when nearby hydroelectric plants were completed. Drummondville, about 60 miles (100 km) northeast of Montreal, is now a commercial and industrial centre on major railroad

lines and the Trans-Canada Highway. In addition to textiles, manufactures include lumber, heavy machinery, paper products, pencils, clothing, light bulbs, and rubber goods. The towns of Saint-Joseph, Drummondville West, and Drummondville South were annexed to Drummondville in 1955, 1966, and 1981, respectively. Inc. village, 1874; town, 1888; city, 1936. Pop. (1991) 35,462.

Drumossie, Battle of (1746): see Culloden, Battle of.

drumstick tree, also called **HORSERADISH TREE** (*Moringa pterygosperma*), small, deciduous tree, of the family Moringaceae, native to tropical Asia but also naturalized in Africa and tropical America. Drumstick trees can reach a height of about 9 m (30 feet); they have corky gray bark, branching, fernlike leaves, and scented clusters of white flowers. The dagger-like fruits sometimes are 45 cm (18 inches) long. Flowers, pods, leaves, and even twigs are cooked and eaten. A horseradish-flavoured condiment is prepared from the crushed roots. Ben oil, extracted from the seeds, is used by watchmakers. Perfume makers value it for its retention of scents.

Druon Antigonus, legendary giant of Antwerp, who cut off the right hands of mariners refusing him tribute. His own right hand was cut off by another legendary giant, called Salvius Brabo, a cousin of Julius Caesar. The two severed hands included in the

Druon Antigonus, illustration from *Gog and Magog*, by Frederick William Fairholt, 1859

By courtesy of the Folklore Society Library, University College, London, photograph, R B Fleming

coat of arms of Antwerp have been connected with this legend, as has the etymology of the city's name. The Brabo Fountain (1887), in front of the Hôtel de Ville, is surmounted by a statue of Brabo brandishing the severed hand of Druon.

drupe, fruit in which the outer layer of the ovary wall is a thin skin, the middle layer is thick and usually fleshy (though sometimes tough, as in the almond, or fibrous, as in the coconut), and the inner layer, known as the pit, or putamen, is hard and stony. Within the pit is usually one seed, or, rarely, two or three, in which case only one develops fully. In aggregate fruits such as the raspberry and blackberry—which are not true berries—many small drupes are clumped together. Other representative drupes are the cherry, peach, mango, olive, walnut, and dogwood.

Drury Lane Theatre, London, oldest English theatre still in use, built by the dramatist Thomas Killigrew for his company of actors as the Theatre Royal under a charter from Charles II. It opened May 7, 1663, in the propitious era of Restoration drama and prospered until destroyed by fire (1672). Rebuilt on its present site in Drury Lane in 1674 with

"The Drury Lane Theatre, London," watercolour by Edward Dayes, 1795; in the Henry E. Huntington Library and Art Gallery, San Marino, Calif.

By courtesy of the Henry E. Huntington Library and Art Gallery, San Marino, Calif

Sir Christopher Wren as architect, the second Theatre Royal featured the plays of John Dryden and works of William Congreve.

Drury Lane enjoyed one of its finest periods (1710–34) under the control of the famous triumvirate made up of the actor-playwright Colley Cibber, the comedian Robert Wilks, and the character actor Thomas Doggett. It then fell into the hands of a spendthrift, Charles Fleetwood, whose mismanagement almost brought the theatre to ruin, despite such triumphs as David Garrick's brilliant performances as Lear and Richard III, and Charles Macklin's revolutionary portrayal of Shylock as a tragic rather than comic character. It was rescued in 1747 when Garrick took over and opened with a brilliant new troupe, a more natural style of acting and production, and superior Shakespearean texts. Garrick upheld these high standards for the next 30 years. He was succeeded by Richard Brinsley Sheridan. Under his management (1776–88), *The School for Scandal* held the stage, and Sarah Siddons' memorable performance of Lady Macbeth and John Philip Kemble's Hamlet were given.

When a new "fireproof" theatre, built in 1794, burned down in 1809, another was designed by Benjamin Wyatt and opened in 1812. In this era the actor Edmund Kean attracted large audiences. After his decline, Drury Lane went into a long period of progressive deterioration until it was taken over by Augustus Harris in the 1880s, when it prospered as the home of spectacles and pantomimes featuring the music-hall artist Dan Leno. In the 1900s it was the scene of the acting triumphs of Henry Irving, Ellen Terry, and Sir Johnston Forbes-Robertson. The conductor Sir Thomas Beecham's great opera seasons were held there. During World War II, it was headquarters of ENSA (Entertainments National Service Association).

On May 7, 1963, the Drury Lane celebrated its tercentenary.

Druse revolt (1925): see Druze revolt.

Drusilla, Livia: see Livia Drusilla.

Drusus, Marcus Livius (d. 109 BC), Roman politician, tribune with Gaius Gracchus in 122 BC who undermined Gracchus' program of economic and political reform by propos-

ing reforms that were even more appealing to the populace but that he evidently did not seriously intend to be implemented. On the issue of colonization Drusus went further than Gracchus by proposing the immediate foundation in Italy and Sicily of 12 colonies to be settled by citizens without property qualifications. He proposed, in addition, that all land

that had been distributed since the passage of Tiberius Gracchus' agrarian reform bill should be rent free.

By pressing for immunity from corporal punishment (even during military service), Drusus was promising the Latins more protection from abuses by Roman magistrates than even Roman citizens enjoyed. This was a skillful measure since many Latins preferred protection from the magistrates to all the privileges that Roman citizenship would confer. Although a commission was set up to carry out these *Leges Livianae*, the laws probably were not implemented.

Drusus was consul in 112 and became governor of Macedonia, where he campaigned successfully against the Scordisci tribe. On his return he celebrated a triumph in 110 and, as censor in 109, died in office.

Drusus, Marcus Livius (b. c. 124 BC—d. 91 BC), son of the tribune of 122 by the same name; as tribune in 91, Drusus made the last nonviolent civilian attempt to reform the government of republican Rome. Drusus began by proposing colonial and agrarian reform bills. He then introduced a judiciary law that probably specified that the law courts, then controlled by the equites, or cavalry, should be impaneled jointly from senators and equites and that all jurors should be liable to prosecution for corruption.

By this compromise Drusus sought to reconcile the equestrian and senatorial orders, which had come into conflict after the trial by equites of an honest governor who had refused to allow extortion of his province by publicans (contractors or tax collectors). Neither order was satisfied with Drusus' proposal, however, and opposition from all sides increased when he pushed for the enfranchisement of the Italian allies. The Senate declared his legislation invalid on technical grounds. Disturbances involving Drusus' supporters among the allies increased, and the reformer was murdered. His assassin was never discovered.

Drusus Julius Caesar (b. c. 13 BC—d. July 1, AD 23), only son of the Roman emperor Tiberius. After the death of Tiberius' nephew and adoptive son Germanicus (AD 19), Drusus became heir to the imperial succession.

Though reputedly violent and dissolute, Drusus showed ability in public business. In AD 14 he suppressed a dangerous mutiny in

Drusus Caesar, detail of a marble statue; in the Lateran Museum, Rome
BBC Hulton Picture Library

Pannonia. He became consul in 15. As governor of Illyricum (17–20), he engineered the fall of Maroboduus, king of the German Marcomanni. After becoming consul again in 21, he received the administrative privileges of tribunician power in 22. He died before Tiberius, allegedly poisoned by his wife Livilla and by Tiberius' adviser Sejanus.

Drusus Germanicus, Nero Claudius (b. 38 BC—d. 9 BC), younger brother of Tiberius (who later became emperor) and commander of the Roman forces that occupied the German territory between the Rhine and Elbe rivers from 12 to 9 BC.

Nero Claudius Drusus Germanicus, marble bust by an unknown artist; in the Capitoline Museum, Rome
Anderson—Ainan from Art Resource

Drusus was born shortly after the divorce of his mother, Livia Drusilla, from Tiberius Claudius Nero; she immediately married Octavian (later Augustus), who was suspected of being Drusus' real father. Like his brother, Drusus was allowed to seek office five years before the legally specified age. He became praetor (magistrate) in 11 and consul in 9. With Tiberius he fought against two Alpine tribes (the Raeti and Vindelici), and in 13 he was made governor of the three Gauls. In this office he carried out an important census and erected the altar of Augustus at Lugdunum (now Lyon).

In 12–9 he led expeditions into Germany, establishing bases, first at Vetera (at the junction of the Lippe and Rhine rivers) and then at Mogontiacum (now Mainz). The Frisii, Chauci, Cherusci, and Chatti tribes were subdued, and a canal, the Fossa Drusiana, was dug from the Rhine to the North Sea. In the year 9, Drusus reached the Elbe River, but he was thrown from his horse and died of the injuries 30 days later. He was posthumously given the cognomen Germanicus.

Drusus had married, about 16 BC, the younger Antonia, daughter of Mark Antony and Octavia. Their surviving children were Germanicus, Livilla, and Claudius, who later became emperor.

Druz, Jebel ed-: see *Durūz*, Mount ad-

Druze, also spelled DRUSE, Arabic plural DURŪZ, singular DARAZI, relatively small Middle Eastern religious sect characterized by an eclectic system of doctrines and by a cohesion and loyalty among its members (at times politically significant) that have enabled them to maintain through almost a thousand years of turbulent history their close-knit identity and distinctive faith. They numbered more than 250,000 in the late 20th century and lived mostly in Lebanon, with smaller communities in Israel and Syria. They call themselves *muwahhidūn* ("monotheists").

The Druze permit no conversion, either away from or to their religion, and no intermarriage. In these circumstances the survival of their religion and community across almost a millennium is the more remarkable in that their religious system is kept secret not only from the outside world but in part even from their own number; only an elite of initiates, known as *'uqqāl* ("knowers"), participate fully in their religious services and have access to the secret teachings of the *ḥikmah*, the Druze religious doctrine. In times of persecution, a Druze is allowed to deny his faith outwardly if his life is in danger. This concession, or *taḥyah*, is allowed according to *at-Taḥim* ("Instruction"), the anonymously written "catechism" of Druze faith.

It is not known to what extent this people was self-conscious and distinct before adopting their present religion. Druze religious beliefs developed out of Isma'elite teachings. Various Jewish, Christian, Gnostic, Neoplatonic, and Iranian elements, however, are combined under a doctrine of strict monotheism. Propagation of the tenets of the new religion began in Cairo in AD 1017, led by Ḥamzah ibn 'Alī; it is from the name of Ḥamzah's subordinate, Muḥammad ad-Darazī, that the group derives its name. The eclectic belief system was organized into a doctrine of the soterialogical divinity of al-Ḥākīm bi-Amr Allāh ("Ruler by the Command of Allāh"), the sixth caliph (996–1021) of the Fāṭimid dynasty of Egypt, whom they call al-Ḥākīm bi-Amrīh ("Ruler by His Own Command"). It is believed by the Druze that al-Ḥākīm did not die but vanished and will one day return in triumph to inaugurate a golden age. There is some suggestion that a number of people in widely scattered areas accepted this system, but only the Druze have survived. It is known certainly that a great many groups in the Middle East at that time, most of whom came under the various headings of the heretical Shī'ite Muslim sects and movements, accepted similar notions and joined similar causes.

Although the Druze cloak their religion in secrecy, the source materials for outsiders' knowledge of Druze history and religion are not as scarce as might be expected. Muslim and Christian accounts of historical events, as well as comments on and assessments of the Druze religion and customs, should be treated with reserve and caution because of their polemical character. Jewish sources contemporary with the first half of the reign of al-Ḥākīm present him in a favourable light.

The Druze people have figured prominently at various periods in Middle Eastern history: in the Arab stand against the Crusades; in the century following the Ottoman conquest (from 1516), prospering as powerful vassals (until their Lebanese leader and early westernizer Fakhr ad-Dīn of the house of Ma'n was driven out, to take asylum at the courts of Tuscany and Naples); in the 19th century, dominating the Lebanese aristocracy under the ruling Shihāb family (who were Sunnite

Muslims); and in the 20th century, in many of the vicissitudes of Arab and Lebanese development.

Druze revolt (1925), Druze also spelled DRUSE, uprising of Druze tribes throughout Syria and in part of Lebanon directed against French mandatory officials who attempted to upset the traditions and the tribal hierarchy of Jabal ad-Durūz.

In 1923 Captain Carbillet, the French, but Druze-elected, governor of Jabal ad-Durūz, introduced modern administrative and social reforms that antagonized the population. The high-handed treatment accorded Druze complaints by the high commissioner, General Maurice Sarrail, and his arrest and detainment of several Druze leaders in July 1925 resulted in a full-fledged rebellion. Led by Sulṭān al-Aṭraṣh, the Druze defeated the French in August and by September were joined by Syrian nationalists from the People's Party, who entreated their countrymen to join the revolt. When the rebellion reached Damascus, the French bombed the city, but Druze discontent continued to expand into southern Lebanon. The French fought the insurgents throughout 1926, bombing Damascus once again, this time meeting with greater success, and by mid-1927 most of the trouble had died out.

Jabal ad-Durūz was henceforth kept under tighter French control; high officials, such as the governor, were no longer elected but appointed and most often were French. The natural tendency of the Druze to isolationism was encouraged in order to keep them free of Arab nationalism but dependent on the French for their security.

druzhina, in early Rus, a prince's retinue, which helped him to administer his principality and constituted the area's military force. The first *druzhinniki* (members of a *druzhina*) in Rus were the Norse Varangians, whose princes established control there in the 9th century. Soon members of the local Slavic aristocracy as well as adventurers of a variety of other nationalities became *druzhinniki*.

The *druzhina* was composed of two groups: the senior members (who became known as boyars) and the junior members. The boyars were the prince's closest advisers; they also performed higher state functions. The junior members constituted the prince's personal bodyguard and were common soldiers. All the members were dependent upon their prince for financial support, but each member served the prince freely and had the right to leave him and join the *druzhina* of another prince. As a result, a prince was inclined to seek the goodwill of his *druzhina*: he paid the *druzhinniki* wages, shared his war booty and taxes with them, and eventually rewarded the boyars with landed estates, complete with rights to tax and administer justice to the local population.

By the middle of the 12th century, the characteristics of the two groups had begun to change. The boyars, having acquired their own patrimonial estates and retinues, became less dependent on the princes and began to form a new landed aristocratic class. The junior members became a prince's immediate servants and collectively assumed the name *dvoriane* (courtiers). During the period of Mongol rule (after 1240), the term *druzhina* fell out of use. See also boyar.

Druzhkivka, Russian DRUZHKOVA, also spelled DRUŽKOVKA, city, Donetsk oblast (province), eastern Ukraine, at the confluence of the Kryvyi Torets and Kazennyi Torets rivers. Druzhkivka, which before the Russian Revolution of 1917 was a small metallurgical centre, now has an important machine-works

as well as a metalworking industry. There are technical colleges offering instruction in machine building and mining. The area is important for the working of fireclays. Pop. (1991 est.) 74,400.

dry dock, type of dock (*q.v.*) consisting of a rectangular basin dug into the shore of a body of water and provided with a removable enclosure wall or gate on the side toward the water, used for major repairs and overhaul of vessels.

When a ship is to be docked, the dry dock is flooded, and the gate removed. After the vessel is brought in, and properly positioned and guyed, the watertight gate is placed in its seat and the dock is pumped dry, bringing the craft gradually to rest on supporting blocks anchored to the floor.

In older installations, in which the basins were relatively small, the dock structure was built mainly of massive stonework, or in a few instances, heavy timber framing. Later, these materials were supplanted by concrete, first in the ordinary mass form and later reinforced with steel. Modern dry docks are considerably larger in size and correspondingly more complex than their prototypes.

A dry dock gate, with its removable watertight barrier, has many forms and arrangements. In some, two leaves form a mitre gate hinged to the side walls of the dock. In others, the leaves roll on a track into recesses in the dock walls. In still others, a one-piece gate is hinged at the bottom sill so it may be lowered to allow a ship to enter. The type most commonly used, however, is the floating gate, which is held in its seat by its weight when the dock is empty and can be removed simply by floating it out of the way when the dock is filled with water.

While most ship repair work is carried out in stationary dry docks, there are some services that can be performed by mobile or floating structures. The principal such facility, the floating dry dock, is a trough-shaped cellular structure, used to lift ships out of the water for inspection and repairs. The ship is brought into the channel of the partly submerged dock, which is then floated by removing ballast from its hollow floor and walls and draining the dock so that it supports the craft on blocks attached to the dock floor. A typical floating dry dock is built of steel, with a framing system similar to that of a ship, although both timber and reinforced concrete have been used. Floating dry docks ordinarily are operated in sheltered harbours where wave action presents no problem.

dry farming, also called DRYLAND FARMING, the cultivation of crops without irrigation in regions of limited moisture, typically less than 20 inches (50 centimetres) of precipitation annually. Dry farming depends upon efficient storage of the limited moisture in the soil and the selection of crops and growing methods that make the best use of this moisture. Tilling the land shortly after harvest and keeping it free from weeds are typical methods, but in certain latitudes stubble is left in the fields after harvest to trap snow. Moisture control during crop growing consists largely of destruction of weeds and prevention of runoff. The ideal soil surface is free of weeds but has enough clods or dead vegetable matter to hinder runoff and prevent erosion.

Crops adapted to dry farming may be either drought resistant or drought evasive. Drought-resistant crops, such as sorghum, are able to reduce transpiration (emission of moisture) and may nearly cease growing during periods of moisture shortage, resuming growth when conditions again become favourable. Drought-evasive crops achieve their main growth during times of year when heat and

drought conditions are not severe. Crops adapted to dry farming are usually smaller and quicker to mature than those grown under more humid conditions and are usually allotted more space.

dry forest: see monsoon forest.

dry gas, natural gas that is always in the gaseous state in the reservoir and produces little condensable hydrocarbons (compounds composed mainly of hydrogen and carbon) when brought to the surface. Thus, these gases contain very small proportions (less than 0.1 gallon condensables per 1,000 cubic feet) of hydrocarbons heavier than ethane—butane or propane, for example. See also wet gas.

Dry Ice, trademark for carbon dioxide (*q.v.*) in its solid form, a dense, snowlike substance that sublimates (passes directly into the vapour without melting) at -78.5°C (-109.3°F), used as a refrigerant, especially during shipping of perishable products such as meats or ice cream. In the production of Dry Ice, advantage is taken of the spontaneous cooling that occurs when compressed, liquefied carbon dioxide at -57°C (-71°F) or lower is allowed suddenly to expand to atmospheric pressure: the liquid freezes to a finely divided solid that is compacted into cakes, weighing about 20 kilograms (45 pounds).

dry offset, also called LETTERSET, or INDIRECT RELIEF PRINTING, offset printing process combining the characteristics of letterpress and offset. A special plate prints directly onto the blanket of an offset press, and the blanket then offsets the image onto the paper. The process is called dry offset because the plate is not dampened as it would be in the offset lithography process.

The process was developed by the U.S. Bureau of Engraving and Printing to produce long runs of tax stamps and savings bonds. See also offset printing.

dry painting: see sand painting.

dry plate, in photography, glass plate coated with a gelatin emulsion of silver bromide. It can be stored until exposure, and after exposure it can be brought back to a darkroom for development at leisure. These qualities were great advantages over the wet collodion process, in which the plate had to be prepared just before exposure and developed immediately after. The dry plate, which could be factory produced, was introduced in 1871 by R.L. Maddox. It was superseded by celluloid film early in the 20th century.

dry rot, symptom of fungal disease in plants, characterized by firm spongy to leathery or hard decay of stem (branch), trunk, root, rhizome, corm, bulb, or fruit. See bulb rot; crown gall; fruit spot; heart rot; rot.

Dry Tortugas, the last eight in a long string of coral islands (keys) and sandbars that extend westward from Key West (in Monroe County), at the tip of southern Florida, U.S., into the Gulf of Mexico. Ponce de León discovered them in 1513 and named them for the tortoises that abounded there. Later,

Ft. Jefferson on Garden Key, Dry Tortugas, Fla.

mariners added the accurate adjective dry. A lighthouse was constructed on Garden Key in 1825 and another, on the largest key, Loggerhead, in 1856. The unfinished Ft. Jefferson (1846–76) on Garden Key remained in Federal hands during the Civil War and served as a prison until 1873. Among the prisoners was Samuel A. Mudd, sentenced for complicity in the assassination of Abraham Lincoln because he had set John Wilkes Booth's broken leg. Possessing abundant bird and marine life, the fort and islands were proclaimed a national monument in 1935.

dry wash: see arroyo.

Dryden, Hugh L(atimer) (b. July 2, 1898, Pocomoke City, Md., U.S.—d. Dec. 2, 1965, Washington, D.C.), U.S. physicist and deputy administrator of the National Aeronautics and Space Administration (NASA) for seven years.

Educated at Johns Hopkins University (Baltimore) in 1920, Dryden was named chief of the aerodynamics section of the National Bureau of Standards, Washington. He made pioneer-

Hugh L. Dryden, 1962

ing studies in the aerodynamics of high speed and some of the earliest studies of air flow around wing surfaces at the speed of sound. In 1934 he became chief of the mechanics and sound division. During World War II he headed the Washington Project of the National Defense Research Committee, which developed the Bat radar-homing missile, the first successful U.S. guided missile, which was used by the navy against the Japanese during World War II. For his part in the project, he was awarded the Presidential Certificate of Merit in 1948.

Dryden resigned from the National Bureau of Standards in 1947 and became director of aeronautical research of the National Advisory Committee for Aeronautics (NACA). Two years later he became director of NACA, and under his leadership the organization gained widespread recognition for its advanced aeronautical research and development. In 1958 he became deputy administrator of NASA and in 1962 led negotiations for joint U.S.–Soviet space projects. He was instrumental in achieving the exchange of weather-satellite data and operation of cooperative communications satellite tests.

Dryden, John (b. Aug. 19, 1631, Aldwinkle, Northamptonshire, Eng.—d. May 1, 1700, London), English poet, dramatist, and literary critic who so dominated the literary scene of his day that it came to be known as the Age of Dryden.

Youth and education. The son of a country gentleman, Dryden grew up in the country. When he was 11 years old the Civil War broke out. Both his father's and mother's families sided with Parliament against the King, but Dryden's own sympathies then are unknown.

About 1644 he was admitted to Westminster School, where Dryden received a predominantly classical education under the celebrated Richard Busby. His easy and lifelong familiarity with classical literature begun at West-

minster later resulted in idiomatic English translations.

In 1650 he entered Trinity College, Cambridge, where he took his B.A. degree in 1654. What Dryden did between leaving the university in 1654 and the Restoration of Charles II in 1660 is not known with certainty. In 1659 his contribution to a memorial volume for Oliver Cromwell marked him as a poet worth watching. His "heroic stanzas" were mature, considered, sonorous, and sprinkled with those classical and scientific allusions that characterized his later verse. This kind of public poetry was always one of the things Dryden did best.

When in May 1660 Charles II was restored to the throne, Dryden joined the poets of the day in welcoming him, publishing in June *Astraea Redux*, a poem of more than 300 lines in rhymed couplets. For the coronation in 1661, he wrote *To His Sacred Majesty*. These two poems were designed to dignify and strengthen the monarchy and to invest the young monarch with an aura of majesty, permanence, and even divinity. Thereafter Dryden's literary productivity was remarkable and his touch almost invariably confident and sure. On Dec. 1, 1663, Dryden married Elizabeth Howard, the youngest daughter of Thomas Howard, 1st Earl of Berkshire. In due course she bore him three sons.

Dryden's longest poem to date, *Annus Mirabilis* (1667), was a celebration of two victories by the English fleet over the Dutch and the Londoners' survival of the Great Fire of 1666. In this work Dryden was once again gilding the royal image and reinforcing the concept of a loyal nation united under the best of kings. It was hardly surprising that when the poet laureate, Sir William Davenant, died in 1668, Dryden was appointed poet laureate in his place and two years later was appointed royal historiographer.

Writing for the stage. Soon after his restoration to the throne in 1660, Charles II granted two patents for theatres, which had been closed since 1642. Dryden soon joined the little band of dramatists who were writing new plays for the revived English theatre. His first play, *The Wild Gallant*, a farcical comedy with some strokes of humour and a good deal of licentious dialogue, was produced in 1663. It was a comparative failure, but in January 1664 he had some share in the success of *The Indian Queen*, a heroic tragedy in rhymed couplets in which he had collaborated with Sir Robert Howard. Dryden was soon to successfully exploit this new and popular genre, with its conflicts between love and honour and its lovely heroines before whose charms the blustering

heroes sank down in awed submission. In the spring of 1665 Dryden had his own first outstanding success with *The Indian Emperour*, a play that was a sequel to *The Indian Queen*.

In 1667 Dryden had another remarkable hit with a tragicomedy, *Secret Love, or the Maiden Queen*, which appealed particularly to the king. The part of Florimel, a gay and witty maid of honour, was played to perfection by the king's latest mistress, Nell Gwynn. In Florimel's rattling exchanges with Celadon, the Restoration aptitude for witty repartee reached a new level of accomplishment. In 1667 Dryden also reworked for the stage Molière's comedy *L'Étourdi* (translated by William Cavendish, Duke of Newcastle) under the title *Sir Martin Mar-all*.

In 1668 Dryden published *Of Dramatick Poesie, an Essay*, a leisurely discussion between four contemporary writers of whom Dryden (as Neander) is one. This work is a defense of English drama against the champions of both ancient Classical drama and the Neoclassical French theatre; it is also an attempt to discover general principles of dramatic criticism. By deploying his disputants so as to break down the conventional oppositions of ancient and modern, French and English, Elizabethan and Restoration, Dryden deepens and complicates the discussion. This is the first substantial piece of modern dramatic criticism; it is sensible, judicious, and exploratory and combines general principles and analysis in a gracefully informal style. Dryden's approach in this and all his best criticism is characteristically speculative and shows the influence of detached scientific inquiry.

In 1668 Dryden agreed to write exclusively for Thomas Killigrew's company at the rate of three plays a year and became a shareholder entitled to one-tenth of the profits. Although Dryden averaged only a play a year, the contract apparently was mutually profitable. In June 1669 he gave the company *Tyrannick Love*, with its blustering and blaspheming hero Maximin. In December of the next year came the first part of *The Conquest of Granada by the Spaniards*, followed by the second part about a month later. All three plays were highly successful; and in the character Almanzor, the intrepid hero of *The Conquest of Granada*, the theme of love and honour reached its climax. But the vein had now been almost worked out, as seen in the 1671 production of that witty burlesque of heroic drama *The Rehearsal*, by George Villiers, 2nd Duke of Buckingham, in which Dryden (Mr. Bayes) was the main satirical victim. *The Rehearsal* did not kill the heroic play, however; as late as November 1675, Dryden staged his last and most intelligent example of the genre, *Aureng-Zebe*. In this play he abandoned the use of rhymed couplets for that of blank verse.

In writing those heroic plays, Dryden had been catering to an audience that was prepared to be stunned into admiration by drums and trumpets, rant and extravagance, stage battles, rich costumes, and exotic scenes. His abandonment of crowd-pleasing rant and bombast was symbolized in 1672 with his brilliant comedy *Marriage A-la-Mode*, in which the Restoration battle of the sexes was given a sophisticated and civilized expression that only Sir George Etherege and William Congreve at their best would equal. Equally fine in a different mode was his tragedy *All for Love* (1677), based on Shakespeare's *Antony and Cleopatra* and written in a flowing but controlled blank verse. Dryden had now entered what may be called his Neoclassical period, and, if his new tragedy was not without some echoes of the old extravagance, it was admirably constructed, with the action developing naturally from situation and character.

By 1678 Dryden was at loggerheads with his fellow shareholders in the Killigrew company, which was in grave difficulties owing to mismanagement. Dryden offered his tragedy

Oedipus, a collaboration with Nathaniel Lee, to a rival theatre company and ceased to be a Killigrew shareholder.

Verse satires. Since the publication of *Annus Mirabilis* 12 years earlier, Dryden had given almost all his time to playwrighting. If he had died in 1680, it is as a dramatist that he would be chiefly remembered. Now, in the short space of two years, he was to make his name as the greatest verse satirist that England had so far produced. In 1681 the king's difficulties—arising from political misgivings that his brother, James, the Roman Catholic Duke of York, might succeed him—had come to a head. Led by the Earl of Shaftesbury, the Whig Party leaders had used the Popish Plot to try to exclude James in favour of Charles's illegitimate Protestant son, the Duke of Monmouth. But the king's shrewd maneuverers eventually turned public opinion against the Whigs, and Shaftesbury was imprisoned on a charge of high treason.

As poet laureate in those critical months Dryden could not stand aside, and in November 1681 he came to the support of the king with his *Absalom and Achitophel*, so drawing upon himself the wrath of the Whigs. Adopting as his framework the Old Testament story of King David (Charles II), his favourite son Absalom (Monmouth), and the false Achitophel (Shaftesbury), who persuaded Absalom to revolt against his father, Dryden gave a satirical version of the events of the past few years as seen from the point of view of the king and his Tory ministers and yet succeeded in maintaining the heroic tone suitable to the king and to the seriousness of the political situation. As anti-Whig propaganda, ridiculing their leaders in a succession of ludicrous satirical portraits, Dryden's poem is a masterpiece of confident denunciation; as pro-Tory propaganda it is equally remarkable for its serene and persuasive affirmation. When a London grand jury refused to indict Shaftesbury for treason, his fellow Whigs voted him a medal. In response Dryden published early in 1682 *The Medall*, a work full of unsparing invective against the Whigs, prefaced by a vigorous and plainspoken prose "Epistle to the Whigs." In the same year, anonymously and apparently without Dryden's authority, there also appeared in print his famous extended lampoon, *Mac Flecknoe*, written about four years earlier. What triggered this devastating attack on the Whig playwright Thomas Shadwell has never been satisfactorily explained; all that can be said is that in *Mac Flecknoe* Shadwell's abilities as a literary artist and critic are ridiculed so ludicrously and with such good-humoured contempt that his reputation has suffered ever since. The basis of the satire, which represents Shadwell as a literary dunce, is the disagreement between him and Dryden over the quality of Ben Jonson's wit. Dryden thinks Jonson deficient in this quality, while Shadwell regards the Elizabethan playwright with uncritical reverence. This hilarious comic lampoon was both the first English mock-heroic poem and the immediate ancestor of Alexander Pope's *The Dunciad*.

Late works. In 1685, after the newly acceded king James II seemed to be moving to Catholic toleration, Dryden was received into the Roman Catholic Church. In his longest poem, the best fable *The Hind and the Panther* (1687), he argued the case for his adopted church against the Church of England and the sects.

The abdication of James II in 1688 destroyed Dryden's political prospects, and he lost his laureateship to Shadwell. He turned to the theatre again. The tragedy *Don Sebastian* (1689) failed, but *Amphitryon* (1690) succeeded, helped by the music of Henry Purcell. Dryden collaborated with Purcell in

a dramatic opera, *King Arthur* (1691), which succeeded. His tragedy *Cleomenes* was long refused a license because of what was thought to be the politically dangerous material in it, and with the failure of the tragicomedy *Love Triumphant* in 1694, Dryden stopped writing for the stage.

In the 1680s and '90s Dryden supervised poetical miscellanies and translated the works of Juvenal and Persius for the publisher Jacob Tonson with success. In 1692 he published *Eleonora*, a long memorial poem commissioned for a handsome fee by the husband of the Countess of Abingdon. But his great late work was his translation of Virgil, contracted by Tonson in 1694 and published in 1697. Dryden was now the grand old man of English letters and was often seen at Will's Coffee-House chatting with younger writers. His last work for Tonson was *Fables Ancient and Modern* (1700), which were mainly verse adaptations from the works of Ovid, Geoffrey Chaucer, and Giovanni Boccaccio, introduced with a critical preface. He died in 1700 and was buried in Westminster Abbey between Chaucer and Abraham Cowley in the Poets' Corner.

Besides being the greatest English poet of the later 17th century, Dryden wrote almost 30 tragedies, comedies, and dramatic operas. He also made a valuable contribution in his commentaries on poetry and drama, which are sufficiently extensive and original to entitle him to be considered, in the words of Dr. Samuel Johnson, as "the father of English criticism."

After Dryden's death his reputation remained high for the next 100 years, and even in the Romantic period the reaction against him was never so great as that against Alexander Pope. In the 20th century there was a notable revival of interest in his poems, plays, and criticism, and much scholarly work was done on them. In the late 20th century his reputation stood almost as high as at any time since his death.

(J.R.Su./Ed.)

Hall, *John Dryden, A Reference Guide* (1984). Critical studies include, on Dryden's poetry, Mark Van Doren, *John Dryden: A Study of His Poetry*, 3rd ed. (1946, reissued 1967); Arthur W. Hoffman, *John Dryden's Imagery* (1962, reissued 1968); Alan Roper, *Dryden's Poetic Kingdoms* (1965); and Earl Miner, *Dryden's Poetry* (1967, reissued 1971); on his plays, Arthur C. Kirsch, *Dryden's Heroic Drama* (1965, reissued 1972); Bruce King, *Dryden's Major Plays* (1966); and Frank H. Moore, *The Nobler Pleasure: Dryden's Comedy in Theory and Practice* (1963); and on his thought, Louis I. Bredvold, *The Intellectual Milieu of John Dryden* (1934, reissued 1966); and Philip Harth, *Contexts of Dryden's Thought* (1968).

Dryden, John Fairfield (b. Aug. 7, 1839, Temple Mills, Maine, U.S.—d. Nov. 24, 1911), American senator and businessman, the founder of the Prudential Insurance Company of America, the first company to issue industrial life insurance in the United States.

Dryden made a study, while attending Yale College (1861-65), of industrial, or "workman's," insurance (small policies usually based on weekly premiums) as developed by the Prudential Assurance Company of London

and by private benevolent societies. In 1873 Dryden and a few backers founded the Widows and Orphans Friendly Society in Newark, N.J. It was succeeded in 1875 by the Prudential Friendly Society, which took the name Prudential Insurance Company of America in 1877. Dryden was secretary of the company from 1875 to 1881 and president from 1881 until his death. He was U.S. senator from New Jersey in 1902-07. His son Forrest Fairfield Dryden (1864-1932) succeeded him as Prudential's president in 1912.

Articles are alphabetized word by word, not letter by letter

Drygalski, Erich Dagobert von (b. Feb. 9, 1865, Königsberg, Prussia [now Kaliningrad, Russia]—d. Jan. 10, 1949, Munich, Ger.), German geographer and glaciologist who led an expedition to the Antarctic (1901-03) as part of an international program of exploration.

Sailing in the *Gauss* under the sponsorship of the German government, Drygalski's party landed on Antarctica at about 90° E, in the area now known as Wilhelm II Coast. Trapped in the pack ice, they were forced to winter about 50 miles (80 km) east of Gaussberg, an

Drygalski
Bavaria-Verlag

ice-free volcanic peak that Drygalski named and that was a notable discovery. The results of the venture were published in 20 volumes of scientific reports, *Deutsche Südpolar-Expedition 1901-1903* (1905-31; "German South Polar Expedition"). His general account of the trip, *Zum Kontinent des eisigen Südens* ("Concerning the Continent of the Icy South"), appeared in 1904.

From 1906 to 1934 he was professor of geography at the University of Munich. In 1910 he took part in the expedition of Ferdinand, Count von Zeppelin, to the Arctic island of Spitsbergen (now Svalbard), north of Norway, where he studied the influence of glaciers on land features. With Fritz Machatschek he published a comprehensive textbook on glaciology, *Gletscherkunde* (1942; "Science of Glaciers").

drying oil, unsaturated fatty oil, either natural (such as linseed oil) or synthetic, that when spread into a thin film becomes hard, tough, and elastic upon exposure to the air. Drying oils are used as vehicles in paints, varnishes, and printing inks.

In the 2nd century AD, the Greek physician Galen wrote of the use of nut oils—e.g., hempseed and linseed oils—as drying oils. In the 6th century AD, another Greek physician, Aëtius, mentioned that certain nut oils could be used as a protective coating. The art of using drying oils for this purpose grew rapidly thereafter.

Chemical drying oils began to be used much later. The Flemish masters Hubert and Jan van Eyck were the first to use drying oils as a vehicle in oil painting in the early 15th century. The films deposited by drying oils may lose some of their elasticity upon aging.

dryland farming: see dry farming.

Dryopithecus, genus of extinct apelike animals that is representative of a group of small, generalized apes that contains the ancestors of both the modern apes and humans. Although *Dryopithecus* has been known by a variety of names based upon fragmentary material found over a widespread area including Europe, Africa, and Asia, it appears probable that only a single genus is represented. *Dryopithecus* is found as fossils in Miocene and Pliocene deposits (23.7 to 1.6 million years old) and apparently originated in Africa.

Several distinct forms of *Dryopithecus* are known, including small, medium, and large, gorilla-sized animals. In many ways, as might be expected, *Dryopithecus* is rather generalized in structure and lacks most of the specializations that distinguish the modern apes from modern humans. The canine teeth are larger than those in humans but not as strongly developed as those in modern apes. The limbs were not excessively long—an adaptation in the apes for swinging through the trees. The skull lacked the well-developed crests and massive brow ridges found in modern apes.

Dryopithecus proper likely gave rise to the modern gorillas and chimpanzees. Sometime during the Miocene Epoch, the dryopithecines gave rise to a derivative that eventually led to the earliest humanlike forms and finally to humans. A form close to this branching of the dryopithecine stock is represented by the genus *Ramapithecus*, distinguished by its more advanced dentition. The dryopithecines probably inhabited forested areas.

drypoint, an engraving method in which the design to be printed is scratched directly into a copperplate with a sharply pointed instrument. Lines in a drypoint print are characterized by a soft fuzziness caused by ink printed from a burr, a rough ridge of metal thrown up on each side of the furrow of the drypoint line. The course of the line, however, is often abruptly angular when changing directions, because the metal of the plate continually resists the engraving point. Drypoint is most often used with other printmaking techniques. It can be used to give dark accents to a nearly completed etching, for example, or it can be used first to sketch in lightly on a copperplate the proposed design for a line engraving.

Drypoint was in use by the late 15th century

"Weary," drypoint on thin Japanese paper by James McNeill Whistler, 1863

By courtesy of the National Gallery of Art, Washington, D.C., gift of Myron A. Hofer in memory of his mother, Jane Arms Hofer, 1947

and, in the early 16th century, the German artist Albrecht Dürer already had a thorough command of the technique. Its greatest master was Rembrandt (1606–69), in whose etchings drypoint became increasingly prominent. After suffering a period of neglect in the late 18th and early 19th centuries, drypoint was revived and has been used by most modern etchers. *See also* engraving; etching.

drywall construction, a type of construction in which the interior wall is applied in a dry condition without the use of mortar. It contrasts with the use of plaster, which dries after application.

The materials used in drywall construction are gypsum board, plywood, fibre-and-pulp boards, and asbestos-cement boards. The large, rigid sheets are fastened directly to the frame of the building with nails, screws, or adhesives or are mounted on furring (strips of wood nailed over the studs, joists, rafters, or masonry, which allow free circulation of air behind the interior wall).

Specialized tools for hanging drywall include the drywall hammer and the joint tool, which is similar to a plastering trowel but made of flexible steel with a concave bow. It is used to apply and smooth a plasterlike compound in joints between wallboards, feathering it out so that the outer edges virtually disappear and the joint, when painted, effectively becomes invisible. Nailheads, slightly depressed or “dimpled” by the hammer, disappear when similarly treated.

Drywall construction is used to avoid delays, because the interior walls do not have to dry before other work can be started, and to obtain specific finishes. Wallboard is manufactured in both finished and unfinished forms. Finished wallboards are faced with vinyl or other materials in a variety of permanent colours and textures, so that they need not be painted when installed. Backing materials and composition of the panel base determine the degree of insulation, fire resistance, and vapour barrier afforded. Wallboards are fire-rated from 1 hour to 4 hours according to the time that a fire’s progress would be retarded by the wallboard.

Because drywall is mounted on the frame of a building, the framing lumber must be straight for the interior wall to align perfectly; and the lumber must have low moisture content to avoid loosening of the drywall nails. These problems are not encountered in the use of plaster for interior finishes. However, because of the time that it saves, drywall construction has become relatively common in residential buildings.

Dschang, town, northwestern Cameroon, west central Africa, on a forested plateau northwest of Yaoundé. Its high elevation of 4,525 feet (1,379 m) makes the town a health and tourist resort, despite communications difficulties caused by rugged terrain and high rainfall. It is also a local trade centre for agricultural products and livestock. In the vicinity there are experimental plantations growing cinchona (plants whose bark yields quinine), an experimental station for processing green tea, and a hydroelectric power plant. Bauxite deposits are located nearby at Fongo-Tongo, and there is a small brick-making industry. Dschang is served by a hospital, an agricultural college, and an airfield. Pop. (2001 est.) 37,600.

DSM, in full NAAMLOZE VENNOOTSCHAP DSM (Dutch: DSM Limited Company), state-owned Dutch chemical company. Until 1975 the company was known as DSM NV Nederlandse Staatsmijnen (the Dutch State Mine Company). The major shareholder is The Netherlands government. Headquarters are in Heerlen, Neth.

Following World War II, the chemical industry was one of the fastest growing sectors of the

Dutch economy. Its output increased 10-fold between the late 1940s and the early ’70s. In the late 20th century, however, the company was beset with problems caused by worldwide recession, and it cut back sharply on investment in chemical production. High wage levels, necessary antipollution improvements, and soaring energy costs also contributed to the company’s financial difficulties.

In addition to chemicals, the company produces fertilizers, plastics, building materials, oil and petroleum products, and household products. It also participates in North Sea oil exploration.

Du Bois, Franz: *see* Sylvius, Franciscus.

Du Bois, W(illiam) E(dward) B(urghardt) (b. Feb. 23, 1868, Great Barrington, Mass., U.S.—d. Aug. 27, 1963, Accra, Ghana), American sociologist, the most important black protest leader in the United States during the first half of the 20th century. He shared in the creation of the National Association for the Advancement of Colored People (NAACP) in 1909 and edited *Crisis*, its magazine, from 1910 to 1934. Late in life he became identified with Communist causes.

Early career. Du Bois was graduated from Fisk University, a black institution at Nashville, Tenn., in 1888. He received a Ph.D. from Harvard University in 1895. His

W.E.B. Du Bois
By courtesy of Atlanta University

doctoral dissertation, *The Suppression of the African Slave-Trade to the United States of America, 1638–1870*, was published in 1896. Although Du Bois took an advanced degree in history, he was broadly trained in the social sciences; and at a time when sociologists were theorizing about race relations, he was conducting empirical inquiries into the condition of blacks. For more than a decade he devoted himself to sociological investigations of blacks in America, producing 16 research monographs published between 1897 and 1914 at Atlanta University, where he was a professor, as well as *The Philadelphia Negro: A Social Study* (1899), the first case study of a black community in the United States.

Although originally Du Bois had believed that social science could provide the knowledge to solve the race problem, he gradually came to the conclusion that in a climate of virulent racism, expressed in such evils as lynching, peonage, disfranchisement, Jim Crow segregation laws, and race riots, social change could be accomplished only through agitation and protest. In this view, he clashed

with the most influential black leader of the period, Booker T. Washington, who, preaching a philosophy of accommodation, urged blacks to accept discrimination for the time being and elevate themselves through hard work and economic gain, thus winning the respect of the whites. In 1903, in his famous book *The Souls of Black Folk*, Du Bois charged that Washington’s strategy, rather than freeing the black man from oppression, would serve only to perpetuate it. This attack crystallized the opposition to Booker T. Washington among many black intellectuals, polarizing the leaders of the black community into two wings—the “conservative” supporters of Washington and his “radical” critics.

Two years later, in 1905, Du Bois took the lead in founding the Niagara Movement, which was dedicated chiefly to attacking the platform of Booker T. Washington. The small organization, which met annually until 1909, was seriously weakened by internal squabbles and Washington’s opposition. But it was significant as an ideological forerunner and direct inspiration for the interracial NAACP, founded in 1909. Du Bois played a prominent part in the creation of the NAACP and became the association’s director of research and editor of its magazine, *Crisis*. In this role he wielded an unequalled influence among middle-class blacks and progressive whites as the propagandist for the black protest from 1910 until 1934.

Both in the Niagara Movement and in the NAACP, Du Bois acted mainly as an integrationist, but his thinking always exhibited, to varying degrees, separatist-nationalist tendencies. In *The Souls of Black Folk* he had expressed the characteristic dualism of black Americans:

One ever feels his twoness—an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder. . . . He simply wishes to make it possible for a man to be both a Negro and an American, without being cursed and spit upon by his fellows, without having the doors of Opportunity closed roughly in his face.

Black nationalism and socialism. Du Bois’s black nationalism took several forms—the most influential being his pioneering advocacy of Pan-Africanism, the belief that all people of African descent had common interests and should work together in the struggle for their freedom. Du Bois was a leader of the first Pan-African Conference in London in 1900 and the architect of four Pan-African congresses held between 1919 and 1927. Second, he articulated a cultural nationalism. As the editor of *Crisis* he encouraged the development of black literature and art and urged his readers to see “Beauty in Black.” Third, Du Bois’s black nationalism is seen in his belief that blacks should develop a separate “group economy” of producers’ and consumers’ cooperatives as a weapon for fighting economic discrimination and black poverty. This doctrine became especially important during the economic catastrophe of the 1930s and precipitated an ideological struggle within the NAACP.

He resigned from the editorship of *Crisis* and the NAACP in 1934, yielding his influence as a race leader and charging that the organization was dedicated to the interests of the black bourgeoisie and ignored the problems of the masses. Du Bois’s interest in cooperatives was a part of his nationalism that developed out of his Marxist leanings. At the turn of the century, he had been an advocate of black capitalism and black support of black business, but by about 1905 he had been drawn toward Socialist doctrines. Although he joined the Socialist Party only briefly in 1912,

he remained sympathetic with Marxist ideas throughout the rest of his life.

Upon leaving the NAACP he returned to Atlanta University, where he devoted the next 10 years to teaching and scholarship. In 1940 he founded the magazine *Phylon*, Atlanta University's "Review of Race and Culture." In 1945 he published the "Preparatory Volume" of a projected encyclopaedia of the black, for which he had been appointed editor in chief. He also produced two major books during this period. *Black Reconstruction: An Essay Toward a History of the Part Which Black Folk Played in the Attempt to Reconstruct Democracy in America, 1860-1880* (1935) was an important Marxist interpretation of the Reconstruction era (the period following the American Civil War during which the seceded Southern states were reorganized according to the wishes of Congress); and, more significantly, it provided the first synthesis of existing knowledge on the role of blacks in that critical period of American history. In 1940 appeared *Dusk of Dawn*, subtitled *An Essay Toward an Autobiography of a Race Concept*. In this brilliant book, Du Bois explained his role in both the African and African-American struggles for freedom, viewing his career as an ideological case study illuminating the complexity of the black-white conflict.

Following this fruitful decade at Atlanta University, he returned once more to a research position at the NAACP (1944-48). This brief connection ended in a second bitter quarrel, and thereafter Du Bois moved steadily leftward politically. Identified with pro-Russian causes, he was indicted in 1951 as an unregistered agent for a foreign power. Although a federal judge directed his acquittal, Du Bois had become completely disillusioned with the United States. In 1961 he joined the Communist Party and, moving to Ghana, renounced his American citizenship more than a year later. *The Autobiography of W.E.B. Du Bois* was published in 1968. (E.L.R.)

Du Bois-Reymond, Emil Heinrich (b. Nov. 7, 1818, Berlin, Prussia [Germany]—d. Dec. 26, 1896, Berlin, Ger.), German founder of modern electrophysiology, known for his research on electrical activity in nerve and muscle fibres.

Working at the University of Berlin (1836-96) under Johannes Müller, whom he later succeeded as professor of physiology (1858), Du Bois-Reymond studied fishes that are capable of generating electrical currents. Turning to the study of electrical conduction along

Du Bois-Reymond, engraving, about 1900

Archiv für Kunst und Geschichte, Berlin

nerve and muscle fibres, he found (1843) that a stimulus applied to the electropositive surface of the nerve membrane causes a decrease in electrical potential at that point and that this "point of reduced potential"—the impulse—travels along the nerve as a "wave of relative negativity." He immediately was able to demonstrate that this phenomenon of "negative variation" also occurs in striated muscle and is the primary cause of muscular contraction. Although later research showed the process of nerve and muscle stimulation to be much more complex than Du Bois-Reymond's model, the summation of his studies in *Untersuchungen über thierische Elektrizität*, 2 vol. (1848-1884; "Researches on Animal Electricity"), created the field of scientific electrophysiology.

Du Bois-Reymond's intellectual collaboration with Hermann von Helmholtz, Carl Ludwig, and Ernst von Brücke proved to be of great importance to the course of German physiology and to biological thought in general. At the university, their biophysics program, designed to reduce physiology to applied physics and chemistry, influenced the psychological theories of Sigmund Freud and did much to purge physiology of vitalistic theories that depicted all organic matter as arising from a "life force" peculiar to living things and quite different from all known physical phenomena.

Du Bos, Charles (b. Oct. 27, 1882, Paris, Fr.—d. Aug. 5, 1939, La Celle-Saint-Cloud), French critic of French and English literature whose writings on William Shakespeare, Percy Bysshe Shelley, and Lord Byron helped turn French attention toward English literature.

Because his mother was English, Du Bos was exposed to English literature at an early age. He studied at the University of Oxford for a year (1900-01) and also in Germany. Among his works are studies of J.W. von Goethe and of the French authors Gustave Flaubert, Prosper Mérimée, and François Mauriac and correspondence with his friend André Gide. The correspondence was published as *Le Dialogue avec André Gide* (1929; 2nd ed., *Lettres de Charles Du Bos et réponses d'André Gide*, 1950). His chief interest was in what he called the "soul" of a work and its effects in the "soul" of a reader. As he became older, this concern became increasingly religious, and his *Journal intime*, 6 vol. (1946-55), written partly in English, is an account of the spiritual evolution that brought him into the Roman Catholic church in 1927.

Du Buat, Pierre-Louis-Georges (b. April 23, 1734, Tortisambert, Fr.—d. Oct. 17, 1809, Vieux-Condé), French hydraulic engineer who derived formulas for computing the discharge of fluids from pipes and open channels.

Educated in Paris, Du Buat served as a military engineer from 1761 to 1791. In his writings, he compiled a wealth of experimental data from which he determined his basic algebraic expression for discharge from pipes and channels. Although valid only within the range of his experimental data, this equation provided the best available means at the time of predicting the performance of water-supply systems and similar works. His emphasis on achieving results that would be of practical use in the design of hydraulic works strongly influenced the development of experimental hydraulics in the 18th and 19th centuries.

Du Camp, Maxime (b. Feb. 8, 1822, Paris, Fr.—d. Feb. 9, 1894, Baden-Baden, Ger.), French writer and photographer who is chiefly known for his vivid accounts of 19th-century French life. He was a close friend of the novelist Gustave Flaubert.

An outgoing, adventurous man, Du Camp also pioneered in photography and published works in virtually every literary genre. He traveled widely with Flaubert (1844-45 and

1849-51), and his *Égypte, Nubie, Palestine et Syrie* (1852), written after one of their journeys, is among the first books illustrated with photographs. During the revolutionary year 1848 he was wounded and then decorated

Du Camp
H. Roger-Vollet

for counterrevolutionary activity in France. His *Expédition des deux-Siciles* (1861; "Expedition to the Two Sicilies") recounted his experiences as a volunteer with the Italian revolutionary Giuseppe Garibaldi.

In 1851 Du Camp founded the *Revue de Paris* and in it published Flaubert's great novel, *Madame Bovary*; disputes arising from the publication of the novel ended their friendship. To *La Revue des Deux Mondes*, Du Camp contributed his *Paris, ses organes, ses fonctions et sa vie*, 6 vol. (1869-75; "Paris, Its Mechanisms, Its Workings, and Its Life"), an extensive document of the city. He also wrote poems (*Les Chants modernes*, 1855; "Modern Songs"), art criticism, novels, a monograph on his friend, the writer Théophile Gautier, and *Souvenirs littéraires*, 2 vol. (1882-83; "Literary Recollections"), which included previously unrevealed information about Flaubert and his struggles with epilepsy.

du Cange, Charles du Fresne, seigneur: see Cange, Charles du Fresne, seigneur du.

Du Casse, Pierre-Emmanuel-Albert, Baron (b. Nov. 16, 1813, Bourges, Fr.—d. March 15, 1893, Paris), French soldier and military historian who was the first editor of the correspondence of Napoleon.

In 1849 Du Casse was commissioned by Prince Jérôme Bonaparte, formerly king of Westphalia, to write a history of one of his commands. On completion of that work, the prince named him aide-de-camp and asked him to edit the papers of Napoleon. Because Du Casse worked with little care, the editions, beginning with *Mémoires pour servir à l'histoire de la campagne de 1812 en Russie* (1852; "Historical Memoirs of the Russian Campaign of 1812"), were not entirely trustworthy, but they did throw some light on Napoleon and his entourage. Du Casse wrote and edited numerous other works, including *La Guerre au jour le jour, 1870-71* (1875; "The War: A Day to Day Account, 1870-71"), *Les Rois frères de Napoléon* (1883; "The Brothers Napoleon, Kings"), and *La Crimée et Sébastopol, de 1853 à 1856* (1892), an account of his experiences in the Crimean War.

Du Fu (Chinese poet): see Tu Fu.

du Maurier, Dame Daphne, married name LADY DAPHNE BROWNING (b. May 13, 1907, London, Eng.—d. April 19, 1989, Par, Cornwall), English novelist and playwright, daughter of actor-manager Sir Gerald du Maurier, best known for her novel *Rebecca* (1938).

Du Maurier's first novel, *The Loving Spirit* (1931), was followed by many successful, usually romantic tales set on the wild coast of Cornwall, where she came to live. She also wrote historical fiction, several plays, and *Vanishing Cornwall* (1967), a travel guide. Her popular *Rebecca* was made into a motion pic-

ture in 1940. Du Maurier was made a Dame Commander in the Order of the British Empire in 1969. She published an autobiography, *Growing Pains*, in 1977; the collection *The Rendezvous and Other Stories* in 1980; and a literary reminiscence, *The Rebecca Notebook and Other Memories*, in 1981.

du Maurier, George, in full GEORGE LOUIS PALMELLA BUSSON DU MAURIER (b. March 6, 1834, Paris, Fr.—d. Oct. 6, 1896, London, Eng.), British caricaturist whose illustrations for *Punch* were acute commentaries on the Victorian scene. He also wrote three successful novels.

Du Maurier's happy childhood at Passy, Fr., is recalled in *Peter Ibbetson* (1891); his full-blooded enjoyment of student life in the Latin Quarter of Paris is reflected in *Tribby* (1894); in *The Martian* (1897) there is a poignant episode based on his own tragic experience of losing the sight of his left eye. This misfortune obliged him to abandon painting in favour of drawing. In 1860 he moved to London, where his skilled draftsmanship and engaging personality quickly established his success. His gently satiric caricatures were mainly aimed at the growing nouveau riche class and the aesthetes led by Oscar Wilde. His book illustrations and drawings for such periodicals as *Once a Week* and *The Leisure Hour*, however, are sometimes considered his best work. His granddaughter, Daphne du Maurier, edited *The Young George du Maurier: A Selection of His Letters, 1860–1867* in 1951.

du Maurier, Sir Gerald, in full SIR GERALD HUBERT EDWARD BUSSON DU MAURIER (b. March 26, 1873, London, Eng.—d. April 11, 1934, London), actor-manager, the chief British exponent of a delicately realistic style of acting that sought to suggest rather than to state the deeper emotions.

A son of the artist and novelist George du Maurier, he won immense popularity, but the fact that he presented characters in terms of his

Sir Gerald du Maurier, 1929
By courtesy of the National Film Archive, London

own personality, in contemporary plays, led many to underrate him. Educated at Harrow, du Maurier made his debut in 1894. Among the plays in which he appeared were Sir James Barrie's *Admirable Crichton*, *Peter Pan*, and *Dear Brutus*. He joined in the management of Wyndham's Theatre in 1910 and then of the St. James's in 1925. He was knighted in 1922. He also acted in and produced films.

BIOGRAPHY. Daphne du Maurier, *Gerald: A Portrait* (1934, reissued 1970).

Du Mont, Allen B., in full ALLEN BALCOM DU MONT (b. Jan. 29, 1901, Brooklyn, N.Y., U.S.—d. Nov. 15, 1965, New York, N.Y.), American engineer who perfected the first commercially practical cathode-ray tube, which was not only vitally important for much scientific and technical equipment but was the essential component of the modern television receiver.

Du Mont joined the Westinghouse Lamp Company, Bloomfield, N.J., in 1924 as an engineer in the development laboratory. He developed high-speed manufacturing and testing

Du Mont, 1953
AP/Wide World Photos

equipment that allowed Westinghouse to increase its production to 50,000 vacuum tubes a day.

In 1928 Du Mont became chief engineer of the De Forest Radio Company, Passaic, N.J., where he became interested in the patents and equipment of Charles F. Jenkins, who had established an experimental television station in the early 1920s. Working from Jenkins' patents, Du Mont set up a simultaneous picture and sound broadcast in 1930 and concluded that electromechanical systems were inadequate for practical television and that a purely electronic system was needed.

Du Mont set up a company in 1931 that later was known as Allen B. Du Mont Laboratories, Inc. He improved cathode-ray tubes and developed the modern oscilloscope, widely used in the laboratory for the measurement and study of wave forms.

In 1937 Du Mont began manufacturing the first commercial television receivers, which were based upon his improved cathode-ray tube. His company also established experimental television transmission facilities and marketed the first postwar television receivers.

Du Mont served with the National Television System Committee, which formulated the broadcast standards for both black-and-white and colour television. He also worked with the Federal Communications Commission concerning the allocation of frequencies for television channels.

du Pont FAMILY, French-descended American family whose fortune was founded on explosive powders and textiles and who diversified later into other areas of manufacturing. Pierre-Samuel du Pont (*q.v.*), born in Paris, was one of the main writers of the physiocratic school of economics. His sons founded the two branches of the du Pont family.

The first son, Victor-Marie du Pont (1767–1827), was attaché to the first French legation to the United States (1787), aide-de-camp to Lafayette (1789–91), second secretary of the French legation (1791–92), and first secretary (1795–96). In 1800 he returned to settle in the United States and became naturalized. When his attempts in New York at a mercantile importing business (1802–05) and then a land development project (1806–09) both failed, he went south to manage his brother Irénée's woolen mills in Wilmington, Del., but was largely ineffectual in this too. He was later a director of the Bank of the United States, Philadelphia. His son, Samuel Francis du Pont (1803–65), was a U.S. naval officer. He served in the Mexican War, was on the board that designed the curriculum for the Naval Academy at Annapolis, Md., and commanded squadrons and fleets in the blockade of the South during the American Civil War, rising to the rank of rear admiral. A naval attack that he led on the defenses of Charleston, S.C., in 1863, however, met a crushing defeat,

and he was relieved of command; he retired from active duty.

The other son of Pierre-Samuel, Eleuthère-Irénée du Pont (1771–1834), had worked at the French royal powder works before arriving in America in 1800. Impressed by the poor quality and high price of American powder, he made further studies and eventually in 1802 established a gunpowder plant near Wilmington, Del., that became highly profitable, especially during the War of 1812, and that marked the successful beginning of the E.I. du Pont de Nemours and Co. (the name that he chose in 1833). He also established a woolen mill and pursued farming as an avocation. His immediate successors were two sons, Alfred Victor du Pont (1798–1856), who headed the company from 1834 to 1850 in a traditional manner, and Henry du Pont (1812–89), who proved more vigorously enterprising. Though a graduate of West Point (1833), Henry left the army a year later and joined the family business, heading the company during the great period from 1850 to 1889 and expanding its activities especially after the Civil War; he acquired powder works as far away as California and gained control of various associated enterprises. In the course of this time he was in partnership with other members of the family. One of his sons, Henry Algernon du Pont (1838–1926), was a graduate of West Point and a Medal of Honor winner in the Civil War; he entered the family business in 1878 and pushed for its incorporation in 1899. Retiring in 1902, he was U.S. senator from Delaware from 1906 to 1917. In 1902, three cousins—Thomas Coleman du Pont (1863–1930), Alfred Irénée du Pont (1864–1935), and Pierre Samuel du Pont (1870–1954)—became chief directors, assuring that direction of the corporation would remain in the family.

"De," "la," and similar components of a name, when followed by a space, are alphabetized as separate words (e.g., De Forest, Lee). When they are joined to the following part of a name, the combination is treated as a single word (e.g., DeForest, John William).

du Pont, Pierre-Samuel, in full PIERRE-SAMUEL DU PONT DE NEMOURS (b. Dec. 14, 1739, Paris, Fr.—d. Aug. 6, 1817, Eleutherian Mills, near Wilmington, Del., U.S.), French economist whose numerous writings were mainly devoted to spreading the tenets of the physiocratic school and whose adherence to these doctrines largely explains his conduct during his long political career.

An early work on free trade, *De l'Exportation et de l'importation des grains* (1764; "On

Pierre-Samuel du Pont, engraving by L.-J. Cathelin, after a portrait by J. Ducreux
By courtesy of the Bibliotheque Nationale Paris

the Export and Import of Grains"), brought him the friendship of A.-R.-H. Turgot, whose biography he wrote (1782) and whose papers he edited (9 vol., 1809-11). When Turgot became minister of finance in 1774, du Pont served as inspector general of commerce (1774-76). He was largely responsible for the clause in the Treaty of Versailles of 1783 calling for a trade treaty between France and Great Britain, and he greatly influenced the free-trade treaty between France and Britain that was signed in 1786. For these services he was ennobled. In 1787 he became secretary to the Assembly of Notables. An adherent of a constitutional monarchy, he was a member of the Estates-General convened for 1789, in which he represented the third estate of Nemours.

One of the chief promoters of the Tennis Court oath, he played an important part in the beginnings of the French Revolution. He was opposed to the policies of the radical republicans, and he defended Louis XVI in August 1792. Though forced into hiding during the Terror and later imprisoned, he was eventually released through the help of friends. A member of the Chamber of Ancients under the Directory, he was suspected of activities on behalf of the royalists and was again arrested but quickly released.

He now planned to go to the United States. After much delay, he arrived in the United States with his sons, Élèuthère Irénée and Victor, in January 1800. For Thomas Jefferson he drew up a scheme of national education and established companies to promote Franco-American trade. These ventures were not successful, but Élèuthère, a pupil of the French chemist Antoine Lavoisier, founded a powder-manufacturing company in the United States that eventually became one of the largest chemical-manufacturing firms in the world.

In 1802 Pierre-Samuel returned to France to promote the sale of Louisiana to the United States, hoping thereby to improve Franco-American relations. He became vice president of the Paris Chamber of Commerce. He eventually became critical of Napoleon's economic and foreign policy. In 1814 he assisted Talleyrand in restoring the Bourbons, became secretary-general of the provisional government, and was made councillor of state by Louis XVIII. During the Hundred Days he left France and went to the United States, where he remained.

du Pont, Pierre Samuel (b. Jan. 15, 1870, Wilmington, Del., U.S.—d. April 5, 1954, Wilmington), manufacturer and the largest American munitions producer during World War I.

Pierre Samuel du Pont was the great-grandson and namesake of the French economist, whose son, Élèuthère Irénée du Pont, began the family's fortunes in America in 1802. Graduating from the Massachusetts Institute of Technology in 1890, the young du Pont joined his family's firm, E.I. du Pont de Nemours Powder Co. He was made assistant superintendent at the Carney's Point, N.J., plant, where he helped produce a smokeless shotgun powder. The family enterprise went through a consolidation in 1902, creating one company, E.I. du Pont de Nemours & Co., out of almost 100 firms. Du Pont became its treasurer and then its president from 1915 to 1919, when he became chairman of the board, a post he held until 1940. He saw the firm's production expand from 12,000,000 pounds of munitions yearly before the war to more than 1,000,000 pounds each day at the height of production during World War I. The company constructed a facility near Nashville, Tenn., for smokeless powder production that became the largest such factory in the world.

Moreover, production began in part of the facility only 67 days after groundbreaking ceremonies. Before the war ended, the du Pont company had sold nearly 1,500,000,000 pounds of explosives to the government and its allies.

After the war, Pierre Samuel du Pont purchased enough stock in the General Motors Corporation to place himself as president (1920-23) and as chairman of the board (1923-29). Besides serving on the boards of numerous banks and corporations, du Pont donated generously to educational activities in Delaware. In 1940 he retired to his 1,000-acre estate, Longwood, though he continued his philanthropies.

Du Pont Company, byname of E.I. DU PONT DE NEMOURS & COMPANY, American corporation engaged primarily in the manufacture of chemicals, plastics, and synthetic fibres. The company was founded by Élèuthère Irénée du Pont (1771-1834) in Delaware in 1802 to produce black powder and later other explosives, which were the company's main products until the 20th century, when it began a diversification of products. Today Du Pont has plants, subsidiaries, and affiliates worldwide. Headquarters are in Wilmington, Del.

As a young French émigré, du Pont discovered that a good prospect for business in America would be the milling of gunpowder. Returning to Paris, he found investors, and on April 21, 1801, the articles of partnership were signed for E.I. du Pont de Nemours & Company. On July 19, 1802, he settled along the Brandywine Creek near Wilmington, Del., and hired workmen to build his powder mills. The first black powder was marketed two years later; sales rose yearly, especially during the War of 1812, and by the time of his death his mills were a major American enterprise.

Blasting powders for industries, mines, and quarries were becoming more important, and in 1857 the company produced a "soda powder" that was the first strictly industrial explosive. In 1880 it began manufacturing nitroglycerin and dynamite. In 1904, as a by-product of its manufacture of explosives, it began producing a special nitrocellulose for lacquers, leather finishes, etc. Nitrocellulose plastics came in 1915; and the purchase of a number of firms in 1917 brought in dyestuffs, paints, acids, heavy chemicals, and other products. Du Pont first introduced neoprene synthetic rubber in 1931 and nylon in 1938 and expanded into such diverse products as plastics, electrochemicals, photographic film, and agricultural chemicals. A few of the famous Du Pont synthetics were Orlon, Mylar, and Dacron.

The company first incorporated in 1899, after nearly a century as a partnership. In 1907 it became the target of a U.S. antitrust suit and in 1912 was forced to divest itself of a major proportion of its powder business. In 1917 the company began buying an interest in General Motors Corporation and owned 25 percent of the stock at the end of 1925. In 1962, after 13 years of antitrust litigation, Du Pont was ordered to divest itself of GM stock.

Corporate management was also changing. From 1802 to 1940 all heads of the company had been members of the du Pont family, and all but one (a son-in-law, presiding 1834-37) had borne the du Pont name. This control had been reinforced in 1915 by creation of the Christiana Securities Company, whose major stockholders were du Ponts and which had effective control (28 percent) of the shares of E.I. du Pont de Nemours & Company (newly incorporated that year). By the 1970s, under the tax laws, however, the du Ponts found the setup disadvantageous and in 1977 succeeded (after lengthy litigation) in having Christiana merged into the Du Pont Company. Direction of the company was passing to persons unrelated to the du Ponts, and the compa-

ny's structure was changing; after 1940 only one chief executive was a du Pont (1962-67), and the company underwent extensive departmental reorganizations in 1967 and 1973-76, largely to streamline operations in the face of stiffening foreign competition. In 1981 Du Pont acquired Conoco, Inc. (Continental Oil Company), which it continued to operate as a subsidiary.

Du Sable, Jean-Baptist-Point (b. 1750?, St. Marc, Sainte-Domingue [now Haiti]—d. Aug. 28, 1818, St. Charles, Mo., U.S.), black pioneer trader and founder of the settlement that later became the city of Chicago.

Du Sable, whose French father had moved to Haiti and married a black woman there, is believed to have been a freeborn. At some time in the 1770s he went to the Great Lakes area of North America, settling on the shore of Lake Michigan at the mouth of the Chicago River, with his Potawatomi wife, Kittihawa (Catherine). His loyalty to the French and the Americans led to his arrest in 1779 by the British, who took him to Fort Mackinac. From 1780 to 1783 or 1784 he managed for his captors a trading post called the Pinery on the St. Clair River in present-day Michigan, after which he returned to the site of Chicago. By 1790 Du Sable's establishment there had become an important link in the region's fur and grain trade.

In 1800 he sold out and moved to Missouri, where he continued as a farmer and trader until his death. But his 20-year residence on the shores of Lake Michigan had established his title as Father of Chicago.

Du Toit, Jakob Daniel, pseudonym TOTIUS (b. Feb. 21, 1877, Paarl, Cape Colony, S.Af.—d. July 1, 1953, Pretoria, Transvaal), Afrikaans poet, pastor, biblical scholar, and the compiler of an Afrikaans Psalter (1936), regarded as one of the finest poetic achievements of its kind in Dutch, Flemish, or Afrikaans.

Du Toit was educated in Pretoria, Rustenburg, and Daljosafat, studied at the theological seminary at Burgesdorp, and passed his final examination for the ministry of the Dutch Reformed Church in 1899.

On the outbreak of the South African War he joined the Boer forces as chaplain. In 1900 he went to the Free University, Amsterdam, where he received a doctor's degree in theology in 1903 and then entered the ministry. From 1911 he was professor of theology at the University of Potchefstroom, Transvaal; on retirement in 1949 he was elected chancellor.

Du Toit was responsible for the greater part of the translation of the Bible into Afrikaans, completed in 1932. The Calvinism and patriotism confirmed in him by the circumstances of his childhood and training are revealed at a high artistic level in his finest poetry, the patriotic poems in *Trekkersvee* (1915) and the personal lyrics in *Passieblomme* (1934) and *Skemering* (1948). These and other volumes—including *By die Monument* (1908), *Verse van Potgieter's Trek* (1909), *Wilgerboombgies* (1912), *Rachel* (1913), and *Uit donker Afrika* (1936)—also show the influence of the Flemish poet Guido Gezelle.

Du Toit, Stephanus Jacobus (b. 1847, Paarl, Cape Colony—d. May 29, 1911, Cape Province, Union of South Africa), South African pastor and political leader who, as the founder of the Afrikaner Bond (a bitterly anti-British political party of Dutch South Africans), was influential in generating Boer (Dutch) political opposition to British rule in South Africa. He was also instrumental in the establishment of Afrikaans (a dialect of Dutch) as an official language in South Africa.

Du Toit's political career began in 1875, when he founded an organization, the Society of True South Africans. He began publishing books in Afrikaans and translated the Bible into that language. His movement had the si-

multaneous effects of establishing Afrikaans as a literary language and of rallying Boer political consciousness around a common Afrikaner culture. He created the Afrikaner Bond in 1879, and by 1884 it was the most important Boer party in Cape Colony. In 1882 Du Toit migrated to the Boer republic of the Transvaal to become its superintendent of education.

du Vigneaud, Vincent (b. May 18, 1901, Chicago, Ill., U.S.—d. Dec. 11, 1978, White Plains, N.Y.), American biochemist and winner of the Nobel Prize for Chemistry in 1955 for the isolation and synthesis of two pituitary hormones: vasopressin, which acts on the muscles of the blood vessels to cause elevation of blood pressure; and oxytocin, the principal

Du Vigneaud, 1968

agent causing contraction of the uterus and secretion of milk.

Du Vigneaud studied at the University of Illinois, Urbana, took his Ph.D. from the University of Rochester, N.Y. (1927), then studied at Johns Hopkins University, Baltimore, the Kaiser Wilhelm Institute, Berlin, and the University of Edinburgh. He headed the biochemistry department of the George Washington University Medical School, Washington, D.C. (1932–38), and was professor and head of the department of biochemistry at the Cornell University Medical College, New York City (1938–67), and professor of chemistry at Cornell University, Ithaca, N.Y. (1967–75).

Under du Vigneaud's direction, the Cornell laboratories contributed to such major achievements as the synthesis of penicillin, the isolation and determination of the structure of the sulfur-bearing vitamin biotin, and the examination of many other sulfur-containing organic compounds.

Dual Alliance, also called FRANCO-RUSSIAN ALLIANCE, a political and military pact that developed between France and Russia from friendly contacts in 1891 to a secret treaty in 1894; it became one of the basic European alignments of the pre-World War I era. Germany, assuming that ideological differences and lack of common interest would keep republican France and tsarist Russia apart, allowed its Reinsurance Treaty (*q.v.*) with Russia to lapse in 1890. In the event of war, France wanted support against Germany; and Russia, against Austria-Hungary. The two powers slowly came closer together, upsetting the system of alliances that had been established by Otto Von Bismarck to protect Germany against such a potential "two-front" threat. In August 1891 they made a preliminary agreement to consult in case of aggression against either of them. This agreement was strengthened by a military convention in August 1892. To preserve secrecy, it was necessary to bypass discussion and ratification by the French Parliament, the alliance being formalized through an exchange of letters (Dec. 27, 1893–Jan. 4, 1894) that accepted the previously agreed

upon terms. The new alliance was to be in force as long as the Triple Alliance (*q.v.*) of Germany, Austria-Hungary, and Italy, and its terms were to be secret. It provided that in the event of an attack on France by Germany or by Italy supported by Germany, Russia would field 700,000 to 800,000 men to fight Germany; in the event of an attack on Russia by Germany or by Austria-Hungary supported by Germany, France would field 1,300,000 men to fight Germany. Provisions for specific military plans and organizations were also made. The alliance was renewed and strengthened in 1899 and 1912.

Dual Monarchy: *see* Austria-Hungary.

dual organization, a social structure characterized by the division of society into two complementary parts called moieties. According to a strict definition, moieties are groups that are exogamous (*i.e.*, marriage between members of the same moiety is forbidden), of unilineal descent, and in some sense opposed. Sometimes the term moiety is used more loosely to refer simply to one of two divisions of a society, regardless of descent or marriage regulation. Dual organization, then, occurs in two basic forms: as a feature related to but not necessarily determining the regulation of marriage (kinship moieties) and as a ceremonial organization. Usually the two forms are combined, but sometimes only one form occurs, or the two appear concurrently as separate systems. Thus, the Canela of South America have four dual schemes, one of which regulates marriage whereas the other three are independent ceremonial groupings; all of these bisect the tribe exhaustively and determine membership by the name given a person by his maternal uncle, by the generation of his peer group, or by affiliation to one of the Canela social groups.

Although moieties are often referred to interchangeably with phratries and clans, they are distinct from these two groupings. Phratries comprise two or more related clans, and there must be more than two phratries in the society. Clan members emphasize descent from a common ancestor, whereas members of a moiety, while regarding themselves as related, do not stress common descent. Clans function frequently as landholding units and in cooperative economic enterprises; moieties do so rarely. More frequently moieties align themselves according to divisions in myth and folklore, such as the Tagaro and Supwe moieties of north Pentecost Island (Vanuatu), named for two culture heroes and bearing the respective traits of each.

On a worldwide basis, matrilineal moieties (matrimoieties) are far more common than patrilineal moieties (patrimoieties) and are generally found in association with smaller kin groups, such as lineages and clans. In all cases—whether the moieties are exogamous or nonexogamous, unilineal or not, or whether they are aligned on the basis of season, geographic position, name bestowal or other criteria—they serve to divide society into two opposed parts that channel reciprocal duties and rights, competition, and cooperation.

Duala, also spelled DOUALA, Bantu-speaking people of the forest region of southern Cameroon living on the estuary of the Wouri River. By 1800 the Duala controlled Cameroon's trade with Europeans, and their concentrated settlement pattern developed under this influence. Their system of chieftaincy was partly founded on trading wealth. For much of the 19th century there were two political-commercial kingdoms, Bell and Akwa; these were weakened by the 1880s.

The Wouri estuary now supports a fishing and agricultural economy in which oil palms, cassava, cocoyam (taro), plantain, and corn (maize) are the principal crops. The Duala trace descent patrilineally, and associations,

or secret societies, serve as instruments of social control. By the 1970s most Duala were nominal Christians. Their older religious system recognized a high god, or creator, but no further pantheon and no true shrines or priests. Other beliefs concerned the power of ancestors, witchcraft, and magical objects.

Many Duala are now found in various urban occupations. In the late 20th century the chiefly lines remained an elite, but their influence was waning.

dualism, in religion, belief in two supreme opposed powers or gods, or sets of divine or demonic beings, that control the world. Dualism is a phenomenon of major importance in the religions of the ancient world.

A brief treatment of religious dualism follows. For full treatment, *see* MACROPAEDIA: Religious and Spiritual Belief, Systems of.

A certain kind of dualism is implied in every religion by the simple fact that the *sacred* is considered to be radically different from and opposed to the *profane*. Hindu philosophy posits an eternal dialectical tension between ultimate reality and the illusory world of phenomena. Greek philosophers from Parmenides to Plato exhibit a marked preoccupation with either refuting or asserting dualistic conceptions of reality. In Chinese Taoism, the entire inventory of opposing principles in the world is embraced in the dualistic doctrine of Yin-Yang.

In terms of mythology, most polytheistic religions recognize a class of supernatural beings (such as demons, Titans, monsters) that are different from and antagonistic to the gods. Even within a single pantheon of divinities there may be noted a tension and a conflict between the celestial and the terrestrial or chthonic gods (*e.g.*, the Asen and the Vanen in Germanic mythology), or between destructive and constructive deities (*e.g.*, Seth and Osiris in Egyptian religion). Another very characteristic type of religious dualism, exemplified in numerous cosmogonies worldwide, stresses the introduction of evil into a previously perfect universe.

The extreme or absolute form of religious dualism is to be found in ancient Persia, where the Iranian religious reformer Zoroaster proclaimed an irreducible opposition between Ahura Mazda, the Wise Lord (or Ormazd, as he later came to be called), and Angra Mainyu, the Evil Spirit (or Ahriman). According to Zoroaster, Ahriman freely chose to do evil, thus bringing misery, illness, and death into the world. Later Zoroastrianism presented Ormazd and Ahriman as two coeternal principles of good and evil—the Creator and the Destroyer. Manichaeism took over this pessimistic valuation and blended it with the Gnostic myth of the corrupted creation.

Under the influence of Iranian eschatology, some dualistic elements found their way into Jewish apocalyptic literature, but only in subordination to absolute monotheism. The New Testament utilizes some old dualistic formulas, but in a different sense, denoting antithetical phases in the history of salvation. Though Christianity accepts a radical difference between good and evil, it rejects a metaphysical dualism. In Roman Catholic theology, God and creature, Spirit and matter, etc., are only different modalities in the absolute unity of being.

dualism, in philosophy, the use of two irreducible, heterogeneous principles (sometimes in conflict, sometimes complementary) to analyze the knowing process (epistemological dualism) or to explain all of reality or some broad aspect of it (metaphysical dualism). Examples of epistemological dualism are being and thought, subject and object, and sense datum and thing; examples of metaphysical

dualism are God and the world, matter and spirit, body and mind, and good and evil. Dualism is distinguished from monism, which acknowledges only one principle, and from pluralism, which invokes more than two basic principles. Philosophers sometimes employ more than one dualism at the same time; e.g., Aristotle simultaneously invoked those of matter and form, body and soul, and immaterial and material substance.

dualism, mind-body (philosophy): see mind-body dualism.

duality, in mathematics, principle whereby one true statement can be obtained from another by merely interchanging two words. It is a property belonging to the branch of algebra known as lattice theory, which is involved with the concepts of order and structure common to different mathematical systems. A mathematical structure is called a lattice if it can be ordered in a specified way (see order). Projective geometry, set theory, and symbolic logic are examples of systems with underlying lattice structures, and therefore also have principles of duality.

Projective geometry has a lattice structure that can be seen by ordering the points, lines, and planes by the inclusion relation. In the projective geometry of the plane, the words "point" and "line" can be interchanged, giving for example the dual statements: "Two points determine a line" and "Two lines determine a point." This last statement, sometimes false in Euclidean geometry, is always true in projective geometry because the axioms do not allow for parallel lines. Sometimes the language of a statement must be modified in order that the corresponding dual statement be clear; the dual of the statement "Two lines intersect in a point" is vague, while the dual of "Two lines determine a point" is clear. Even the statement "Two points intersect in a line," however, can be understood if a point is considered as a set (or "pencil") containing all the lines on which it lies, a concept itself dual to the idea of a line being considered as the set of all points that lie on it.

There is a corresponding duality in three-dimensional projective geometry between points and planes. Here, the line is its own dual, because it is determined by either two points or two planes.

In set theory, the relations "contained in" and "contains" can be interchanged, with the union becoming the intersection and vice-versa. In this case, the original structure remains unchanged, so it is called self-dual.

In symbolic logic there is a similar self-duality if "implied" and "is implied by" are interchanged, along with the logical connectives "and" and "or."

Duality, a pervasive property of algebraic structures, holds that two operations or concepts are interchangeable, all results holding in one formulation also holding in the other, the dual formulation.

Duan Qirui: see Tuan Ch'i-ju.

Duane-Hunt law, in atomic physics, the relationship between the voltage (V) applied to an X-ray tube and the maximum frequency ν of the X rays emitted from the target. It is named after the American physicists William Duane and Franklin Hunt. The relationship is expressed as $\nu = Ve/h$, in which e is the charge of the electron and h is Planck's constant. This law is sometimes called the inverse photoelectric equation.

Duang (king of Cambodia): see Duong.

Duārs, also spelled DWĀRS, or DOOĀRS, region of northeastern India, at the foot of the west Assam Himalayas. Its 3,400-square-mile (8,800-square-kilometre) area is divided by the

Sankosh River into the Western and Eastern Duārs. Both were ceded by Bhutan to the British at the end of the Bhutan War (1864–65). The Eastern Duārs, in western Assam state, comprises a level plain intersected by numerous rivers and only slightly populated. The Western Duārs lies in northern West Bengal state and is a portion of the Tarai (q.v.), a lowland belt linking the Himalayas and the plains region. The Western Duārs is an important centre of the tea industry. The name Duārs (literally "doors") is derived from the several passes that lead from the region into the Lesser Himalayas.

Duarte (Portuguese personal name): see under Edward.

Duarte, Fausto (Castilho) (b. 1903, Praia, São Tiago, Cape Verde Islands—d. 1953, Portugal), government official and writer whose early work in Portuguese established him as one of the earliest African novelists.

Duarte was educated under the official program of *assimilação* ("assimilation"), which after 1921 had social and political equality for Africans in the Portuguese sphere of influence as a goal. He was then sent to Portuguese Guinea (now Guinea-Bissau) as a government administrator.

Duarte's first novel, *Auá: Novela Negra* (1934; "Auá: Black Novel"), is set among the Fulani peoples of Guinea. He wrote three other novels—*O Negro sem Alma* (1935; "The Black Without Soul"), *Rumo ao Degrêdo* (1939; "Adrift as an Exile"), and *A Revolta* (1945; "The Revolution")—and a book of short stories—*Foram Estes os Vencidos* (1945; "To Move is to Conquer"). His works are important primarily because of the interest he took in African indigenous culture.

Duarte, Juan Pablo (b. 1813, Santo Domingo, Hispaniola [now in Dominican Republic]—d. 1876, Caracas, Venez.), father of Dominican independence, who lost power after the struggle succeeded and spent the end of his life in exile.

Duarte, who was sent to Europe for his education (1828–33), became determined to free the eastern part of Hispaniola from Haitian domination. On his return to the island he and several other patriots organized a secret society, La Trinitaria, to work toward independence and to stimulate liberalism. His first attempt to oust the Haitians in 1843 collapsed, and he fled the country; but his followers succeeded in overthrowing the Haitians the next year.

In February 1844 Duarte returned, and the Dominican Republic proclaimed its independence. It was not Duarte's followers, however, who ultimately triumphed, but a local caudillo (military dictator), Pedro Santana. The defeated Duarte was exiled and took up residence in Caracas, Venez. He left Caracas for

his homeland only once, during the War of Restoration (1864) against Spain, after which he was sent on a diplomatic mission for one year.

Consult the INDEX first

Dubayy, also spelled DUBAI, constituent emirate of the United Arab Emirates (formerly Trucial States, or Trucial Oman). The second most populous and second largest state of the federation (area 1,510 square miles [3,900 square km]), it is roughly rectangular, with a frontage of about 45 miles (72 km) on the Persian Gulf. The capital, Dubayy town, the largest town of the federation, is on a small creek at the northeast of the state. Well over 90 percent of the emirate's population lives in the capital and nearby built-up sections. Dubayy is surrounded by Abu Dhabi emirate on the south and west and by Ash-Shāriqah emirate on the east and northeast. In addition, the small exclave (detached section) of Al-Hajarayn in the Wadi Hattá, more than 25 miles (40 km) from the nearest territory of Dubayy proper, belongs to the state.

The settlement of Dubayy town is known from 1799. The sheikh of Dubayy (then a minor) signed the British-sponsored General Treaty of Peace (1820), but the area was seemingly dependent on Abu Dhabi until 1833. In that year, a group of Al bū Falāsāh clansmen of the Banī Yās, chiefly pearl fishers, left Abu Dhabi in a rivalry dispute and took over Dubayy town without resistance. From then on, Dubayy became, by local standards, a powerful state and was frequently at odds with its former rulers. The Qawāsīm pirates tried to take control of Dubayy, but its rulers retained their independence by playing off the neighbouring sheikhdoms against each other. Together with the rest of the original Trucial States, Dubayy signed with Britain a maritime truce in 1835 and the Perpetual Maritime Truce in 1853. Its foreign relations were placed under British control by the Exclusive Agreement of 1892. When Britain finally left the Persian Gulf (1971), Dubayy was a prominent founding member of the United Arab Emirates.

The sheikhs of Dubayy, unlike most of their neighbours, long fostered trade and commerce; Dubayy town was an important port by the beginning of the 20th century. Many foreign merchants (chiefly Indians) settled there; until the 1930s, it was known for pearl exports. More recently, Dubayy town (including its twin city and commercial centre, Dayrah, on the opposite side of the creek) has become the region's chief port for the import of Western manufactures. Most of the United Arab Emirates' banks and insurance companies are headquartered there. After the devaluation of the Gulf rupee (1966), Dubayy joined the now independent state of Qatar in setting up a new monetary unit, the Qatar/Dubayy riyal. In 1973 Dubayy joined the other emirates in adoption of a national currency, the dirham. Dubayy has free trade in gold, and there is a brisk smuggling trade in gold ingots to India, where gold imports are restricted.

In 1966 the offshore oil field of Fath (Fateh, or Fatta) was discovered in the Persian Gulf about 75 miles (120 km) due east of Dubayy town, in waters where the state had granted an oil concession. By the 1970s, three 20-story submarine tanks, each holding 500,000 barrels, were installed on the seabed at the site. Shaped like inverted champagne glasses, they are popularly called The Three Pyramids of Dubayy. Dubayy's estimated oil reserves are less than one-twentieth those of neighbouring Abu Dhabi, but oil income combined with trading wealth have made Dubayy a very prosperous state. An aluminum smelter and an associated natural gas fractionator were built in the late 1970s near Dubayy town. The town

Duarte, portrait bust by Abelard
By courtesy of the Organization of American States

has been thoroughly modernized, with electricity, modern hotels, telecommunications stations, hospitals, and an international airport. A new deepwater harbour, Port Ráshid (named for the emir), was opened there in 1972 and a supertanker dry dock was completed in 1979. Dubayy town is connected by paved road with Ra's al-Khaymah town and Abu Dhabi town. Pop. (1999 est.) emirate, 858,000.

dubbing, in filmmaking, the process of adding new dialogue or other sounds to the sound track of a motion picture that has already been shot. Dubbing is most familiar to audiences as a means of translating foreign-language films into the audience's language. When a foreign language is dubbed, the translation of the original dialogue is carefully matched to the lip movements of the actors in the film. Dubbed sound tracks rarely equal the artistic quality of original foreign-language sound tracks, however, and hence subtitles may be preferred by viewers as a means of understanding the dialogue in foreign films.

Dubbing is often employed in the original-language version of a sound track for technical reasons. Filmmakers routinely use it to remedy defects that arise from synchronized filming (in which the actors' voices are recorded simultaneously with the photography). Synchronously recorded dialogue may be unclear or inaudible in a long-distance shot or because of accidental air traffic overhead, or it may simply be impossible to conceal a microphone close enough to pick up the actors' voices intelligibly. Dubbing allows the filmmaker to obtain high-quality dialogue regardless of the actual conditions that existed during shooting. Dubbing is also used to add sound effects to the original sound track. It may also be used in musicals to substitute a more pleasing voice for that of an actor who performs a song on camera.

The filmmakers of some countries rely on dubbing to supply the sound track of an entire film, because the technique can be less expensive and troublesome than synchronized filming.

Dubbo, city, east-central New South Wales, Australia, on the Macquarie River. Visited in 1818 by the explorer John Oxley, the district received its first settlers in 1824. Founded in 1841, Dubbo was an established village by 1849. It became a municipality in 1872 and a city in 1966. It is the trade centre of an area producing wheat, livestock, timber, and fruits and vegetables. Dubbo has slaughterhouses, flour mills, sawmills, brickworks, and joinery works. It is a major rail and road (Newell and Mitchell highways) junction lying 160 miles (260 km) northwest of Sydney. The Western Plains Zoo is nearby. Pop. (1996) 30,102.

Dubček, Alexander (b. Nov. 27, 1921, Uhrovec, Czech. [now in Slovakia]—d. Nov. 7, 1992, Prague, Czech. [now in Czech Republic]), first secretary of the Communist Party of Czechoslovakia (Jan. 5, 1968, to April 17, 1969) whose liberal reforms led to the Soviet invasion and occupation of Czechoslovakia in August 1968.

Dubček received his early education in Kirgiziya (Kyrgyzstan) in Soviet Central Asia, where his father, Stefan Dubček, a member of the Czechoslovak Communist Party, had settled. The family returned to Czechoslovakia in 1938. During World War II, Dubček took part in the underground resistance to Nazi occupation and after the war rose steadily in Communist Party ranks, becoming in 1958 chief secretary of the regional committee in Bratislava and a member of the central committees of both the Slovak and the Czechoslovak Communist Parties. In 1962 he became a full member of the Central Committee's Presidium.

In October 1967, at a Central Committee

meeting in Prague, Dubček rallied the support of party and economic reformers, as well as Slovak nationalists, against the leadership of Antonín Novotný. Novotný was forced to resign as first secretary on Jan. 5, 1968, and Dubček replaced him. During the early months of 1968 the Czechoslovak press was granted greater freedom of expression, and victims of political purges during the Stalin era were rehabilitated. On April 9 a reform program called "Czechoslovakia's Road to Socialism" was promulgated that envisaged economic reforms and a wide-ranging democratization of Czechoslovak political life. The trend of developments aroused concern in the Soviet Union. From July 29 to August 2, the top leaders of the two countries conferred at the Slovak town of Cierna; their deliberations concluded with only minor compromises by Dubček. Still dissatisfied with developments in Czechoslovakia and fearful of the implications of liberalization, the Soviet Union and its Warsaw Pact allies invaded the country the night of August 20–21. Dubček and five other Presidium members were seized and taken to Moscow, where the Soviets wrested major concessions from them. On his return to Prague Dubček gave an emotional address to his countrymen, requesting their cooperation in the curtailment of his reforms.

Dubček was in a weak position. Gradually, his more progressive aides were removed, and in April 1969 he was demoted from first secretary of the party to president of the Federal Assembly (the national parliament). In January 1970 he was appointed ambassador to Turkey, but, after being expelled from the party, he was made an inspector of the forestry administration, based in Bratislava.

Dubček returned to prominence in Czechoslovakia's national affairs in December 1989 after the country's Communist Party had given up its monopoly on power and agreed to participate in a coalition government. On December 28 he was elected chairman of the Federal Assembly, and by 1992 he had become the leader of Slovakia's Social Democrats. He died of injuries suffered in an automobile accident.

Dube, John Langalibalele (b. Feb. 22, 1871, near Inanda Mission Station, Natal [now in South Africa]—d. Feb. 11, 1946, Umhlanga, Natal, S.Af.), South African minister, educator, journalist, and author of *Insila ka Shaka* (1930; *Jeje, the Bodyservant of King Shaka*), the first novel published by a Zulu in his native language.

After studying at Oberlin College, Oberlin, Ohio, U.S., and being ordained a minister, Dube returned to Natal with the goal of establishing a school for his fellow Africans similar to Alabama's Tuskegee Institute. In the early 1900s he founded Ohlange Institute, 15 miles (25 km) from Durban, S.Af., and several years later he founded a girls' school nearby. His work with the institute and on *Ilanga lase Natal* ("The Natal Sun"), the first Zulu newspaper (which he helped to found in 1904), made him widely known. In 1912 he was elected the first president general of the South African Native National Congress (later the African National Congress).

Political involvement occupied much of the rest of his life, but he also found time to write a biography of the prophet Isaiah Shembe (*U-Shembe*) and *Insila ka Shaka*, his historical novel about Shaka, the great 19th-century chief who brought the Zulus to power. Dube received a Ph.D. degree from the University of South Africa in 1936, and from 1937 until his death, he represented Natal at the biannual meetings of the Native Representative Council in Pretoria.

Dubinsky, David (b. Feb. 22, 1892, Brest-Litovsk, Russian Empire [now Brest, Belarus]—d. Sept. 17, 1982, New York, N.Y., U.S.), American labour leader who served as

president of the International Ladies' Garment Workers Union (ILGWU) from 1932 to 1966.

The son of a baker in Russian Poland, Dubinsky was sent to Siberia in 1908 for his union activities. He escaped and emigrated to the United States in 1911. While working as a garment cutter in New York City, he renewed his union activities and became manager-secretary of Local 10 of the ILGWU in 1921, a post that he left in 1929 to assume the position of secretary treasurer of the entire ILGWU. He was elected president of the union in 1932.

Dubinsky transformed the ILGWU from a faction-ridden, insolvent regional union with 45,000 members into a model international union representing 450,000 workers. Under Dubinsky, the ILGWU pioneered initiatives in housing, pension plans, and health centres. An independent in national union affairs and in politics, Dubinsky maintained his allegiance to the American Federation of Labor (AFL) but also supported the emergence of the CIO unions in the 1930s. He played a significant role in the merger of the AFL and CIO in 1955. His autobiography, *David Dubinsky: A Life with Labor*, was published in 1977.

Dublin, Irish BAILE ÁTHA CLIATH, county in the province of Leinster, Ireland, bounded by County Meath (north), by the Irish Sea (east), by County Wicklow (south), and by Counties Kildare and Meath (west). County Dublin is one of the smallest counties in Ireland and, including Dublin city, is one of the most populous. Its central and northern parts arc low-lying, while low mountains occupy the southern border of the county; the mountains are chiefly covered with heath and bog. The northern coast from Balbriggan to Howth has sandy shores but assumes a bolder aspect in the promontory of Howth. The chief river is the Liffey, which rises in the Wicklow Mountains a few miles southwest of Dublin city and flows through the city and into Dublin Bay. Among early remains are raths (prehistoric hill forts), dolmens, and round towers. Malahide Castle was founded in the 12th century.

The county was probably formed in the late 12th century; and it comprised the chief portion of country within the English Pale (the English enclave in Ireland), though the limits of the county itself underwent many changes before reaching their present configuration. Because of its proximity to the capital city, the county was the scene of sporadic fighting in the troubled years between 1914 and 1922, and gunrunning by Nationalists took place at Howth in June 1914.

Wheat, barley, and potatoes are the county's principal crops; cattle breeding is receiving greater attention. Cotton hosiery is manufactured at Balbriggan, and chocolate and cement goods are made in the west of the county. Administration is by a county council and a county manager. Dún Laoghaire has its own corporation. Several important railways converge on Dublin city. Area 356 square miles (922 square km). Pop. (1996) 1,922,000.

Dublin, Irish DUBH LINN ("Black Pool"), also called BAILE ÁTHA CLIATH ("Town of the Ford of the Hurdle"), city, formally a county borough, and capital of County Dublin and of Ireland. Located in east-central Ireland at the head of Dublin Bay on the Irish Sea, Dublin is the country's chief port, centre of financial and commercial power, and seat of culture.

A brief treatment of Dublin follows. For full treatment, see MACROPAEDIA: Dublin.

Dublin stands on a hill-ringed plain and straddles the River Liffey, which flows eastward into Dublin Bay. The city extends little more than 4 miles (6.5 km) in any direction from central Dublin Castle. The suburbs, how-

ever, stretch toward the nearby hills and the sea as far as 16 miles (26 km) from the city centre. The surrounding region is devoted mainly to agriculture.

Dublin was at one time famous for its textiles, particularly woolens, cotton, silk, and poplin. The Guinness Brewery, producer of beer and stout, is the nation's largest private employer and its largest industrial exporter. Other industries include electronics, food processing, the manufacture of glass and cigarettes, and shipbuilding. Government and trade are major activities; the principal exports include agricultural products, alcoholic beverages, and computer software.

The city is low-built, with a municipal ordinance limiting most buildings to 10 stories. Few buildings date from before the 17th century; the city's architectural heritage, however, derives primarily from Norse, Norman, and Georgian influences, and the three elements meet in the historic Dublin Castle. Christ Church and St. Patrick's, both Protestant cathedrals, were rebuilt by the Normans in the 12th century and restored in the 19th. The Pro-Cathedral, a Roman Catholic church, was built in 1816.

The area between St. Patrick's and the Guinness Brewery, known as the Liberties for having formerly been outside the city's jurisdiction, has been largely cleared for low-cost housing. Several of Dublin's most impressive government buildings were originally erected by leading citizens as residences. Among these are the lord mayor's residence, built by Joshua Dawson in 1705, which was the site in 1919 of the ratification of the Irish declaration of independence from Great Britain, and Leinster House (1745–48), now the seat of the Irish parliament. Other monumental buildings include the Neoclassical Custom House (1781–91) and the Four Courts (1786–1802), both heavily damaged in the midst of rebellion and civil war (1921–22) and since rebuilt.

Educational and cultural institutions include the University of Dublin, or Trinity College (1592), the Royal Dublin Society (1731), and Dublin City University (1975; founded as the National Institute for Higher Education). The National Library and National Museum are housed in Victorian buildings on the grounds of Leinster House.

Dublin is the centre of the Irish railway network, and its port is the largest in the republic. Ferries from Great Britain land at Dublin and the suburb of Dún Laoghaire. The international airport at Collinstown is located 6 miles (10 km) to the north of Dublin. Area city, 44 square miles (114 square km). Pop. (1996) county borough, 480,996.

"De," "la," and similar components of a name, when followed by a space, are alphabetized as separate words (e.g., De Forest, Lee).

When they are joined to the following part of a name, the combination is treated as a single word (e.g., DeForest, John William).

Dublin, University of, also called TRINITY COLLEGE, oldest university in Ireland, founded in 1592 by Queen Elizabeth I of England and Ireland and endowed by the city of Dublin. When founded, it was intended that Trinity College would be the first of many constituent colleges of the University of Dublin. No other colleges were established, however, and the two names became interchangeable. The full benefits of the university—degrees, fellowships, scholarships, and emoluments—were limited to Anglicans for many years, but in 1873 all religious requirements were eliminated. The university library

The University of Dublin (Trinity College)

contains many illuminated manuscripts, including the famous *Book of Kells*.

Dublin Bay prawn: see scampi.

Dubna, city, Moscow oblast (province), western Russia. The city lies along the Volga River where it is joined by the Moscow Canal (completed 1937). Dubna is a new city, incorporated in 1956; in 1960 it absorbed the town of Ivankovo on the opposite bank. It is one of several planned "science cities," its existence depending on the Joint Institute for Nuclear Research, which employs scientists from many countries. Dubna University opened in 1994. The city includes much open green area. Pop. (1995 est.) 67,500.

dubnium: see unnilquadium.

Dubnow, Simon Markovich, Simon also spelled SEMON, or SEMYON (b. Sept. 10, 1860, Mstislavl, Russia [now in Belarus]—d. December 1941, Riga, Latvia, U.S.S.R.), Jewish

Dubnow, 1921

By courtesy of YIVO Institute for Jewish Research, New York

historian who introduced a sociological emphasis into the study of Jewish history, particularly that of eastern Europe.

Dubnow early ceased to practice Jewish rituals. He later came to believe that his vocation as a historian of Judaism was as true to the faith of his ancestors as were the Talmudic studies of his piously Orthodox grandfather.

Dubnow was largely a self-educated man. Throughout his life he supported himself as a teacher and professional writer. In 1882 he began his long association with the Russian-Jewish periodical *Voskhod* ("Rising"), to which he contributed, in serial form, many of his most famous scholarly and literary works. He left Russia in 1922 because of his hatred for Bolshevism and settled in Berlin. In 1933 he fled Germany because of the anti-Jewish policies of the Nazi government and sought refuge in Riga. He was killed by the Nazis during the deportation of most of Riga's Jewish population to extermination camps.

Dubnow was one of the first scholars to

subject Hasidism to systematic and unbiased study based upon laboriously collected source materials from both the Hasidim and their various opponents. This work appeared in *Geschichte des Chassidismus* (1931; "History of Hasidism"). The mature fruit of Dubnow's historical studies is his monumental *Die Weltgeschichte des jüdischen Volkes*, 10 vol. (1925–30; "The World History of the Jewish People"; Eng. trans. *History of the Jews*), which was translated into several languages. The work is notable for its scholarship, impartiality, and cognizance of social and economic currents in Jewish history. According to Dubnow, the Jews not only are a religious community but also possess the distinctive characteristics of a cultural nationality and as such create their own forms of autonomous social and cultural life. He viewed the history of the Jews as a succession of large autonomous communities, or centres.

Dubnow's theory of autonomism, or Diaspora nationalism, was first expressed in his famous "Letters on Old and New Judaism" (Russian ed. 1907; *Nationalism and History: Essays on Old and New Judaism*). As a cultural nationalist he rejected Jewish assimilation but at the same time believed that political Zionism was messianic and unrealistic. Other notable works by Dubnow include his history of the Jews in Russia and Poland (Russian ed., 3 vol., 1916–20; *History of the Jews in Russia and Poland from the Earliest Times Until the Present Day*) and an autobiography entitled *Kniga zhizni*, 3 vol. (1930, 1934, 1940; "Book of Life").

Dubois, Eugène, in full MARIE EUGÈNE FRANÇOIS THOMAS DUBOIS (b. Jan. 28, 1858, Eidsen, Neth.—d. Dec. 16, 1940, de Bedlaer), Dutch anatomist and geologist who discovered the remains of Java man, the first known fossil of *Homo erectus*.

Appointed lecturer in anatomy at the University of Amsterdam (1886), Dubois investigated the comparative anatomy of the larynx in vertebrates but became increasingly interested in human evolution. In 1887 he went to the East Indies as a military surgeon and on the island of Sumatra began to excavate caves in search of early hominid remains.

Continuing his quest on the island of Java, Dubois found at Trinil a jaw fragment (1891) and later a skullcap and thighbone. The skull gave evidence of a small brain, massive brow ridges, a flat, retreating forehead, and other apelike features. Dubois named the fossils *Pithecanthropus erectus* to indicate an intermediate phase in the evolution then believed to proceed from simian ancestors having the upright posture characteristic of modern man. After publishing his findings (1894), he returned to Europe (1895) and became a professor of geology at the University of Amsterdam. Because of controversy surrounding his

discovery, he withdrew his materials from all examination until 1923.

Dubois, Guillaume (b. Sept. 6, 1656, Brive-la-Gallarde, Fr.—d. Aug. 10, 1723, Versailles), French cardinal, leading minister in the administration of Philippe II, duc d'Orléans (regent for King Louis XV from 1715 to 1723), and architect of the Anglo-French alliance that helped maintain peace in Europe from 1716 to 1733.

The son of a country doctor, Dubois studied for the priesthood before serving as tutor to the children of nobles who lived at the court of King Louis XIV. Among his pupils was Philippe, duc de Chartres, who succeeded to the title duc d'Orléans in 1701. When Orléans became regent for the five-year-old King Louis XV on the death of Louis XIV (Sept. 1, 1715), he made Dubois his secret adviser and envoy for foreign affairs.

Capable and unscrupulous, Dubois devoted himself to promoting the dynastic interests of Orléans, whose claim to the succession to the crown of the sickly Louis XV was disputed by a rival claimant, King Philip V of Spain, a grandson of Louis XIV. In order to gain support against Philip, Dubois concluded in 1716 an alliance with France's traditional enemy, Great Britain. He pledged to back the British king George I against the Jacobites (supporters of Stuart claims to the British throne), and in return he obtained a guarantee of British support for the dynastic rights of Orléans. In 1717–18 Dubois made similar agreements with the Dutch and Austrians, thereby forming the Quadruple Alliance (Aug. 2, 1718). He was officially designated secretary of state for foreign affairs in September 1718.

Guillaume Dubois, detail of an engraving by C. Roy, after a painting by H. Rigaud

By courtesy of the Musée Conde, Chantilly, Fr photograph, Giraudon

When the chief minister of Spain, Giulio Alberoni, tried to further Spain's territorial ambitions by unilaterally invading Sardinia and Sicily in 1717–18, Dubois joined the British in attacking Spain (1719). In June 1720, Philip V was forced to renounce his claims to the French throne and to dismiss Alberoni. Four months later, however, a severe financial crisis in France discredited Orléans's regime and jeopardized Dubois' position. The foreign minister saved himself by pursuing a pro-Spanish policy that was popular in France because both countries were under Bourbon rule. The result was the Franco-Spanish treaty of March 1721 and the betrothal of Louis XV to the infanta Mariana, daughter of Philip V. At the same time, Dubois remained faithful to the British alliance.

In spite of his disreputable personal life, Dubois acquired the support of the French Roman Catholic Church by opposing the Jansenists, a dissident church faction. Owing to this stance, as well as to his lavish bribery at the papal curia, he was made a cardinal in July 1721. He became *premier ministre* ("first minister") in August 1722, a year before his death.

Dubois, Jean-Antoine (b. 1765, Saint-Remève, Fr.—d. Feb. 17, 1848, Paris), French educator, abbot, and priest who attempted

Jean-Antoine Dubois, detail of a lithograph by F.-S. Delpech
J.P. Zlotto

to convert the Hindus of India to Roman Catholicism.

Ordained in 1792, he sailed to India under the Missions Étrangères. Despite his efforts in many parts of South India, his mission failed, and he returned to Paris (1823), convinced that the conversion of the Hindus was impossible. In Paris he became director of the Missions Étrangères and later superior (1836–39). He translated the *Pañca-tantra* into French (1826), including *Aventures de Paramarta*, or *The Exploits of the Guru Paramarta*. His best-known book is considered to be *Moeurs, institutions et cérémonies des peuples de l'Inde* (1825; published first in English as *Description of the Character, Manners and Customs of the People of India*, 1817).

Dubois, Pierre (b. c. 1250, probably at Coutances, in Normandy, Fr.—d. c. 1320), French lawyer and political pamphleteer during the reign of Philip IV the Fair; his most important treatise, *De recuperatione Terrae Sanctae* (1306, "On the Recovery of the Holy Land"), dealt with a wide range of political issues and gave a good picture of contemporary intellectual trends while ostensibly outlining the conditions for a successful crusade.

Dubois studied at the University of Paris and became a successful lawyer at Coutances, in Normandy. By 1300 he had become an advocate in royal legal cases, and he represented Coutances in the Estates-General of 1302 and again in that of 1308. In 1300 he published a pamphlet articulating his ideas for monarchical reform and later another that dealt with the struggle between Philip IV and Pope Boniface VIII.

Chauvinistic, anticlerical, and considerably influenced by Aristotelianism, Dubois believed that internal peace in France could be won only by extending royal authority, especially over the clergy, and by radically reforming French education, law, and administration. He believed that peace between the sovereign princes in Europe was possible only by the creation of a sort of permanent board of arbitration and by the French king's assumption of the position of leadership traditionally reserved for the Holy Roman emperors but left vacant by recent imperial weakness.

Dubois, (François-Clément-) Théodore (b. Aug. 24, 1837, Rosnay, Fr.—d. June 11, 1924, Paris), French composer, organist, and teacher known for his technical treatises on harmony, counterpoint, and sight-reading.

He studied under the cathedral organist at Rheims and at the Paris Conservatoire. In 1871 he succeeded César Franck as organist at the church of Sainte-Clotilde. In 1868 he was choirmaster at the Church of the Madeleine and later succeeded Camille Saint-Saëns as organist there. He taught harmony at the Paris Conservatoire (1871–90) and was director there (1896–1905). He wrote music of all types, including operas and choral and orchestral works; his outstanding composition is his oratorio, *Les sept paroles du Christ* (1867; "The Seven Words of Christ").

Dubos, René (Jules) (b. Feb. 20, 1901, Saint-Brice, Fr.—d. Feb. 20, 1982, New York City), French-born American microbiologist, environmentalist, and author whose pioneering research in isolating antibacterial substances from certain soil microorganisms led to the discovery of major antibiotics. Dubos is also known for his research and writings on a number of subjects, including antibiotics, acquired immunity, tuberculosis, and bacteria indigenous to the gastrointestinal tract. In his later years his interest shifted to man's relationship to the natural environment.

Dubos was graduated in 1921 from the Institut National Agronomique in Paris. In 1924 he emigrated to the United States and continued his studies at Rutgers University (Ph.D., 1927). He then joined the Rockefeller Institute for Medical Research in New York City, where he spent most of his career, becoming a professor in 1957 and professor emeritus in 1971.

In 1930 Dubos isolated from a soil microorganism an enzyme that could decompose part of the bacillus that causes lobar pneumonia in humans. The enzyme subsequently proved to have a therapeutic effect on laboratory animals with that disease. In 1939 Dubos isolated another antibacterial substance and named it tyrothricin. This substance, which he was able to chemically analyze, became the first antibiotic to be commercially manufactured, though it soon proved too toxic for large-scale use. Dubos' researches and techniques stimulated interest in penicillin and led Selman Waksman to isolate streptomycin.

Dubos's works include *Bacterial and Mycotic Infections in Man* (1948), *Pasteur and Modern Medicine* (1960), *Man, Medicine, and Environment* (1968), and *So Human an Animal* (1968; Pulitzer Prize, 1969). He was for many years an editor of the *Journal of Experimental Medicine*.

Dubrovnik, Italian RAGUSA, port of Dalmatia in Croatia. Situated on the southern Adriatic coast, it is usually regarded as the most picturesque city on the Dalmatian coast. It occupies a promontory jutting into the sea under the bare limestone mass of Mount Srdj. The port's sea fortifications rise directly from the water's edge, and a massive round tower dominates the city on the landward side.

The city walls, mostly a double line, have long been the pride of Dubrovnik. Beyond them are many villas surrounded by gardens. The basic city plan dates from 1292, when the port was rebuilt following a fire. The Stradun, or main street, with beautiful late-Renaissance houses on each side, runs along a valley that, until 1272, was a marshy channel dividing the Latin island of Ragusa from the forest settlement of Dubrovnik (*dubrava* in Serbo-Croatian means "grove"). No motor vehicles are allowed inside the walls, and, except for the Stradun, the old city is a maze of picturesque narrow streets, many of them steep and twisting. Two 14th-century convents stand at the ends of the city; the Franciscans guarded the western gate, while the Dominicans kept the eastern. The Rector's Palace is one of the masterpieces of Dalmatian architecture. Lokrum, an offshore island, is famous for its gardens and orange groves. Annual festivals of the arts attract many tourists to the scenic city.

Dubrovnik is connected to Sarajevo and Belgrade by rail. From its new harbour at nearby Gruž, ships ply to other Dalmatian ports and to Italy. The main industries produce liqueurs, cheeses, silk, and leatherwork.

The city was founded as Rausa, or Ragusium, in the 7th century by Roman refugees fleeing the Slav and Avar sack of Epidaurus, just to the southeast. A colony of Slavs soon joined the Romans there, and from an early date

the city formed a link between two great civilizations. After the fall of Rome, Dubrovnik was ruled by Byzantium. From the 9th to the 12th century it defended itself against foreign powers, but in 1205–1358 it acknowledged Venetian suzerainty, though keeping much of

Dubrovnik, Croatia
Ray Manley—Shostal Assoc.

its independence. The city-republic afforded asylum to refugees of all nations—one of them was King Richard I of England—and by means of treaty and tribute it enlarged its territory along the Dalmatian coast. It became a great mercantile power, being situated at the seaward end of overland trade routes to Byzantium and the Danube region. Ragusan land trade flourished throughout the Balkans.

In 1420, when Dalmatia was sold to Venice, Dubrovnik remained a free city in all but name. For centuries the people of Dubrovnik were able to preserve their city-republic by skillful manoeuvring between East and West. A strategic treaty with Turkey protracted Dubrovnik's liberty and maintained the opportunity for a major trading role between the Ottoman Empire and Europe. In the 16th century it traded with India and the Americas, and the city sent men-of-war to Spain in 1588 for the abortive invasion of England.

A great development of art and literature, from the 15th century to the 17th, earned Dubrovnik the title of "the South Slav Athens." For the first time in the history of the South Slavs, the language of the people was introduced into literature. The city's literary history, however, never compared to its maritime and mercantile achievements.

In 1667 an earthquake destroyed parts of the city, and about one-fifth of the inhabitants perished. Only during the Napoleonic Wars did the republic regain its prosperity. From 1800 to 1805, as the only neutral Mediterranean state, it secured a large share of the carrying trade. Napoleon I subjugated Dubrovnik in 1808, and the Congress of Vienna (1815) gave Dubrovnik to Austria; in 1918 it was incorporated into Yugoslavia. Dubrovnik suffered some damage in 1991 during Croatia's struggle for independence. Pop. (1991) 49,700.

Dubuffet, Jean(-Philippe-Arthur) (b. July 31, 1901, Le Havre, Fr.—d. May 12, 1985, Paris), French painter, sculptor, and printmaker, best known for his development of art brut (*q.v.*; "raw art").

As an art student in Paris, Dubuffet demonstrated a facility for academic painting. In 1924, however, he gave up his painting, and by 1930 was making a living as a wine merchant. He did not return to a full-time art career until the early 1940s.

After World War II, as one of the leading artists of the School of Paris, he developed the techniques and philosophy of art brut. Derived from Dubuffet's studies of the art of children and of the mentally ill, art brut is intended to achieve immediacy and vitality of expression not found in self-conscious, academic art. To reflect these qualities, Dubuffet often used crude ideographic images incised

into a rough impasto surface made up of such materials as tar, gravel, cinders, ashes, and sand bound with varnish and glue. His drawings and paintings are by turns childlike and obsessive, and their unfinished appearance excited much controversy.

During the 1960s Dubuffet experimented with musical composition and the creation of architectural environments. In various graphic and sculptural mediums he continued to explore the potentials of art brut. In his later years he also created several large sculptures of black-and-white painted fiberglass for various public spaces.

Dubuque, city, seat (1834) of Dubuque county, northeastern Iowa, U.S., on the Mississippi River (bridged to East Dubuque, Ill.), opposite the junction of the Wisconsin and Illinois boundary lines. It was named for Julien Dubuque (1762–1810), a French trader, who

Julien Dubuque Monument, Dubuque, Iowa
By courtesy of the Iowa Development Commission

in 1788 concluded a treaty with the Fox Indians giving him lead-mining rights. He was the first white man to permanently settle in the region later to become Iowa; a monument marks the site of his mine and burial plot. Further concessions were rejected by the Indians until the Black Hawk Treaty of 1832. Mining and sawmilling were pioneering enterprises, but with the development of river and rail transportation the city became industrialized,

emerging by the 1980s as the focal point of an expanding manufacturing area. Meat-packing, agriculture, and the manufacture of wood products and machinery are among the main economic activities.

In 1893 Dubuque was made an archdiocese of the Roman Catholic Church, which maintains Loras (1839) and Clarke (1843) colleges there. The University of Dubuque was founded in 1852 as the German Theological School of the Northwest. Our Lady of New Melleray Abbey, 12 mi (19 km) southwest, was founded in 1849 by Trappist monks. The city's Old Shot Tower (1856) was in full production during the Civil War, utilizing locally mined lead for bullets. Inc. town, 1837; city, 1841. Pop. (2000) city, 57,686; Dubuque MSA, 89,143.

Ducale, Palazzo (Venice, Italy): *see* Doges' Palace.

Ducas FAMILY, also spelled **DUKAS**, or **DOUKAS**, Byzantine family that supplied several rulers to the empire. First prominent in the 9th century, the family suffered a setback when Constantine Ducas, son of Gen. Andronicus Ducas, lost his life attempting to become emperor in 913. Another Ducas family, perhaps connected with the earlier one through the female line, appeared toward the end of the 10th century. A member of this family became Emperor Constantine X in 1059, and his son, Michael VII (*see* Michael VII Ducas), ruled from 1071 to 1078. With Alexius I Comnenus, Michael's son Constantine was nominally co-emperor from 1081 to about 1090. Betrothed to Alexius' daughter, Anna, Constantine did not live to marry her. In 1204 Alexius V Ducas Murtzuphlus deposed the emperor Isaac II Angelus and his son Alexius IV, after which he tried in vain to defend Constantinople against crusaders from the West. A Michael Ducas played a leading role in the mid-14th-century civil war between emperors John V Palaeologus and John VI Cantacuzenus. His grandson was the 15th-century historian Ducas, known for his vernacular history of the period 1341–1462. So much prestige was attached to the Ducas name that many later rulers tried to add it to their own.

Ducas, Irene (Byzantine empress): *see* Irene (1066–1120).

Duccio di Buoninsegna (b. mid-13th century, Siena, Republic of Siena—d. c. 1318, Siena?), one of the greatest Italian painters of the Middle Ages and the founder of the Siennese school. In Duccio's art the formality of the Italo-Byzantine tradition, strengthened by a clearer understanding of its evolution from classical roots, is fused with the new spirituality of the Gothic style. Greatest of all his works is "Maestà" (1311), the altarpiece of Siena cathedral.

Beginnings. There is little documented information about Duccio's life and career. In large part his life must be reconstructed from the evidence of those works that can be attributed to him with certainty, from the evidence contained in his stylistic development, and from the learning his paintings reveal. Duccio's father was from the town of Buoninsegna, near Siena, but at the time of Duccio's birth he lived in the town of Camporegio. He is first mentioned in 1278, when the treasurer of the commune of Siena commissioned him to decorate 12 strongboxes for documents. The following year he was given the task of decorating one of the wooden covers of the account books of the treasury. That Duccio was doing work more appropriate for an artisan than an artist must not lead one to assume that even at this time he was only a beginner. It is known that services of this type were requested, both in Siena and in Florence, of already established painters. Further, the fact that he was designated as "painter" and

was working for himself demonstrate that he was a mature and independent artist by 1278. In 1280 Duccio was fined the large sum of 100 lire by the commune of Siena for some

the Virgin, in the serious and robust Child, and in the faces of the six adoring angels; nevertheless, it reveals strikingly new stylistic innovations in the softness of the angels set in midair, in the elegant and subtle lines, in the first feeling of French Gothic animated sweetness and spirituality, and in the light and shade modulation of the free-flowing, clear brush strokes.

There is no doubt that his knowledge of Cimabue's work was one of the components of Duccio's style at this time, but it was not the predominant, nor even the earliest influence; very probably Cimabue's influence was a late insertion into a personal style that had already evolved within the framework of the well-developed Siennese tradition. In the years between 1260 and 1280, largely due to the inspiration of its magnificent cathedral, Siena had emerged as one of the most vital centres of art in Italy. A remarkable succession of altarpieces by Siennese painters testifies to the simultaneous work of a number of artists, some of whom possessed quite distinct personalities. The variety of orientations of these painters shows that they did not work in provincial isolation but were sensitive to the diverse influences of the age, including Cimabue.

Duccio certainly studied these painters and was influenced by them. Notably evident in his style are the influence of the older painter Guido da Siena with the serene dignity of his figures, permeated by lyrical tenderness and grace, in the now-fading stylized postures of the Byzantine tradition, and of the master of the "St. John the Baptist Altarpiece" in the Pinacoteca Nazionale of Siena, with his complex Byzantine iconography and his vivid, dense colouring. Duccio was able to draw from sources outside Siena as well: from the combination of linear stylization and Hellenistic types that characterized the illustrations of books imported from Constantinople and also from contemporary French Gothic miniatures, with their lively tone and lyrical, animated stylizations of clothing and gesture. Duccio may also have travelled to Florence in his early years, coming into contact with Cimabue, but such an explanation is not entirely necessary to account for the formation of his style. In fact, in Duccio's only certain work prior to the "Madonna Rucellai," echoes of Cimabue are even less apparent than in the Rucellai altarpiece. The conclusion that Duccio was nothing more than a follower of Cimabue at the time he painted the "Madonna Rucellai" is implausible and overlooks the originality, as well as the excellence, of the work. If, in fact, he was in 1285 entrusted with a work of such significance at Florence, his reputation must have already been established and have spread beyond the confines of his native Siena.

Later commissions. Traces of Duccio's association with Cimabue remain in the large round stained-glass window of the choir of the Siena cathedral, for which Duccio made the designs. This work was commissioned between 1287 and 1288 and is the earliest known example of stained glass produced by an Italian.

Numerous documents attest to Duccio's action in Siena during the 20 years following the creation of the "Madonna Rucellai." He was by now the leading painter of the city and as such executed in 1302 an altarpiece, now lost, for the altar of the chapel of the Palazzo Pubblico, the city hall. During this period, some unsigned and undocumented altarpieces appeared, and some of these are certainly Duccio's work; the most significant of these is a small altarpiece representing the Virgin enthroned with angels and called "The Madonna of the Franciscans" because of the three monks kneeling at the foot of the throne. In this work a developed Gothic style appears in the curving outlines, which give an exquisite decorative effect.

The work in which the genius of Duccio

unfolds in all its brilliant fullness and the one to which the painter owes his greatest fame, however, is the "Maestà," the altarpiece for the main altar of the cathedral of Siena. He was commissioned to do this work on Oct. 9, 1308, for a payment of 3,000 gold florins, the highest figure paid to an artist up to that time. On June 9, 1311, the whole populace of Siena, headed by the clergy and civil administration of the city, gathered at the artist's workshop to receive the finished masterpiece. They carried it in solemn procession to the accompaniment of drums and trumpets to the cathedral. For three days alms were distributed to the poor, and great feasts were held. Never before had the birth of a work of art been greeted with such public jubilation and never before had there been such immediate awareness that a work was truly a masterpiece and not just a reflection of the religious fervour of the people. Duccio himself was aware of the work's significance; he signed the throne of the Virgin with an invocation that was devout yet proud for the time: "Holy Mother of God, grant peace to Siena, and life to Duccio because he has painted you thus."

The "Maestà" is in the form of a large horizontal rectangle, surmounted by pinnacles, and with a narrow horizontal panel, or predella, as its base. It is painted on both sides. The entire central rectangle of the front side is a single scene showing the Madonna and Child enthroned in the middle of a heavenly court of saints and angels with the four patron saints of Siena kneeling at their feet. The back is subdivided into 26 compartments that illustrate the Passion of Christ. The front and back of the predella contain scenes of the infancy and the ministry of Jesus, and the pinnacles, crowning the entire work, represent events after the Resurrection. In all, there are 59 narrative scenes.

The rigorous symmetry with which the groups of adoring figures at the sides of the Virgin are arranged in the imposing scene of the central panel is inspired by compositions of the Byzantine tradition and gives evidence of Duccio's keen architectural sensibility by its power to draw attention to the "Maestà" as the true focal point of the cathedral's spatial and structural organization. Like elements of a living architecture, the 30 figures, through the slightest of gestures and turnings of the head, are intimately related, their positions repeated to give a feeling of intense lyrical contemplation. The consonance of feeling that arises from this contemplation gives the facial features of each a distinct, spiritual beauty, reminiscent, especially the faces of the angels, of the more idealistic creations of Hellenistic art. The Madonna, slightly larger than the other figures, seated on a magnificent and massive throne of polychrome marbles, inclines her head gently as if trying to hear the prayer of the faithful. Duccio thus succeeds in reconciling perfectly the Byzantine ideal of power and dignity with the underlying tenderness and mysticism of the Siennese spirit. The scenes in the predella, pinnacles, and back are filled with the Byzantine iconographic schemes from which Duccio finds it difficult to detach himself, and they are developed with a deeper concern for their narrative significance. The scenes are not, however, merely descriptions or chronicles. They include many touches from daily life, which provide a lyrical synthesis that harmonizes the character and gestures of the figures with their landscape and architectural surroundings.

Last years. Only scanty bits of information are available about the few years that Duccio lived after the completion of the "Maestà." He had a prosperous workshop from which other works emerged, but they seem to have been executed in great part by students. His finan-

"Madonna Rucellai," tempera on wood by Duccio di Buoninsegna, 1285; in the Uffizi, Florence

Alinari—Art Resource/EB Inc

unrecorded misconduct. This was the first of a considerable number of fines that the artist incurred at various times and for various reasons, and they suggest that he was of a restless and rebellious temperament. He was fined more than once for nonpayment of debts; in 1295 he was penalized for refusing to pledge allegiance to the head of the *popolo* party; in 1302 for not appearing for military duty; and in the same year for what appears to have been practicing sorcery.

The "Madonna Rucellai." On April 15, 1285, the Compagnia dei Laudesi, or singers of praise, of the Virgin Mary at the church of Sta. Maria Novella in Florence, commissioned "Duccio di Buoninsegna, painter of Siena" to paint a great altarpiece that was to represent the Madonna and Child together with other figures. For the work he was to be paid 150 florins, but if the painting, which had to be "a most beautiful picture" and had to have a gold border, was not satisfactory, the artist would receive no reimbursement. Despite the fact that this employment contract, preserved in the State Archives of Florence, came to light in 1790 and was published in 1854, it was only in 1930 that it was indisputably determined that the document referred to the Madonna of Sta. Maria Novella, now called the "Madonna Rucellai." From the time of Giorgio Vasari, a minor Florentine Renaissance painter who was the earliest, and probably the most influential, biographer of early Italian artists, this altarpiece, which was the largest yet painted, was considered to be a masterpiece of the Florentine painter Cimabue. Vasari's attribution, whereas it was probably due in part to a desire not to deprive the Florentine school and its founder of credit for so brilliant a work, was accepted almost unanimously until the present century because of strong similarities to the work of Cimabue in the "Madonna Rucellai." Some recent critics, no longer able to deny that the work is by Duccio, have concluded that he was a pupil, and in all essentials of his art even an imitator, of Cimabue.

The problem of the relative influence of Cimabue upon Duccio is critically very complex. The "Madonna Rucellai" shows affinities with the work of Cimabue in the type of

cial condition must have been quite sound because by 1304 he bought a vineyard in the neighbourhood of Siena. Nevertheless, in 1313 he was once again deep in debt. At death he was survived by his wife, Taviana, and seven children. At least two of his children, Galgano and Giorgio, were painters, but nothing is known about their work or their merits. The identity of one of his direct followers is known, his nephew Segna di Buonaventura.

(E.Ca.)

MAJOR WORKS. "Madonna Rucellai" (1285; Uffizi, Florence); "Triptych: The Virgin and Child with Saints" (c. 1300; National Gallery, London); "Madonna with Child and Angels" (c. 1300; Galleria Nazionale dell'Umbria, Perugia, Italy); "Maestà," altarpiece (1302; Palazzo Pubblico, Siena; now lost); "Maestà," altarpiece (1308-11; Museo dell'Opera del Duomo, Siena); panels from this altarpiece can be seen in the National Gallery, London; the Frick Collection, New York City; and the National Gallery of Art, Washington, D.C.); "Madonna and Child of St. Cecilia a Crevole" (undated; Museo dell'Opera del Duomo, Siena); "Madonna Enthroned with Angels" (undated; Kunstmuseum, Bern); "The Madonna of the Franciscans" (undated; Pinacoteca Nazionale, Siena); "Madonna and Child" (undated; Stoclet Collection, Brussels); "St. Paul" (undated; Christian Museum [Keresztény Múzeum], Esztergom, Hung.); "The Annunciation" (undated; National Gallery, London); "Nativity with the Prophets Isaiah and Ezekiel" (undated; National Gallery of Art, Washington, D.C.); "The Presentation in the Temple" (undated; Museo dell'Opera del Duomo, Siena); "The Marriage at Cana" (undated; Museo dell'Opera del Duomo, Siena).

BIBLIOGRAPHY. C.H. Weigelt, *Duccio di Buoninsegna* (1911), the first and the longest monograph on the artist (in German), prepared with great scientific exactitude, although some of the conclusions have been modified or superseded by succeeding studies; R.S. Van Marle, *The Development of the Italian Schools of Painting*, vol. 2 (1924), the chapter on Duccio constitutes the fullest treatment of the artist published in English, although it does not present any original ideas (also important for its treatment of the school of Duccio); E. Cecchi, *Trecentisti senesi* (1928), contains some fine pages on Duccio written by an author who was an excellent art critic; P. Bacci, *Documenti e commenti per la storia dell'arte*, pp. 1-47 (1944), a chapter dedicated to the research in the archives on Duccio and his family; E. Carli, *Vetrata duccesca* (1946), a study of the great stained-glass window in the choir of the Siena cathedral, establishing the time it was executed and revealing the authorship of Duccio; *Duccio di Buoninsegna* (1961), an interpretation, in Italian, of the work of Duccio, including the entire corpus of his established works reproduced in colour; C. Brandi, *Duccio* (1951), a thoroughly researched, critical study (in Italian) of the works of Duccio in the light of modern aesthetic theories, with an appendix containing accurate biographical data, chronological lists of documents, and philological notes; G. Vigni, "Duccio di Buoninsegna," in the *Encyclopedia of World Art*, vol. 4, col. 503-509 (1961), an accurate and acute biographical and critical synthesis founded on the most recent research; *L'opera completa di Duccio*, critical text (in Italian) by Edi Baccheschi with an introduction by Giulio Cattaneo (1972).

Duccio, Agostino di: see Agostino di Duccio.

Ducetius (d. c. 440 BC), a Hellenized leader of the Siculi, an ancient people of Sicily, who for a short time welded the native communities of east Sicily into a powerful federation. He seized his opportunity during the confusion that followed the collapse of tyranny in Syracuse and other Sicilian states in 460. Enjoying the goodwill of the Syracusan democracy, he enlisted its help in driving out the colonists of the former tyrant Hieron from Catana and restoring it to its original Chalcidian inhabitants.

Ducetius then extended his influence over other communities and founded a new centre at Palice, but his independent policy led to an alliance of Syracuse and Acragas against him. After minor preliminary successes (including the capture of Inessa from its Greek colonists) he was decisively defeated by their combined forces in 450 and lost the confidence of the Siculi. On the strength of earlier connections, he took refuge in Syracuse and then went to Corinth.

In 446 Ducetius returned to Sicily and colonized Cale Acte on the north coast with Greeks and Siculi. From this centre he attempted to rebuild Siculi power, but his efforts were only partly successful before he died.

Duchamp, Gaston: see Villon, Jacques.

Duchamp, Marcel (b. July 28, 1887, Blainville, Fr.—d. Oct. 2, 1968, Neuilly), French artist who broke down the boundaries between works of art and everyday objects. After the sensation caused by "Nude Descending a Staircase, No. 2" (1912), he painted few other pictures. His irreverence for conventional aesthetic standards led him to devise his

"Nude Descending a Staircase, No. 2," oil on canvas by Marcel Duchamp, 1912; in the Philadelphia Museum of Art

By courtesy of the Philadelphia Museum of Art, the Louse and Walter Arensberg Collection

famous ready-mades and heralded an artistic revolution. Duchamp was friendly with the Dadaists, and in the 1930s he helped to organize Surrealist exhibitions. He became a U.S. citizen in 1955.

Early years. Although Duchamp's father was a notary the family had an artistic tradition stemming from his grandfather, a shipping agent who practiced engraving seriously. Four of the six Duchamp children became artists. Gaston, born in 1875, was later known as Jacques Villon, and Raymond, born in 1876, called himself Duchamp-Villon. Marcel, the youngest of the boys, and his sister Suzanne, born in 1889, both kept the name Duchamp as artists.

When Marcel arrived in Paris in October 1904, his two elder brothers were already in a position to help him. He had done some painting at home, and his "Portrait of Marcel Lefrançois" shows him already in possession of a style and of a technique. During the next few years, while drawing cartoons for comic magazines, Duchamp passed rapidly through the main contemporary trends in painting—Postimpressionism, the influence of Paul Cézanne, Fauvism, and finally Cubism. He was merely experimenting, seeing no virtue in making a habit of any one style. He was

outside artistic tradition not only in shunning repetition but also in not attempting a prolific output or frequent exhibition of his work. In the Fauvist style Marcel painted some of his best early work three or four years after the Fauvist movement itself had died away. The "Portrait of the Artist's Father" is a notable example. Only in 1911 did he begin to paint in a manner that showed a trace of Cubism. He had then become a friend of the poet Guillaume Apollinaire, a strong supporter of Cubism and of everything avant-garde in the arts. Another of his close friends was Francis Picabia, himself a painter in the most orthodox style of Impressionism until 1909, when he felt the need of complete change. Duchamp shared with him the feeling that Cubism was too systematic, too static and "boring." They both passed directly from "semirealism" to a "nonobjective" expression of movement. There they met "Futurism" and "Abstractionism," which they had known before only by name.

The "Nude." To an exhibition in 1911 Duchamp sent a "Portrait" that was composed of a series of five almost monochromatic, superimposed silhouettes. In this juxtaposition of successive phases of the movement of a single body appears the idea for the "Nude Descending a Staircase, No. 2." The main difference between the two works is that in the earlier one the kangaroo-like silhouettes can be distinguished. In the "Nude," on the other hand, there is no nude at all but only a descending machine, a nonobjective and virtually cinematic effect that was entirely new in painting.

When the "Nude" was brought to the 28th Salon des Indépendants in February 1912, the committee, composed of friends of the Duchamp family, refused to hang the painting. These men were not reactionaries and were well accustomed to Cubism, yet they were unable to accept the novel vision. A year later at the Armory Show in New York City, the painting again was singled out from among hundreds that were equally shocking to the public. Whatever it was that made the work so scandalous in Paris, and in New York so tremendous a success, prompted Duchamp to stop painting at the age of 25. A widely held belief is that Duchamp introduced in his work a dimension of irony, almost a mockery of painting itself, that was more than anyone could bear and that undermined his own belief in painting. The title alone was a joke that was resented. Even the Cubists did their best to flatter the eye, but Duchamp's only motive seemed to be provocation.

Farewell to art. In 1912, after the "Nude," Duchamp did a few more paintings. Some of these, notably "Le Passage de la Vierge à la Mariée" and "Mariée" (Philadelphia Museum of Art), both done in Munich, are among the finest works of the period. Again they were neither Cubist, nor Futurist, nor Abstract, but they expressed Duchamp's typical vision of the body perceived in its inmost impulses.

There was no question that as a painter Duchamp was on a footing with the most gifted. What he lacked was faith in art itself, and he sought to replace aesthetic values in his new world with an aggressive intellectualism opposed to the so-called common-sense world. As early as 1913 he began studies for an utterly awkward piece: "The Large Glass, or The Bride Stripped Bare by Her Bachelors, Even." For it, he repudiated entirely what he called retinal art and adopted the geometrical methods of industrial design. It became like the blueprint of a machine, albeit a symbolic one, that embodied his ideas of man, woman, and love.

Like the "Nude," "The Large Glass" was to be unique among works of modern painting. Between 1913 and 1923, Duchamp worked almost exclusively on the preliminary studies and the actual painting of the picture itself.

His farewell to painting was by no means a farewell to work.

During this period a stroke of genius led him to a discovery of great importance in contemporary art, the so-called ready-made. In 1913 he produced the "Bicycle Wheel," which was simply an ordinary bicycle wheel. In 1914, "Pharmacy" consisted of a commercial print of a winter landscape, to which he added two small figures reminiscent of pharmacists' bottles. It was nearly 40 years before the ready-mades were seen as more than a derisive gesture against the excessive importance attached to works of art, before their positive values were understood. With the ready-mades, contemporary art became in itself a mixture of creation and criticism.

When World War I broke out, Duchamp, who was exempt from military service, was living and working in almost complete isolation. He left France for the United States, where he had made friends through the Armory Show. When he landed in New York in June 1915, he was welcomed by reporters as a famous man. His warm reception in intellectual circles as well raised his spirits. The wealthy poet and collector Walter Arensberg arranged a studio for him in his own home, where the painter immediately set to work on "The Large Glass." He became the centre of the Arensberg group, enjoying a reputation that led to many offers from art galleries eager to handle the works of the painter of the "Nude." He refused them all, however, not wanting to start a full-time career as a painter. To support himself, he gave French lessons. He was then, and remained, an artist whose works would have been sought after but who was content to distribute them free among his friends or to sell them for intentionally small amounts. He helped Arensberg buy back as many of his works as could be found, including the "Nude." They became a feature of the Arensberg Collection, which was left to the Philadelphia Museum of Art.

Besides "The Large Glass," on which he worked for eight more years until abandoning it in 1923, Duchamp did only a few more ready-mades. One, a urinal entitled "Fountain," he sent to the first exhibition of the Society of Independent Artists, in 1917. Although he was a founder-member of this society, he had signed the work "R. Mutt," and therefore it was refused. His ready-mades had anticipated by a few years the Dada movement, which Picabia introduced to New York City in the magazine *291* (1917). As an echo of the movement, Duchamp helped Arensberg and H.P. Roché to publish *The Blind Man*, which had only two issues, and *Rongwrong*, which had only one. Later, with the painter Man Ray, he published a single issue of *New York Dada* in 1921.

In 1918 he sold "The Large Glass," which was still unfinished, to Walter Arensberg. With the money from this and another painting, his last, he spent nine months in Buenos Aires, where he heard of the armistice and of the deaths of his brother Raymond Duchamp-Villon and of Guillaume Apollinaire. In Paris in 1919 he stayed with Picabia and established contact with the first Dada group. This was the occasion of his most famous ready-made, a photograph of the "Mona Lisa" with a moustache and a goatee added. The act expressed the Dadaists' scorn for the art of the past, which in their eyes was part of the infamy of a civilization that had produced the horrors of the war just ended.

In February 1923 Duchamp stopped working on "The Large Glass," considering it definitely and permanently unfinished. As the years passed, art activity of any kind interested him less and less, but the cinema came to fulfill his pleasure in movement. His works to this point had been only potential machines, and it was time for him to create machines that were real, that worked and moved. The first

ones were devoted to optics and led to a short film, *Anemic Cinema* (1926). With these and other products, including "optical phonograph records," he acted as a kind of amateur engineer. The modesty of his results, however, was a way by which he could ridicule the ambitions of industry. The rest of the time he was absorbed in chess playing, even taking part in international tournaments and publishing a treatise on the subject in 1932.

Although Duchamp carefully avoided art circles, he remained in contact with the Surrealist group in Paris, composed of many of his former Dadaist friends. When in 1934 he published the *Green Box*, containing a series of documents related to "The Large Glass," the Surrealist poet André Breton perceived the importance of the painting and wrote the first comprehensive study of Duchamp, which appeared in the Paris magazine *Minotaure* in 1935. From that time on there was a closer association between the Surrealists and Duchamp, who helped Breton to organize all the Surrealist exhibitions from 1938 to 1959. Just before World War II he assembled his *Boîte-en-valise*, a suitcase containing 68 small-scale reproductions of his works. When the Nazis occupied France, he smuggled his material across the border in the course of several trips. Eventually he carried it to New York City, where he joined a number of the Surrealists in exile, including Breton, Max Ernst, and Yves Tanguy. He was instrumental in organizing the Surrealist exhibition in New York City in October and November of 1942.

Unlike his co-exiles, he felt at home in America, where he had many friends. During the war, the exhibition of "The Large Glass" at the Museum of Modern Art, New York City, helped to revive his reputation, and a special issue of the art magazine *View* was devoted to him in 1945. Two years later he was back in Paris assisting Breton with a Surrealist exhibition, but he returned to New York City promptly and spent most of the remainder of his life there. After his marriage to Teeny Sattler in 1954, he lived more than ever in semiretirement, content with chess and with producing, as the spirit moved him, some strange and unexpected objects.

This contemplative life was interrupted in about 1960, when the rising generation of American artists realized that Duchamp had found answers for many of their problems. Suddenly tributes came to him from all over the world. Retrospective shows of his works were organized in America and Europe. Even more astonishing were the replicas of his ready-mades produced in limited editions with his permission, but the greatest surprise was still to come. After his death in Neuilly his friends heard that he had worked secretly for his last 20 years on a major piece called "Étant donné: 1. la chute d'eau, 2. le gaz d'éclairage" (Given: 1. the waterfall, 2. the illuminating gas"). It is now at the Philadelphia Museum of Art and offers through two small holes in a heavy wooden door a glimpse of Duchamp's enigma.

Assessment. As artist and anti-artist, Marcel Duchamp is considered one of the leading spirits of 20th-century painting. With the exception of the "Nude Descending a Staircase, No. 2," however, his works were ignored by the public for the greater part of his life. Until 1960 only such avant-garde groups as the Surrealists claimed that he was important, while to "official" art circles and sophisticated critics he appeared to be merely an eccentric and something of a failure.

He was more than 70 years old when he emerged in the United States as the secret master whose entirely new attitude toward art and society, far from being negative or nihilistic, had led the way to Pop art, Op art, and many of the other movements embraced by younger artists everywhere. Not only did he

change the visual arts but he also changed the mind of the artist.

(R.L.e.)

MAJOR WORKS. "Church at Blainville" (1902; Philadelphia Museum of Art); "Portrait of Marcel Lefrançois" (1904; Philadelphia Museum of Art); "Nude on Nude" (1909?; Arnold D. Fawcus Collection, Paris); "Portrait of the Artist's Father" (1910; Philadelphia Museum of Art); "Red Nude" (1910; Mary Sisler Collection, New York); "The Chess Players" (1910; Philadelphia Museum of Art); "Landscape" (1911; Museum of Modern Art, New York City); "Sad Young Man in a Train" (1911; Peggy Guggenheim Collection, Venice); "Nude Descending a Staircase, No. 1" (1911; Philadelphia Museum of Art); "Portrait" (1911; Philadelphia Museum of Art); "Apropos of Little Sister" (1911; Solomon R. Guggenheim Museum, New York City); "Nude Descending a Staircase, No. 2" (1912; Philadelphia Museum of Art); "Le Passage de la Vierge à la Mariée" (1912; Museum of Modern Art); "The King and Queen Surrounded by Swift Nudes" (1912; Philadelphia Museum of Art); "Bride" (1912; Philadelphia Museum of Art); "Bicycle Wheel" (1913; replica, Museum of Modern Art); "3 Standard Stoppages" (1913-14; Museum of Modern Art); "Glider Containing a Water Mill in Neighbouring Metals" (1913-15; Philadelphia Museum of Art); "Bottle Dryer" (1914; replica, Moderna Museet, Stockholm); "Network of Stoppages" (1914; Museum of Modern Art); "Nine Malic Moulds" (1914-15; Mrs. Marcel Duchamp Collection, New York); "In Advance of the Broken Arm" (1915; replica, Yale University Art Gallery); "With Hidden Noise" (1916; Philadelphia Museum of Art); "Nude Descending a Staircase, No. 3" (1916; Philadelphia Museum of Art); "Fountain" (1917; replica, Sidney Janis Collection, New York); "Tu m'" (1918; Yale University Art Gallery); "Nude Descending a Staircase, No. 4" (1918; Museum of the City of New York); "To be Looked at (from the Other Side of the Glass) with One Eye, Close to, for Almost an Hour" (1918; Museum of Modern Art); "L.H.O.O.Q." (1919; Mary Sisler Collection); "Why Not Sneeze Rose Sélavy?" (1921; Philadelphia Museum of Art); "The Large Glass" (1915-23; Philadelphia Museum of Art); "The Brawl at Austerlitz" (1921; W.N. Copley Collection, New York); "Rotary Demi-Sphere" (1925; Museum of Modern Art); "Disks Inscribed with Puns" (1926; W.N. Copley Collection); *The Green Box* (1934); *Rotorels* (1935); "Door for Gradiva" (1937; replica, Dieter Keller Collection, Stuttgart, Ger.); *Boîte-en-valise* (1938-42; Mary Sisler Collection); "In the Manner of Delvaux" (1942; V. and A. Schwarz Collection, Milan); "Pocket Chess Set" (1943; New York); "George Washington" (1943; André Breton Estate, Paris); "Given the Illuminating Gas and the Waterfall" (1948-49; Maria Martins Collection, Rio de Janeiro); "Female Fig Leaf" (1950; Mary Sisler Collection); "Object-Dard" ("Dart-Object"; 1951; Mrs. Marcel Duchamp Collection); "Wedge of Chastity" (1954; Mrs. Marcel Duchamp Collection); "Self-Portrait in Profile" (1958; New York); "Cols alités" (1959; R. Lebel Collection, Paris); "With My Tongue in My Cheek" (1959; R. Lebel Collection); "Torture-morte" (1959; R. Lebel Collection); "Sculpture-morte" (1959; R. Lebel Collection); *Nine Etchings for the Large Glass and Related Works* by A. Schwarz (1967; A. Schwarz Collection); *Nine Etchings for the Large Glass and Related Works* by A. Schwarz (1968; A. Schwarz Collection); "Étant donné: 1. la chute d'eau, 2. le gaz d'éclairage" (1946-66, assembled 1969; Philadelphia Museum of Art).

BIBLIOGRAPHY. *Monographs and catalogues raisonnés.* Robert Lebel, *Marcel Duchamp* (1959, reprinted with an addenda to the catalogue raisonné and an updated bibliography, 1967), is the first major biography and critical study. The catalog includes a list of replicas, editions, working studies and documents, single copies or reconstructions, and variations on Duchamp's projects. Arturo Schwarz (ed.), *The Complete Works of Marcel Duchamp* (1969), is the most extensive catalogue raisonné and includes Duchamp's last works.

Studies. Guillaume Apollinaire, *Les Peintres*

cubistes (1913; *The Cubist Painters*, 2nd ed., 1949); Calvin Tomkins, *The World of Marcel Duchamp* (1966); Pierre Cabanne, *Entretiens avec Marcel Duchamp* (1967; *Dialogues with Marcel Duchamp*, 1971), and *Les 3 Duchamp* (*The Brothers Duchamp*, 1976); Arturo Schwarz, *The Large Glass, and Related Works*, 2 vol. (1967–68) and *Marcel Duchamp* (1970; Eng. ed. 1975); Octavio Paz, *Marcel Duchamp* (1968), in Spanish; and Sarane Alexandrian, *Marcel Duchamp* (1976; Eng. trans. 1977).

Major exhibition catalogs. *Marcel Duchamp, Pasadena Art Museum: A Retrospective Exhibition, October 8 Through November 3, 1963* (1963), the first major exhibition of Duchamp's works; *The Almost Complete Works of Marcel Duchamp: Catalogue of an Exhibition at the Tate Gallery 18 June–31 July 1966* (1966); Paris, Musée National D'art Moderne, *Marcel Duchamp* (1967), the first comprehensive exhibition of Duchamp's works in France; Anne d'Harnoncourt and Kynaston McShine, *Marcel Duchamp* (1973), published by the Museum of Modern Art, New York City, the most complete collection assembled to date.

Duchamp-Villon, Raymond, original name RAYMOND DUCHAMP (b. Nov. 5, 1876, Paris—d. Oct. 7, 1918, Cannes, Fr.), French sculptor, who was one of the first major modern sculptors to apply the principles of Cubism in his work.

In 1900 he gave up medicine for sculpture, often working closely with his brothers, the artists Marcel and Gaston Duchamp (the last-named being better known by his pseudonym, Jacques Villon). Duchamp-Villon was first influenced by the work of Auguste Rodin. His progression to more simplified forms can be seen in such portrait heads as "Baudelaire" (1911; Alexander M. Bing, New York City) and "Maggy" (1911; Solomon R. Guggenheim Museum, New York City), which was virtually reduced to simple geometric shapes. "The Seated Woman" (1914; Yale University Art Gallery) shows the growing influence on Duchamp-Villon of the Cubist painters' characteristic method of abstracting form out of the analytically dissected parts of the object depicted. His move toward abstraction was fully achieved in his masterpiece, "Horse" (1914),

"Horse," bronze sculpture by Raymond Duchamp-Villon, 1914

Collection Walker Art Center, Minneapolis, Minn., gift of the T B Walker Foundation, permission A D A G P 1971, by French Reproduction Rights, Inc.

which reduces forms to their geometric essentials and integrates space into the mass of the work. He also began to apply Cubist principles to architecture but was killed in World War I before his experiments could be realized.

Duchenne, Guillaume-Benjamin-Amand (b. Sept. 17, 1806, Boulogne, Fr.—d. Sept. 15, 1875, Paris), French neurologist, who was first to describe several nervous and muscular disorders and, in developing medical treatment for them, created electrodiagnosis and electrotherapy.

During his lifelong private practice in

Boulogne (1831–42) and Paris (1842–75), he explored the effects of electrical stimulation on diseased nerves and muscles. He rendered the first accounts of several types of muscular atrophy and paralysis caused by nerve disorders, including (1858) *tabes dorsalis*, or locomotor ataxia, a muscular atrophy caused by a degeneration of the dorsal columns of the spinal cord and sensory nerve trunks. His invention of an instrument (now known as Duchenne's trocar) to remove small portions of tissue located deep in the body founded the diagnostic practice of biopsy. His best-known writings are *De l'électrisation localisée* (1855) and *Physiologie des mouvements* (1867).

Duchesne, André, Latin ANDREAS CHESNEUS, ANDREAS QUERCETANUS, OF ANDREAS QUERNEUS (b. May 1584, Ile-Bouchard, Fr.—d. May 30, 1640, Paris), historian and geographer, sometimes called the father of French history, who was the first to make critical collections of sources for national histories.

Duchesne was educated at Loudun and Paris and devoted his early years to studies in history and geography. His first work, *Egregiarum seu Selectarum Lectionum et Antiquitatum Liber*

André Duchesne, detail from an engraving

J E Bulloz

(1602; "Andreas Querneus' Book of Extraordinary or Select Readings and Antiquities"), drew attention to his great erudition. Later, through the influence of the Cardinal de Richelieu, he was appointed historiographer and geographer to the king.

Duchesne's numerous works include general histories, genealogies, and family histories, as well as many folio volumes of manuscript extracts. Among the more noteworthy are *Historiae Normannorum Scriptores Antiqui* (1619; "Ancient Writers of the History of the Normans"), now the only source for some of the texts, and *Historiae Francorum Scriptores*, 5 vol. (1636–49; "Writers of the History of the Franks"), a projected 24-volume comprehensive collection of narrative sources of French history, of which only five volumes were written (the last three by Duchesne's son François).

Duchesne, Louis-Marie-Olivier (b. Sept. 13, 1843, Saint-Servan, Fr.—d. April 21, 1922, Rome), church historian, a leading figure in the 19th- and early 20th-century Roman Catholic revival of learning, who pioneered in the application of archaeological, topographical, liturgical, theological, and social studies to church history.

Ordained a priest in 1867, he studied in Rome and in Paris (1871–73), where he was appointed professor at the Catholic Institute (1877–85) and where in 1881 he founded the *Bulletin Critique de Littérature, d'Histoire et de Théologie*. Persuaded to resign after criticism of his lectures, he taught at the École Supérieure des Lettres from 1885 to 1895, when he was appointed director of the École Française de Rome; he served there until his death. In 1910 he was elected to the French Academy and was made a prothonotary apostolic by Pope Leo XIII.

Louis Duchesne, drawing by an unknown artist, 1903

Harlingue—H Roger-Viollet

Duchesne's works include the authoritative edition of the *Liber Pontificalis*, 2 vol. (1886–92); *Autonomies ecclésiastiques: églises séparées* (1896; "Ecclesiastical Autonomies: Detached Churches"), dealing with the origin of the Greek and Anglican churches; and *Histoire ancienne de l'église chrétienne* (*Early History of the Christian Church*), of which the first three volumes (1905–08) were put on the *Index of Forbidden Books*, the fourth volume being published posthumously (1925).

Duchesne, Père (Father): see Hébert, Jacques-René.

Duchesne, Saint Rose Philippine (b. Aug. 29, 1769, Grenoble, Fr.—d. Nov. 18, 1852, St. Charles, Mo., U.S.; canonized July 3, 1988; feast day November 17), missionary who founded the first Sacred Heart convents in the United States.

Duchesne was born into a wealthy family with high political and financial connections. In 1780 she went to study at a convent and, despite her father's opposition, entered the Visitation Order in Grenoble in 1788. When the community was dispersed by the French Revolution (1792), she did charitable works for nine years. After vainly trying to reestablish the Visitandines in their convent of Sainte-Marie-d'en-Haut, she turned the convent over to the newly founded Society of the Sacred Heart in 1804 and was received by its founder, St. Madeleine Sophie Barat.

For 14 years Mother Duchesne prepared for a missionary career, during which time she founded the first Sacred Heart convent in Paris (1815). In 1818 she headed a band of five nuns, the first to pioneer U.S. territory west of the Mississippi. At St. Charles, in the soon-to-be state of Missouri, the women opened a free school and a boarding academy, moving in 1819 to Florissant, Mo., where they founded an orphanage and a novitiate. Two convent schools were founded in Louisiana, at Grand Coteau (1821) and St. Michael's (1825), and an academy and orphanage in St. Louis, Mo. (1827). The house at St. Charles was reopened in 1828.

At the invitation of the Jesuit missionary Father Pierre-Jean de Smet, Mother Duchesne in 1841 was sent to the Indian mission among the Potawatomi at Sugar Creek (in present-day Kansas), remaining there in ill health for one year. She spent the last decade of her life at St. Charles, where a memorial church was built in her honour.

duchess: see duke.

duchesse lace, a Belgian lace, named after Marie-Henriette, duchess of Brabant (later queen of the Belgians). It was made from c. 1840 throughout the 19th century both at Brussels and (particularly) at Bruges. Much inferior (except for a few Brussels specimens) to the lace that had made Brussels famous, it was cheap and commercially successful. In

Duchesse lace from Brussels, second half of the 19th century; in the Rijksmuseum, Amsterdam

duchesse lace, floral motifs, bobbin-made and sometimes resembling tape motifs, are joined by thread bars (brides).

Ducis, Jean-François (b. Aug. 22, 1733, Versailles, France—d. March 31, 1816, Versailles), French dramatist who made the first sustained effort to present William Shakespeare's tragedies on the French stage. Although he remodeled the tragedies to the

Ducis, portrait by François Gérard

J.E. Bulloz

French taste for witty, epigrammatic style and attempted to confine the plays within the "classical unities" (of time, place, and action), such critics as Voltaire still raged against what he called Shakespeare's "barbarous histrionics." Nonetheless, Ducis achieved great success with his principal adaptations—from *Hamlet* (1769), which he saw mainly as a lesson in filial piety, through his works titled *Roméo et Juliette* (1772), *Le Roi Lear* (1783), *Macbeth* (1784), and *Othello* (1792).

Ducis came from a bourgeois family, rising through his position as secretary to several powerful figures of the court. He knew no English and thus was hampered from the start by having to work with the mediocre translations of two contemporaries, Pierre-Antoine de La Place and Pierre Le Tourneur. Aware of his uncomfortable position between an audience with specific tastes and a body of brilliant but largely unfamiliar works in an alien style, he attempted to compromise the plays, buying exposure for them by revising the texts and, in some cases, even by changing the catastrophes. Nevertheless, his adaptations have a certain vigorous eloquence.

Of Ducis's original tragedies, *Oedipe chez Admète* (1778; "Oedipus at the Home of Admetus") and *Abufar* (1795) are considered his best; the first earned him election to the French Academy in succession, ironically, to Voltaire. His complete works, including his beautifully written letters, were edited and published by

his friend François-Vincent Campenon (1818 and 1826).

duck, any of several genera of relatively small, short-necked, large-billed waterfowl that belong to the subfamily Anatinae, family Anatidae (*q.v.*), order Anseriformes. In true ducks, *i.e.*, those classified in Anatinae, the legs are placed rearward, as in swans, resulting in a waddling gait. Most true ducks, including a few inaccurately called geese by reason of size and build, differ from swans and true geese in the following characteristics: males molt twice annually, females lay large clutches of smooth-shelled eggs, and both sexes have overlapping scales on the skin of the leg and exhibit some degree of sexual differentiation in plumage and in call.

All true ducks, except those in the shelduck (*q.v.*) group and sea ducks, mature in the first year and pair only for the season—unlike the late-maturing, life-mating true geese and swans. They are generally divided into three major groups, dabbling, diving, and perching ducks, based on their characteristic behaviours. The mallard (*q.v.*), a typical dabbling duck, is one of the most popular game birds and is the ancestor of most domestic ducks (*see fowl*). Perching ducks such as the muscovies have long claws and are the most arboreal of ducks, often roosting in trees. The diving ducks include the greatest number of marine species, such as the eider and the scoter (*qq.v.*), but also include the merganser (*q.v.*) group, most of which prefer freshwater areas. Members of the stiff-tail (*q.v.*) group, typified by the ruddy duck, are highly aquatic ducks, characterized by legs set far toward the rear of the body. The whistling duck (*q.v.*) species, also called tree ducks, are not true ducks but are more closely related to the geese and swans. *See also* dabbling duck; diving duck; perching duck.

duck (from Dutch *doek*, "cloth"), any of a broad range of strong, durable, plainwoven fabrics made originally from tow yarns and subsequently from either flax or cotton. Duck is lighter than canvas or sailcloth and differs from these in that it is almost invariably single in both warp and weft, or filling.

The fabric, in its various qualities and colours, is used for an enormous variety of goods, including tents, wagon and motor hoods, light sails, belting, mailbags and other bags and pocketings, and clothing; the plural form is used colloquially for trousers made of the material. Russian duck is a fine white linen canvas.

duck hawk: *see* peregrine falcon.

Duck Lake, town, central Saskatchewan, Canada. It lies between the North and South Saskatchewan rivers, 33 miles (53 km) southwest of Prince Albert. Originally settled about 1870 on nearby Duck Lake, the town was the site of the first clash (March 26, 1885) of the Riel (North West) Rebellion between Métis (people of mixed American Indian and French or Scottish ancestry) led by Gabriel Dumont and a detachment of the North West (later Royal Canadian) Mounted Police, who were forced to retreat. Duck Lake is now a local market town for a grain-growing and mixed-farming area and a service centre for nearby Beardy and Okemasis Indian reservations. The Métis association is commemorated by Duck Lake Historic Park, which includes a museum displaying relics of the period. Batoche (*q.v.*), site of the decisive battle of the Riel Rebellion, is a few miles southeast. Inc. village, 1903; town, 1952. Pop. (1991) 661.

Duck Mountain, plateau in southwestern Manitoba, Canada, forming the highest part of the Manitoba Escarpment. It extends south-eastward from the Saskatchewan border for 50 miles (80 km), culminating in Baldy Mountain (2,730 feet [832 m]), 36 miles northwest of Dauphin. A large part of the plateau is em-

braced by Duck Mountain Provincial Park, established in 1962 to preserve the region's dense forests, numerous lakes, and abundant wildlife; both are named for the wild ducks found there.

duckbill (mammal): *see* platypus.

duckbill cat (fish): *see* paddlefish.

duckpins, bowling game played on a standard tenpin lane with smaller pins and balls. Duckpins are 9.4 inches (23.3 cm) tall. The ball that is used to knock the pins down is a maximum of 5 inches in diameter and 3 pounds 12 ounces (1.7 kg) in weight, and it has no finger holes. Three balls may be rolled in each frame of the 10-frame game. There is no bonus for knocking down all 10 pins with three balls. Other rules are similar to those of tenpins. A perfect game is 300, as it is in tenpin bowling.

Duckpins is most popular in the United States, where it is governed by the National Duck Pin Bowling Congress (founded Sept. 8, 1927). The game was introduced in 1900 at a bowling alley owned by professional baseball players Wilbert Robinson and John J. McGraw.

A popular variation of the game is rubber-band duckpins. In this version, the pins are the same height as in duckpins, but there is a hard rubber band about the belly of each pin, giving it greater rebounding action when hit by a ball. The ball is also the same size as in duckpins but may weigh no more than 3 pounds 8 ounces (1.6 kg). Only two balls are bowled in each frame.

Ducommun, Élie (b. Feb. 19, 1833, Geneva, Switz.—d. Dec. 7, 1906, Bern), Swiss writer and editor who in 1902, with Charles-Albert Gobat, won the Nobel Prize for Peace.

After working as a magazine and newspaper editor in Geneva and Bern, Ducommun spent most of his career as general secretary of the Jura-Simplon Railway. His spare time, however, was spent on peace activities. He took an active part in the movement for European union, editing *Les États-Unis d'Europe*, periodical of the International League of Peace and Freedom, founded in 1867.

In 1889 Ducommun participated in the first of the regular International Peace congresses. Two years later he became honorary general

Ducommun, detail of an engraving

By courtesy of the Bibliothèque Nationale Suisse, Bern

secretary of the newly founded International Peace Bureau. After 1895 he published the bureau's *Correspondance bi-mensuelle*. In this period Ducommun also wrote a number of works on the peace movement.

Ducos du Hauron, Louis, in full ARTHUR-LOUIS DUCOS DU HAURON (b. 1837, Langon, France—d. October 1920, Agen), French physicist and inventor who in 1869 developed the so-called trichrome process of colour photography, a key 19th-century contribution to photography.

The son of a tax collector, Ducos du Hauron

began experimenting in his 20s and on March 1, 1864, patented (but did not build) a device for taking and projecting motion pictures. Four years later, on Nov. 23, 1868, he was granted a patent on a process for making colour photographs. He photographed each scene through green, orange, and violet filters, then printed his three negatives on thin sheets of bichromated gelatin containing carbon pigments of red, blue, and yellow, the complementary colours of the negatives. When the three positives, usually in the form of transparencies, were superimposed, a full-colour photograph resulted. Another French experimenter, Charles Cros, discovered the process independently, publishing his findings just 48 hours after Ducos du Hauron received his patent. Ducos du Hauron described his results in *Les Couleurs en photographie: Solution du problème* (1869; "Colours in Photography: Solution of the Problem") and *Les Couleurs en photographie et en particulier l'héliochromie au charbon* (1870; "Colours in Photography: Colour Reproduction with Carbon Pigments").

Ducos du Hauron also devised improvements and cost reductions for printed colour reproductions. In 1891 he patented a device for three-dimensional photography called an anaglyph. Though he realized little profit from his inventions, he did receive a pension from the government and in 1912 was made a chevalier of the French Legion of Honour.

Ducrow, Andrew (b. Oct. 10, 1793, London, Eng.—d. Jan. 27, 1842, London), spectacular British equestrian performer and an originator of horsemanship acts.

Ducrow, engraving by T.C. Wageman

By courtesy of the Raymond Mander and Joe Mitchinson Theatre Collection, London

Ducrow's father, a Belgian strong man who came to England in 1793, trained him from infancy in tumbling, riding, and rope dancing. Ducrow later developed a horsemanship act, "The Courier of St. Petersburg," variations of which are still performed in 21st-century circuses. A rider straddled two cantering horses while other horses bearing the flags of the countries through which a courier would pass on his way to Russia passed between his legs. He appeared in European circuses and in spectacles at Covent Garden and Drury Lane in London, but he is best remembered for his long career as proprietor and chief performer at the famous Astley's Amphitheatre, a permanent modern circus (1824–41). When Astley's was destroyed by fire for the third time in 1841, Ducrow suffered a mental breakdown and died soon after.

ductus deferens, also called *VAS DEFERENS*, thick-walled tube in the male reproductive system that transports sperm cells from the epididymis, where the sperm are stored prior to ejaculation. Each ductus deferens ends in an enlarged portion, an ampulla, which acts as a reservoir. There are two ductus deferentes,

identical in structure and function, which emerge from the two epididymides.

The channel of the ductus deferens is slightly larger than that of the ductus epididymidis, the tube found in the epididymis gland from which it originates. The tissue lining the inside wall is a moist and folded layer of mucous membrane. Surrounding the mucous membrane are three layers of circular and longitudinal muscle fibres. These fibres cause the ducts to contract and thus allow the sperm and fluids to be transported. The ductus deferens begins at the tail of the epididymis, in the lower region of the scrotal sac, the pouch of thin skin that covers the testes and epididymides. It extends into the pelvic region. While ascending to the level of the bladder, the ductus deferens is surrounded by a network of arteries, veins (pampiniform plexus), and nerve fibres, and the whole is covered by layers of connective tissue. (This complex tubular structure, called the spermatic cord, also serves to suspend the testes.) At the level of the bladder, each duct separates from its sheath of connective tissue and travels back over the top of the bladder; the two ducts turn downward at the rear of the bladder, and their channels enlarge to form the two ampullae attached to the outside left and right walls of the bladder.

The ampullae act as storage chambers for the semen and contribute secretions to it. The yellow secretions of the ampullae include ergothioneine, a substance that reduces chemical compounds, and fructose, a sugar and nutrient. Both secretions moisten the sperm and help to keep them viable. The inside cavities of the ampullae have several meshlike partitions and folds. The walls of the ampulla are thinner than the rest of the sperm canal, and the channel is usually larger. The size of the ampulla varies with different animal species; in the stallion the ampullae are relatively large, whereas in man they are only about twice the size of the ductus deferentes. The ampullae join the ducts of the seminal vesicles to form the ejaculatory ducts. *See also* ejaculation.

For a depiction of the ductus deferens in human anatomy, *see* the colour Trans-Vision in the PROPÆDIA: Part Four, Section 421.

Dudek, Louis (b. Feb. 6, 1918, Montreal, Que., Can.—d. March 22, 2001, Montreal), major figure in the Canadian poetry renaissance of the 1940s.

Educated at Columbia University and McGill University (where he later taught), Dudek worked as an editor and wrote criticism. His poetic output includes *East of the City* (1946); *The Transparent Sea* (1956), love poems; and *Laughing Stalks* (1958), a social satire that includes parodies of certain Canadian poets and critics. His *Collected Poems* appeared in 1974. Dudek's poems reflect his power of observation of people, places, and objects. The influence of Ezra Pound is evident in *Europe* (1955), a travelogue poem in 99 cantos, and in other works. Later collections of poetry include *Cross Section* (1980), *Small Perfect Things* (1991), and *Surface of Time* (2000).

Dudek cofounded Contact Press, Delta Canada, and D.C. Books (all small presses) and the McGill Poetry Series. He also published his own literary journal, *Delta* (1957–66).

Dudinka, city and administrative centre of Taymyr autonomous *okrug* (district), northern Krasnoyarsk *kray* (region), north-central Russia. A port on the lower Yenisey River, it was founded in 1667 and became a city in 1951. Dudinka exports nickel from the mines at Norilsk, with which it is connected by rail. It also has a natural-gas plant, using gas from fields about 100 miles (160 km) west of the city. Pop. (2000 est.) 26,800.

Dudley, metropolitan borough, metropolitan county of West Midlands, Eng., at the western edge of the metropolitan county. The borough

is bisected by the Sedgley-Northfield ridge. To the south and west lies the fertile countryside around the River Severn; on the River Stour, a tributary of the Severn in the south of the borough, are the towns of Stourbridge and Halesowen. North and east of the ridge is the industrial Black Country plateau, dominated by Dudley Castle Hill, the site of Saxon and Norman fortifications and, since 1935, of a zoological garden.

Coal and ironstone were mined in the area since the Middle Ages, the coal used for iron smelting beginning in the 18th century. The tremendous expansion of industry after 1700 was stimulated by the building of canals, which transformed communications, as well as by the area's rich mineral resources. By the first half of the 19th century there were numerous blast furnaces, whose pollution helped to give the Black Country its name. Coal mining had ceased by the end of the 20th century, however. Nail making was an important industry from the 17th century, and chains and anchors were also made. Glassmaking dates from the early 17th century, and crystal glassware is produced today.

Metalworking remains an important industry of the district; products range from heavy engineering castings to tubes, chains, cables, nuts, and bolts. Other industries include plastics, textiles, chemicals, and electronics. Within the district is the Wren's Nest Geological Nature Reserve, with classic exposures of Silurian limestone extensively quarried until 1924. Area 38 square miles (98 square km). Pop. (2001) 305,164.

Dudley, Charles Benjamin (b. July 14, 1842, Oxford, N.Y., U.S.—d. Dec. 21, 1909, Altoona, Pa.), American chemical engineer who helped found the science of materials testing.

Having entered Yale College in 1867, Dudley worked his way through school as a night editor on the *New Haven Palladium* and eventually earned a Ph.D. from the Sheffield Scientific School, as well as election to Phi Beta Kappa. In 1875 he was appointed chemist to the Pennsylvania Railroad Company, where he instituted a program of research on the composition and properties of rails.

The publication of Dudley's study "The Chemical Composition and Physical Properties of Steel Rails" in the *Transactions of the American Institute of Mining Engineers* (1878) created a sensation. The steel producers viewed with disfavour the invasion of their metallurgical domain by an outsider; but Dudley continued to publish his findings, and the principle he stood for, the enforcement of rigorous standards, prevailed. Eventually he developed a complete set of standard specifications for fuels, lubricants, paints, and lighting devices, as well as for mechanical components of locomotives and rolling stock. In 1898 he helped found the American Society for Testing and Materials, and he served as its president from 1902 until his death.

Dudley, Dud (b. 1599, England?—d. 1684 England?), English ironmaster usually credited with having been the first to smelt iron ore with coke, which is a hard, foamlake mass of almost pure carbon made from bituminous coal.

Charcoal, made from wood, had been exclusively used for smelting iron until Dudley began experimenting with coke, or, as he called it, "pit-coal." Such experimentation had been encouraged by the English government, which was concerned about the rapid destruction of forests for fuel. Dudley obtained a patent for his innovation in 1621 and was soon producing a record seven tons of pig iron per week at the Hasco Bridge ironworks owned by his father, Edward Sutton, 5th Baron Dudley.

Dudley, Edmund (b. c. 1462—d. Aug. 18, 1510, London), minister of King Henry VII

of England and author of a political allegory, *The Tree of Commonwealth* (1509).

In 1506 Dudley was "president of the king's council," a small body of lawyers and fiscal administrators that helped reestablish the payment of feudal dues and of fines for lawbreaking. Charges that he defrauded the King—he amassed a fortune—and was otherwise guilty of corruption were not proved. In April 1509, just after the death of Henry VII, Dudley and Sir Richard Empson, another leader in the council, were arrested. Both were convicted of treason and were executed, largely because of Henry VIII's desire for popularity.

Dudley wrote *The Tree of Commonwealth* (ed. D.M. Brodie, 1948) while in the Tower. It is informed with the irony and wit of a great advocate. In the work Dudley insists on punctual performance of duties by all ranks of society, inveighs against administrative abuses sanctioned by law, and urges moderation in the use of royal powers.

Dudley was the father of John Dudley, duke of Northumberland.

Dudley, Lady Jane: see Grey, Lady Jane.

Dudley, John: see Northumberland, John Dudley, duke of.

Dudley, Sir Robert: see Leicester, Robert Dudley, earl of.

Dudley, Sir Robert (b. Aug. 7, 1574, Richmond, Surrey, Eng.—d. Sept. 6, 1649, Florence), English sailor, engineer, and titular duke of Northumberland and earl of Warwick who wrote a well-known treatise, *Dell'Arcano del mare* (3 vol., 1646–47; "Concerning the Secret of the Sea"), that contained the sum of contemporary knowledge of navigation.

Proposing to explore Guiana, he voyaged to Trinidad and sent a boat some distance up the Orinoco River (1594). In 1596 he was knighted for his part in England's naval operations against Spain. He later attempted to establish his legitimacy and claim to the titles of his father, Robert Dudley, earl of Leicester, basing his claims on an alleged marriage between his parents in 1573 (a marriage that his father had denied).

In 1605 he went to Italy, where he entered the service of the Grand Duke of Tuscany and was employed in draining the marshes between Pisa and Leghorn (1620) and in constructing the port of Leghorn. Published near the end of his life, his *Arcano* considered ship construction, a plan for building a navy of five classes of ships, and naval discipline; it also contained determinations of longitude, charts based on the map projections of Gerardus Mercator, and designs for instruments.

Dudley, Thomas (b. 1576, Northampton, Eng.—d. July 31, 1653, Roxbury, Mass.), British colonial governor of Massachusetts, for many years the most influential man in the Massachusetts Bay Colony, save John Winthrop.

Dudley was the son of a country gentleman in England and for a time was the steward of the earl of Lincoln's estates. After being converted to Puritanism he joined with other Lincolnshire gentlemen in 1629, entering into an agreement to settle in New England provided they were allowed to take a charter with them. This proposal the general court of the Massachusetts Bay Company agreed to, and in April 1630 Dudley sailed to America in the same ship with Winthrop, the newly appointed governor. Dudley was elected deputy governor 13 times between 1629 and 1650, and served as governor 4 times.

Soon after his arrival in the colony Dudley settled at New Towne (later Cambridge), which he helped found. He was also one of the promoters of the plan to establish Harvard College. Winthrop's decision to make Boston instead of New Towne the capital precipitated the first of many quarrels between the two

and prompted Dudley to move his residence to Roxbury.

From Dudley, an earnest and persistent heresy hunter, New England Puritanism derived some of its harshest aspects; his sterner Puritanism stood in strong contrast to Winthrop's more tolerant and liberal views.

Dudley diamond (gem): see Star of South Africa.

DUDO OF SAINT-QUENTIN, also spelled DUDON (b. c. 960, Vermandois, Picardy, Fr.—d. before 1043, Rouen, Normandy), historian of the first dukes of Normandy; his chronicle is a primary source for the early history of the Norman state.

A canon of Saint-Quentin, Dudo was sent by the count of Vermandois to Rouen in 986 to petition for Norman aid against Hugh Capet, founder of the Capetian dynasty. He began to frequent the court of Richard I, duke of Normandy, and was employed to write a history of the Norman dukes. The work, *De moribus et actis primorum Normanniae ducum* ("Concerning the Customs and Deeds of the First Dukes of the Normans"), was completed sometime between 1015 and 1026. Trained as a poet, Dudo wrote his history as an apologetic for the Norman dukes. Its inaccurate and legendary character makes it a relatively untrustworthy document; but, as a record of local oral tradition, contemporary chansons de geste, and rare firsthand information on the emerging Norman court, the chronicle remains highly important.

Dudok, Willem Marinus (b. July 6, 1884, Amsterdam—d. April 6, 1974), Dutch architect whose work is related both to the school of Amsterdam, which emphasized individual expression, and to the De Stijl group, which stressed geometric form. He attended the Royal Military Academy at Breda and remained in the army until 1913. He became municipal architect of Hilversum in 1915 and thereafter designed many buildings for the city, notably the Dr. H. Bravink School (1921), the Vondel School (1928–29), and the Town Hall (1928–30). These structures, though compositions of cubes, convey solidity and texture through the use of solid brick.

Other Dudok works include The Netherlands House, Cité Universitaire, Paris (1927–28); the Bijenkorf department store, Rotterdam (1929–30), which was destroyed in World War II; and the Erasmus Huis, Rotterdam (1939–40).

due process, a course of legal proceedings according to rules and principles that have been established in a system of jurisprudence for the enforcement and protection of private rights. In each case, due process contemplates an exercise of the powers of government as the law permits and sanctions, under recognized safeguards for the protection of individual rights.

Principally associated with one of the fundamental guarantees of the United States Constitution, due process derives from early English common law and constitutional history. The first concrete expression of the due process idea embraced by Anglo-American law appeared in the 39th article of Magna Carta (1215) in the royal promise that "No freeman shall be taken or (and) imprisoned or disseised or exiled or in any way destroyed . . . except by the legal judgment of his peers or (and) by the law of the land." In subsequent English statutes, the references to "the legal judgment of his peers" and "laws of the land" are treated as substantially synonymous with due process of law. Drafters of the U.S. federal Constitution adopted the due process phraseology in the Fifth Amendment, ratified in 1791, which provides that "No person shall . . . be deprived of life, liberty, or property, without due process of law." Because this amendment was held inapplicable to state actions that might

violate an individual's constitutional rights, it was not until the ratification of the Fourteenth Amendment in 1868 that the several states became subject to a federally enforceable due process restraint on their legislative and procedural activities.

The meaning of due process as it relates to substantive enactments and procedural legislation has evolved over decades of controversial interpretation by the Supreme Court. Today, if a law may reasonably be deemed to promote the public welfare and the means selected bear a reasonable relationship to the legitimate public interest, then the law has met the due process standard. If the law seeks to regulate a fundamental right, such as the right to travel or the right to vote, then this enactment must meet a stricter judicial scrutiny, known as the compelling interest test. Economic legislation is generally upheld if the state can point to any conceivable public benefit resulting from its enactment.

In determining the procedural safeguards that should be obligatory upon the states under the due process clause of the Fourteenth Amendment, the Supreme Court has exercised considerable supervision over the administration of criminal justice in state courts, as well as occasional influence upon state civil and administrative proceedings. Its decisions have been vigorously criticized, on the one hand, for unduly meddling with state judicial administration and, on the other hand, for not treating all of the specific procedural guarantees of the first 10 amendments as equally applicable to state and to federal proceedings.

Some justices have adhered to the proposition that the framers of the Fourteenth Amendment intended the entire Bill of Rights to be binding on the states. They have asserted that this position would provide an objective basis for reviewing state activities and would promote a desirable uniformity between state and federal rights and sanctions. Other justices, however, have contended that states should be allowed considerable latitude in conducting their affairs, so long as they comply with a fundamental fairness standard. Ultimately, the latter position substantially prevailed, and due process was recognized as embracing only those principles of justice that are "so rooted in the traditions and conscience of our people as to be ranked as fundamental." In fact, however, almost all of the Bill of Rights has by now been included among those fundamental principles.

duel, a combat between persons, armed with lethal weapons, which is held according to pre-arranged rules to settle a quarrel or a point of honour. It is an alternative to having recourse to the usual process of justice.

The judicial duel or trial by battle was the earliest form of duelling. Caesar and Tacitus report that the Germanic tribes settled their quarrels by single combat with swords, and with the Germanic invasions the practice became established in western Europe early in the Middle Ages. The judicial duel was adopted because solemn affirmation, or swearing of oaths, in legal disputes had led to widespread perjury and because the ordeal (*q.v.*) seemed to leave too much to chance or to manipulation by priests. If a man declared before a judge that his opponent was guilty of a certain crime and the opponent answered that his accuser lied, the judge ordered them to meet in a duel, for which he established the conditions as to place, time, and arms; both combatants had to deposit sureties for their appearance. The throwing down of a gauntlet was the challenge, which the opponent accepted by picking it up. As it was believed that in such an appeal to the "judgment of God" the defender of the right could not be

worsted, the loser, if still alive, was dealt with according to law.

This form of trial was open to all free men and even, in certain cases, to serfs. Only ecclesiastics, women, the sick, persons under 20 years of age, and men over 60 could claim exemption. In certain circumstances, however, persons under trial could appoint professional fighters or "champions" to represent them, but the principal as well as his defeated champion was subjected to the legal punishment.

In most countries duels also served to decide impersonal questions. In Spain, for example, a duel was fought in 1085 to decide whether the Latin or the Mozarabic rite should be used in the liturgy at Toledo: the Mozarabic champion, Ruiz de Mastanza, won. The procedure of these duels was laid down in great detail. They took place in *champs clos* (lists), generally in the presence of the court and high judicial and ecclesiastical dignitaries. Before combat each participant swore that his case was just and his testimony true and that he carried no weapons other than the stipulated ones and no magical aids. When one of the combatants was wounded or thrown, his opponent usually placed his knee on his chest and, unless asked for mercy, drove his dagger through a joint in the armour.

William I introduced the judicial duel or trial by battle to England in the 11th century; it was finally abolished in 1819. In France, fatal judicial duels became so frequent that, from the 12th century, attempts were made to reduce them. The last one to be authorized by a French king took place on July 10, 1547.

Duels of honour were private encounters about real or imagined slights or insults. The practice, considerably facilitated by the fashion of wearing a sword as part of everyday dress, seems to have spread from Italy from the end of the 15th century. Men fought on the slightest pretext and often, at first, without witnesses; as this secrecy came to be abused (e.g., by ambushes) it soon became usual for duellists to be accompanied by friends or seconds. Later, these seconds also fought, to prove themselves worthy of their friends.

Duels of honour became so prevalent in France that Charles IX issued an ordinance in 1566 that applied the death penalty to anyone taking part in a duel. This ordinance became the model for later edicts against duelling. Duelling, however, survived longer than did the monarchy in France. From the Revolutionary period onward, it came to be a feature of political disputes, and political duels were frequent in the 19th century. In the 20th century, duels still took place occasionally in France—often however for form's sake alone, with such precautions that neither sword nor pistol could prove fatal—or even for purposes of publicity. In Germany duels of honour were authorized by the military code up to World War I and were legalized again (1936) under the Nazis. The Fascist regime in Italy also encouraged duelling. The *Mensur* (student duel) is still a feature of German university life. Most German universities have long-established *Verbundungen* (fighting corps) with strict rules, secret meetings, distinctive uniforms, and great prestige. The method of swordplay differs from that of normal fencing, and students can obtain the scars on head and cheek that are prized as marks of courage.

Duels among women, although rare, have been recorded.

Duellona (Roman goddess): see Bellona.

Duero River (Europe): see Douro River.

Duese, Jacques, Duèse also spelled D'EUZE: see John XXII under John (papacy).

Dufaure, (Jules-) Armand (-Stanislas) (b. Dec. 4, 1798, Saujon, Fr.—d. June 28,

1881, Rueil, near Paris), French political figure whose longevity as a conservative republican—his career bridged the July Monarchy and the early years of the Third Republic—reflected the variable fortunes of republicanism in 19th-century France.

After a legal career in Bordeaux, Dufaure was elected to the Chamber of Deputies in 1834. He joined Marshal Soult's government as minister of public works (1839) and was an important influence in the development of the French railway system. In 1840 he joined

Dufaure, detail from a lithograph by Charles-Jérémie Fuhr, c. 1861-74. H. Roger-Vollet

the opposition to King Louis-Philippe, and he was elected vice president of the Chamber in 1845.

Dufaure joined the republican cause in the revolutionary year of 1848. He served in the Legislative Assembly and then was minister of the interior in the provisional government of Gen. Louis Cavaignac during the early stages of the Second Republic. The accession of Napoleon III to the imperial throne forced him into political retirement. Returning to the bar, he was elected to the Académie Française in 1864.

When the Second Empire collapsed, Dufaure joined the aged republican Adolphe Thiers in the formation of a new republic. He served both Thiers and Louis Buffet as minister of justice. He became premier in March 1876, resigned the following February 12, and then returned to power on Dec. 13, 1877. Dufaure was especially influential in the series of events that forced the resignation of Marshal Mac-Mahon from the presidency (January-February 1879), because of Mac-Mahon's alleged anti-republican intentions. Soon after, he, too, went into a final political retirement.

Dufay, Guillaume, Dufay also spelled DU FAY (b. c. 1400—d. Nov. 27, 1474, Cambrai, Bishopric of Cambrai), French composer noted for both his church music and his secular chanson.

Dufay was chorister at the Cambrai cathedral (1409), entered the service of Carlo Malatesta

Dufay (left) and Gilles Binchois, illumination from Martin le Franc's *Le Champion des Dames*, c. 1440; in the Bibliothèque Nationale, Paris (Ms. Fr. 12476). By courtesy of the Bibliothèque Nationale, Paris

of Rimini c. 1420, and in 1428 joined the papal singers. In 1426 he became a canon of Cambrai. After seven years with the Duke of Savoy he lived at Cambrai from about 1440 and supervised the music of the cathedral. He took a degree in canon law about 1445 and in 1446 became a canon of Mons. Dufay's surviving works include 87 motets, 59 French chansons, 7 Italian chansons, 7 complete masses, and 35 mass sections. He often used, and may have originated, the technique of *fauxbourdon*, a style of composition based on the sonorities of the third and sixth and derived from English descant, an improvisational practice.

During his Italian period Dufay composed a number of ceremonial motets for public celebrations, among them the election of Pope Eugenius IV (1431), the Treaty of Viterbo (1433), and the dedication of Brunelleschi's dome for Sta. Maria del Fiore, Florence (1436). For the brilliant "Feast of the Pheasant" held in 1454 by Philip the Good of Burgundy and intended to initiate a crusade to recapture Jerusalem, Dufay composed a lamentation for the Church in Constantinople.

Dufay's chansons, normally in three voices, deal with subjects such as springtime, love, and melancholy. Most use the poetic-musical forms of the ballade, rondeau, and virelai; a few are written in freer form.

Dufay's masses laid the foundation for the rapid musical development of the mass in the second half of the 15th century. His complete mass settings are in four voices and use a *cantus firmus* placed in the tenor line. His *canti firmi* include secular songs such as *L'homme armé* (used by many composers up to Palestrina) and his own ballade *Se la face ay pale*, and sacred melodies such as *Ave Regina coelorum*.

In these and other works of his Cambrai period Dufay perfected a graceful and expressive style that incorporated into continental music the sweet harmonies of the *contenance angloise* or "English manner" that according to Martin le Franc's *Le Champion des Dames* (c. 1440) he had adopted from John Dunstable. In his music he created the characteristic style of the Burgundian composers that links late medieval music with the style of later Franco-Flemish composers of the Renaissance.

"De," "la," and similar components of a name, when followed by a space, are alphabetized as separate words (e.g., De Forest, Lee).

When they are joined to the following part of a name, the combination is treated as a single word (e.g., DeForest, John William).

Duff, Alexander (b. April 26, 1806, Moulin, Perthshire, Scot.—d. Feb. 12, 1878, Edinburgh), first Presbyterian foreign missionary of the Church of Scotland, highly influential on later missionary endeavours through his promotion of higher education.

Duff was twice shipwrecked before reaching Calcutta (May 1830), where he opened an English language school for Hindus and Muslims, combining Bible studies with aspects of Western science that challenged local religious beliefs.

In 1844 Duff cofounded the *Calcutta Review* and served as editor from 1845 to 1849, after which time he returned to Scotland. In 1851 he was elected moderator of the Free Church assembly but returned to India in 1856, the year the Bengal army mutinied against the British colonial government. Condemnation of the government's policy was voiced in *The Indian Mutiny: Its Causes and Results* (1858). Duff was offered the post of vice chancellor of the University of Calcutta in 1863 but declined because of poor health. He returned to Scotland, where in 1873 he was again appointed moderator of the Free Church assembly.

Dufferin and Ava, Frederick Temple Hamilton-Temple-Blackwood, 1st Marquess of, EARL OF AVA, EARL OF DUFFERIN, VISCOUNT CLANDEBOYE, BARON CLANDEBOYE, BARON DUFFERIN AND CLAN[D]EBOYE OF BALLYLEIDY AND KILLYLEAGH (b. June 21, 1826, Florence, Grand Duchy of Tuscany [Italy]—d. Feb. 12, 1902, Clondeboye, near Belfast, Ire.), British diplomat who was a distinguished governor-general of Canada and viceroy of India.

The son of the 4th Baron Dufferin, he was educated at Eton and Christ Church College,

1st Marquess of Dufferin and Ava, detail of a portrait by George Frederic Watts; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Oxford. He held undersecretaryships in 1864–66 and was William Ewart Gladstone's chancellor of the duchy of Lancaster, outside the Cabinet, from 1868 to 1872. He was created Earl of Dufferin in 1871.

As governor-general of Canada from 1872 to 1878, Dufferin did much to unite the newly formed dominion. In 1881 he became British ambassador to Ottoman Turkey and dealt with the problems raised by the British occupation of the Ottoman dependency of Egypt. He succeeded Lord Ripon as viceroy of India in 1884 and placated the British community there, which had been antagonized by Ripon's reforms. By the annexation of Burma (Myanmar) in 1886, he consolidated British territories. For his services he was made Marquess of Dufferin and Ava when, in 1888, he retired from India. He then spent three years (1889–91) as Britain's ambassador to Italy and four years (1892–96) as ambassador to France. He retired in 1896.

Duffy, Sir Charles Gavan (b. April 12, 1816, County Monaghan, Ire.—d. Feb. 9, 1903, Nice, Fr.), Irish nationalist who later became an Australian political leader.

While studying law in Dublin, Duffy, along with John Blake Dillon and Thomas Davis, founded the *Nation* (1842), a weekly journal of Irish nationalist opinion. Later he and his two colleagues formed the "Young Ireland" party, which advocated Irish independence. Duffy was seized just before an abortive attempt at insurrection (August 1848) and imprisoned until 1849. In 1852 he was elected to Parliament for New Ross, County Wexford, and in that body he organized an independent opposition of some 50 Irish members to obstruct any government that did not support the demands of the Irish Tenant League. His tactics foreshadowed those of Charles Stewart Parnell, but Duffy's efforts were frustrated by factionalism and by lack of support from the Irish clergy, who thought him too radical.

Duffy retired from Irish politics in 1855, and, leaving Ireland, he said, "as a corpse on a dissecting table," he went to Australia. He practiced law in Melbourne and was elected to the Victoria House of Assembly in 1856. After becoming minister of that state's land and works (1857), he promoted an important land act. He served as prime minister of Victoria in 1871–72, was knighted in 1873, and was

speaker of the Victoria House of Assembly from 1877 to 1880. He thereafter retired to southern France to write his memoirs, which form a principal source for the history of Ireland in the period. His books include *The League of North and South, 1850–54* (1886) and *My Life in Two Hemispheres* (1898).

Dufour, Guillaume-Henri (b. Sept. 15, 1787, Konstanz, Austrian Empire [now in Germany]—d. July 14, 1875, Les Contamines, near Geneva, Switz.), engineer and army officer who was elected four times to supreme command of the Swiss army.

After studying in Geneva, at the École Polytechnique in Paris, and at the École du Génie in Metz, Dufour served in Napoleon's army, defending Corfu in 1813 and taking part in the campaigns in France in 1814. He resigned in 1817 and returned to Switzerland, where he was appointed *ingénieur cantonal*, supervising the construction of public works that greatly improved Geneva. He also helped to form the military school at Thun in 1819, where he became chief instructor. Appointed chief of staff of the Swiss army in 1831, he commanded a division sent to restore order in Basel in 1833. In the same year, he began his pioneer topographical survey of Switzerland (published 1842–64). In 1847 Dufour was elected general of the federal army to act against the separatist confederation of Roman Catholic cantons known as the Sonderbund, and he displayed skill and moderation in its suppression. He was elected general for the second time in 1849 to maintain Swiss neutrality in the face of insurgents from Baden; again in 1857, during the conflict with Prussia over Neuchâtel; and finally in 1859, when

Dufour, portrait by Anne-Octavie Dufour; in the Bibliothèque Publique et Universitaire, Geneva

By courtesy of the Bibliothèque Publique et Universitaire, Geneva; photograph Jean Arlaud

the French were about to annex Savoy. He presided over the international congress in Geneva in 1864 that drew up the convention for the wounded in time of war and resulted in the creation of the Red Cross. He also sat in the federal assembly as a Conservative.

Dufourspitze (German), Italian PUNTA DUFUR, highest peak (15,203 feet [4,634 m]) of Switzerland and second highest of the Alps, lying 28 miles (45 km) south-southwest of Brig in the Monte Rosa Massif of the Pennine Alps near the Italian border. The summit of the mountain was first reached by an English party in 1855. The peak was named after General Guillaume-Henri Dufour, the head of the survey that first fixed instrumentally the positions of several Monte Rosa peaks.

Dufy, Raoul (b. June 3, 1877, Le Havre, Fr.—d. March 23, 1953, Forcalquier), French painter and designer noted for his brightly coloured and highly decorative scenes of luxury and pleasure.

In 1900 Dufy went to Paris to attend the École des Beaux-Arts, but the conventional art of the past did not attract him. Rather

he was fascinated by the vibrant colour juxtapositions of the Impressionists and Post-impressionists, whose styles he adopted. By 1904 Dufy had abandoned the Impressionist style and had begun to work in the flat

"Château and Horses," oil on canvas by Raoul Dufy, 1930; in the Phillips Collection, Washington, D.C.

By courtesy of the Phillips Collection, Washington, D.C.

areas of bright colour typical of the Fauvist style. But in 1908–09, while working with the Cubist painters Georges Braque and Émile-Othon Friesz, he changed his style again and temporarily adopted subdued colours and a Cubist manner of composition. He then did woodcuts as illustrations for books, and his success in this medium encouraged him to design textiles and eventually to produce ceramics and tapestries.

In the early 1920s Dufy rededicated himself to painting and began producing what are now his best-known works. His distinctive style is characterized by bright, decorative colours thinly spread over a white ground, with objects sketchily delineated by sensuously undulating lines. Dufy took as his subjects scenes of recreation and spectacle, including horse races and regattas, parades, and concerts. He spent much time on the French Riviera and produced series of paintings of Nice (1927), the Bois de Boulogne (1929), and Deauville (1930). Though very popular, his lively, carefree, elegant paintings have been criticized as occasionally bordering on the superficial.

Dugdale, Sir William (b. Sept. 12, 1605, Shustoke, Warwickshire, Eng.—d. Feb. 10, 1686, Blythe Hall, Warwickshire), English antiquary who was preeminent among the medievalist scholars in his time. An authority on genealogy and charters, he displayed accurate scholarship and insight unusual for his period.

Dugdale married early and settled as a small landowner at Blythe Hall, Warwickshire. Gradually he became the centre of a scholarly circle, and, following an introduction to the antiquary Sir Henry Spelman in London, he

Dugdale, detail of an engraving by Wenzel Hollar, frontispiece to the first edition of Dugdale's *Antiquities of Warwickshire*, 1656

By courtesy of the Trustees and Guardians of Shakespeare's Birthplace

compiled, with the help of Roger Dodsworth, *Monasticon Anglicanum*, 3 vol. (1655–73), a collection of records relating to medieval English religious houses. Among his other important works are the *Antiquities of Warwickshire* (1656), which became a model for large-scale county histories, and *The Baronage of England* (1675–76). He was knighted in 1667.

Dughet, Gaspard, also called GASPARD POUSSIN, byname LE GUASPARE (b. 1615, Rome, Papal States [Italy]—d. 1675, Rome), landscape painter of the Baroque period known for his topographic views of the Roman Campagna. He worked chiefly in Rome and its vicinity throughout his life, but, because his father was French, it is usual to class him among the French school. Dughet's sister married Nicolas Poussin, and he called himself after his famous brother-in-law.

Dughet's style is familiar, being composed mainly of elements derived from Poussin, with whom he studied, and from Claude Lorrain. He tended sometimes toward the former's architectonic grandeur, sometimes toward the latter's more lyrical style, but as a rule produced a compromise between them. Most of his paintings express the character of the countryside near Rome. He excelled at depicting storms in his landscapes. Major series of his works are in galleries and churches in Rome. Brought back by English travelers, many of Dughet's works are still in England where, in the 18th century, they were taken as models for garden and landscape designs.

dugong (species *Dugong dugon*), large marine mammal of the order Sirenia that is the sole extant member of the family Dugongidae. It

Dugong (*Dugong dugon*)

Painting by Donald C. Meighan

inhabits shallow coastal waters from the Red Sea and eastern Africa to the Philippines, New Guinea, and northern Australia.

The dugong ranges in length from about 2.2 to 3.4 m (7 to 11 feet) and usually weighs from 230 to 360 kg (500 to 800 pounds). It has a round, tapered body that ends in a flipper with paired, pointed, horizontal branches. The forelimbs are rounded flippers; there are no hind limbs. The head, which blends into the body with no visible neck, has a broad, square, bristled snout. A single calf is born after a gestation period of about 11 months, after which it nurses on its mother's two pectoral (chest) teats.

Dugongs live in pairs or in groups of up to six individuals. They graze on green algae and marine grasses, remaining submerged up to 10 minutes. When resting, they may "tail stand" in water of proper depth, keeping their heads out of the water. Sightings of dugongs by early seafarers are believed to have given rise to the extensive mythology of mermaids and sirens.

Dugongs were heavily hunted for their meat, hides, and oil. Although they are now protected by law throughout most of their range, some populations remain in danger of extermination through overhunting.

dugout, boat made from a hollowed log. Of ancient origin, the dugout is still used in many parts of the world. The hull may be as much as 100 feet (30 m) long; it is streamlined

Dugout

outside and is dug out by burning, chipping, and scraping. The dugout formed the basis for more complicated construction by the addition of planking to the sides, such as in the pirogue (*q.v.*). See also canoe.

Duguit, Léon (b. Feb. 4, 1859, Libourne, Fr.—d. Dec. 18, 1928, Bordeaux), French jurist, one of the most revolutionary legal thinkers of his generation, who elaborated an influential natural-law philosophy.

Duguit studied law at the University of Bordeaux and was appointed professor in the faculty of law at Caen in 1883. In 1886 he returned as professor to Bordeaux, where he became dean of the faculty of law and remained until his death.

Discarding traditional theories that looked upon law as deriving from the authority of the monarch or the state, Duguit instead found the basis of law in the fact that humans are social animals endowed with a universal sense or instinct of solidarity and social interdependence. Out of this sense came the recognition of certain rules of conduct as essential for living together in a society. In Duguit's view, the state is not a sovereign power but is rather an institution that has arisen out of mankind's social needs; governments, like individuals, are bound by the rules of law derived from social necessity. Duguit's work remains an important and original contribution to legal thought. One of his most important works is *Traité de droit Constitutionnel*, 5 vol. (1921–25; *Treatise on Constitutional Law*).

Duhamel, Georges (b. June 30, 1884, Paris, Fr.—d. April 13, 1966, Valmondois, near Paris), French author most noted for two novel cycles: *Vie et aventures de Salavin*, 5 vol. (1920–32), and *Chronique des Pasquier*, 10 vol. (1933–44).

Duhamel took a science degree in 1908 and qualified as a doctor of medicine in 1909. He began by writing poetry, plays, and literary criticism, and in 1906 he joined with several other writers and artists in founding a short-lived community at Créteil-sur-Marne, known as the Abbaye. Duhamel served as a front-line surgeon during World War I. Deeply moved by the sufferings of war and oppressed by its futility, he recorded his experiences treating the wounded in two short-story collections, *Vie des martyrs* (1917; *The New Book of Martyrs*) and *Civilisation 1914–1917* (1918); the latter book was awarded the Goncourt Prize.

In 1920 Duhamel decided to make writing his career. Henceforth he chiefly wrote novels and a great variety of essays and miscellaneous

Duhamel

H. Roger-Viollet

works on social and moral issues. Among his writings is a five-volume autobiography, *Lumières sur ma vie* ("Lights on My Life"). His two novel cycles also contain many reflections of his own experiences. The *Salavin* cycle describes the frustrations and perplexities of a "little man" of the 20th century trying to work out his own salvation with no religious faith to sustain him. In the *Pasquier* cycle, Duhamel relates the history of a French middle-class family from the 1880s to the 1920s. In this work, critics have found his gifts of humour, sympathy, and observation particularly apparent. Duhamel became a member of the Académie Française in 1935.

Duhamel, Jean-Marie-Constant (b. Feb. 5, 1797, Saint-Malo, Fr.—d. April 29, 1872, Paris), French mathematician and physicist who proposed a theory dealing with the transmission of heat in crystal structures based on the work of the French mathematicians Jean-Baptiste-Joseph Fourier and Siméon-Denis Poisson.

Duhamel entered the École Polytechnique in 1814 but was forced to return to Rennes in 1816. In 1830 he began teaching analysis at the École Polytechnique, a position he held for 39 years. While at the École he engaged in acoustical studies involving vibrating strings and the vibration of air in cylindrical and conical pipes, as well as the physics of harmonic overtones. Duhamel also researched the distribution of heat in a solid with a variable boundary temperature, which led to a principle in partial differential equations known as Duhamel's principle. He also taught at the École Normale Supérieure and at the Sorbonne. He was a member of the French Academy of Sciences.

Duhem, Pierre(-Maurice-Marie) (b. June 10, 1861, Paris, Fr.—d. Sept. 14, 1916, Cabrespine), French physicist, mathematician, and philosopher of science who emphasized a history of modern science based on evolutionary metaphysical concepts. He maintained that the role of theory in science is to systematize relationships rather than to interpret new phenomena.

Duhem studied at the Collège Stanislas and École Normale Supérieure before teaching at Lille and Rennes. As professor of theoretical physics at the University of Bordeaux (1894), he was also known for work in thermodynamics and hydrodynamics. Among his voluminous writings are *Études sur Léonard de Vinci* (1906–13; "Studies on Leonardo da Vinci") and *La Théorie physique, son objet et sa structure* (1906; "Physical Theory, Its Aim and Structure"). In 1913 he began publication of *Le Système du monde; Histoire des doctrines cosmologiques, de Platon à Copernic* (1913–17; "The World System; History of Cosmological Doctrines from Plato to Copernicus"), which eventually comprehended 10 volumes; but only five were completed by the time of his death.

duḥkha (Buddhism): see dukkha.

Dühring, (Karl) Eugen (b. Jan. 12, 1833, Berlin, Prussia [Germany]—d. Sept. 21, 1921, Nowawes, Ger.), philosopher, political economist, prolific writer, and a leading German adherent of positivism, the philosophical view that positive knowledge is gained through observation of natural phenomena.

Dühring practiced law from 1856 to 1859 and lectured on philosophy at the University of Berlin from 1864 to 1877. He was an unflinching critic whose targets included militarism, Marxism, religion, Judaism, and universities. A versatile scholar, he wrote treatises on philosophy, economics, mathematics, physics, and literature.

Dühring maintained the optimistic view that men possess instincts that naturally make them sympathetic to one another. This attitude has led some critics to call his socialism

Dühring, c. 1900
Archiv für Kunst und Geschichte, Berlin

excessively utopian. The same notion, transferred to his economic theory, led him to reject the social Darwinist concept of a constant struggle for existence among men in favour of a "free society," in which all human relations based on power are abolished.

Disagreement between Dühring and Marxist socialists was also reflected in Dühring's "ethics of sympathy," by which he asserted that the Marxist dichotomy between capitalist and proletariat was unnecessary. Friedrich Engels in his renowned book *Anti-Dühring*, first entitled *Herrn Eugen Dührings Umwälzung der Wissenschaft* (1877–78; "Eugen Dühring's Revolution in Science"), attacked Dühring's socialist ideas and his "vulgar Materialism."

Among Dühring's major works are *Capital and Arbeit* (1865; "Capital and Labour"); *Natürliche Dialektik* (1865); *Kritische Geschichte der Philosophie* (1869; "Critical History of Philosophy"); and *Cursus der National- und Socialökonomie* (1873–92; "Course of National and Social Economy").

dui (Chinese vessel): *see* tui.

duiker, any of the small, shy antelopes of the family Bovidae (order Artiodactyla) belonging either to the species *Sylvicapra grimmia* (gray duiker) or to approximately 13 species of the genus *Cephalophus* (forest duikers); they are named duiker (Afrikaans: "diver") because they dive, or dart, for cover when they are frightened.

The duikers inhabit most of Africa but are rarely encountered by humans. The gray, or bush, duiker is long-legged and inhabits regions with bush or grass cover. The forest duikers are short-legged, hunchbacked animals that frequent forests and dense brush. Duikers are nocturnal, live alone or in pairs, and eat a variety of plants; at times, they eat small animals or carrion.

The gray duiker stands 57–67 cm (22–26 inches) at the shoulder and has a grizzled yellowish to brownish gray coat. Horns, borne by males only, are straight and spikelike. The forest duikers are 36–46 cm (14–18 inches)

Zebra duiker (*Cephalophus zebra*)
Kenneth W. Fink from The National Audubon Society Collection/Photo Researchers—EB Inc

tall at the shoulder and vary from pale brown through reddish brown to nearly black. Both sexes have short, spikelike horns. Representative forest duikers include the yellow-backed duiker (*C. silvicultor*), a dark brown form with

an erectile yellow triangle of hair on the lower back; the blue duiker (*C. monticola*), a blue-tinged, grayish or brown duiker; and the zebra, or banded, duiker (*C. zebra*), a bright reddish brown animal with vertical black stripes on its body.

Duilius, Gaius (fl. 3rd century BC), Roman commander who won a major naval victory over the Carthaginians during the First Punic War (264–241).

As consul in 260, Duilius was in charge of the army in Sicily when he was assigned to command Rome's newly created fleet. Realizing that his forces lacked skill in naval warfare, he decided that they must fight under conditions as similar as possible to those of a land engagement. Hence, he invented boarding bridges fitted with grappling irons (*corvi*). With these devices he decisively defeated the Carthaginian fleet off Mylae on the north coast of Sicily. He celebrated a triumph at Rome that was the first naval triumph in Roman history. In 258 Duilius was censor.

Duisburg, city, North Rhine-Westphalia *Land* (state), western Germany. Duisburg lies at the junction of the Rhine and Ruhr rivers and is connected with the North Sea German ports by the Rhine-Herne Canal, which links it to Dortmund and thus with the Dortmund-Ems Canal. Known to the Romans as

Barges moored at Duisburg, Ger., near the junction of the Rhine and Ruhr rivers

E. Winter—ZEFA/EB Inc

Castrum Deutonis, it was mentioned in 740 as Diuspargum, a seat of the Frankish kings. Chartred in 1129, it became a free imperial city until it passed to Cleves (Kleve) in 1290 and, with Cleves, to Brandenburg in 1614. After suffering heavily in the Dutch wars of independence and the Thirty Years' War, it revived as the seat of a Protestant university from 1655 to 1818.

Its modern importance dates from increasing industrialization after 1880 and its absorption of the outer communities of Ruhrort (which includes the harbour) and Meiderich in 1905 and Hamborn (the chief industrial area), Hochfeld, Neudorf, and Duisern in 1929. Duisburg was occupied by Belgian troops (1921–25) and was called Duisburg-Hamborn from 1929 to 1934. The union of Duisburg and the outlying centres made it one of the world's largest inland ports and one of western Europe's principal iron and steel centres. In 1975 the outlying cities of Rheinhausen, Homberg-Niederrhein, Rumeln-Kaldenhausen, and Walsum were annexed, enlarging the city yet again.

Although the centre of the city, the Burgplatz, is on the site of the Frankish court and a later foundation (1253) of the Knights of the Teutonic Order, there are few traces of Duisburg's preindustrial past. Surviving the destruction of World War II are the 14th-century Gothic Salvator Church and the

12th-century Romanesque Premonstratensian Abbey Church. There are museums for municipal arts (the Lehbruck Museum honours famed local sculptor Wilhelm Lehbruck) and local history and a zoo with Germany's largest aquarium. A *Gesamthochschule* (a university-level institution for advanced technical training) was founded in 1972 by the union of existing teachers and technical colleges.

Duisburg is a coal-mining and iron- and steel-manufacturing centre and also manufactures heavy machinery, chemicals, textiles, and wood and metal products. The Duisburg-Neuenkamp Bridge across the Rhine is one of the world's longest span truss structures (1,148 feet [350 m]). Pop. (1989 est.) 527,447.

Duitama, city, northwestern Boyacá *departamento*, north-central Colombia. It lies along the Chicamocha River in the Cordillera Oriental of the Andes Mountains, at an elevation of 8,300 feet (2,530 m) above sea level. Duitama is a resort and a commercial and manufacturing centre; flour milling and cigar making are the chief industries. Silver and copper deposits are nearby. Duitama is on the Pan-American Highway and the railroad linking Bogotá and Paz de Río. Pop. (1985) 56,390.

Dujardin, Félix (b. April 5, 1801, Tours, Fr.—d. April 8, 1860, Rennes), French biologist and cytologist, noted for his studies in the classification of protozoans and invertebrates.

Largely self-educated, Dujardin was appointed to the chair of geology and mineralogy on the faculty of sciences at the University of Toulouse (1839) and professor of botany and zoology and dean of the faculty of sciences at the University of Rennes (1840).

His studies of infusoria (microscopic animal life frequently found in infusions of decaying organic materials) led Dujardin in 1834 to propose a new group of one-celled animals (called protozoans) that he called the Rhizopoda (meaning "rootfeet"). In the group Foraminifera, he observed the seemingly formless life substance that exuded outward through openings in the calcareous shell and named the substance sarcode, later known as protoplasm. This work led him in 1835 to refute the theory (reintroduced by Christian Ehrenberg) that microscopic organisms have the same organs as higher animals. He also studied cnidarians (e.g., jellyfish and corals) and echinoderms (e.g., starfish); his study of helminths (flatworms) laid the foundation for the later development of parasitology.

Dujardin, Karel, Dujardin also spelled DU JARDIN (b. 1622, Amsterdam, Neth.—d. Nov. 20, 1678, Venice [Italy]), Dutch Romanist painter and etcher, best known for his spirited representations of Italian peasants and shepherds with their animals.

Dujardin was a son of the painter Guiliam Dujardin. After a trip to Italy, he worked in Amsterdam and The Hague from 1652 until 1674; after that he returned to Rome, where he stayed until shortly before his death. He also painted religious, mythological, and allegorical subjects; genre scenes; and a number of excellent likenesses, notably a large group portrait (Rijksmuseum, Amsterdam).

Dukakis, Michael S(tanley) (b. Nov. 3, 1933, Brookline, Mass., U.S.), American politician and lawyer who was the Democratic Party's nominee for president in 1988.

The son of Greek immigrants, Dukakis graduated from Swarthmore College in 1955. After serving in the U.S. Army in South Korea, he attended Harvard Law School, earning his law degree in 1960. He subsequently became active in Massachusetts Democratic politics and served eight years (1962–70) in the state's House of Representatives. He lost a bid for the Massachusetts lieutenant governorship in

1970 but in 1974 won election to the governorship, in which post he coped with a serious budgetary crisis and restored the state's fiscal health. He lost his bid for reelection in 1978 but was again elected governor of Massachusetts in 1982. During his second term as governor he coordinated the government's policies so as to greatly strengthen the state's economic base, saving old industries and encouraging the growth of new ones. He was overwhelmingly reelected in 1986. Partly as a result of his efforts, Massachusetts for a brief

Dukakis, 1988
Rick Friedman/Black Star

time had one of the nation's healthiest state economies.

In April 1987 Dukakis declared his candidacy for the presidency. He emerged as the most popular candidate in the 1988 Democratic primaries and won his party's nomination for president. Dukakis lost the November 1988 presidential election to the Republican candidate, George Bush. He later announced that he would leave office at the expiration of his term as governor in January 1991.

Dukas FAMILY (Byzantine family): *see* Ducas family.

Dukas, Paul (-Abraham) (b. Oct. 1, 1865, Paris, Fr.—d. May 17, 1935, Paris), French composer whose fame rests on a single orchestral work, the dazzling, ingenious *L'Apprenti sorcier* (1897; *The Sorcerer's Apprentice*).

Dukas studied at the Paris Conservatory and, after winning a second Grand Prix de Rome with his cantata *Velléda* (1888), established his position among the younger French composers with the overture, first performed in 1892, to Pierre Corneille's *Polyeucte* and with the *Symphony in C Major* (1896). The rest of his output (never large, owing to his own strict censorship of his works) was mainly dramatic and program music and compositions for piano. Dukas, a master of orchestration, was from 1910 to 1912 professor of the orchestral class at the Paris Conservatory, and from 1927 until his death he was professor of composition there. He also contributed musical criticism to several Paris papers, and his collected writings, *Les Écrits de Paul Dukas sur la musique* (1948), include some of the best es-

Dukas
The Bettmann Archive

says ever published on Jean-Philippe Rameau, Christoph Gluck, and Hector Berlioz.

Dukas's *L'Apprenti sorcier* (based on J.W. von Goethe's "Zauberlehrling") was a piece of descriptive music written at the same time and in much the same style as Richard Strauss's *Till Eulenspiegel*. Yet Dukas's musicianship was of a considerably wider range than this brilliant period piece suggests. His *Sonate* (1901) is one of the last great works for piano that prolong the tradition of Ludwig van Beethoven, Robert Schumann, and Franz Liszt; his *Variations, interlude et final pour piano sur un thème de Rameau* (1903) represent an elegant translation into French musical idiom and style of Beethoven's *Diabelli Variations*, Opus 120. The ballet *La Péri* (1912), on the other hand, displays mastery of Impressionist scoring; and, in his opera *Ariane et Barbe-Bleue* (1907), on the play of Maurice Maeterlinck, the atmosphere and musical texture make up for the lack of dramatic impact.

After 1912 Dukas ceased publishing his compositions—except for a piano piece written in memory of his admirer Claude Debussy, the evocative *La Plainte au loin du faune* (1920), and a song setting, the charming "Sonnet de Ronsard" (1924). A few weeks before his death, he destroyed several of his musical manuscripts. Dukas collaborated with the Paris publishing firm of Durand in preparing modern editions of some of the works of Jean-Philippe Rameau, François Couperin, and Domenico Scarlatti and of the piano works of Beethoven.

duke, feminine **DUCHESS**, a European title of nobility, having ordinarily the highest rank below a prince or king (except in countries having such mediant titles as archduke or grand duke).

The title of *dux*, given by the Romans to high military commanders with territorial responsibilities, was taken over by the barbarian invaders of the Roman Empire and was used in their kingdoms and also in France and Germany for rulers of very large areas. The early Carolingian sovereigns in France and in Germany continued to appoint dukes, but their weaker successors found themselves constrained to free the dukes more and more from royal control in the areas that they had to defend.

Germany. Franconia, Swabia, Bavaria, and Saxony, originally the homes of distinct tribes, emerged as the great "stemduchies" of Germany as the dukes appointed by the Carolingians as military governors made themselves increasingly independent.

In the 12th century the Hohenstaufen emperors, who created the new duchies of Austria (1156) and Styria (1180), seemed likely to succeed in reducing the dukes to genuinely obedient vassalage; and, at the same time, the lesser noble families began to consolidate their own holdings and jurisdiction at the expense of the ducal authority. The growth of these smaller territorial principalities (countships, etc.) naturally diminished the real prestige of the dukes. Despite the collapse of the Hohenstaufen design after 1250 and the success of the dukes in securing their independence in their own principalities, their title came no longer to denote greater power under the king but to signify only a higher rank than that of the princely counts. Furthermore, with the extensive privileges accorded the electors (only one of whom was a duke) by the Golden Bull of 1356, the duke had ceased even in theory to be the highest-ranking of the princes of the empire; the Austrian dukes indeed assumed the new title of archduke, claiming equal rights with electors.

From the 16th to the 19th century, lords of even comparatively small territories were granted or took the ducal title. Eleven duchies survived until 1918: Oldenburg, the two Mecklenburgs, Saxe-Weimar (as the grand duchy

of Saxony), Baden, and Hesse-Darmstadt were grand duchies; and Anhalt, Brunswick, Saxe-Altenburg, Saxe-Meiningen, and Saxe-Coburg-Gotha were sovereign duchies.

France. The dukes of Normandy, Aquitaine, and Burgundy were practically independent of the French crown in the early feudal period, as also was the duke of Brittany, though the French royal chancellery at first accorded him only the style of count. Gradually, however, these great fiefs were reunited to the French crown. Thereafter they were granted only in appanage, as *duchés-pairies*, or peerage duchies—initially to princes of the blood royal but, from the 16th century onward, also to bastard princes of the blood, to foreign princes, and to other noble subjects of the French king. *Duchés-pairies* were hereditary, but there were also hereditary duchies that were not peerages, as well as life duchies (*à brevet*, or *par lettres*). Apart from those in the royal house of France, there were more than 30 ducal titles dating from the *ancien régime* still being borne (unofficially) in the 1980s, the premier duchy of France being that of Uzès (1565; registered 1572).

Italy. The great territorial duchies of Italy that survived into modern times were those of Milan, Florence (as the grand duchy of Tuscany), Lucca, Mantua, Modena, and Parma-Piacenza. The popes, the emperors, and the kings of Naples, however, could all bestow the ducal title as they wished and often did so: consequently, the title is now fairly widespread. The kings of the house of Savoy gave the title of *duca* occasionally to their offspring.

Spain. The Visigothic duchies of Spain disappeared under the Muslims. During the Christian reconquest the title *duque* was revived for honorific purposes. Apart from the Castilian duchy of Soria y Molina, created in 1370 for Bertrand du Guesclin, the title was at first usually reserved for royal princes, but, from the middle of the 15th century onward, it was accorded more and more frequently to other nobles. Of these latter creations, the premier surviving is that of Medina Sidonia (1445). The Spanish kings also created duchies very liberally in their Neapolitan and Sicilian dominions. By virtue of the right accorded to him by the *Cortes*, General Francisco Franco created three duchies in 1948: those of Calvo Sotelo, of Mola, and of Primo de Rivera.

Portugal. John I of Portugal created the duchies of Coimbra and Viseu for his sons Dom Pedro and Dom Henrique after their capture of Ceuta from the Moors (1415), and in 1442 the duchy of Bragança was created for his illegitimate son Afonso. Six more duchies were created for branches of the royal house before the Spanish annexation of Portugal. Thereafter duchies were accorded outside the royal house, but the total number of creations was far less than in Spain.

The British Isles. There were no English ducal titles (the duchies of Normandy and Aquitaine held by the English kings being, of course, French fiefs) until 1337, when Edward III erected the county of Cornwall into a duchy for his son Edward, the Black Prince. There followed the duchies of Lancaster (1351), Clarence (1362), York (1385), Gloucester (1385), Bedford (1st creation: 1413), and Somerset (1st creation: 1443), all for descendants of the royal house in the male line. In 1444, however, Humphrey Stafford, of royal blood only through his mother, was made Duke of Buckingham (1st creation). From the creation of the dukedom of Norfolk (1483) onward, the ducal title was quite regularly bestowed outside the royal house, though creations were not frequent.

In Scotland the title was first bestowed in 1398 by Robert III on his eldest son, David, who was made Duke of Rothesay, and on his brother Robert, Duke of Albany.

In the late 20th century, apart from royal dukedoms, there were nine dukedoms in the

peerage of England (Norfolk, 1483; Somerset, 1546; Richmond, 1675; Grafton, 1675; Beaufort, 1682; St. Albans, 1684; Bedford, 1694; Devonshire, 1694; and Rutland, 1703); eight in that of Scotland (Hamilton, 1643; Buccleuch, 1663; Lennox, 1675; Queensberry, 1684; Argyll, 1701; Atholl, 1703; Montrose, 1707; and Roxburghe, 1707); six in that of Great Britain (Marlborough, 1702; Brandon, 1711; Portland, 1716; Manchester, 1719; Newcastle, 1756; and Northumberland, 1766); two in that of Ireland (Leinster, 1766; and Abercorn, 1868); and six in that of the United Kingdom (Wellington, 1814; Sutherland, 1833; Westminster, 1874; Gordon, 1876; Argyll, 1892; and Fife, 1900). However, the duke of Richmond was also duke of Lennox and duke of Gordon; the duke of Buccleuch was also duke of Queensberry; the duke of Hamilton was also duke of Brandon; and the dukedom of Argyll belonged to two peerages. As a result, the 31 peerages provided only 26 dukes.

Duke, James Buchanan (b. Dec. 23, 1856, Durham, N.C., U.S.—d. Oct. 10, 1925, New York, N.Y.), American tobacco magnate and philanthropist.

The son of Washington Duke, who had entered the tobacco business after the American Civil War, James entered the family business with his brother Benjamin (1855–1929). When the principal American cigarette-manufacturing companies merged to form the American Tobacco Company in 1890, James became its president. He later helped to organize the American Snuff Company (1900) and the American Cigar Company (1901). In 1911 the U.S. Supreme Court ordered the dissolution of the monopolistic American Tobacco Company, and Duke bore the chief task of breaking the company up into the separate corporations that henceforth became the principal cigarette manufacturers of the United States.

The Duke family contributed heavily to Trinity College in Durham, which was later expanded and renamed Duke University under provisions of a fund created by James Duke in 1924.

Duke, Vernon, original name VLADIMIR ALEKSANDROVICH DUKELSKY (b. Oct. 10, 1903, Parfyanovka, near Pskov, Russia—d. Jan. 16, 1969, Santa Monica, Calif., U.S.), Russian-born American composer noted for his sophisticated melodies for films, Broadway musicals, and revues. Among his most popular songs are “April in Paris” from the revue *Walk a Little Faster* (1932) and “I Can’t Get Started” from *Ziegfeld Follies of 1936*.

After training at the Kiev Conservatory, Dukelsky at age 16 fled the Russian Revolution and settled in Constantinople (now Istanbul). Impressed upon hearing George Gershwin’s “Swanee,” he developed a lasting interest in American popular music. In 1921 he traveled to the United States and met Gershwin, who

suggested the Americanization of his name and advised him, “Do not be scared about going low-brow.” However, Duke returned to Europe and concentrated on classical music, composing the ballet *Zéphyr et Flore* (1925) for Serge Diaghilev’s Ballets Russes as well as two symphonies.

Duke settled in the United States in 1929, and throughout the 1930s he composed background music for films and theatrical productions. His lyricists included John Latouche, E.Y. Harburg, Ira Gershwin, Ogden Nash, and Howard Dietz. His song “Banjo Eyes” was adopted by the comedian Eddie Cantor as his theme. In 1940 Duke received critical acclaim for his score for *Cabin in the Sky* (filmed 1943), a musical with an all-black cast that featured Ethel Waters.

In 1944 Duke composed the score to *Sadie Thompson*. He translated American popular songs into Russian for Radio Liberty broadcasts to the Soviet Union; wrote his autobiography, *Passport to Paris* (1955); and in 1957 composed music for the Broadway production of Jean Anouilh’s *Time Remembered*.

Duke of York Islands, also called DUKE OF YORK GROUP, formerly NEU LAUENBURG, coral formations of the Bismarck Archipelago in the southwestern Pacific, eastern Papua New Guinea. The Duke of York Islands are situated in St. George’s Channel between the islands of New Ireland (east) and New Britain (southwest). The low, wooded islands, which include Duke of York (the largest, 5 miles [8 km] by 5 miles), Makada, Ulu, Kabakon, Kerawara, and Mioko, have a total land area of 23 square miles (60 square km). They were first sighted in 1767 by the British navigator Philip Carteret. The area’s first Methodist mission was established there in 1880. European settlement on the islands expanded and eventually spread to New Britain. Pop. (latest est.) 6,368.

Duke University, American private coeducational institution of higher learning in Durham, N.C., affiliated with but not controlled by the United Methodist Church. In 1838 the Union Institute Society was established in Randolph county, N.C., and in 1859 was reorganized as Trinity College. In 1892 the college moved to Durham. When a new charter was issued in 1924, the college became, under an endowment from the tobacco magnate James B. Duke, Duke University.

Duke maintained separate campuses for undergraduate men and women, Trinity College and Woman’s College, until they were merged in the 1970s into Trinity College. Besides Trinity (liberal arts), the university includes schools of engineering, law, business, nursing, and forestry. Cooperative programs are conducted with other North Carolina universities.

Dukenfield, William Claude (American actor): see Fields, W.C.

Dukhobor (Russian: “Spirit Wrestler”), member of a Russian peasant religious sect, prominent in the 18th century, that rejected all external authority, including the Bible, in favour of direct individual revelation.

The liturgical reforms of Patriarch Nikon in 1652 and the opening of Russia to Western influences by Tsar Peter the Great (reigned 1682–1721) provoked an opposition that manifested itself in the proliferation of mystical—usually either orgiastic or rationalist—evangelist sects. The Dukhobors, combining features of both types of reaction, lived mainly in southern Russia. They rejected the authority of both church and state, relying instead on direct individual revelation supplemented by a growing body of canticles and proverbs handed down orally, called the “Book of Life.” Priests and sacraments were abolished, the only ceremony being the *sobraniye* (“meeting”), at which prayers were chanted around a table laid with bread, salt, and water. Their egalitarian and pacifist beliefs, together with their proselytizing activities and refusal to accept conscription, provoked sporadic persecutions from 1773 onward. They were several times deported and resettled in unfamiliar territory.

Leo Tolstoy, the Russian novelist whose principles of moral and spiritual reform found eager acceptance among the Dukhobors in the late 19th century, successfully petitioned the tsar to allow the persecuted Christian Community of Universal Brotherhood, as they were known after 1886, to emigrate. Through funds collected by English Quakers, 7,500 reached Canada by 1899; 12,000 remained in Russia.

The Canadian government granted them land on easy terms in Saskatchewan and exemption from conscription. Some settled well, but one group started a series of nudist protest pilgrimages, prompting Peter Verigin, the leader of the “large party” faction of the Dukhobors, to go to Canada to restore order. In 1908 he founded a communal settlement of 6,000 in British Columbia, which prospered until his death in 1924. His son’s lack of leadership and the Great Depression of the 1930s ruined the communal enterprises, and they were not later restarted.

The Dukhobors, renamed in 1939 the Union of Spiritual Communities of Christ, have clashed with the Canadian government because of their noncompliance with land, tax, and education laws. They have striven to avoid schooling on the ground that “the letter killeth” and that “schools teach war.” Since World War II the sect has become more prosperous, but extremist elements still survive in a distinct group called the Sons of Freedom. The Sons of Freedom have continued nudist parades, arson, and dynamiting, burning their own as well as their neighbours’ and government property to show contempt for material goods. Another group of independents has assimilated into Canadian society.

Dukhonin, Nikolay Nikolayevich (b. Dec. 13 [Dec. 1, Old Style], 1876—d. Dec. 3 [Nov. 20], 1917, Mogilyov, Russia), last commander of the tsarist army, killed by a mob during the Russian Revolution.

One of the youngest generals in the Russian army, Dukhonin held various posts during World War I before being appointed chief of staff by Aleksandr Kerensky’s provisional government in September 1917. After the Bolsheviks seized power in Petrograd, then the Russian capital, on November 7 (October 25, Old Style), Dukhonin appealed to the troops to remain loyal to the provisional government but with little success. By November 13 (October 31) efforts to oust the Bolsheviks had clearly failed, and Kerensky went into hiding, appointing Dukhonin supreme commander in chief.

In the ensuing confusion Dukhonin attempted to keep army units in place against the Germans but in a status of political neutrality. On November 20 (November 7), however, he was ordered by the Bolsheviks to negotiate a truce with the Germans. This he refused to do, whereupon he was dismissed. On December 2 (November 19) he was arrested and ordered transferred from his headquarters at Mogilyov to a prison in Petrograd. While he was preparing to leave the next day, a crowd of soldiers and sailors, angered that he had previously released several generals who had led the Kornilov Mutiny against the provisional government, dragged him from his train and bayoneted and trampled him to death.

dukkha (Pāli), Sanskrit दुःखः (“sorrow,” “suffering,” “imperfection,” or “spiritual anguish”), in Buddhist thought, the true nature of all existence. The whole of Buddhist doctrine is based on the fact of suffering; its reality, cause, and means of suppression formed

the subject of the Buddha's first sermon (*see* Four Noble Truths). Recognition of the fact of suffering as one of three basic characteristics of existence—along with impermanence (*anicca*) and the absence of a self (*anattā*)—constitutes the “right knowledge” that is the first step along the course of spiritual development known as the Eightfold Path that leads ultimately to enlightenment (*nirvana*). Three types of suffering are distinguished: they result, respectively, from torment, such as old age, sickness, and death; from the absence of pleasure; and from the necessity of giving up what one loves and has become attached to, because of the inescapable transitory quality of all phenomena.

Dukla Pass, Polish PRZEŁĘCZ DUKIELSKA, Slovak PRŮSMYK DUKELSKÝ, passage through the Carpathian Mountains (locally, the eastern Beskids), on the frontier between Slovakia and Poland. The Russian army used the pass to cross Slovakia southward into Hungary in 1849 and used it again in World Wars I and II. It constitutes a major commercial route for traffic and goods between Slovakia and Poland.

Dulany, Daniel (b. 1685, County Queens, Ireland—d. Dec. 5, 1753, Annapolis, Md. [U.S.]), Irish-American colonial lawyer, landowner, and public official.

Dulany moved to Maryland in 1703, studied law, and was admitted to the bar in 1709. He soon became prominent and wealthy from his legal practice. A year after Dulany moved to Annapolis, he was elected to represent the town in the Maryland Assembly. At first, Dulany became a leader of the legislative faction that opposed proprietorial authority in the colony, and he argued that the citizens of Maryland were entitled to the benefits of all English legal statutes. During the next decade, however, Dulany crossed over to support the proprietorial faction and was rewarded with successively higher offices in the colony. In 1742 he became a member of the Governor's Council, where he took a leading role in securing the passage in 1747 of a tobacco inspection law that considerably enhanced the quality of the colony's tobacco crop.

Dulany, Daniel (b. June 28, 1722, Annapolis, Md. [U.S.]—d. March 17, 1797, Baltimore, Md., U.S.), American lawyer who was an influential political figure in the period just before the War of Independence.

The son of the Maryland official of the same name, Daniel Dulany was educated in England and became a lawyer after returning to Maryland. He was a member of the Maryland legislative assembly from 1751 to 1754, and he was appointed to the Governor's Council in 1757 in recognition of his support for the colony's proprietary government. In the following years he held other high offices and also became known as one of the best lawyers in the American Colonies. Though his sympathies were those of a loyal British subject, Dulany was critical of some policies of the British government, and, during the crisis over the Stamp Act of 1765, he wrote *Considerations on the Propriety of Imposing Taxes in the British Colonies* (1765), which was the most influential pamphlet that appeared in opposition to the Stamp Act. He opposed revolutionary action against British rule, however, and, during the American War of Independence, he remained a Loyalist, being deprived of his property in 1781 on account of this.

Dulbecco, Renato (b. Feb. 22, 1914, Catanzaro, Italy), Italian virologist who shared the Nobel Prize for Physiology or Medicine in 1975 with Howard M. Temin and David Baltimore, both of whom had studied under him. Dulbecco obtained his M.D. from the Uni-

versity of Turin in 1936 and remained there several years as a member of its faculty. He came to the United States in 1947 and studied viruses, first with Salvador Luria at Indiana University, then at the California Institute of Technology (1949–63). He was a fellow at the Salk Institute for Biological Studies in La Jolla, Calif. (1963–72), and returned there in 1977 as a distinguished research professor after serving for five years as a director of the Imperial Cancer Research Fund in London. During his second tenure at the Salk Institute, he served also on the faculty of the medical school of the University of California at San Diego (1977–81).

Dulbecco, with Marguerite Vogt, pioneered the growing of animal viruses in culture in the 1950s and investigated how certain viruses gain control of the cells they infect. They showed that polyoma virus, which produces tumours in mice, inserts its DNA into the DNA of the host cell. The cell then undergoes transformation (a term used in this restricted sense by Dulbecco) into a cancer cell, reproducing the viral DNA along with its own and producing more cancer cells. Dulbecco suggested that human cancers could be caused by similar reproduction of foreign DNA fragments.

Dulce, Gulf of, Spanish GOLFO DULCE, also called OSA GULF, long, narrow inlet of the Pacific Ocean, bounded on the north, east, and west by southwestern Costa Rica. Extending northwestward from Cape Matapalo and Banco Point for 30 miles (50 km), it measures about 15 miles (24 km) from the Osa Peninsula on the west to the mainland on the east. The principal ports along the gulf are Golfito and Puerto Jiménez.

dulce melos, also spelled DOULCEMELE (French: “sweet song”), a rectangular stringed keyboard musical instrument of the late European Middle Ages, known entirely from written records; no original examples are extant. It is possible, however, that the instrument presented to the king of France by King Edward III of England in 1360 and called *échiquier d'Angleterre* was a dulce melos.

In the famous manuscript of Henri Arnaut of Zwolle (c. 1435), the dulce melos is pictured and described. It appears that its 12 pairs of strings stretched over the tails of 35 keys. The strings passed over bridges that divided each pair of strings into three sections, each producing a different pitch and controlled by a different key. Each section was caused to vibrate by means of a weighted wooden shaft that sat on the end of each key; when the key was depressed and suddenly halted (or checked), the shaft continued to fly upward, and a brass attachment on its side struck the string. The shaft then rebounded to rest on the key. In principle this action anticipated the modern piano's hammer action; as in the piano and clavichord, the loudness of each note was controlled by the force with which the finger depressed the key.

dulcimer, stringed musical instrument, a version of the psaltery in which the strings are beaten with small hammers rather than plucked. European dulcimers—such as the Alpine *hackbrett*, the Hungarian cimbalom, the Romanian *țambal*, the Greek *santouri*, and the Turkish and Persian *santūr*, as well as the Chinese *yang-ch'in*—have for each note

two or more metal strings stretched across a flat, usually trapezoidal sound box. They pass over one and under the other of two long bridges, sloping alternately to right and left to facilitate rapid playing with the light beaters. Dulcimers probably entered central Europe from Persia about the 15th century.

The pianoforte is a dulcimer in which a keyboard mechanism operates the beaters. One of its immediate predecessors was the pantaleon, a 5-foot (1.5-metre) or longer dulcimer fashionable in the early 18th century.

The Appalachian, or mountain, dulcimer of the United States is a narrow folk zither with three to five metal strings running over a fretted fingerboard, which is set centrally along the dulcimer's entire length. The player's right hand strums with a small stick or quill, and the left hand stops one or more strings to provide the melody.

DuLhut, Daniel Greysolon, Sieur, DuLhut also spelled DU LHUT, DU LUTH, or DULUTH (b. c. 1639, Saint-Germain-Laval, Fr.—d. Feb. 25/26, 1710, Montreal [now in Quebec, Can.]). French soldier and explorer who was largely responsible for establishing French control over the country north and west of Lake Superior. The city of Duluth, Minn., was named for him.

DuLhut became an ensign in the regiment at Lyon in 1657, and about 1665 he became an officer in the royal household regiment. He fought against the Dutch under the Great Condé in 1674, by which time he had already made two voyages to New France.

In 1675 he returned to Montreal until September of 1678, when he led a party of Frenchmen and three Indian slaves to the Lake Superior country, where he hoped to negotiate peace among the Indian tribes north and west of the lake (a rich source of beaver pelts). In September 1679 DuLhut was able to bring the Indians together in a seemingly successful assembly in which amity was declared among the tribes. After wintering in the West, DuLhut decided to move farther west the next summer in search of the western ocean. The party penetrated well into what is now Minnesota and reached the Mississippi River.

On returning to Montreal, DuLhut found himself accused as a renegade trader, in violation of a 1676 edict prohibiting Frenchmen from venturing into the woods as traders. He returned to France to clear his name but was back in 1682 and the next year went off again to the West to renew his peacemaking efforts and to try to dissuade the Indians from trading their pelts to the English. He also raised Indian support for French troops and campaigned with Louis de Frontenac against the Indian allies of the British, the Oneida and Onondaga. In 1696 he was in command at Fort Frontenac. Thereafter he retired to spend his waning years in Montreal.

Dulkadir DYNASTY, Turkmen dynasty (1337–1522) that ruled in the Elbistan-Maras-Malatya region of eastern Anatolia. Its lands were the focus of rivalry between the Ottoman Empire and the Mamlūks of Syria.

The dynasty was founded by Karaca, the chief of the Bozok Turkmen, who was recognized as *nā'ib* (deputy) by the Mamlūk sultan in 1337 but who, with his sons, later was defeated and killed in a revolt against the sultan. In 1399 the Ottoman sultan Bayezid I, challenging Mamlūk influence, installed Dulkadir Mehmed as ruler. He tried to maintain peaceful relations with both powers.

After 1450 Ottoman-Mamlūk rivalry intensified, resulting in dynastic struggles and frequent changes in Dulkadir leadership. When Ali, the last Dulkadir prince, was overthrown by his grand vizier in 1522, the principality was incorporated into the Ottoman Empire, the Dulkadir family was accorded vassal status, and its members were appointed to high offices.

Turkish *santūr* dulcimer inlaid with mother-of-pearl, 19th century; in the Cincinnati Art Museum, Ohio. By courtesy of the Cincinnati Art Museum, Ohio, William H. Doane, donor.

Dull Knife, also called MORNING STAR (d. 1883, Tongue River Indian Reservation, Montana Territory), chief of the northern Cheyenne who led his people on a desperate trek from confinement in Indian Territory (Oklahoma) to their home in Montana.

Five months after Lieutenant Colonel George A. Custer's defeat at the Battle of the Little Big Horn, the cavalry, on a punitive expedition, attacked Dull Knife's camp on the Red Fork of Powder River (Nov. 25–26, 1876). Most of his tribe escaped, but their shelters, clothing, blankets, and stores of food were destroyed. By the time that Dull Knife surrendered to the Army, many of his people had succumbed to starvation or exposure. In 1877 the U.S. Army sent him and his tribe to a reservation of southern Cheyenne in Indian Territory. The land was unprofitable, there was little food, and the climate was unhealthy; within two months of their arrival in Oklahoma, two-thirds of the tribe were sick and many died. Dull Knife and other exiled northern Cheyenne leaders pleaded for a reservation for their people in their former territory, but to no avail.

Fearing that his tribe would die out, Dull Knife, along with Little Wolf, a war chief of the northern Cheyenne, determined to go home, despite Army opposition. On Sept. 9, 1878, he and Little Wolf led what was left of their people from the reservation. Their combined band consisted of 89 warriors and 246 women and children. They traveled more than 400 miles, managing to defeat or elude the various Army detachments sent to bring them back (more than 10,000 soldiers were employed for this task). In October the Cheyenne crossed the South Platte River of Nebraska, and the followers of Little Wolf and Dull Knife separated. (Little Wolf's band headed northwest, surrendered to the Army on March 25, 1879, and was allowed to remain in Montana.) Dull Knife and his people headed for the Red Cloud Agency, not knowing it had been discontinued. On Oct. 23, 1878, he and his people surrendered peaceably to the Army and were imprisoned in nearby Fort Robinson (Nebraska). When they refused to return to Oklahoma, an attempt was made (from Jan. 5, 1879) to starve them into submission, and the Indians were deprived of heat, food, and water. They broke out of prison on January 9, and, in their dash for freedom, 64 were killed and 78 were eventually recaptured (most of them wounded). Six people, including Dull Knife and surviving members of his family, escaped and made it to the relative safety of the Pine Ridge Reservation in South Dakota. By this time, public opinion was on the side of the Indians, forcing the Bureau of Indian Affairs to abandon its plans to relocate them, and a reservation was established for the northern Cheyenne on the Tongue and Rosebud rivers, where Dull Knife and his people (fewer than 80 remaining) were finally allowed to settle, rejoining Little Wolf's band.

The flight of the Cheyenne was described by Mari Sandoz in her work *Cheyenne Autumn* (1953).

Dulles, Allen W(els)h (b. April 7, 1893, Watertown, N.Y., U.S.—d. Jan. 29, 1969, Washington, D.C.), U.S. diplomat and intelligence expert who was director (1953–61) of the Central Intelligence Agency (CIA) during its early period of growth.

The younger brother of U.S. Secretary of State John Foster Dulles, Allen Dulles received his M.A. from Princeton in 1916 and then served in various diplomatic posts until 1922, when he was named chief of the State Department's Near Eastern Division. After receiving his law degree in 1926, he served briefly as counselor to the U.S. delegation in Peking and then joined the New York law firm of which his brother was a member.

When the United States entered World War II, Dulles was recruited by Colonel William J. Donovan for the Office of Strategic Services (OSS), an intelligence service. From October 1942 to May 1945 he served as chief of the OSS office in Bern, playing, in particular, a notable role in the events that led to the surrender of German troops in northern Italy.

In 1948 Dulles was made chairman of a three-man committee charged with surveying the U.S. intelligence system. After the CIA was established in 1951, he served as deputy director under General Walter Bedell Smith, and in 1953 he was appointed director by President Dwight D. Eisenhower. The agency was effective in a number of major operations, notably the overthrow of the governments of Mohammad Mosaddeq in Iran in 1953 and Jacobo Arbenz in Guatemala in 1954. It also succeeded in obtaining a copy of Nikita Khrushchev's secret speech of 1956 denouncing Stalin. It was, however, embarrassed by the downing of a U-2 intelligence plane over the Soviet Union on the eve of a scheduled summit conference in June 1960.

Reappointed by President John F. Kennedy, Dulles was implicated in the failure of the Bay of Pigs invasion of Cuba in April 1961 and resigned that autumn. He was the author of many articles and a number of books on foreign affairs, notably *Germany's Underground* (1947), *The Craft of Intelligence* (1963), and *The Secret Surrender* (1966).

Dulles, John Foster (b. Feb. 25, 1888, Washington, D.C.—d. May 24, 1959, Washington, D.C.), U.S. secretary of state (1953–59) under President Dwight D. Eisenhower.

John Foster Dulles

By courtesy of U.S. Information Agency, photograph Harris and Ewing

He was the architect of many major elements of U.S. foreign policy in the Cold War with the Soviet Union after World War II.

Early Career. Dulles was one of five children of Allen Macy and Edith (Foster) Dulles. His maternal grandfather was John Watson Foster, who served as secretary of state under President Benjamin Harrison. Robert Lansing, Dulles' uncle by marriage, was secretary of state in the Cabinet of President Woodrow Wilson.

Dulles was educated in the public schools of Watertown, N.Y., where his father served as a Presbyterian minister. A brilliant student, he attended Princeton and George Washington universities and the Sorbonne, and in 1911 he entered the New York law firm of Sullivan and Cromwell, specializing in international law. By 1927 he was head of the firm.

But Dulles, who never lost sight of his goal of becoming secretary of state, actually started his diplomatic career in 1907 when, aged 19, he accompanied his grandfather John Foster, then a private citizen representing China, to the second international peace conference at The Hague. At 30 years of age Dulles was named by President Woodrow Wilson as legal counsel to the U.S. delegation to the Versailles Peace Conference, at the end of World War I,

and afterward he served as a member of the war reparations commission.

In World War II, Dulles helped prepare the United Nations charter at Dumbarton Oaks, in Washington, D.C., and in 1945 served as a senior adviser at the San Francisco United Nations conference. When it became apparent that a peace treaty with Japan acceptable to the United States could not be concluded with the participation of the Soviet Union, President Harry Truman and his secretary of state, Dean Acheson, decided not to call a peace conference to negotiate the treaty. Instead, they assigned to Dulles the difficult task of personally negotiating and concluding the treaty. Dulles traveled to the capitals of many of the nations involved, and in 1951 the previously agreed to treaty was signed in San Francisco by Japan and 48 other nations.

Secretary of state. Emboldened by his formidable achievements, Dulles viewed his appointment as secretary of state by President Eisenhower, in January 1953, as a mandate to originate foreign policy, which is normally regarded as the domain of the president. "The State Department," Dulles once told an aide, "can only keep control of foreign policy as long as we have ideas." A man bent on realizing his ideas, he was an assiduous planner, and, once he enjoyed President Eisenhower's complete confidence, policy planning flourished during his administration.

Dulles, fully aware that the North Atlantic Treaty Organization (NATO) would be effective only for the defense of western Europe, leaving the Middle East, the Far East, and the Pacific islands unprotected, was eager to fill these gaps. He initiated the Manila conference in 1954, which resulted in the Southeast Asia Treaty Organization (SEATO) pact that united eight nations either located in Southeast Asia or with interests there in a neutral defense pact. This treaty was followed in 1955 by the Baghdad Pact, later renamed the Central Treaty Organization (CENTO), uniting the so-called northern tier countries of the Middle East—Turkey, Iraq, Iran, and Pakistan—in a defense organization.

In Europe, Dulles was instrumental in putting into final form the Austrian State Treaty (1955), restoring Austria's pre-1938 frontiers and forbidding a future union between Germany and Austria, and the Trieste agreement (1954), providing for partition of the free territory between Italy and Yugoslavia.

Three factors determined Dulles' foreign policy; his profound distaste of Communism, which was in part based on his deep religious faith; his powerful personality, which often insisted on leading rather than following public opinion; and his strong belief, as an international lawyer, in the value of treaties. Of the three, passionate hostility to Communism was the leitmotif of his policy. Wherever he went, he carried with him Joseph Stalin's *Problems of Leninism* and impressed upon his aides the need to study it as a blueprint for conquest similar to Adolf Hitler's *Mein Kampf*. He seemed to derive personal satisfaction from pushing the Soviet Union to the brink. In fact, in 1956 he wrote in a magazine article that "if you are scared to go to the brink, you are lost." Once, during the Austrian State Treaty negotiations, he refused to compromise on some minor points, even though the Austrians themselves pleaded with him to do so for fear the Soviets would walk out. Dulles stood his ground, and the Soviets yielded.

But Dulles could be equally intransigent with the allies of the United States. His insistence upon the establishment of the European Defense Community (EDC) threatened to polarize the free world, when in 1953 he announced that failure to ratify EDC by France would result in an "agonizing reappraisal" of

the United States' relations with France. That expression, and Dulles' announcement in a Paris speech that the United States would react with "massive nuclear retaliation" to any Soviet aggression, found a permanent place in the vocabulary of U.S. foreign policy. It can also be argued that Dulles' brusque rejection in July 1956 of the Egyptian president Gamal Abdel Nasser's request for aid in building the Aswān Dam was the beginning of the end of the influence that the U.S. had exerted in the Middle East. In a complete reversal of his former pro-Egyptian policy, Dulles claimed that Nasser was "nothing but a tin-horn Hitler." Although Dulles later conceded that his refusal could have been more subtle, he never wavered in his belief that Nasser, who had already purchased arms from the Soviet bloc, was bound to turn decisively against the U.S. because he felt that he had the Soviet Union on his side.

Assessment. Dulles' detractors in the U.S. and abroad viewed him as harsh, inflexible, and a tactician, rather than an architect of international diplomacy. But President Eisenhower ignored all criticisms. He said of his secretary of state, "He is one of the truly great men of our time." Whatever their opinion of the man and his policies, many leading statesmen of the non-Communist nations have credited his firmness with having checkmated Communist Cold War strategy. Seriously ill with cancer, Dulles resigned his Cabinet position on April 15, 1959. Shortly before he died in the following month, he was awarded the Medal of Freedom. (E.W.)

BIBLIOGRAPHY. John R. Beal, *John Foster Dulles*, rev. ed. (1959), a formal biography written by an admirer, a former State Department correspondent for *Time* magazine; Edward Weintal and Charles Bartlett, *Facing the Brink* (1967), a critical and intimate account of crisis diplomacy and management by presidents Eisenhower, Kennedy, and Johnson and their secretaries of state; Richard Gould-Adams, *John Foster Dulles: A Reappraisal* (1962), a critical biography concluding that upon reevaluation Dulles' concepts and policies will rank higher than his methods of implementing them; Eleanor Lansing Dulles, *John Foster Dulles: The Last Year* (1963), a friendly biography by his sister, replete with anecdotal material.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Dulong, Pierre-Louis (b. Feb. 12, 1785, Rouen, Fr.—d. July 18, 1838, Paris), chemist and physicist who helped formulate the Dulong-Petit law of specific heats (1819), which proved useful in determining atomic weights.

He was an assistant to Claude-Louis Berthollet, eventually became a professor of physics at the Polytechnical School, Paris (1820), and was appointed its director (1830). While working in chemistry he impoverished himself purchasing equipment. During investigations of the highly explosive nitrogen trichloride, which he discovered in 1813, he lost the sight in one eye and nearly lost a hand. His important research in physics was carried out with Alexis-Thérèse Petit. In 1817 they showed that Newton's law of cooling was true only for small differences in temperature. Their work on the measurement of temperature and the transfer of heat (1818) was honoured by the French Academy.

A paper with Jöns Berzelius (1820) was concerned with fluid densities and water. With Louis-Jacques Thenard he explored the property of certain metals to facilitate combinations of gases. He also studied the refracting power of gases (1826) and the specific heat of gases (1829). He published a study with François Arago of the elasticity of steam at high

Dulong, lithograph
Boyer—H. Roger-Viollet

temperatures (1830). His last paper (1838) described experiments determining the heat evolved in a chemical reaction.

Dulong-Petit law, statement that the gram-atomic heat capacity (specific heat times atomic weight) of an element is a constant; that is, it is the same for all solid elements, about six calories per gram atom. The law was formulated (1819) on the basis of observations by the French chemist Pierre-Louis Dulong and the French physicist Alexis-Thérèse Petit. If the specific heat of an element is measured, its atomic weight can be calculated using this empirical law; and many atomic weights were originally so derived. Later it was modified to apply only to metallic elements, and later still low-temperature measurements showed that the heat capacity of all solids tends to become zero at sufficiently low temperature. The law is now used only as an approximation at intermediately high temperatures.

dulse (*Rhodymenia palmata*), red seaweed found along both coasts of the North Atlantic; a salty confection made from this red algae is also called dulse. Shaped like the palm of a hand, it has the texture of thin rubber; both the amount of branching and size (ranging from 12 to about 40 centimetres [5 to 16 inches]) vary. Growing on rocks, mollusks, or larger seaweeds, dulse attaches by means of disks or rhizomes. It is commonly dried and eaten raw by North Atlantic fishermen; the flavour becomes evident after prolonged chewing. Dulse is eaten also with fish and butter, boiled with milk and rye flour, or as a relish. The gelatinous substance contained in dulse is a thickening agent and imparts a reddish colour to the food with which it is mixed.

Duluth, city, seat of St. Louis county, north-eastern Minnesota, U.S., and a major inland port on Lake Superior at the mouth of the St. Louis River opposite Superior, Wis. Elevation is abrupt, rising 600 to 800 ft (180 to 240 m) above the level of the lake in high rock bluffs, once the shoreline of glacial Lake Duluth. Along the crest a 30-mi (48-km) skyline boule-

vard commands an excellent view of both city and harbour. The combined Duluth-Superior harbour results from a natural breakwater formed by deposits left where river and lake meet. This resulting 9-mi strip, Minnesota Point, or Park Point, extends toward Wisconsin Point, separating St. Louis Bay from Lake Superior. The narrow channel between the two points forms the Superior harbour entrance, and a dredged 300-ft ship canal across the Minnesota Point, spanned by an aerial lift bridge, forms the Duluth harbour entrance. The combined harbour is the western terminus of the St. Lawrence Seaway and, although icebound during the winter months, it ranks second only to New York, among U.S. ports, in tonnage handled. Through it are shipped: iron ore from the Mesabi, Cuyuna, and Vermilion ranges; coal from Lake Erie ports; grain from the Red River Valley, Manitoba, and the Dakotas; and crude oil from Canada refined at Wrenshall, Minn., and at Superior. Harbour facilities include coal docks, grain elevators, and iron-ore docks (which receive ore and taconite from processing plants in north-eastern Minnesota). Industry is highly diversified. Tourism, merchandising, conventions, and a military air-defense installation at Duluth International Airport are economic assets. It is the site of a branch of the University of Minnesota, established in 1947; the College of St. Scholastica, founded in 1912; the Duluth Institute of Technology; Chisholm Museum (natural history); and Tweed Museum of Art. It also supports a symphony orchestra and playhouse. Duluth is the headquarters of Superior National Forest.

The area, occupied originally by the Sioux and then by the Ojibwa Indians, was visited in the 17th century by French voyageurs including Daniel Greysolon, sieur DuLhut (or Du Luth), for whom Duluth was named. The fur-trading post of Fond du Lac, on the St. Louis River, was controlled by the Hudson's Bay Company in 1692, the North West Company in 1793, and by John Jacob Astor's American Fur Company from 1817 until 1854. Another post on Minnesota Point was established in 1852 by George R. Stuntz, surveyor of the Minnesota-Wisconsin boundary. The following year brought many settlers in search of copper deposits. Duluth was laid out in 1856 and incorporated as a city in 1870, with a population of 3,131; was relegated to a village in 1877; and was reincorporated in 1887. Railway extension into the northwestern wheat region, increased lake commerce following the cutting of the Duluth Ship Canal in 1871, and development of the iron ranges brought increasing prosperity. Pop. (1990) city, 85,493; Duluth MSA, 239,971.

The Picture Gallery of Dulwich College, London
A.F. Kersting

of the Greater London Borough of Southwark, England. Edward Alleyn, a successful Shakespearean actor, bought Dulwich Manor in 1605 and founded the College of God's Gift to provide education for "12 poor scholars" and almshouses for "6 poor brethren and 6 poor sisters." The foundation, reconstituted in 1857, now comprises three schools: Dulwich College, Alleyn's School, and James Allen's Girls' School. The present college was built in 1866–70 to designs of Sir Charles Barry. Dulwich College Picture Gallery (1814), fully restored after World War II, is a leading private art gallery.

The College Estates Governors have contained development and preserved the area's rural character. Dulwich Village is noted for its historic houses, and Dulwich Tollgate (c. 1800) is the last tollgate still in use in the London area.

dulzian (musical instrument): *see* curtal.

Dum Dum, the industrial suburbs of Calcutta, southeastern West Bengal state, north-eastern India. The name was derived from the Persian word *damdama*, which refers to a raised mound or battery. The four towns that bear the name are Dum Dum, North Dum Dum, South Dum Dum, and Dum Dum Aerodrome Area (the site of Calcutta's international airport). All of the towns are part of the Calcutta urban agglomeration. North Dum Dum still contains large rural enclaves. South Dum Dum constitutes the northern fringe of Greater Calcutta.

The best known of the towns is Dum Dum, founded in 1783. It was the headquarters of the Bengal artillery until 1853 and has an ammunition factory in which the dum dum expanding bullet was first made. Jute mills, a tannery, iron- and steel-rolling works, glass, match, and soap factories, and several large engineering concerns are also located there. The town has several hospitals and a college affiliated with the University of Calcutta. The town was enlarged by the amalgamation of Kadihati municipality in 1883. Pop. (1991) Dum Dum, 40,942; North Dum Dum, 151,298; South Dum Dum, 230,507; Dum Dum Aerodrome Area, 4,919.

Dum-Dum fever (disease): *see* kala-azar.

Duma, Russian in full GOSUDARSTVENNAYA DUMA (State Assembly), elected legislative body that, along with the State Council, constituted the imperial Russian legislature from 1906 until its dissolution at the time of the February (March) 1917 Revolution. As a traditional institution, the Duma (meaning "deliberation") had precedents in certain deliberative and advisory councils of pre-Soviet Russia, notably in the boyar dumas (existing from the 10th to the 17th century) and the city dumas (1785–1917). The Gosudarstvennaya Duma, or state duma, however, constituted the first genuine attempt toward parliamentary government in Russia.

Initiated as a result of the 1905 revolution, the Duma was established by Nicholas II in his October Manifesto (Oct. 30 [Oct. 17, Old

Style], 1905), which promised that it would be a representative assembly and that its approval would be necessary for the enactment of legislation. But the Fundamental Laws, issued in April 1906, before the First Duma met (May 1906), deprived it of control over state ministers and portions of the state budget and limited its ability to initiate legislation effectively.

Four Dumas met (May 10–July 21, 1906; March 5–June 16, 1907; Nov. 14, 1907–June 22, 1912; and Nov. 28, 1912–March 11, 1917). They rarely enjoyed the confidence or the cooperation of the ministers or the emperor, who retained the right to rule by decree when the Duma was not in session. The first two Dumas were elected indirectly (except in five large cities) by a system that gave undue representation to the peasantry, which the government expected to be conservative. The Dumas were, nevertheless, dominated by liberal and socialist opposition groups that demanded extensive reforms. Both Dumas were quickly dissolved.

In 1907, by a virtual coup d'état, Prime Minister Pyotr Arkadyevich Stolypin restricted the franchise to reduce the representation of radical and national minority groups. The Third Duma, elected on that basis, was conservative. It generally supported the government's agrarian reforms and military reorganization; and, although it criticized bureaucratic abuses and government advisers, it survived its full five-year term.

The Fourth Duma was also conservative. But as World War I progressed, it became increasingly dissatisfied with the government's incompetence and negligence, especially in supplying the army. By the spring of 1915 the Duma had become a focal point of opposition to the imperial regime. At the outset of the February (March) Revolution of 1917, it established the Provisional Committee of the Duma, which formed the first Provisional Government and accepted the abdication of Nicholas II.

Dumaguete, city, southeastern Negros Island, Philippines. On the Bohol (Mindanao) Sea at the southern entrance to Tanon Strait, it is the second leading port in the central Visayas (after Cebu City), serving both interisland and overseas vessels. Despite its commercial and administrative functions, the city is probably best known nationally as an educational centre. Silliman University, an American Presbyterian missionary school with a well-known liberal arts college, was founded there in 1901. Its presence has resulted in a considerable degree of Americanization. This university and the Foundation College (1949) attract students from various sectors of the archipelago, particularly the southern island of Mindanao. Dumaguete is also noted for its pottery, matting, and basketry industries, and it has regular air service. Inc. city, 1948. Pop. (2000) 102,000.

Dumas, Alexandre, PÈRE (French: "Father") (b. July 24, 1802, Villers-Cotterêts, Aisne, Fr.—d. Dec. 5, 1870, Puys, near Dieppe), one

of the most prolific and most popular French authors of the 19th century. Without ever attaining indisputable literary merit, Dumas succeeded in gaining a great reputation first as a dramatist and then as a historical novelist, especially for such works as *The Count of Monte Cristo* and *The Three Musketeers*. His memoirs, which, with a mixture of candour, mendacity, and boastfulness, recount the events of his extraordinary life, also provide a unique insight into French literary life during the Romantic period. He was the father of the dramatist and novelist Alexandre Dumas, called Dumas fils.

Dumas's father, Thomas-Alexandre Davy de La Pailleterie (who was the natural son of the Marquis de La Pailleterie and Marie Cessette Dumas, a black of Santo Domingo), was a common soldier under the ancien régime who assumed the name Dumas in 1786 and later became a general in Napoleon's army. The family fell on hard times, however, especially after General Dumas's death in 1806; and the young Alexandre went to Paris to attempt to make a living as a lawyer. He managed to obtain a post in the household of the Duke d'Orléans, the future King Louis-Philippe, but tried his fortune in the theatre. He made contact with the actor François-Joseph Talma and with the young poets who were to lead the Romantic movement.

Dumas's plays, when judged from a modern viewpoint, are crude, brash and melodramatic, but they were received with rapture in the late 1820s and early 1830s. *Henri III et sa cour* (1829) portrayed the French Renaissance in garish colours; *Napoléon Bonaparte* (1831) played its part in making a legend of the recently dead emperor; and in *Antony* (1831) Dumas brought a contemporary drama of adultery and honour to the stage.

Though he continued to write plays, Dumas next turned his attention to the historical novel, often working with collaborators (especially Auguste Maquet). Considerations of probability or historical accuracy generally were ignored, and the psychology of the characters was rudimentary. Dumas's main interest was the creation of an exciting story set against a colourful background of history, usually the 16th or 17th century.

The best known of his works are *Les Trois Mousquetaires* (published 1844, performed 1845; *The Three Musketeers*), a romance about four swashbuckling heroes in the age of Cardinal Richelieu; *Vingt Ans après* (1845; "Twenty Years After"); *Le Comte de Monte Cristo* (1844–45; *The Count of Monte Cristo*); *Dix Ans plus tard ou le Vicomte de Bragelonne* (1848–50; "Ten Years Later; or, The Vicomte de Bragelonne"); and *La Tulipe noire* (1850; "The Black Tulip").

When success came, Dumas indulged his extravagant tastes and consequently was forced to write more and more rapidly in order to pay his creditors. He tried to make money by journalism and with travel books but with little success.

Dumas père
Gramstorff Bros

Dumas, Alexandre, FILS (French: "Son") (b. July 27, 1824, Paris, Fr.—d. Nov. 27, 1895, Marly-le-Roi), French playwright and novelist, one of the founders of the "problem play"—that is, of the middle-class realistic drama treating some contemporary ill and offering suggestions for its remedy.

Dumas fils

H. Roger-Viollet

Dumas *fils*, the illegitimate son of Alexandre Dumas *père*, possessed a good measure of his father's literary fecundity, but the work of the two men could scarcely be more different. His first success was a novel, *La Dame aux camélias* (1848), but he found his vocation when he adapted the story into a play, known in English as *Camille*, first performed in 1852. (Giuseppe Verdi based his opera *La Traviata*, first performed in 1853, on this play.) Although his father had written colourful historical plays and novels, Dumas *fils* specialized in drama set in the present. The unhappy witness of the ruin brought on his father by illicit love affairs, Dumas *fils* devoted his plays to sermons on the sanctity of the family and of marriage; *Le Demi-Monde* (performed 1855), for example, dealt with the threat to the institution of marriage posed by prostitutes. Modern audiences usually find Dumas's drama verbose and sententious, but in the late 19th century eminent critics praised his plays for their moral seriousness. He was admitted to the French Academy in 1875.

Among his most interesting plays are *Le Fils naturel* (1858; "The Natural Son") and *Un Père prodigue* (1859), a dramatization of Dumas's interpretation of his father's character.

Dumas, Jean-Baptiste-André (b. July 14, 1800, Alais, Fr.—d. April 10, 1884, Cannes), French chemist who pioneered in organic chemistry, particularly organic analysis.

Before Dumas was 21 he had done original work in biochemistry and embryology; in 1818, with Charles Coindet, he introduced the

Jean-Baptiste-André Dumas, engraving

Boyer—H. Roger-Viollet

use of iodine in the treatment of goitre. In 1832 he became a professor at the University of Paris and the Collège de France.

Dumas originated a combustion method for determining the nitrogen content of organic

compounds (1830), isolated anthracene (1831), discovered the formula for camphor (1832), and showed that halogens could replace hydrogen in organic compounds (1834). With Eugène-Melchior Péligot he isolated methyl alcohol (1834) and established the alcoholic series (1836).

With Justus von Liebig, Dumas showed that, in organic chemistry, groups of atoms can act in unison, remaining unchanged during chemical reactions that alter other parts of molecules containing the groups. He demonstrated atomic weights that differed from those of Jöns Berzelius, whose theories came to be replaced by the ideas of Dumas, Liebig, Auguste Laurent, and Charles Gerhardt.

Dumas became a member of the National Assembly in 1849 and was later a senator, president of the city council of Paris, and master of the French mint.

dumb barter: *see* silent trade.

dumb cane, any of several species of the genus *Dieffenbachia* that are valued as indoor foliage plants for their ability to tolerate low light intensities. The name mother-in-law's tongue, sometimes used for these plants, is also applied to *Sansevieria* species.

Dumb cane (especially *D. seguine*) gets its name from the temporary speechlessness that occurs after chewing a piece of the stem. Juices of the plant contain oxalates and other substances that irritate the mucous membranes and cause swelling and inflammation of the tongue and throat. The plant is reported to have been given to slaves as a form of punishment.

Dieffenbachia includes about 30 species of erect tropical American herbs in the arum or aroid family (Araceae). Only a few display fancy, large, more or less variegated leaves; they include *D. seguine* (native to the West Indies) and *D. maculata* (formerly *D. picta*), both of which have yielded colourful varieties of horticultural interest. *D. amoena* is a plant of large size, up to 6 feet (180 cm) or more, with 20-inch- (50-cm-) long leaves, having creamy markings along the larger veins. Flowers are borne on a long spadix, with male flowers on top and female flowers below. A row of sterile flowers separates the two sexes. Clusters of bright red or red-orange berries are the resultant fruits. The genus was named for an Austrian gardener of the 1800s who worked at Schönbrunn.

dumb gulper shark (*Centrophorus harrisi*), little-known shark of the family Squalidae that is related to the dogfishes (*q.v.*). Like all members of the genus *Centrophorus*, it has large green eyes. The dumb gulper shark grows to up to 43 inches (109 centimetres) in length. It has been found almost solely off the coast of Australia at depths of 820 to 1,260 feet (250 to 385 m). No details are known of its diet.

Dumbarton, former district (1975–96) of the Strathclyde region, southwestern Scotland. It is now part of the council area of West Dunbartonshire.

Dumbarton, royal burgh (town), West Dunbartonshire council area, historic county of Dunbartonshire, Scotland. It lies north-northwest of the metropolitan complex of Glasgow, on the banks of the River Leven near its confluence with the River Clyde. The site is dominated by a hill of basalt—with an elevation of 240 feet (75 m)—which has long been a defensive stronghold. The Alcluth ("Hill of the Clyde") of the Celtic Britons and Dunbreatain ("Fort of the Britons") of the Scots became (from the 5th to the 8th century) the capital of the kingdom of Strathclyde, later incorporated into Scotland. As a medieval royal fortress, Dumbarton occasionally fell into the hands of the English. It was designated a burgh in 1222, and its municipal privileges were confirmed by a charter of James V of Scotland (1513–

42). Shipbuilding, formerly an important industry, declined after World War II. Dumbarton's main industry is now the blending and distilling of whisky. It is the administrative centre of West Dunbartonshire. Pop. (1991) 21,962.

Dumbarton Oaks Conference (Aug. 21–Oct. 7, 1944), meeting at Dumbarton Oaks, a mansion in Georgetown, Washington, D.C., where representatives of China, the Soviet Union, the United States, and the United Kingdom formulated proposals for a world organization that became the basis for the United Nations.

This conference constituted the first important step taken to carry out paragraph 4 of the Moscow Declaration of 1943, which recognized the need for a postwar international organization to succeed the League of Nations. The Dumbarton Oaks proposals (Proposals for the Establishment of a General International Organization) did not furnish a complete blueprint for the United Nations. They failed to provide an agreed arrangement on such crucial questions as the voting system of the proposed Security Council and the membership provisions for the constituent republics of the Soviet Union. These issues were resolved at the Yalta Conference in February 1945, which also resulted in the proposal of a trusteeship system under the new agency to take the place of the League mandate system. The proposals, as thus supplemented, formed the basis of negotiations at the San Francisco Conference, out of which came the Charter of the United Nations in 1945.

Dumbarton Oaks Research Library and Collection, in Washington, D.C., institution in a Georgian-style mansion built in 1801 and housing Byzantine art (4th–15th century), pre-Columbian art (in an addition of eight circular glass galleries designed by Philip Johnson), and three libraries: a 100,000-volume Byzantine collection, an 18,000-volume pre-Columbian collection, and a 13,000-volume gardening and landscape architecture collection. The mansion (originally the home of William Hammond Dorsey), art collections, and book collections were all owned by Mr. and Mrs. Robert Woods Bliss, who presented them (along with funds to maintain them) to Harvard University in 1940. In 1944 the conference of representatives of the United States, the United Kingdom, China, and the Soviet Union that led to the founding of the United Nations was held at the mansion.

Dumbartonshire, also called DUNBARTONSHIRE, DUNBARTON, or DUMBARTON, historic region and former county of western Scotland. The county had a land area of 244 square miles (632 square km) and embraced the Vale of the Leven and the basin of Loch Lomond, located northwest of Glasgow. With the reorganization of 1975, it was divided between the districts of Dumbarton, Cumbernauld, Beardsden and Milngavie, Strathkelvin, and Clydebank. The northwest and west of the region are mountainous, the highest point exceeding 3,200 feet (975 m).

Prehistoric peoples left rude forts and tumuli, and there are several remains of the Antonine Wall, built between the Firth of Forth and the Clyde River. Other Roman relics were found at Duntocher, Cumbernauld, and elsewhere. The shire formed part of the old Scottish territory of Lennox. It gave the title of the earldom created in 1174 by William the Lion and of the dukedom conferred by Charles II on his natural son, Charles, Duke of Richmond and Lennox. Robert the Bruce is said to have mustered his forces at Dullatur prior to the Battle of Bannockburn, and he died at Cardross Castle in 1329. The Covenanters, in their flight from the field of Kilsyth, where in 1645 Montrose had defeated them, made their way through the southern districts. The

clans of Macgregor and Macfarlane made their home in the Highland and raided their Central Lowland neighbours.

Dumesnil, Mademoiselle, original name MARIE-FRANÇOISE MARCHAND (b. Jan. 2, 1713, Paris—d. Feb. 20, 1803, Paris), French tragic actress best known for her roles in the plays of Voltaire and Jean Racine.

Mlle Dumesnil, detail of an engraving
BBC Hulton Picture Library

She made her Paris debut in 1737 at the Comédie-Française as Clytemnestre in Racine's *Iphigénie en Aulide*. A fiery actress who scorned tradition, she played Cléopâtre in Corneille's *Rodogune* and played Racine's Phèdre, Athalie, and Hermione, with great effect. She retired in 1775 and 25 years later authorized publication of *Mémoires de Marie-Françoise Dumesnil*, in reply to an attack by her rival, the actress Mlle Clairon.

Dumfries, royal burgh (1186), Dumfries and Galloway council area, historic county of Dumfriesshire, situated on the left bank of the River Nith 8 miles (13 km) from the Solway Firth, an Irish Sea inlet. Dumfries is the main market centre for the surrounding intensive livestock farming region.

Dumfries suffered during the wars of Scottish independence and also from frequent raids because of its location near the English border. In 1745 the rebellious national leader Prince Charles Stuart held the town for ransom to obtain funds. Robert Burns, Scotland's national poet, lived in Dumfries from 1791 until his death in 1796. Numerous memorials are dedicated to him, and the Burns Mausoleum was erected in 1815. Burns's house is now a museum. Hosiery and knitwear are the traditional crafts of the town, but the production of tweed has been replaced by new industries. No fewer than five bridges, including the 15th-century Old Bridge, span the River Nith. Pop. (1991) 32,136.

Dumfries and Galloway, council area of southwestern Scotland, whose coast borders the Solway Firth, the Irish Sea, and the North Channel. It encompasses the historic counties of Dumfriesshire, Kirkcudbrightshire, and Wigtownshire and a small section of Ayrshire in the west. The council area extends eastward from the Rhins—a hammer-shaped peninsula that includes the Mull of Galloway, the most southerly point in Scotland—to take in the hills and moors of Galloway Forest Park in the north and the coastal plain and river valleys in the south. Dairy farming and forestry are the most widespread economic activities, but services, including tourism, are increasingly important. Dumfries, on the River Nith near the border with England, is Dumfries and Galloway's largest town and administrative centre. Area 2,469 square miles (6,395 square km). Pop. (1999 est.) 146,800.

Dumfriesshire, also called DUMFRIES, historic county, southwestern Scotland. Dumfriesshire incorporates a coastal plain stretching from the mouth of the River Nith in the west to the English border in the east. A series of river valleys—Nithsdale, Annandale, and

Eskdale—extend northward from this plain into the surrounding forested and moor-covered hills of the Southern Uplands. Dumfriesshire lies entirely within the council area of Dumfries and Galloway.

The Celtic British inhabitants of the region were called Selgovae by the Romans, who built many forts in Annandale. Upon the withdrawal of the Romans in the 5th century AD, the Selgovae were conquered by Scots from Ireland. The Anglo-Saxon conquest of Dumfriesshire does not seem to have been thorough, since the people of Nithsdale and elsewhere maintained their Celtic institutions up to the time of David I (c. 1082–1153). The border clans were continually at strife until the 18th century. Famous men of the region include historian Thomas Carlyle (born at Ecclefechan), civil engineer Thomas Telford, and Bank of England founder William Paterson.

Dumka, also called NAGA DUMKA, town, east-central Bihār state, northeastern India, east of the Mor River. It is a road junction and major agricultural-trade centre. A weekly cattle mart is held. There is a college affiliated with Bhāgalpur University. Dumka was constituted a municipality in 1903. Pop. (1991) 38,096.

Dummer, Jeremiah (b. 1681, Boston, Mass.—d. May 19, 1739, Plaistow, Essex, Eng.), British-American colonial agent, author, and benefactor of Yale College.

Jeremiah Dummer, the son of Jeremiah Dummer, Sr., a prosperous Boston silversmith and engraver, graduated from Harvard University in 1699 and afterward studied in Holland and received a doctorate from the University of Utrecht in 1703. He returned to Boston but was unsuccessful in efforts to obtain a prestigious Congregational pulpit or a professorship at Harvard.

Dummer traveled to England in 1708 to defend Massachusetts's claim to Martha's Vineyard. In London he engaged in commercial enterprises and wrote a Tory political polemic. Near the end of 1710, Governor Joseph Dudley appointed him colonial agent for Massachusetts. Two years later he was also made Connecticut's agent in England.

Dummer has been considered one of the best colonial agents prior to Benjamin Franklin. He laboured diligently to promote and protect the interests of the colonies he represented before the British government. His most notable action was his *A Defence of the New-England Charters*, a work written in 1715. This pamphlet used Lockean precepts to argue against any alterations of existing New England charter rights, after they had been attacked in Parliament. The work was later praised by John Adams, who called it "one of our most classical American productions." As agent, Dummer also was quite active in securing books and patrons for the Collegiate School of Connecticut. The school was later named for his principal patron, Elihu Yale. Dummer's political fortunes began to decline after the Hanoverian succession in England, and the Massachusetts lower house voted to discontinue his services in 1721. He remained Connecticut's agent until 1730; he then retired to Plaistow, near London.

Dumont, Alberto Santos (flight pioneer): see Santos-Dumont, Alberto.

Dumont, François (b. Jan. 7, 1751, Lunéville, France—d. Aug. 27, 1831, Paris), one of the greatest miniature painters.

He studied for a time under Jean Girardet and in 1788 was accepted as an academicien and granted an apartment in the Louvre. He painted portraits of Louis XVI, Marie Antoinette, Louis XVIII, and Charles X and of almost all the important persons of his day. A younger brother, known as Tony Dumont, was also a miniature painter, a pupil of his brother, a frequent exhibitor, and the recipient of a medal from the French Academy in 1810.

Each artist signed with the surname only, and there is some controversy concerning the attribution to each of his own canvases.

Dumont d'Urville, Jules-Sébastien-César (b. May 23, 1790, Condé-sur-Noireau, France—d. May 8, 1842, near Meudon), French navigator who commanded voyages of exploration to the South Pacific (1826–29) and the Antarctic (1837–40), resulting in extensive revisions of existing charts and discovery or redesignation of island groups.

In 1820, while on a charting survey of the eastern Mediterranean, d'Urville helped the French government gain possession of what became one of the best-known Greek sculptures, the Venus de Milo, which had been unearthed on the Aegean island of Milos in that year. In 1822 he served on a voyage around the world and returned to France in 1825. His next mission took him to the South Pacific, where he searched for traces of explorer Jean-François La Pérouse, lost in that region in 1788. On this voyage he charted parts of New Zealand and visited the Fiji and Loyalty islands, New Caledonia, New Guinea, Amboyna, Van Diemen's Land (now Tasmania), the Caroline Islands, and the Celebes. In February 1828 d'Urville sighted wreckage, believed to be from the frigates of La Pérouse, at Vanikoro in the Santa Cruz Islands. The expedition returned to France on March 25, 1829. The voyage resulted in extensive revision in charts of South Sea waters and redesignation of island groups into Melanesia, Micronesia, Polynesia, and Malaysia. D'Urville also returned with about 1,600 plant specimens, 900 rock samples, and information on the languages of the islands he had visited. Promoted to *capitaine de vaisseau* (captain) in 1829, he conveyed the exiled king Charles X to England in August 1830.

Dumont d'Urville, engraving by Émile Lassalle after Maurin

By courtesy of the Bibliothèque Nationale Paris

In September 1837 d'Urville set sail from Toulon on a voyage to Antarctica. He hoped to sail beyond the 74° 15' S reached by James Weddell in 1823. After surveying in the Straits of Magellan, d'Urville's ships reached the pack ice at 63° 29' S, 44° 47' W, but they were ill-equipped for ice navigation. Unable to penetrate the pack, they coasted it for 300 miles to the east. Heading westward, they visited the South Orkneys and the South Shetlands and discovered Joinville Island and Louis Philippe Land before scurvy forced them to stop at Talcahuano, Chile. After proceeding across the Pacific to the Fiji and Pelew (now Palau) islands, New Guinea, and Borneo, they returned to the Antarctic, hoping to discover the magnetic pole in the unexplored sector between 120° and 160° E. In January 1840 they sighted the Adélie coast, south of Australia, and named it for Mme d'Urville. The expedition reached France late in 1841. The following year d'Urville was killed, with his wife and son, in a railway accident.

Dumont d'Urville's chief works include (with others) *Voyage de la corvette "l'Astrolabe," 1826-1829* (1830-34; "Voyage of the Corvette 'Astrolabe,' 1826-1829") and *Voyage au Pole Sud et dans l'Océanie, 1837-1840* (1841-54; "Voyage to the South Pole and in Oceania, 1837-1840").

Dumouriez, Charles-François du Pérrier (b. Jan. 25, 1739, Cambrai, Fr.—d. March 14, 1823, Turville Park, Buckinghamshire, Eng.), French general who won signal victories for the French Revolution in 1792-93 and then traitorously deserted to the Austrians.

Dumouriez, detail of a portrait by J. Rouillard; in the National Museum of Versailles and Triansons

H. Roger-Viollet

The son of a war commissary, Dumouriez entered the French army in 1758 and served with distinction against the Prussians in the Seven Years' War (1756-63). King Louis XV sent him on secret diplomatic missions to Madrid (1767), Poland (1770-72), and Sweden (1773), but he was recalled and imprisoned (1773-75) for engaging in intrigues. In 1778 he was appointed commander at Cherbourg, where for the next 11 years he supervised the development of the port.

The Revolution of 1789 opened new opportunities to the ambitious Dumouriez. He joined the Jacobin Club in 1790, and in March 1792 he was appointed minister of foreign affairs at the head of a largely Girondin cabinet. On April 20, 1792, war was declared on Austria. Dumouriez probably planned to win quickly and then use his army to overthrow the Legislative Assembly (successor to the National Assembly) and rule in the king's name. But French forces suffered a series of setbacks in the initial campaign. Dumouriez was made minister of war on June 12, 1792, but he resigned three days later and assumed command of the army in the north. Meanwhile, Prussia had entered the conflict on the side of Austria. With François-Christophe Kellermann, Dumouriez was able to defeat an invading Prussian army in the Battle of Valmy (September 20) and force it to withdraw from French soil. Dumouriez then conquered Belgium by crushing an Austrian army in the Battle of Jemappes (November 6).

On Feb. 26, 1793, Dumouriez invaded Holland. Forced to retreat into Belgium, he was defeated by the Austrians at Neerwinden (March 18) and at Louvain (March 21). He then concluded an armistice with the enemy and made plans to march on Paris and overthrow the National Convention, which had succeeded the Legislative Assembly in September 1792. When the Convention sent the minister of war, Pierre Riel, Count de Beurnonville, and four commissaries to relieve him of his command, Dumouriez handed them over to the Austrians on April 2. His troops deserted, and on April 5 he went over to the Austrians. His defection discredited his Girondin associates,

and on June 2 the Jacobins had the leading Girondins expelled from the Convention.

After living for a time in Germany and Switzerland, Dumouriez settled in England, where he was granted a pension in 1800. Upon the restoration of the French monarchy in 1814, King Louis XVIII refused to allow him to return to France.

dumpling, small mass of leavened dough that is either boiled or steamed and served in soups or stews or with fruit. Dumplings are most commonly formed from flour or meal bound with egg and then simmered in water or gravy stock until they take on a light, cakey texture. Many recipes call for herbs, onions, grated cheeses, or chopped meats to be rolled into the dough before cooking.

Many ethnic varieties of the dumpling have found their way into popular cookery. Many cookbooks include the Hungarian *nockerl*, which often contains grated cheese, and the central European *spaetzle*, made by forcing batter through a colander into boiling water. *Gnocchi*, an Italian variety, often contain potato or pumpkin pulp. Unleavened matzo meal is used to make dumplings served by Jewish peoples on holidays or the traditional Sabbath eve. Both the Jewish *kreplach* and the Chinese *won ton*, usually served in soups, are filled noodle pockets rather than dumplings. Oriental dumplings are typically filled with a combination of shrimp, pork, beef, and vegetables and flavoured with soy. Apple and other fruit dumplings are desserts made by baking fruit wrapped in biscuit dough.

Dumuzi (Mesopotamian deity): see Tammuz.

Dumyāt, muhāfazah (governorate) in the Nile River delta, Lower Egypt, on the Mediterranean coast. It is bisected by the Damietta branch of the Nile, which empties into the Mediterranean Sea 8 miles (13 km) northeast of the capital, Damietta (*q.v.*). Fishing and agriculture are the main industries outside of Damietta. The Al-Salaam Canal was opened in 1979 to bring water from the Damietta branch to the Suez Canal zone and Sinai. Reclamation from Lake Al-Manzilah to the east has brought more land under cultivation, but there are still extensive salt marshes in the north. The capital is the only important urban centre. Area 227 square miles (589 square km). Pop. (1990 est.) 808,000.

Dumyāt (Egypt): see Damietta.

Dun Cow, The Book of the, Irish Gaelic LEABHAR NA H-UIDHRE, oldest surviving miscellaneous manuscript in Irish literature, so called because the original vellum upon which it was written was supposedly taken from the hide of the famous cow of St. Ciarán of Clonmacnoise. Compiled about 1100 by learned Irish monks at the monastery of Clonmacnoise from older manuscripts and oral tradition, the book is a collection of factual material and legends that date mainly from the 8th and 9th centuries; it is interspersed with religious texts. It contains a partial text of *The Cattle Raid of Cooley* (*Táin Bó Cuallnge*), the longest tale of the Old Irish Ulster cycle and the one that most nearly approaches epic stature, as well as other descriptions of the conflict between Ulster and Connaught. The book also includes a poem praising St. Columba, credited to Dallán Forgaill; a poem on winter, ascribed to Finn MacCool, the legendary hero of the Fenian cycle; historical accounts of Mongan, an Ulster king of the 7th century, and of the Battle of Cnucha; and the story of the court of Dá Derga, an Irish romantic saga.

Dun Karm (Maltese poet): see Karm, Dun.

Dún Laoghaire, seaport and borough of County Dublin, Ireland, on Dublin Bay, 7 miles (11 km) southeast of Dublin. Tradition has it that King Laoghaire of Tara had a fort there in the 5th century. Formerly a

fishing village called Kingstown, it grew into a large, ribbonlike residential town after the construction of an extensive harbour begun in 1816. Dun Laoghaire is on the terminus of the passenger and car-ferry shipping services from Holyhead, Wales; a new car-ferry terminal was completed in 1969. The harbour is much used by yachtsmen, and the town has a number of hotels and boardinghouses. Pop. (1986) 54,715.

Dünaburg (Latvia): see Daugavpils.

Dunajec River, river in southern Poland, rising in the Tatra Mountains near the Slovak border and flowing about 156 miles (251 km) northeast into the Vistula River. It is dammed for hydropower at Rożnów, Czchów, and Czorsztyn. It was the scene of heavy fighting in World War I when the Germans broke through the Russian trenches. In March 1975 Czechoslovakia and Poland modified their border along the Dunajec to permit Poland to construct a dam for irrigation in the Czorsztyn region, southeast of Kraków.

Dunant, Henri, in full JEAN-HENRI DUNANT (b. May 8, 1828, Geneva, Switz.—d. Oct. 30, 1910, Heiden), Swiss humanitarian, founder of the Red Cross (now Red Cross and Red Crescent), a founder of the World's Young Men's Christian Association, and cowerner of the first Nobel Prize for Peace, in 1901.

An eyewitness of the Battle of Solferino (June 24, 1859), which resulted in nearly 40,000 casualties, Dunant organized emergency aid services for the Austrian and French wounded. In *Un Souvenir de Solferino* (1862), he proposed the formation in all countries of voluntary relief societies for the prevention and alleviation of suffering in war and peacetime, without distinction of race or creed; he also proposed an international agreement covering the war wounded. In 1864, the year he founded the Red Cross, the first national societies and the first Geneva Convention came into being.

Dunant, 1901

By courtesy of the American Red Cross

Having gone bankrupt because he neglected his business affairs, Dunant left Geneva in 1867 and spent most of the rest of his life in poverty and obscurity. He continued to promote interest in the treatment of prisoners of war, the abolition of slavery, international arbitration, disarmament, and the establishment of a Jewish homeland. After he was "rediscovered" by a journalist at Heiden, Switz., in 1895, Dunant received many honours and annuities, including the first Nobel Prize for Peace.

Dunántúl (Hungary): see Transdanubia.

Dunash BEN LABRAT, Labrat also spelled LIBRAT, also called AL-ABRAD, or ADONINA HA-LEVI (b. c. 920, Fès, Mor.?—d. c. 990, Córdoba?), Hebrew poet, grammarian, and polemicist who was the first to use Arabic metres in his verse, thus inaugurating a new mode in Hebrew poetry. His strictures on the Hebrew lexicon of Menahem ben Saruq provoked a quarrel that helped initiate a golden age in Hebrew philology.

Dunash was born either in Fès or in Baghdad

and after travelling to Sura, Babylonia, studied there under a renowned master of Jewish learning, Sa'adia ben Joseph. It was in Sura that he first composed his poems in Arabic metres, an innovation that amazed Sa'adia.

After a time, Dunash migrated to Córdoba, in Moorish Spain, then experiencing a renaissance of Jewish culture under a powerful Jewish statesman and adviser to the caliph, Hisdai ibn Shaprut (c. 915–975?).

A favourite of Hisdai's, the philologist Menahem ben Saruq, had written the first true Hebrew dictionary. Dunash wrote a devastating polemic against this work that combined personal attacks on Menahem with praise for Hisdai. Menahem lost favour with Hisdai and died not long afterward. Menahem's pupils answered with a polemic of their own, a quarrel that paved the way for a fresh examination of Hebrew grammar. Dunash also wrote an unpublished treatise on grammar in which he reveals his understanding (unusual for his time) that, although Hebrew verbs are based on three-consonant roots, in some conjugations a root letter may be dropped.

Dunash BEN TAMIM, also called **ADONIM**, or **ABU SAHL** (b. c. 900—d. c. 960), Jewish physician and one of the first scholars to make a comparative study of the Hebrew and Arabic languages.

He practiced medicine at the Fātimid court of al-Qayrawān, (now in Tunisia) and, like other educated Jews of his time, was versed in Hebrew. The work for which he is best known was written in Arabic, but the original was lost and it is known only in Hebrew translation. In it he advanced the view that Hebrew is an older language than Arabic, which he also considered to be a corruption of Hebrew. He was frequently quoted by Muslim writers.

Dunaújváros, town, Fejér *megye* (county), central Hungary, on the west bank of the Danube, 40 mi (65 km) downstream from Budapest. The town consists of Dunapentele (the original village [before 1950] on the site, now incorporated) and the new town sector of Komárom (where modern construction began in 1950), with extensive housing estates and large integrated ironworks and steelworks. Iron ore comes by river from the Ukraine, coking coal from the Pécs-Komló field in southwestern Hungary. The busy river port on the island of Szalki is linked by a bridge to the town. Other industries are a prefabricated house factory, textiles, and ready-to-wear clothing. Rail connections are via the new town, road and river links via the old town. A Roman city, Intercisa, located on a ford at the site of Dunapentele, perished about the 4th century, but ruins of the old fort are visible. Dunapentele, called Sztálinváros between 1950 and 1961, has a Greek Orthodox church (1696) and old peasant houses, some of which are cave dwellings carved in the soft loess. Pop. (2001 est.) 59,000.

Dunbar, royal burgh (1369) and fishing port. East Lothian district, Lothian region, eastern Scotland, on the southern shore of the Firth of Forth. Dunbar Castle, built c. 856, was an important stronghold against English invasion, and the town developed under its protection. In 1568 the castle was destroyed for political reasons, notably because of its close association with Mary, Queen of Scots. The old Town House, built in 1620, is still in use. Dunbar has two harbours, the Old Harbour, extended by Oliver Cromwell before the Battle of Dunbar, and the Victoria Harbour—both with difficult access because of submerged reefs. A cluster of modern fishermen's cottages, designed by Basil Spence in 1951, were erected as part of the redevelopment of the old town. Apart from tourism, the chief industries are fishing, agriculture, brewing, and malting.

The Battle of Dunbar (1650) was fought between the English under Oliver Cromwell and

the Scots under the national leader David Leslie, at a site 3 mi (5 km) southeast of the town. The Scots were eventually scattered and utterly defeated; Cromwell estimated that the Scots lost 3,000 killed and 10,000 prisoners, while he put his own casualties as low as 20. Pop. (1991) 6,518.

Dunbar, Patrick Dunbar, 9th earl of: see March, Patrick Dunbar, 2nd earl of.

Dunbar, Paul Laurence (b. June 27, 1872, Dayton, Ohio, U.S.—d. Feb. 9, 1906, Dayton), U.S. author whose reputation rests upon his verse and short stories written in black dialect. He was the first black writer in the U.S. to make a concerted attempt to live by his writings and one of the first to attain national prominence.

Both of Dunbar's parents were former slaves; his father escaped to freedom in Canada and

Paul Laurence Dunbar, 1906
By courtesy of the Library of Congress, Washington, D.C.

then returned to the U.S. to fight in the Civil War. The young Dunbar was the only black student in his Dayton high school, where he was the popular editor of the school paper. He published his first volume of poetry, *Oak and Ivy* (1893), at his own expense while working as an elevator operator and sold copies to his passengers to pay for the printing. His second volume, *Majors and Minors* (1895), attracted the favourable notice of the novelist and critic William Dean Howells, who also introduced Dunbar's next book, *Lyrics of Lowly Life* (1896), which contained some of the finest verses of the first two volumes.

A vogue sprang up for Dunbar's poems; he read them to audiences in the U.S. and England, and when he returned from abroad he was given a job in the reading room of the Library of Congress in Washington, D.C. (1897–98). He turned to fiction as well as verse, publishing four collections of short stories and four novels before his early death. Writing for a largely white readership, Dunbar made use of the then current plantation tradition in both his stories and his poems, depicting the pre-Civil War South in pastoral, idyllic tones. Only in a few of his later stories did a suggestion of racial disquiet appear.

His first three novels—including *The Uncalled* (1898), which reflected his own spiritual problems—were about white characters. His last, sometimes considered his best, was *The Sport of the Gods* (1902), concerning an uprooted black family in the urban North.

Dunbar, William (b. 1460/65, Scotland—d. before 1530), Middle Scots poet attached to the court of James IV who was the dominant figure among the Scottish Chaucerians (see makar) in the golden age of Scottish poetry.

He was probably of the family of the earls of Dunbar and March and may have received an M.A. degree from St. Andrews in 1479. It is believed that he was a Franciscan novice and travelled to England and France in the King's service. In 1501 he was certainly in England, probably in connection with the arrangements for the marriage of James IV and Margaret Tudor, which took place in 1503. In 1500 he was granted a pension of £10 by the King. By 1504 he was in priest's orders, and in 1510 he

received, as a mark of royal esteem, a pension of £80. In 1511 he accompanied the Queen to Aberdeen and celebrated in the verse "Blyth Aberdeen" the entertainments provided by that city. After the King's death at the Battle of Flodden (1513), he evidently received the benefice for which he had so often asked in verse, as there is no record of his pension after 1513.

With few exceptions the more than 100 poems attributed to Dunbar are short and occasional, written out of personal moods or events at court. They range from the grossest satire to hymns of religious exaltation. Of his longer works, some are courtly Chaucerian pieces like the dream allegory *The Goldyn Targe*, which wears its allegory very lightly and charms with descriptive imagery. *The Thrissill and the Rois* is a nuptial song celebrating the marriage of James IV and Margaret Tudor.

In a quite different vein, the alliterative *Flyting of Dunbar and Kennedie* is a virtuoso demonstration of personal abuse directed against his professional rival Walter Kennedy, who is, incidentally, mentioned with affection in *The Lament for the Makaris*, Dunbar's reminiscence of dead poets. Dunbar's most celebrated and shocking satire is the alliterative *Tretis of the tua mariit Wemen and the Wedo* ("Treatise of the Two Married Women and the Widow").

Dunbar's versatility was astonishing. He was at ease in hymn and satire, morality and obscene comedy, panegyric and begging complaint, elegy and lampoon. His poetic vocabulary ranged through several levels, and he moved freely from one to another for satiric effect. He wrote with uncommon frankness and wit, manipulating old themes and forms with imagination and originality. Like other Scots poets after him—notably Robert Burns—he was a vigorously creative traditionalist. In artistry and range, though not in humanity, he was the finest of Scotland's poets.

Dunbarton, also called **DUMBARTON**, **DUNBARTONSHIRE**, or **DUMBARTONSHIRE**, former county, western Scotland, since the reorganization of 1975 largely in Dumbarton (*q.v.*) district, of Strathclyde (*q.v.*) region.

Duncan, city, seat (1907) of Stephens county, south central Oklahoma, U.S. Once a cow town on Chisholm Trail, it was founded officially in 1892 when the Rock Island Railroad reached the site. It was named for William Duncan, a pioneer trader and tailor from Fort Sill. After the discovery of oil in 1921, the petroleum industry replaced agriculture as the primary economic activity. Erle Halliburton initiated and developed there an oil-well cementing business that grew to worldwide importance. Inc. town, 1898; city, 1910. Pop. (2000) 22,505.

Duncan I (d. Aug. 1, 1040, near Elgin, Moray, Scot.), king of the Scots from 1034 to 1040.

Duncan was the grandson of King Malcolm II (ruled 1005–34), who irregularly made him ruler of Strathclyde when that region was absorbed into the Scottish kingdom (probably shortly before 1034). Malcolm violated the established system of succession whereby the kingship alternated between two branches of the royal family. Upon Malcolm's death, Duncan succeeded peacefully, but he soon faced the rivalry of Macbeth, Mormaor (subking) of Moray, who probably had a better claim to the throne. Duncan besieged Durham unsuccessfully in 1039 and in the following year was murdered by Macbeth. Duncan's elder son later killed Macbeth and ruled as King Malcolm III Canmore (1058–93).

Duncan II (d. 1094), king of Scotland (1093–94), son of Malcolm III and grandson of Duncan I.

For many years (1072?–87) Duncan lived as a hostage of the Norman English, allegedly as a confirmation of his father's homage to William I of England. He became king of the Scots while driving out his uncle, Donald Bane, in 1094, an enterprise in which he was helped by some English and Normans. He was killed at the instigation of Donald Bane, possibly at Monthechin, making way for the restoration of Donald Bane.

Duncan, David Douglas (b. Jan. 23, 1916, Kansas City, Mo., U.S.), American photojournalist noted for his dramatic combat photography during the Korean War.

After graduation in 1938 from the University of Miami, Duncan was a freelance photographer. During World War II he served with the U.S. Marine Corps, photographing Marine Corps aviation in the Pacific. In 1946 he became a staff photographer for *Life* magazine. He covered the Korean War in 1950; his photographs, which later appeared in the book *This Is War!* (1951), conveyed the life of the ordinary soldier in telling terms.

In 1955 Duncan resigned from *Life* and resumed freelance work. His meeting with Pablo Picasso in 1956 resulted in an enduring interest in the artist's work reflected in Duncan's photographic essays *The Private View of Pablo Picasso* (1958), *Picasso's Picassos* (1961), *Goodbye Picasso* (1974), and *The Silent Studio* (1976). His pictures of the Democratic and Republican presidential conventions in 1968 appeared in *Self-Portrait, U.S.A.* (1969) and a selection of Vietnam war photographs in *War Without Heroes* (1971). Later experimental works were *Prismatics: Exploring a New World* (1973) and *Magic Worlds of Fantasy* (1978). *Yankee Nomad* (1966) and *Photo Nomad* (2003) are photographic autobiographies.

Duncan, Isadora, original name (until 1894) ANGELA DUNCAN (b. May 26, 1877, San Francisco—d. Sept. 14, 1927, Nice, France), American dancer, who was among the first to raise interpretive dance to the status of creative art. She met with little success at her first appearances in the United States, but her free style of performance was rapturously greeted in England and later in other parts of Europe, including Russia.

Duncan was one of four children brought up in genteel poverty by their mother, a music teacher. As a child she rejected the rigidity of the classic ballet and based her dancing on more natural rhythms and movements, an approach she later used consciously in her interpretations of the works of the great composers—particularly Brahms, Wagner, and Beethoven. Her earliest public appearances, in Chicago and New York City, met with little success, and at the age of 21 she left the United States to seek recognition abroad. With her meagre savings she sailed on a cattle boat for England.

At the British Museum her study of the sculptures of ancient Greece confirmed the classical use of those dance movements and gestures that hitherto instinct alone had caused her to practice and upon a revival of which her method was largely founded. Through the patronage of the celebrated actress Mrs. Patrick Campbell, she was invited to appear at the private receptions of London's leading hostesses, where her dancing, distinguished by a complete freedom of movement, enraptured those who were familiar only with the conventional forms of the ballet, which was then in a period of decay. It was not long before the phenomenon of a young woman dancing barefoot, as scantily clad as a woodland nymph, crowded theatres and concert halls throughout Europe. Her controversial first visit to Russia, in 1905, brought the dance

to the attention of the art critic Sergey Diaghilev, who as impresario was soon to lead a resurgence of ballet throughout western Europe. At one time or another she founded dance schools in Germany, Russia, and the United States, but none of these survived.

Isadora Duncan dancing in an amphitheatre in Athens, Greece; photograph by Raymond Duncan, 1903

By courtesy of the Blair Collection

Her private life, quite as much as her art, kept her name in the headlines owing to her constant defiance of existing taboos. The father of her first child, Deirdre, was the stage designer Gordon Craig, who shared her abhorrence of marriage; the father of her second child, Patrick, was Paris Singer, the heir to a sewing machine fortune and a prominent art patron. In 1913 a tragedy occurred from which Duncan never really recovered; the car in which her two children and their nurse were riding in Paris rolled into the Seine and all three were drowned. In an effort to sublimate her grief she was about to open another school when the advent of World War I put an end to her plans. Her subsequent tours in South America, Germany, and France were less successful than before, but in 1920 she was invited to establish a school of her own in Moscow. To someone with her revolutionary temperament, the Soviet Union seemed the land of promise. There she met Sergey Aleksandrovich Yesenin, a poet 17 years younger than she, whose work had won him a considerable reputation. She married him in 1922, sacrificing her scruples against marriage in order to take him with her on a tour of the United States. She could not have chosen a worse time for their arrival. Fear of the "Red Menace" was at its height, and she and her husband were unjustly labeled as Bolshevik agents. When, at the Symphony Hall, Boston, she introduced him at one of her concerts, members of the audience shouted abuse at her. She harangued them from the stage and the evening ended in uproar. Leaving her native country once more, she told reporters: "Good-bye America, I shall never see you again!" She never did. There followed an unhappy period with Yesenin in Europe, where his increasing mental instability turned him against her. He returned alone to the Soviet Union and, in 1925, committed suicide.

During the last years of her life Duncan was a somewhat pathetic figure, living precariously in Nice on the French Riviera, where she met with a fatal accident: her scarf became en-

tangled in the rear wheel of the car in which she was riding, and she was strangled.

Isadora Duncan was acclaimed by the foremost musicians, artists, and writers of her day. Although an inspiration to the intelligentsia, with whom she remained a cult figure, she was often an object of attack by the less broad-minded. Her ideas were too much in advance of their time, and she flouted social conventions too flamboyantly to be regarded by the wider public as anything but an advocate of "free love." Certainly her place as a great innovator in dance is secure: her repudiation of artificial technical restrictions and reliance on the grace of natural movement helped to liberate the dance from its dependence on rigid formulas and on displays of brilliant but empty technical virtuosity, paving the way for the later acceptance of modern dance as it was developed by Mary Wigman, Martha Graham, and others.

(S.St.)

BIBLIOGRAPHY. The dancer's autobiography is Isadora Duncan, *My Life* (1927, reissued 1972). Accounts of her life and career include Alan Ross Macdougall, *Isadora: A Revolutionary in Art and Love* (1960); Walter Terry, *Isadora Duncan: Her Life, Her Art, Her Legacy* (1964, reprinted 1984); Victor Seroff, *The Real Isadora* (1971); and Fredrika Blair, *Isadora: Portrait of the Artist as a Woman* (1986). Maurice Dumesnil, *An Amazing Journey* (1932), chronicles Duncan's South American tour; and Ilya Ilyich Schneider, *Isadora Duncan: The Russian Years* (1969), is an account of her years in the Soviet Union during the early 1920s. Studies of her dance philosophy and technique are Isadora Duncan, *The Art of Dance* (1928, reprinted 1970); and *The Technique of Isadora Duncan* by Irma Duncan (1937, reprinted 1970).

Duncan, Otis Dudley (b. Dec. 2, 1921, Nacoma, Texas, U.S.—d. Nov. 16, 2004, Santa Barbara, Calif.), American sociologist whose study of the black population of Chicago (1957) demonstrated early in his career the validity of human ecology as an extension of the discipline of sociology.

Duncan received a B.A. from Louisiana State University (1941), an M.A. from the University of Minnesota (1942), and a Ph.D. from the University of Chicago (1949). He served as associate professor of human ecology at the University of Chicago (1957–60), where he had taught since 1951, becoming a full professor (1960–62). He later taught at the Universities of Michigan (1962–73), Arizona (1973–84), and California in Santa Barbara (1984–87). He introduced many statistical techniques to sociology, such as the statistical causal models typically used in biology. These are detailed in *Notes on Social Measurements* (1984).

Duncan's widely referenced *The American Occupational Structure* (1967; with Peter M. Blau) advanced scientific understanding of the structure and development of work-related mobility patterns in the United States. It was the first national intergenerational survey to represent the influences of family background, education, race, region, and other factors on the occupational mobility of men.

Duncan, Robert (Edward), original name EDWARD HOWARD DUNCAN, adopted name ROBERT EDWARD SYMMES (b. Jan. 7, 1919, Oakland, Calif., U.S.—d. Feb. 3, 1988, San Francisco), American poet, a leader of the Black Mountain group of poets in the 1950s.

Duncan attended the University of California at Berkeley in 1936–38 and 1948–50. He edited the *Experimental Review* (1938–40) and later traveled widely, lecturing on poetry in the United States and Canada throughout the 1950s. He taught at Black Mountain College in North Carolina in 1956. He was a long-time resident of San Francisco and was active in that city's poetry community.

Duncan's poetry is evocative and highly musical and uses a rich fabric of associations and images whose meanings are sometimes obscure. Myths and a visionary mysticism inform much of his poetry, though his the-

matic concerns also include strong social and political statements. His earlier poems were collected in *The Years as Catches: First Poems, 1939–1946* (1966), and his poems of the 1950s appear in *Derivations: Selected Poems, 1950–56* (1968). *The Opening of the Field* (1960), *Roots and Branches* (1964), *Bending the Bow* (1968), and *Ground Work* (1984) are collections of his finest poems. He also wrote plays, including *Medea at Kolchis* (1965).

Duncan, Ronald, in full RONALD FREDERICK HENRY DUNCAN (b. Aug. 6, 1914, Salisbury, Rhodesia [now Harare, Zimb.].—d. June 3, 1982, Barnstaple, Devon, Eng.), British playwright, poet, and man of letters whose verse plays express the contrast between traditional religious faith and the materialism and skepticism of modern times.

From an early interest in socialism, Duncan moved to the expression of Christian and Buddhist convictions in his literary work. He is best known for a number of plays that express in intense, poetic language his sense of the decline of moral values and the growth of skepticism in contemporary society. Among these plays are *This Way to the Tomb* (1945), *Stratton* (1949), *Our Lady's Tumbler* (1951), *Don Juan* (1953), *The Death of Satan* (1954), and *The Catalyst* (1958). Duncan also wrote television plays, verse, short stories, novels, and many works of nonfiction. He wrote the libretto for the English composer Benjamin Britten's opera *The Rape of Lucretia* (1946), and he was a founder in 1955 of the English Stage Company. He served as poetry editor of *The Townsman* from 1938 to 1946.

Duncan Island (Galapagos Islands): see Pinzón Island.

Dundalk, Irish DÚN DEALGAN ("Dealgan's Fort"), seaport, urban district, and administrative centre of County Louth, Ireland. It lies near the mouth of the Castletown River on Dundalk Bay. It received charters from King John about 1200 and from other monarchs. Dundalk is a railway junction and has railway workshops, distilleries, and breweries. Its industries produce bacon, shoes, clothing, cigarettes and tobacco, flour, computers, and electrical components. Trade is carried on in livestock and agricultural produce, and coal is imported. Pop. (1996) 25,762.

Dundas, formerly THULE, former Greenlandic (Eskimo) settlement of Umanak (Umanaq), now a major U.S. air base and communications centre, northwestern Greenland. It lies on Cape Atholl and the southern shore of Wolstenholme Fjord, an inlet of Baffin Bay. The region was explored (1912–24) by the expeditions of Knud Rasmussen, who brought in polar Eskimo and founded the original settlement of Umanak in 1910. The name was subsequently changed to Thule, derived from the prehistoric Thule culture. A U.S. air base, established there during World War II, was adapted in 1952 as an intermediate stop

on the transpolar air route between North America and northern Europe. A ballistic missile early warning station was completed at Dundas in 1961. By the late 20th century there was no longer any civilian population at Dundas.

Dundas, Henry: see Melville, Henry Dundas, 1st Viscount.

Dundee, major industrial city, royal burgh, and seaport of eastern Scotland. Dundee is the fourth largest city of Scotland by population. It constitutes the council area of Dundee City in the historic county of Angus. About 40 miles (64 km) north of Edinburgh, it is situated on the northern bank of the North Sea inlet known as the Firth of Tay, which is crossed there by the Tay road and rail bridges; Dundee's frontage on the Tay exceeds 8 miles (13 km). The city extends from the Tay to the Dundee Law, which is a prominent volcanic plug with an elevation of 571 feet (174 m).

The earliest mention of the town dates from the late 12th or early 13th century, when it was designated a royal burgh (town). The next four or five centuries saw repeated sackings of the town and much bloodshed at the hands of the English. Dundee was created a city in 1892 and an autonomous county burgh in 1894. Fishing was important in Dundee from early times, and one of Scotland's largest whaling fleets came to be based there. The city's traditional textile manufactures became closely linked with whaling in the 19th century after the discovery that jute fibre, when mixed with whale oil, could be woven into sacking for bags and carpet backing. Dundee then emerged as a world centre for jute manufacturing, and the city grew rapidly. Textiles—including linen, canvas, rope, and carpet—are still produced, but since World War II large numbers of workers have been employed in new light manufactures. Dundee is also known for its production of confectionery and preserves, particularly marmalade. From the late 20th century Dundee's manufacturing sectors gradually declined, and service activities came to play an increasingly important role in the city's economy. Dundee became a prominent educational and research centre, with special strengths in information technology and biotechnology research and development.

Few historic buildings and only one town gate (the East Port) have survived the city's turbulent past. The City Churches, a collection of three parish churches housed under one roof, remain as a focal point in the modern glass-and-concrete city centre. Slum clearance has removed many of Dundee's old streets, courtyards, and buildings. The University of Dundee dates to 1881; it gained independent university status in 1967. Other educational institutions include the University of Abertay Dundee and Dundee International College. Broughty Ferry, once a separate burgh and favourite residence of wealthy Dundee merchants, is now incorporated within the city. Area 25 square miles (65 square km). Pop. (1999 est.) 144,430.

Dundee, John Graham of Claverhouse, 1st Viscount of, LORD GRAHAM OF CLAVERHOUSE (b. 1649?—d. July 17/18, 1689, Pass of Killiecrankie, Perth, Scot.), Scottish soldier, known as "Bonnie Dundee," who in 1689 led an uprising in support of the deposed Roman Catholic monarch James II of Great Britain. Graham's death at the outset of the revolt deprived the Scottish Jacobites, as James's adherents were called, of any hope of success in their resistance to King William III and Queen Mary II.

Coming from a noble family, Graham began his military career as a soldier of fortune in France and the Netherlands. He returned to Scotland by 1678 and was made captain of the dragoons sent to the southwest to suppress Presbyterian insurgents who opposed the An-

glican regime of King Charles II. Although beaten by the rebels at Drumclog Moss, Larnark, on June 1, 1679, Graham helped defeat them at Bothwell Bridge on June 22.

He spent most of the next two years in England, where he won the favour of Charles's brother James, Duke of York. After the Duke of York assumed the throne as James II in 1685, Graham at first took little part in military or governmental affairs. But when the Dutch Protestant stadtholder William of Orange invaded England in November 1688, Graham became second-in-command of the

Lord Dundee, ink miniature by David Paton; in the Scottish National Portrait Gallery, Edinburgh

By courtesy of the Scottish National Portrait Gallery, Edinburgh

Scottish army sent to aid the king. He was created Viscount Dundee by James on November 12.

James fled from England in December, and Dundee then returned to Scotland to champion the cause of the exiled monarch. Rallying forces in the central Highlands, he ambushed General Hugh Mackay at the Pass of Killiecrankie on July 17, 1689. Dundee's forces were completely victorious, but he was shot and fell from his horse, mortally wounded. In August the Scottish resistance was crushed at the Battle of Dunkeld.

BIBLIOGRAPHY. Two biographies, Magnus Linklater and Christian Hesketh, *For King and Conscience* (1989); and Andrew Murray Scott, *Bonnie Dundee* (1989), reassess his life and actions.

Dundee City, former district, now a unitary council area coterminous with the city of Dundee, eastern Scotland.

Dunderlands, valley, along the lower course of the Rana River, Nordland fylke (county), north-central Norway. On the Arctic Circle, it extends about 30 miles (50 km) northeast from Rana, an inlet of the North Sea. Rich deposits of magnetic and hematite in the valley are mined to supply the ironworks and steelworks at Mo on the mouth of the river. Dunderlands valley is also known for its scenic limestone caverns and underground streams.

Dundo, mining town, northeastern Angola. It lies 15 miles (24 km) south of the Congo (Kinshasa) border. Founded near where diamonds were first discovered in 1912, the town was developed as a planned community privately operated by Diamang (Companhia de Diamantes de Angola). This international consortium, monopolizing the exploitation of the area between the early 1920s and 1971, was nationalized by the Angolan government in 1977. Until 1980 the mines, southeast of Dundo in the alluvial till of riverbeds, annually produced nearly 10 percent of the world's total output of gem-quality diamonds. Since then, civil strife and a shortage of technical equipment and other economic problems have greatly reduced the area's diamond output. The Dundo National Museum (founded in 1947

Wolstenholme Fjord near Dundas, Greenland
Ron Singer—Shostal

by the mining company) has extensive ethnographic collections that include wooden traditional masks and wooden sculptures of the local heterogeneous Lunda-Chokwe peoples.

Dundonald, Thomas Cochrane, 10th Earl of (b. Dec. 14, 1775, Annesfield, Lanarkshire, Scot.—d. Oct. 30, 1860, London, Eng.), British admiral, who ranks among the greatest of British seamen.

He was the eldest son of the 9th earl, whose scientific experiments on his Scottish estates impoverished his family. In 1793 Thomas joined the ship commanded by his uncle, Alexander Cochrane, and thereafter served on other ships during the Napoleonic wars. In 1806 and again in 1807 he was elected member of Parliament. He led a hazardous fireship attack on the French fleet in the Aix roads in April 1809, but the fruits of his courage were thrown away by the commander in chief, Admiral James Gambier. Cochrane's ill-advised criticisms of Gambier resulted in the latter's court-martial, at which he was acquitted. This, together with Cochrane's unpopularity in government circles because of his demands for parliamentary and naval reform, resulted in his not being employed again at sea. In February 1814 Cochrane and others were involved in a plot to make money on the stock exchange by spreading false rumours about the abdication of Napoleon I. In the trial that followed he was sentenced to a period of imprisonment, expelled from Parliament, and deprived of the order of the Bath, which he had been awarded for his exploit in 1809.

At this lowest point of his fortunes Cochrane accepted (May 1817) the invitation of Chile to command its fleet in the war of independence against Spain. His capture of the Spanish flagship *Esmeralda* in Callao harbour contributed largely to the independence of Chile and Peru. From 1823 to 1825 he transferred his services to Brazil in its war against Portugal. Soon after his return to Europe he was employed by the Greeks in their war of independence but resigned in 1828 because of factional disputes and delays in the delivery of steamships, which he proposed to use in warfare for the first time.

At home he campaigned vigorously for reinstatement in the navy, which he achieved in 1832, the year after he succeeded his father as earl of Dundonald. From 1848 to 1851 he commanded the American and West Indies station. He died in 1860 and was buried in Westminster Abbey.

Cochrane was the author of *Autobiography of a Seaman*, 2 vol. (1860–61) and *Narrative of Services in the Liberation of Chili, Peru and Brazil*, 2 vol. (1959).

dùndún pressure drum, double-membrane, hourglass-shaped drum of the Yoruba people of southwestern Nigeria. It is capable of imi-

Dùndún pressure drum

From *Odu: A Journal of Yoruba and Related Studies*

tating the tones and glides of the spoken language and is employed by a skilled musician to render ritual praise poetry to a deity or king. It has counterparts in East Africa, Asia, and Melanesia.

The term pressure drum derives from the shape of the instrument's body, which is waisted, or smaller in diameter in the middle than it is at each end. The drum is suspended from the player's left shoulder; the left hand manipulates the leather tensioning thongs that connect the two membranes, while the drum is beaten with a curved stick held in the right hand. By tightening or loosening the thongs, the player is able to control (*i.e.*, to raise or lower) the pitch of the drum.

The set of six *dùndún* (called *iyá ilù, gùdùgùdù, kerikeri, ifájú, kàràngó, and gàngan*) is generally part of any Yoruba ceremony or festival, taking the lead in town processions. All except the *gùdùgùdù* can be used for "talking."

Dunedin, city and port, Otago local government region, southeastern South Island, New Zealand, at the head of Otago Harbour (14 miles [23 km] long) with deepwater Port Chalmers at its mouth.

Founded in 1848 as a Scottish Free Church settlement, the town was chosen for its timber resources and potential for farm settlement. It was called Dunedin for the Gaelic word for Edinburgh (Duneideann). The discovery of gold in 1861 in Otago brought prosperity

Memorial gateway to Otago Boys' High School, Dunedin, N.Z.

By courtesy of New Zealand National Publicity

and migration to the town, making it New Zealand's leading city during the second half of the 19th century. A borough since 1855, it was proclaimed a city in 1865.

Despite slow growth since World War II, the city remains an industrial centre. Its factories produce woolens, textiles, home appliances, footwear, furniture, soap, fertilizer, and chemicals, and it has flour mills, ship-repair facilities, engineering works, and iron and brass foundries. Dunedin is connected by road and railway to Christchurch, 228 miles (337 km) to the north, and it has an airport and an excellent port.

Dunedin is also noted for its green "Town Belt," planned by the founders to surround the inner city with 500 acres (200 hectares) of forest. Other prominent features include a botanic garden, an art gallery, the University of Otago (1869; the oldest university in New Zealand), the Otago Museum, and the Early Settlers' Museum. The city is also a religious centre with Roman Catholic and Anglican cathedrals and the theological Knox, Selwyn,

and Holy Cross colleges. Pop. (1991) city, 116,577.

Duneideann (Scotland): *see* Edinburgh.

Dunér, Nils Christofer (b. May 21, 1839, Billeberga, Sweden—d. Nov. 10, 1914, Stockholm), Swedish astronomer who studied the rotational period of the Sun.

Dunér was senior astronomer (1864–88) at the Royal University Observatory in Lund, Sweden. In 1867 he began his investigations of binary stars. He also performed pioneering stellar spectroscopy studies (studies of the individual characteristic wavelengths of light).

Shortly after he became professor of astronomy at the University of Uppsala and director of the Uppsala Observatory in 1888, Dunér undertook a now-classic study of the Sun's rotation. Using the Doppler shift, he established that the Sun's rotational period is about 25½ days near the Equator but up to 38½ days near the Sun's poles.

Dunes, Battle of the (June 14, 1658), military victory of French and English forces led by Henri de La Tour d'Auvergne, Viscount de Turenne, attacking Spanish forces near Dunkirk (then in the Spanish Netherlands). The victory contributed greatly to the surrender of Dunkirk by Spain and to the conclusion of the Peace of the Pyrenees by France and Spain (1659).

The battle occurred after Oliver Cromwell sent General William Lockhart with 6,000 English infantry to reinforce Turenne, who was besieging Dunkirk. A Spanish force, under Don Juan the Younger of Austria and Louis II de Bourbon, 4th Prince de Condé, with several corps of English royalists commanded by the Duke of York (later James II), arrived to relieve Dunkirk and took up positions on the dunes. Turenne attacked. Although Condé's cavalry gained an advantage, the rest of the Spanish force could not resist the Anglo-French troops and retreated, except for a corps of English royalists (who later rejoined their king, Charles II, at Ypres).

Dunfermline, district, Fife region, eastern Scotland; created by the reorganization of 1975, it is part of the former county of Fife. The district, located on the north side of the Firth of Forth, is generally low-lying. Coal mining, textile manufacturing, engineering, and dairy farming are the principal economic activities. Dunfermline city is the seat of the district authority. Area 116 square miles (301 square km). Pop. (1991 prelim.) 125,529.

Dunfermline, royal burgh, city, and seat of the district authority of Dunfermline, in Fife region, Scotland, situated on high ground 3 miles (5 km) inland from the Firth of Forth.

Early Celtic monks had a settlement there, but the community really developed around the Benedictine abbey (c. 1072). A fragment of the royal residence of that time survives in Pittencrief Park. Seven Scottish kings from Malcolm III Canmore to Robert I the Bruce are buried there. The surviving abbey nave (a fine example of massive Norman architecture) served as a parish church until 1821. The guesthouse was rebuilt as a palace and became a favourite residence of Scottish kings.

Virtually destroyed by fire in 1624, Dunfermline later developed as a centre for the manufacture of linen and damask, with the associated industries of bleaching and dyeing.

Andrew Carnegie, the millionaire industrialist and philanthropist, was born in Dunfermline (1835) and was especially generous to his hometown, which remains the headquarters of all the Carnegie Trusts. Pop. (1986 est.) 42,780.

dung beetle, also called DUNG CHAFER, or TUMBLEBUG, any member of the scarab subfamily Scarabaeinae (Coprinae) of the insect order Coleoptera. The dung beetle forms manure into a ball—sometimes as large as an

Earth-boring dung beetle (*Geotrupes*)

M W F Tweedie—EB Inc

apple—with its scooper-like head and paddle-shaped antennae. In the early part of the summer the dung beetle buries itself and the ball and feeds on it. Later in the season the female deposits eggs in balls of dung, on which the larvae will later feed.

Dung beetles are usually round with short wing covers (elytra) that expose the end of the abdomen. They vary in size from 5 to 30 millimetres (0.2 to more than 1 inch) and are usually dark in colour, although some have a metallic lustre. On the top of the male's head is a long, curved horn. Dung beetles can eat more than their own weight in 24 hours and are considered helpful to man because they speed up the process of converting manure to substances usable by other organisms.

The sacred scarab of ancient Egypt (*Scarabaeus sacer*), found in many paintings and jewelry, is a dung beetle. Egyptian cosmogony includes the scarab beetle rolling its ball of dung; the ball represents the Earth and the beetle the Sun. The 30 segments of its six legs—actually, this species has only 20, but closely related ones do have 30—represent the 30 days of each month. An interesting member of this subfamily is the Australian *Macrocopris symbioticus*, which lives in the anus of the wallaby. The Indian scarabs *Helicocopris* and certain *Catharsius* species make very large manure balls and cover them with a layer of clay, which becomes so hard when dry that the balls were once thought to be old stone cannonballs.

Members of other scarab subfamilies are also called dung beetles; e.g., Aphodiinae and Geotrupinae. Instead of forming balls, however, they excavate a chamber under a pile of dung that is used during feeding or for depositing eggs. The aphodian dung beetle is small (4 to 6 mm, or about 1/8 in.) and usually black with yellow wing covers. The earth-boring dung beetle (e.g., *Geotrupes*) is about 14 to 20 mm (about 1/2 to 3/4 in.) long and brown or black in colour. *Geotrupes stercorarius*, known as the dor beetle, is a common European dung beetle.

dung fly, also called CORDYLURID, any insect of the family Scatophagidae (order Diptera). These flies, common in pastures, breed and live in cow dung and speed its decomposition.

Dung fly (*Scatophaga stercoraria*)

E S Ross

The adult fly is yellow or brown and may be parasitic on insects; some feed on plants. Members of the Sphaeroceridae family are known as small dung flies.

Dungan (Chinese Muslims): see Hui.

Dungannon, Irish DÚN GEANAINN, town, seat, and district (established 1973; formerly astride Counties Armagh and Tyrone), Northern Ireland. Its early history is linked with the O'Neills, earls of Tyrone, whose chief residence was there; a large rath, or earthwork, north of the town, was the scene of the inauguration of their chiefs. The independence of the Irish Parliament was first proclaimed by Protestants at Dungannon in 1782. It is today a market town producing linens and cut crystal. A Royal School was founded there in the early 17th century.

Dungannon district covers an area of 352 sq mi (911 sq km); it extends from Lough (lake) Neagh in the east to the district of Fermanagh in the west and from the foothills of the Sperrin Mountains in the north to the Blackwater River and the Irish Republic in the south. The district is essentially a pastoral area; pigs, dairy cattle, and poultry are raised. The other main population centre, besides Dungannon town, is Coalisland, the centre of a coal region that has never been profitably exploited. A national highway from Belfast passes around Dungannon town. Pop. (1991) town, 9,190; (1998 est.) district, 47,100.

dungarees (apparel): see jeans.

Dungarpur, town, administrative headquarters of Dungarpur district, Rājasthān state, northwestern India. An agricultural market centre, it is linked by road with Udaipur, as well as with Vadodara, Ahmadābād, and Indore via Godhra (Gujarāt). Dungarpur, former capital of the Dungarpur princely state, was founded in the 14th century and was named after Dungaria, an independent chieftain of the Bhil people. A hospital and a government college affiliated with the University of Rājasthān are located there.

Dungarpur district (1,456 sq mi [3,770 sq km]) consists of a hilly forested area drained by the Mahi River, which forms part of its eastern boundary. Agriculture is the principal occupation, and wheat, millet, rice, corn (maize), and pulses are the chief crops. Beryllium, lead, zinc, silver, iron-ore, and mica deposits are worked extensively. A former princely state, Dungarpur was included in Bānswāra state until c. 1530. Successively under Mughal, Marāṭhā, and British control, it became part of the state of Rājasthān in 1948. Pop. (1991) town, 35,608; district, 874,329.

Dungarvan, Irish DÚN GARBHÁN (Garbhan's Fort), market town, seaport, urban district, and administrative centre of County Waterford, Ireland, on the Bay of Dungarvan at the mouth of the River Colligan. The name is derived from St. Gervan, who founded a monastery there in the 7th century. Ruins include a castle built by King John c. 1200 and a keep and portions of an Augustinian friary. The town has a glue works, a tannery, a dairy-products factory, and a fruit-packing station. Pop. (1986) 6,800.

Dungeness, promontory on the south coast of the county of Kent, England. It is a bleak triangle of shingle (gravel), projecting south-eastward into the English Channel where it narrows to the north into the Strait of Dover. Romney Marsh lies to its north and the River Tillingham below Rye to its south. There is a modern lighthouse, and near it a nuclear power station at Dungeness Point. A lifeboat station, signalling station, and a bird sanctuary are situated on the promontory.

Dungeness crab (*Cancer magister*), edible crab (order Decapoda of the class Crustacea), occurring along the Pacific coast from Alaska to lower California; it is one of the largest and, commercially, most important crabs of that coast.

The male is 18 to 23 centimetres (about 7 to 9 inches) in width and 10 to 13 cm (4 to 5 in.) long. The reddish-brown upper surface is lighter toward the back; the legs and undersurface are yellowish. It lives on sandy bottoms below the low-tide mark.

Closely related North American species are the rock crab of the Atlantic coast (*C. irroratus*); the Jonah crab (*C. borealis*), in coastal waters from New England to Canada; and the red crab (*C. productus*) and the Pacific rock crab (*C. antennarius*), both in Pacific coastal waters. All are edible but their commercial importance varies.

In Great Britain, *C. pagurus*, known as edible crab or common crab, is fished commercially. It grows to 25 cm (10 in.) in width and weighs up to 5 kilograms (11 pounds).

Dunham, Katherine (b. June 22, 1910, Joliet, Ill., U.S.), U.S. dancer, choreographer, and anthropologist noted for her innovative interpretations of primitive, ritualistic, and ethnic dances. The first person to organize a black dance troupe of concert calibre, she was both a popular entertainer who toured the U.S. and Europe with a spectacularly colourful program of dance forms and a serious artist intent on tracing the roots of black culture.

After receiving an M.A. and later a Ph.D. in anthropology from the University of Chicago, she studied primitive dances in the Caribbean on a fellowship. She established her first school in Chicago in 1931 and in 1936 she was awarded a Julius Rosenwald Foundation fellowship to study traditional dance in Haiti. In 1940 she formed an all-black company, which began touring extensively by 1943. *Tropics* (choreographed 1937) and *Le Jazz Hot* (1938) were among the earliest of many works based on her research.

Many of Dunham's students, trained in her studios in Chicago and New York City, have become prominent in the field of modern dance. She also choreographed for Broadway stage productions, opera, and films, including *Aida* (1963) for the New York Metropolitan Opera; conducted special projects for Chicago black high school students; was artistic and technical director to the president of Senegal; and artist-in-residence, and later professor, at Southern Illinois University, Edwardsville, and director of Southern Illinois' Performing Arts Training Centre and Dynamic Museum in

Katherine Dunham in *Tropical Revue*, 1945–46

East St. Louis, Ill. Her writings include *Katherine Dunham's Journey to Accompong* (1946), an account of her anthropological studies in Jamaica; *A Touch of Innocence* (1959), an autobiography; and articles for popular and scholarly journals.

Dunhill, Thomas Frederick (b. Feb. 1, 1877, London, Eng.—d. March 13, 1946, Scunthorpe, Lincolnshire), British composer known for his light operas and songs.

Dunhill studied at the Royal College of Music in London and was assistant music master at Eton College, 1899–1908. His outstanding comic operas were *Tantivy Towers* (1931) and *Happy Families* (1933). Among his songs, “The Cloths of Heaven” and “The Fiddler of Dooney,” set to poems by W.B. Yeats, were especially popular. He also wrote symphonies, chamber music, and a critical study, *Sullivan's Comic Operas* (1928).

Dunhuang (China): see Tun-huang.

Dunira, Henry Dundas, Baron: see Melville, Henry Dundas, 1st Viscount.

dunite, light yellowish green, intrusive igneous rock that is composed almost entirely of olivine. Dunite usually forms sills (tabular bodies intruded between other rocks) but may also occur as lenses (thin-edged strata) or pipes (funnels, more or less oval in cross section, that become narrower with increasing depth). Occurrences include Dun Mountain, New Zealand, from which the rock takes its name; the Bushveld Igneous Complex, South Africa; and Frostviken, Jämtland, Sweden. Chromite, picotite, and magnetite also occur in dunite, as do spinel, ilmenite, pyrrhotite,

Dunite from Jackson County, North Carolina
By courtesy of the Illinois State Museum, photograph, John H. Gerard—EB Inc

and platinum in some cases. Dunites constitute an important source of chromium, a commercially valuable metal.

Dunk Island, island in the Family Islands group, 3 miles (5 km) off the coast of north-eastern Queensland, Australia. It lies north of the entrance to Rockingham Bay, which is an inlet of the Coral Sea. Coral-fringed and composed of granite, Dunk Island has an area of 2 square miles (5 square km). Its surface, densely covered with vegetation, rises to 800 feet (240 m). The British navigator Captain James Cook named the island after George Montagu Dunk, Earl of Halifax. It is one of the least-spoiled resorts of the Great Barrier Reef. Its principal settlement is Brama Bay in the west, which is accessible by air from Townsville and Cairns on the mainland. A bird sanctuary and national park, Dunk also has examples of cave art executed by its once-substantial Aboriginal population. The island was made famous by the writings of a British-Australian journalist and naturalist, Edmund James Banfield, who lived there from 1897 to 1923.

Dunkeld, historic cathedral city in Perth and Kinross district of Tayside region, Scotland. It

is situated on the left bank of the River Tay and is surrounded by wooded mountains. The community was an early centre of the Celtic church, and in 850 the relics of St. Columba were transferred to Dunkeld. The church was made a cathedral in 1127 and enlarged during the 14th and 15th centuries. After the Reformation it fell into disrepair until it was restored in 1815 and 1908.

The town was made a royal burgh in 1704, but, in spite of the building of Telford Bridge over the Tay in 1809, Dunkeld has failed to develop and remains a small settlement. Pop. (latest est.) 590.

Dunkirk, French DUNKERQUE, town, seaport, in the Nord département, Nord-Pas-de-Calais région, northern France. It lies along the Strait of Dover between Calais and the Belgian frontier, 49 miles (79 km) northwest of Lille by road. First mentioned in 1067 as Dunkerk (Flemish: “Church of the Dunes”), the town was besieged and sacked six times during the Middle Ages and was in the centre of conflicts between France, Spain, England, and Holland in the 16th and 17th centuries before it was finally recovered by France in 1662. Louis XIV had important fortifications built there to make it a safe base for Jean Bart and other famous French corsairs who pillaged foreign ships. Forced to demolish the fortifications by the Treaty of Utrecht in 1713, France was not allowed to rebuild them until the late 18th century.

During World War II, in May–June 1940, the British Expeditionary Force and other Allied troops, cut off by the Germans, were evacuated from Dunkirk to England by naval vessels and hundreds of civilian boats. The town was liberated by the U.S. Army in May 1945, but more than three-quarters of its houses were destroyed in the fighting.

The town was subsequently rebuilt on a new plan, with the spacious Place Jean Bart in the centre. Near that square is a belfry, 131 feet (40 m) high, that was built in the 15th century and restored after severe damage by fire in 1940. It was originally the western tower of the Gothic Church of Saint-Eloi (damaged in World Wars I and II) but was separated from it by a street in the 18th century. The town museum, also partly destroyed in 1940, has preserved a collection of 17th-century paintings by minor Dutch masters.

Dunkirk's great artificial port was largely rebuilt after 1945 and subsequently expanded. There are 8.5 miles (13.5 km) of quays with berths for ships of all sizes, including giant tankers. Well-equipped with modern machinery, the port has four dry docks, two floating docks for repairs, and storehouses for fruit, grain and refrigerated products. A complex railway and canal network connects the docks with Belgium and with all important points of northern France. Dunkirk ranks as one of the largest French ports in its amount of cargo handled. The port's major imports are fuel oil, coal, phosphates, and minerals. Exports include sugar, cement, and chemical products. There are daily ferry services to Dover, Eng. The first French steel plant separated from the inland coalfields was opened in Dunkirk in the early 1960s. Dunkirk is also an industrial centre that has oil refineries, metallurgical works, and shipbuilding. Pop. (1999 est.) 71,200.

Dunkirk, city, port of entry, Chautauqua county, western New York, U.S. It lies along Lake Erie, just north of Fredonia and 40 miles (64 km) southwest of Buffalo. First settled about 1805, it was known as Chadwick's Bay but was renamed because of the supposed similarity of its harbour to that of Dunkirk (Dunkerque), Fr. The opening of the Erie Canal (1825) and the arrival of the Erie Railroad (1851; now part of Consolidated Rail Corporation) stimulated Dunkirk's growth. It developed commercial fishing, shipped agricultural products (particularly Concord grapes), and

St. Mary's Monastery, Dunkirk, N.Y.
Milt and Joan Mann from CameraMann

acquired diversified industry (chiefly stainless steel). Holy Cross and St. Columban's seminaries, St. Mary's Monastery, and the Conference Grounds of the Evangelical and Reformed Church are in the city. Dunkirk was the birthplace (1871) of Samuel Hopkins Adams, the noted author-journalist. Inc. village, 1837; city, 1880. Pop. (2000) city, 13,131; Jamestown-Dunkirk MSA, 139,750.

Dunkleosteus (extinct fishlike animal): see Dinichthys.

Dunkula (The Sudan): see Dunqulah.

dunlin, also called OXBIRD, OXEYE, or RED-BACKED SANDPIPER (*Calidris*, or *Erolia alpina*), one of the most common and sociable birds of the sandpiper (*q.v.*) group. The dunlin is a member of the family Scolopacidae (order Charadriiformes). It is about 20 cm (8 inches) long and has a bill curved downward at the tip. In breeding plumage, the bird has a black belly and a reddish back (dun-coloured, hence

Dunlin (*Calidris alpina*)
Mary M. Tremaine from Root Resources—EB Inc

the name). In the winter the plumage is gray above and white below. It breeds around the North Pole and also in the British Isles and the Baltic region and winters in great numbers on seacoasts, mainly north of the equator.

Dunlop Holdings PLC, subsidiary company of BTR PLC, and the major British manufacturer of tires and other rubber products. It is headquartered in London.

The company has been involved in rubber-tire manufacture since the late 19th century. Dunlop's founder, John Boyd Dunlop (1840–1921), who had constructed the first pneumatic (air-filled) tire, received a patent for the tire in 1888. The following year he formed a

company to manufacture pneumatic bicycle tires. In 1896 Dunlop registered the company in Great Britain as Byrne Brothers India Rubber Company, Ltd. The name was changed to Dunlop Rubber Company, Ltd., in 1900, and the company began making automobile tires six years later. To ensure that the company would have an uninterrupted supply of raw rubber, Dunlop started buying rubber plantations on the Malay Peninsula, and by 1926 the company held the largest acreage under one ownership anywhere in the British Empire. In 1981, however, the company sold its holdings there to Malaysian investors. That same year the company converted to a public limited company and assumed its current name.

In 1982, Dunlop sold a large portion of its European tire operations to Sumitomo Rubber Industries, Inc., of Japan—an associate company and former Dunlop subsidiary. BTR PLC, an industrial holding company, acquired Dunlop in 1985, selling off Dunlop's American tire company.

Dunmore, John Murray, 4th Earl of, VISCOUNT OF FINCASTLE, LORD MURRAY OF BLAIR, MOULIN, AND TILLEMOT (b. 1730?—d. Feb. 25 or Mar. 5, 1809, Ramsgate, Kent, Eng.), British royal governor of Virginia on the eve of the American Revolution.

A descendant of the Scottish house of Stuart, he was the eldest son of William Murray, the 3rd earl, whom he succeeded in 1756. He sat in the House of Lords from 1761 to 1770 and then was appointed governor first of New York in 1770 and then of Virginia in 1771. Personally interested in western lands as well as officially concerned with protection of the Virginia frontier to the west, he raised 3,000 militiamen to subdue the Shawnee Indians in the upper Ohio River valley in 1774, an action known as Lord Dunmore's War.

As the revolution approached, Dunmore's power declined rapidly, especially through his own rashness. He dissolved the Virginia Assembly in 1772, 1773, and 1774 on account of its revolutionary sentiments. In April 1775 he seized the colony's store of powder, thereby bringing about an armed uprising. Taking refuge aboard an English warship, he shortly declared martial law, proclaimed freedom to slaves who would join the British, and proposed to Lord Dartmouth the use of Indians against the rebels. Defeated at Great Bridge near Norfolk on Jan. 1, 1776, he ordered his ships to bombard Norfolk, thereby setting it afire. He returned to England in July 1776. After serving again in the House of Lords, he was royal governor of the Bahamas from 1787 to 1796.

Dunmow, Great (Essex, England): see Great Dunmow.

Dunne, Finley Peter (b. July 10, 1867, Chicago, Ill., U.S.—d. April 24, 1936, New York, N.Y.), American journalist and humorist who created the homely philosopher Mr. Dooley.

Dunne was born of Irish-immigrant parents. In 1884 he began working for various Chicago newspapers, specializing eventually in politi-

cal reporting and editorial writing. In 1892 he began contributing Irish-dialect sketches to the *Chicago Evening Post* and five years later to the *Chicago Journal*. In these Dunne introduced Martin Dooley, a saloonkeeper who commented on politics and society in a rich Irish brogue. Dunne's sketches attained national circulation after the success of Mr. Dooley's comical observations on Admiral George Dewey's victory at Manila in 1898, and soon Dunne's witty penetration of shams and hypocrisies made Mr. Dooley a force for clear thinking and tolerance in public affairs. Many of Mr. Dooley's remarks, such as "th' supreme coort follows th' illection [i.e., election] returns," became part of American lore. Dunne wrote more than 700 dialect essays, some of which were republished in eight volumes from 1898 to 1919.

Dunne, Irene, original name IRENE MARIE DUNN (b. Dec. 20, 1898, Louisville, Ky., U.S.—d. Sept. 4, 1990, Los Angeles, Calif.), American motion-picture and stage actress and singer, known for her leading roles as a gracious and well-bred woman and also well-known for her comedic roles.

Trained for a career in singing, Dunne went to New York City hoping to join the Metropolitan Opera Company. She was unsuccessful and instead joined the Chicago touring company of the musical comedy *Irene* in 1920. Several Broadway stage roles followed, most notably that of Magnolia Hawks in a touring production of *Show Boat* (1929), which won her a contract with RKO film studios.

Her first motion picture, *Leathernecking* (1930), was not memorable, but with the release of *Cimarron* in 1931, she became a popular success. After *Cimarron*, she appeared in some 40 feature-length films. These included both dramatic roles—as in *Back Street* (1932); *Magnificent Obsession* (1935), with Robert Taylor; *Love Affair* (1939), with Charles Boyer; *Anna and the King of Siam* (1946), with Rex Harrison; and *I Remember Mama* (1948)—and roles in a number of comedies—such as *Roberta* (1935), with Fred Astaire and Ginger Rogers; *Show Boat* (1936); and *The Awful Truth* (1937) and *My Favorite Wife* (1940), both with Cary Grant. She retired after making *It Grows on Trees* in 1952.

Dunnet Head, a rounded, cliffed sandstone headland in the district of Caithness, Highland region, Scotland, that is the northernmost point on the mainland of Britain. Dunnet Head juts out into Pentland Firth of the North Sea. The headland is about 3 miles (5 km) across and forms a plateau at an elevation of about 100 feet (30 m), with hills rising to 422 feet (129 m). The headland's northern tip is crowned by a 346-foot- (105-metre-) high lighthouse built in 1831.

Dunning, John: see Ashburton, John Dunning, 1st Baron.

Dunning, John R(ay) (b. Sept. 24, 1907, Shelby, Neb., U.S.—d. Aug. 25, 1975, Key Biscayne, Fla.), American nuclear physicist whose experiments in nuclear fission helped lay the groundwork for the development of the atomic bomb.

Dunning graduated from Nebraska Wesleyan University in 1929 and earned a Ph.D. in physics from Columbia University, New York City, in 1934. About the time he received his doctoral degree, he also became an instructor at Columbia. Dunning spent the years 1935–36 in Europe meeting with prominent nuclear physicists before he returned to Columbia University to direct the construction of Columbia's first cyclotron. In 1939 Dunning led the American research team that verified German physicists' report of the fission of the uranium atom. With Alfred Nier and other colleagues, he then showed in 1940 that it was mostly the uranium-235 isotope that was involved in the fission of the uranium nu-

cleus. Dunning went on to direct the research team at Columbia that developed the gaseous-diffusion method of separating uranium-235 from the more abundant uranium-238 isotope. Gaseous diffusion is still the principal method for obtaining uranium-235. Dunning became a full professor of physics at Columbia in 1946 and headed its engineering faculty from 1950 to 1969.

duncock, thrushlike bird, a species of accentor (*q.v.*).

Dunois, Jean d'Orléans, comte de (count of), byname THE BASTARD OF ORLEANS, French LE BÂTARD D'ORLÉANS (b. 1403, Paris, Fr.—d. Nov. 24, 1468, L'Haÿ-les-Roses), French military commander and diplomat, important in France's final victory over England in the Hundred Years' War.

Jean was the natural son of Louis, Duke d'Orléans, by his liaison with Mariette d'Enghien. Jean entered the service of his cousin the dauphin, the future Charles VII, in 1420 and became his trusted adviser; he was later appointed grand chamberlain. His first notable success was the defeat of the English at Montargis (1427), and during 1427–28 he defended Orléans until Joan of Arc arrived. He then took part in the Battle of Patay and accompanied Charles to Reims for his coronation. He captured Chartres and Lagny in 1432 and engaged in a series of campaigns culminating in a triumphal entry into Paris in 1436.

Dunois, detail from a statue in the chapel of the castle at Châteaudun, Eure-et-Loir, France

H. Roger Viollet—Hurault

He shared in the negotiations with the English at Gravelines (1439) and worked with Charles on the reorganization of the military. He received the countship of Dunois from his half brother, Charles, Duke d'Orléans, and later received the countship of Longueville (1443) from Charles VII. He helped negotiate the truce of 1444 with the English and in 1447–49 the abdication of the antipope Felix V. At the end of the truce, he served in the reconquest of Normandy (1449–50) and Guyenne (1451). Charles VII later entrusted him with the arrest of the Duke d'Alençon (Jean II) in 1456 and with measures against the intrigues of the dauphin, the future Louis XI. When Louis acceded to the throne, Dunois joined the League of the Public Weal against him, but he made his peace with him and returned to royal service. The future dukes de Longueville descended from his marriage to Marie d'Harcourt.

Dunoon, small burgh (town), Argyll and Bute district, Strathclyde region, western Scotland, on the northwestern shore of the Firth of Clyde. It has grown as a seaside resort, with a marine frontage of hotels and villas along the esplanade, which extends for 2 miles (3 km) to the entrance of Holy Loch at Hunter's Quay,

Finley Peter Dunne
Brown Brothers

site of the headquarters of the Royal Clyde Yacht Club. Pop. (1991) 9,038.

Dunqulah, also spelled DONGOLA, or DUNKULA, town, northern Sudan. It lies on the west bank of the Nile River, about 278 miles (448 km) northwest of Khartoum. The town is an agricultural centre for the surrounding area, which produces cotton, wheat, barley, sugarcane, and vegetables. Dunqulah is linked by road with Wādī Halfā' and Marawī and has a domestic airport.

The historic town of Old Dunqulah (Dunqulah al-'Ajūz) was situated on the east bank of the Nile about 100 miles (160 km) southeast of present-day Dunqulah. Old Dunqulah was besieged in 652 by a Muslim army from Egypt under 'Abd Allāh ibn Sa'd ibn Abī Sarh, who agreed to raise the siege only after conclusion of a pact, which regulated relations between Egypt and Dunqulah for some six centuries thereafter. Medieval Dunqulah was described as having many churches, large houses, wide streets within a city wall, and, from 1002, a red-brick palace. After the Christian kingdom of Nubia collapsed (14th century), Dunqulah became a Muslim town. Upon the establishment at Sennār of the Funj dynasty (16th century), it emerged as the seat of a tributary king whose dominion extended northward to the third cataract of the Nile. Following the rise of the Shāyqiyah confederacy of Dunqulah in the late 17th century, the region was ruled by petty chiefs, and the principal north-south trade routes tended to skirt Dunqulah. In its subsequent decline, Dunqulah was prey both to the Shāyqiyah from within and to Mamlūk refugees fleeing southward from Egypt. By the time these refugees founded the present-day Dunqulah as a camp in the early 19th century, Old Dunqulah had sunk into ruins and been abandoned. Pop. (2001 est.) 16,900.

Duns, small burgh (town), Scottish Borders council area, historic county of Berwickshire, southeastern Scotland. It is the historic county town (seat) of Berwickshire. The old settlement, Duns Law, was the birthplace of the 13th-century philosopher John Duns Scotus. The town was destroyed by the English in 1545 and rebuilt in 1588. Pop. (1991) 2,444.

Duns Scotus, John, Latin given name JOANNES, byname DOCTOR SUBTILIS (b. c. 1266, Duns, Lothian, Scot.—d. Nov. 8, 1308, Cologne), influential Franciscan realist philosopher and scholastic theologian who pioneered the classical defense of the doctrine that Mary, the mother of Jesus, was conceived without original sin (the Immaculate Conception). He also argued that the Incarnation was not dependent on the fact that man had sinned, that will is superior to intellect and love to knowledge, and that the essence of heaven consists in beatific love rather than the vision of God.

Early life and career. As the historian Ernest Renan noted, there is perhaps no other great medieval thinker whose life is as little known as that of Duns Scotus. Yet patient research during the 20th century has unearthed a number of facts. Early 14th-century manuscripts, for instance, state explicitly that John Duns was a Scot, from Duns, who belonged to the English province of Friars Minor (the order founded by Francis of Assisi), that "he flourished at Cambridge, Oxford, and Paris and died in Cologne."

Though accounts of his early schooling and entry into the Franciscan Order are unreliable, as a novice Duns Scotus would have learned of St. Francis' personal love for Christ in the Eucharist, his reverence for the priesthood, and

his loyalty to "the Lord Pope"—themes given special emphasis in Duns Scotus' own theology. In addition, he would have studied interpretations of St. Francis' thought, particularly those of St. Bonaventure, who saw the Franciscan ideal as a striving for God through learning that will culminate in a mystical union of love. In his early *Lectura Oxoniensis*, Duns Scotus insisted that theology is not a speculative but a practical science of God and that man's ultimate goal is union with the divine Trinity through love. Though this union is known only by divine revelation, philosophy can prove the existence of an infinite being, and herein lies its merit and service to theology. Duns Scotus' own intellectual journey to God is described in his prayerful *Tractatus de primo principio* (*A Treatise on God As First Principle*, 1966), perhaps his last work.

Jurisdictionally, the Scots belonged to the Franciscan province of England, whose principal house of studies was at the University of Oxford, where Duns Scotus apparently spent 13 years (1288–1301) preparing for inception as master of theology. There is no record of where he took the eight years of preliminary philosophical training (four for a bachelor's and four for the master's degrees) required to enter such a program.

After studying theology for almost four years, John Duns was ordained priest by Oliver Sutton, bishop of Lincoln (the diocese to which Oxford belonged). Records show the event took place at St. Andrew's Church in Northampton on March 17, 1291. In view of the minimum age requirements for the priesthood, this suggests that Duns Scotus must have been born no later than March 1266, certainly not in 1274 or 1275 as earlier historians maintained.

Duns Scotus would have spent the last four years of the 13-year program as bachelor of theology, devoting the first year to preparing lectures on Peter Lombard's *Sentences*—the textbook of theology in the medieval universities—and the second to delivering them. A bachelor's role at this stage was not to give a literal explanation of this work but rather to pose and solve questions of his own on topics that paralleled subject "distinctions" in Lombard. Consequently, the questions Duns Scotus discussed in his *Lectura Oxoniensis* ranged over the whole field of theology. When he had finished, he began to revise and enlarge them with a view to publication. Such a revised version was called an *ordinatio*, in contrast to his original notes (*lectura*) or a student report (*reportatio*) of the actual lecture. If such a report was corrected by the lecturer himself, it became a *reportatio examinata*. From a date mentioned in the prologue, it is clear that in 1300 Duns Scotus was already at work on his monumental Oxford commentary on the *Sentences*, known as the *Ordinatio* or *Opus Oxoniense*.

Statutes of the university required that the third year be devoted to lectures on the Bible; and, in the final year, the bachelor *formatus*, as he was called, had to take part in public disputations under different masters, including his own. In Duns Scotus' case, this last year can be dated rather precisely, for his name occurs among the 22 Oxford Franciscans, including the two masters of theology, Adam of Howden and Philip of Bridlington, who were presented to Bishop Dalderby on July 26, 1300, for faculties, or the proper permissions to hear confessions of the great crowds that thronged to the Franciscans' church in the city. Because the friars had but one chair of theology and the list of trained bachelors waiting to be incept was long, regent masters were replaced annually. Adam was the 28th and Philip the 29th Oxford master, so that Philip's year of regency was just beginning. It must have coincided with Duns Scotus' final and 13th year because an extant disputation of Bridlington as master indicates John Duns was

the bachelor respondent. This means that by June of 1301 he had completed all the requirements for the mastership in theology; yet, in view of the long line ahead of him, there was little hope of incepting as master at Oxford for perhaps a decade to come.

Years at the University of Paris. When the turn came for the English province to provide a talented candidate for the Franciscan chair of theology at the more prestigious University of Paris, Duns Scotus was appointed. One *reportatio* of his Paris lectures indicates that he began commenting on the *Sentences* there in the autumn of 1302 and continued to June 1303. Before the term ended, however, the university was affected by the long-smouldering feud between King Philip IV the Fair and Pope Boniface VIII. The issue was taxation of church property to support the king's wars with England. When Boniface excommunicated him, the monarch retaliated by calling for a general church council to depose the pope. He won over the French clergy and the university. On June 24, 1303, a great antipapal demonstration took place. Friars paraded in the Paris streets. Berthold of Saint-Denis, bishop of Orleans and former chancellor of the university, together with two Dominicans and two Franciscans, addressed the meeting. On the following day royal commissioners examined each member of the Franciscan house to determine whether he was with or against the king. Some 70 friars, mostly French, sided with Philip, while the rest (some 80 odd) remained loyal to the pope, among them John Duns Scotus and Master Gonsalvus Hispanus. The penalty was exile from France within three days. Boniface countered with a bull of August 15 suspending the university's right to give degrees in theology or canon and civil law. As a result of his harassment and imprisonment by the king's minister, however, Boniface died in October and was succeeded by Pope Benedict XI. In the interests of peace, Benedict lifted the ban against the university in April 1304, and shortly afterwards the king facilitated the return of students.

Where Duns Scotus spent the exile is unclear. Possibly his Cambridge lectures stem from this period, although he may have given them during the academic year of 1301–02 before coming to Paris. At any rate, he was back before the summer of 1304, for he was the bachelor respondent in the *disputatio in aula* (public disputation) when his predecessor, Giles of Ligny, was promoted to master. On November 18 of that same year, Gonsalvus, who had been elected minister general of the Franciscan order at the Pentecost chapter, or meeting, assigned as Giles' successor "Friar John Scotus, of whose laudable life, excellent knowledge, and most subtle ability as well as his other remarkable qualities I am fully informed, partly from long experience, partly from report which has spread everywhere."

The period following Duns Scotus' inception as master in 1305 was one of great literary activity. Aided by a staff of associates and secretaries, he set to work to complete his *Ordinatio* begun at Oxford, using not only the Oxford and Cambridge lectures but also those of Paris. A search of manuscripts reveals a magisterial dispute Duns Scotus conducted with the Dominican master, Guillaume Pierre Godin, against the thesis that matter is the principle of individuation (the metaphysical principle that makes an individual thing different from other things of the same species), but so far no questions publicly disputed *ordinarie*—i.e., in regular turn with the other regent masters—have been discovered. There is strong evidence, however, that some questions of this sort existed but were eventually incorporated into the *Ordinatio*. Duns Scotus did conduct one solemn quodlibetal disputation, so called because the master accepted questions on any topic (*de quodlibet*) and

from any bachelor or master present (*a quodlibet*). The 21 questions Duns Scotus treated were later revised, enlarged, and organized under two main topics, God and creatures. Though less extensive in scope than the *Ordinatio*, these *Quaestiones quodlibetales* are scarcely less important because they represent his most mature thinking. Indeed, Duns Scotus' renown depends principally on these two major works.

The short but important *Tractatus de primo principio*, a compendium of what reason can prove about God, draws heavily upon the *Ordinatio*. The remaining authentic works seem to represent questions discussed privately for the benefit of the Franciscan student philosophers or theologians. They include, in addition to the *Collationes* (from both Oxford and Paris), the *Quaestiones in Metaphysicam Aristotelis* and a series of logical questions occasioned by the Neoplatonist Porphyry's *Isagoge* and Aristotle's *De praedicamentis*, *De interpretatione*, and *De sophisticis elenchis*. These works certainly postdate the Oxford *Lectura* and may even belong to the Parisian period. Antonius Andreas, an early follower who studied under Duns Scotus at Paris, expressly says his own commentaries on Porphyry and *De praedicamentis* are culled from statements of Duns Scotus *sedentis super cathedram magistralem* ("sitting on the master's chair").

Final period at Cologne. In 1307 Duns Scotus was appointed professor at Cologne. Some have suggested that Gonsalvus sent Scotus to Cologne for his own safety. His controversial claim that Mary need never have contracted original sin seemed to conflict with the doctrine of Christ's universal redemption. Duns Scotus' effort was to show that the perfect mediation would be preventative, not merely curative. Though his brilliant defense of the Immaculate Conception marked the turning point in the history of the doctrine, it was immediately challenged by secular and Dominican colleagues. When the question arose in a solemn quodlibetal disputation, the secular master Jean de Pouilly, for example, declared the Scotist thesis not only improbable, but even heretical. Should anyone be so presumptuous as to assert it, he argued impassionedly, one should proceed against him "not with arguments but otherwise." At a time when Philip IV the Fair had initiated heresy trials against the wealthy Knights Templars, Pouilly's words have an ominous ring. There seems to have been something hasty about Duns Scotus' departure in any case. Writing a century later, the Scotist William of Vaurouillon referred to the traditional account that Duns Scotus received the Minister General's letter while walking with his students and set out at once for Cologne taking little or nothing with him. Duns Scotus lectured at Cologne until his death. His body at present lies in the nave of the Franciscan church near the Cologne cathedral and in many places he is venerated as blessed.

Whatever the reason for his abrupt departure from Paris, Duns Scotus certainly left his *Ordinatio* and *Quodlibet* unfinished. Eager pupils completed the works, substituting materials from *reportationes examinatae* for the questions Duns Scotus left undictated. The critical Vatican edition begun in 1950 is aimed, among other things, at reconstructing the *Ordinatio* as Duns Scotus left it, with all his corrigenda, or corrections.

Despite their imperfect form, Duns Scotus' works were widely circulated. His claim that universal concepts are based on a "common nature" in individuals was one of the central issues in the 14th-century controversy between Realists and Nominalists concerning the question of whether general types are figments of the mind or are real. Later this same Scotist principle deeply influenced Charles Sanders Peirce, a U.S. philosopher, who considered Duns Scotus the greatest spec-

ulative mind of the Middle Ages as well as one of the "profoundest metaphysicians that ever lived." His strong defense of the papacy against the divine right of kings made him unpopular with the English Reformers of the 16th century for whom "dunce" (a Dunsman) became a word of obloquy, yet his theory of intuitive cognition suggested to John Calvin, the Genevan Reformer, how God may be "experienced." During the 16th to 18th century among Catholic theologians Duns Scotus' following rivalled that of Thomas Aquinas and in the 17th century outnumbered that of all the other schools combined.

BIBLIOGRAPHY. Oduf Schaefer, *Bibliographia de vita, operibus et doctrina Iohannis Duns Scoti, saec. XIII-XX* (1955), continued in "Resenha Abreviada da Bibliografia Escotistica Mais Recente" (1954-1966), *Revista Portuguesa de Filosofia*, 23:338-363 (1967), are exhaustive bibliographies prepared for the Scotistic Commission. *De doctrina Iohannis Duns Scoti*, 4 vol. (1968), contains 125 papers given at the 2nd International Scotistic Congress 1966 on the philosophy, theology, and influence of Scotus; *Deus et Homo ad mentem I. Duns Scoti* (1972), is a similar collection from the 3rd International Scotistic Congress 1970. A.B. Wolter (trans.), *Duns Scotus, Philosophical Writings* (1962), includes selections from the *Ordinatio*; and *A Treatise on God As First Principle* (1966), the *De Primo Principio*, and selections from the *Lectura*. On the theology of Scotus, see the article by C. Balic in the *New Catholic Encyclopedia*, vol. 4 (1967). On his philosophy, the following are particularly recommended: A.B. Wolter in the *Encyclopedia of Philosophy*, vol. 2 (1967), a concise general introduction; Efreim Bettoni, *Duns Scotus: The Basic Principles of His Philosophy* (1961), a more detailed analysis with a good bibliography; J.K. Ryan and B.M. Bonansea (eds.), *John Duns Scotus, 1265-1965* (1965), a series of essays; F.C. Copleston, *A History of Philosophy*, 2nd ed., vol. 2 (1950); and D.E. Sharp, *Franciscan Philosophy at Oxford in the Thirteenth Century* (1930).

Dunsany, Edward John Moreton Drax Plunkett, 18th baron of (b. July 24, 1878, London—d. Oct. 25, 1957, Dublin), Irish dramatist and storyteller, whose many popular works combined imaginative power with intellectual ingenuity to create a credible world of fantasy.

Educated at Eton and Sandhurst, Dunsany served in the South African War and World War I. His first book of short stories was *The Gods of Pegana* (1905); his first play, *The Glittering Gate*, was produced by the Abbey Theatre in Dublin in 1909; and his first London production, *The Gods of the Mountain*, at the Haymarket Theatre in 1911. As in his more than 50 subsequent verse plays, novels, short stories and memoirs, in these works Dunsany explored in a richly coloured prose mysterious kingdoms of fairies and gods; he also introduced a characteristic element of the macabre.

Dunsinane, peak, in the Sidlaw Hills, about 8 mi (13 km) northeast of Perth, eastern Scotland. The peak, at an elevation of 1,012 ft (308 m) is surmounted by the ruins of an ancient fort, traditionally identified with the castle of Shakespeare's *Macbeth*. Both are in close proximity to Birnam Wood, about 12 mi to the northwest, which was part of the circumstances attending the traditional account of the defeat of Macbeth by Siward, Earl of Northumbria, in 1054.

Dunstable, town, South Bedfordshire district, county of Bedfordshire, England, on the northern slopes of the Chiltern Hills. Dunstable appears as a royal borough in the reign of Henry I (ruled 1100-35), who granted a charter to the Augustinian priory he had built. It once was known for its straw hat industry, but rapid modern growth has been centred on light engineering and motor vehicle industries. Nearby is an extensive cement works. Whipnade Zoo, the country branch of the London Zoological Gardens, was opened in 1931; it

occupies 500 acres (200 ha) on the Chiltern Hills near Dunstable. The London Gliding Club also has its headquarters nearby. Pop. (1991) 49,666.

Dunstable, John (b. c. 1385, Eng.—d. Dec. 24, 1453, London), English composer who influenced the transition between late medieval and early Renaissance music. The influence of his sweet, sonorous music was recognized by his contemporaries on the Continent, including Martin le Franc, who wrote in his *Champion des dames* (c. 1440) that the leading composers of the day, Guillaume Dufay and Gilles Binchois, owed their superiority to what they learned from Dunstable's "English manner."

Information about Dunstable's life is scanty. He was in the service of the Duke of Bedford, who was regent of France from 1422 to 1435 and military opponent of Joan of Arc. Dunstable probably accompanied his patron to France; his music was well known on the Continent. His epitaph referred to him as skilled in mathematics and astronomy as well as in music.

Dunstable's influence on European music is seen in his flowing, gently asymmetrical rhythms and, above all, in his harmonies. He represents a culmination of the English tradition of full, sonorous harmonies based on the third and sixth that persisted through the 14th century alongside the starker, more dissonant style of continental music.

Dunstable left about 60 works, including mass sections, motets, and secular songs; they are largely in three parts. In the cantus firmus tenors of some of his mass sections he frequently used the continental device of isorhythm (rhythmic patterns overlapped with melodic patterns of different length). In many of his works the treble line, rather than the tenor line, dominates; it may be freely composed, or it may carry an ornamented version of the cantus firmus, an English innovation. Some of his motets show double structure: building the polyphonic composition on two melodies, a plainchant cantus firmus in the tenor and a melody in the treble that appears with variations. This structure, possibly invented by Dunstable, became popular with later composers.

Dunstan of Canterbury, saint (b. 924, near Glastonbury, Eng.—d. May 19, 988, Canterbury; feast day May 19), English abbot, celebrated archbishop of Canterbury, and a chief adviser to the kings of Wessex, who is best known for the major monastic reforms that he effected.

Of noble birth, Dunstan was educated by Irish monks and visitors at Glastonbury. Later he entered first the household of his uncle, Archbishop Aethelhelm of Canterbury, and then the court of Athelstan, king of the English. Maliciously accused of practicing the black arts, he took refuge with his kinsman Aelfeah (Elphege), bishop of Winchester, who influenced him to become a monk and later ordained him.

Dunstan then lived as a hermit at Glastonbury, where he learned various crafts and music until Athelstan's successor, Edmund I, recalled Dunstan as one of his counselors. About 943 Edmund made him abbot of Glastonbury, and under Dunstan the abbey became a famous school. Under Edmund's successor, Eadred, Dunstan became the chief minister of state, in which capacity he sought to establish royal authority, to conciliate the Danish section of the kingdom, to eradicate heathenism, and to reform clergy and laity.

On the accession in 955 of King Eadwig (Edwy), however, Dunstan's influence and office were temporarily eclipsed. He apparently quarrelled with Eadwig and was outlawed, be-

ing driven to Flanders. At the abbey of Blandinium he studied continental monasticism, which he used as a chief source in restructuring English monasticism when recalled by King Edgar in 957. In the same year, Edgar made him bishop of Worcester and London. In 959 Eadwig died, Edgar became sole king of the English, and Dunstan was appointed archbishop of Canterbury. During this period intellectual activity flourished, and Dunstan personally reformed and reestablished several celebrated monasteries and sponsored missionaries to Scandinavia.

On Edgar's death, in 975, Dunstan secured the crown for Edgar's elder son, later known as St. Edward the Martyr. When Edward was murdered (978) and was succeeded by Ethelred (Aethelred) II, Dunstan's public career abated, and he retired to Canterbury, where he taught at the cathedral school.

Dunster, town ("parish"), West Somerset district, county of Somerset, England. It lies at the edge of Exmoor National Park and 1.5 miles (2.4 km) from Dunster Beach on the Bristol Channel. It is dominated by its hilltop castle, and remains of prehistoric Iron Age settlement have been discovered in the deer park. After the Norman Conquest (1066), the castle became the caput (administrative centre) of an honour (feudal administrative division) that included lands in the counties of Somerset, Dorset, Devon, and Wiltshire. The town was incorporated in the 12th century. A 16th-century octagonal building lies in the main street. Dunster's main industry is tourism. Agriculture and forestry provide other employment. Pop. (latest est.) 807.

Dunster, Henry (baptized Nov. 26, 1609, Bury, Lancashire, Eng.—d. Feb. 27, 1659, Scituate, Massachusetts Bay Colony [now in Massachusetts, U.S.]), American clergyman and first president of Harvard College.

Dunster was educated at the University of Cambridge (B.A., 1631; M.A., 1634) and then taught school and served as curate of Bury. He had a reputation as a learned man, and three weeks after his arrival in Massachusetts he was installed as president of Harvard (Aug. 27, 1640) in the town of Cambridge. The college was all but extinct, instruction having been given for one disastrous year (1638) and then suspended, so Dunster had to make a fresh beginning without students, faculty, buildings, income, curriculum, statutes, or charter. He proved to be an able teacher, administrator, and money raiser and gave to the college a form and character that was modeled on the English universities and that persisted at Harvard in all essential features until the 19th century.

In 1653 he scandalized the Massachusetts colony by adopting Baptist views and refusing to have his child baptized. In 1654 he was ejected from the presidency, brought to trial, sentenced to be publicly admonished, and put under bond to keep the peace. Although he had contributed generously out of his own limited means to the support of the college, there was delay in paying his back salary, and in the end he received only partial recompense. Removing to the more liberal atmosphere of Scituate, Mass., he continued to preach until his death.

Dunwich, town ("parish"), Suffolk Coastal district, county of Suffolk, England, on the North Sea coast. The first development on the site was probably a Romano-British community, and in Anglo-Saxon days it became the most important commercial centre in East

Anglia. Early in the 7th century, when Sigebert became king of East Anglia, Dunwich was chosen as his capital, and a bishopric was founded before 650. The community received a charter from King John (reigned 1199–1216). Dunwich became a wealthy port, but severe coastal erosion caused its decline. In 1347 more than 400 houses were washed away in a storm, and similar disasters occurred in 1570. Until 1832, Dunwich returned two members to Parliament in spite of its small population. The corporation was abolished in 1886. Pop. (latest est.) 129.

duodenum, the first part of the small intestine, which receives partially digested food from the stomach and begins the absorption of nutrients. The duodenum is the shortest segment of the intestine and is about 9 to 11 inches (23 to 28 cm) long. It is roughly horse-shoe-shaped, with the open end up and to the left, and it lies behind the liver. On anatomic and functional grounds, it can be divided into four segments: the superior, descending, horizontal, and ascending duodenum.

For a depiction of the duodenum in human anatomy, shown in relation to other parts of the body, see the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

A liquid mixture of food and gastric secretions enters the superior duodenum from the pylorus of the stomach, triggering the release of pancreas-stimulating hormones from glands in the duodenal wall. Ducts from the pancreas and gallbladder enter at the descending duodenum, bringing bicarbonate to neutralize the acid in the gastric secretions, pancreatic enzymes to further digestion, and bile salts to emulsify fat. The mucous lining of the last two segments of the duodenum begins the absorption of nutrients, in particular iron and calcium, before the food contents enter the next part of the small intestine, the jejunum.

Its exposure to unneutralized stomach acid makes the duodenum, in particular the superior segment, especially susceptible to peptic ulcers, which are the most common health problem affecting this part of the intestine. The horizontal duodenum, because of its location between the liver, pancreas, and major blood vessels, can become severely compressed by these structures, requiring surgical release to eliminate painful duodenal dilatation, nausea, and vomiting.

Duolun (China): see To-lun.

Duonelaitis, Kristijonas: see Donelaitis, Kristijonas.

Duang, also spelled DUANG (b. 1796—d. Oct. 19, 1860, Oudong, Cambodia), king of Cambodia by 1841, formally invested in 1848, the last Cambodian king to reign before the French-imposed protectorate.

Duang was the younger brother of King Chan II, who had ruled uncertainly in joint vassalage to Siam (Thailand) and Vietnam. Between 1841 and 1847 these two neighbours confronted each other in Cambodia in alternating periods of war and uneasy truce. With neither able to gain a decisive victory, they agreed to a dual hegemony over the Khmer state. By mutual agreement, Duang was crowned king at the new capital, Oudong (Odöngk), in 1848.

Duang's reign is idealized by modern Cambodians for the efforts he made to revitalize the state at a time when his more powerful neighbours were preoccupied with other concerns. To a considerable extent, however, his hopes were frustrated by the poverty of the state and by internal dissension. Duang showed his awareness of the outside world in his efforts to enlist assistance from Singapore to combat pirates operating along the Cambodian coast. Contrary to the repeated assertions of French authors writing in the colonial period, Duang did not seek the imposition of a French protectorate over his country. In the

face of multiple problems he agreed to explore the possibility of some ill-defined relationship with France, but his death in 1860 came before any consideration to such an agreement had taken place. The French advance into Cambodia came in 1863 and 1864, after Duang's death, while his successor, Norodom, was on the throne.

Despite his own personal energy, Duong was at best able to preserve a shakily independent Cambodia. In the closing years of his reign there were already signs of dissension between his sons, and the kingdom was troubled by revolts by the Chams and the Malays living in the southeastern part of the state.

duoviri, also spelled DUUMVIRI, singular DUOVIIR, or DUUMVIR, in ancient Rome, a magistracy of two men. *Duoviri perduellionis* were two judges, selected by the chief magistrate, who tried cases of crime against the state. *Duoviri navales*, at first appointed but later popularly elected (311–178 BC), had charge of a fleet. The two chief magistrates of the colonies and municipia (*i.e.*, communities under Roman domination) were often called *duoviri jure dicundo*.

Dupanloup, Félix-Antoine-Philibert (b. Jan. 3, 1802, Saint-Félix, Fr.—d. Oct. 11, 1878, Lacombe), Roman Catholic bishop of Orléans who was a clerical spokesman for the liberal wing of French Catholicism during the mid-19th century.

Dupanloup, engraving
J.E. Bulloz

Ordained priest in 1825, Dupanloup began his series of successful catechetical classes at the Parisian Church of the Madeleine. As director of the Parisian junior seminary of Saint-Nicolas-du-Chardonnet (1837–45), he attracted many lay students. He was prominent in the struggle for educational freedom under the July Monarchy and was an architect of the Falloux Law (1850), which gave legal status to independent secondary schools. While bishop of Orléans (consecrated 1849), and as a member of the French Academy (elected 1854), he helped reorganize the liberal Catholic journal *Le Correspondant*.

When papal temporal sovereignty was threatened by Emperor Napoleon III, Dupanloup defended it in a series of public letters (1860), but he supported Louis-Adolphe Thiers's refusal to reopen the issue after 1870. His explanation of Pope Pius IX's *Syllabus of Errors* under the terms thesis and hypothesis became famous. At the first Vatican Council (1869–70) he was one of the party that considered the definition of papal infallibility to be inopportune. His *Christian Marriage* and *The Studious Women* have been translated into English.

Duparc, (Marie-Eugène)-Henri, original name HENRI FOUQUES-DUPARC (b. Jan. 21, 1848, Paris, Fr.—d. Feb. 12, 1933, Mont-de-Marsan), French composer known for his original and lasting songs on poems of Charles Baudelaire, Leconte de Lisle, Théophile Gautier, and others.

Duparc studied with César Franck at the

Duparc
J.P. Ziolo

Jesuit College of Vaugirard. In 1869 he met Franz Liszt and Richard Wagner at Weimar and in 1870 published five songs (*Cinq Mélodies*, Opus 2). Two of them, "Soupir" and "Chanson triste," were later incorporated in his collection of songs, written between 1868 and 1884, including eight with orchestral accompaniment. In these songs, Duparc enlarged the French song into a *scena*, or operatic scene, and brought to it a poetic sense of musical prosody and a symphonic conception of form. In his youth Duparc wrote two orchestral works, *Aux Étoiles (To the Stars)* and *Lénore*, and a motet. He was also keenly interested in Russian literature, planning an opera, *Roussalka*, based on a narrative poem by Aleksandr Pushkin. About 1890 his creative faculties began to be undermined by doubts, and he thereafter produced little. In a spirit of severe self-criticism, he destroyed nearly all his subsequent works and sketches, together with his earlier unpublished manuscripts and the correspondence addressed to him by Wagner and contemporary poets. During the latter part of his life he was associated with two French Catholic writers, Francis Jammes and Paul Claudel, and composed the song "Testament" (1906-13), the text of which is a prose prayer.

Duperron, Jacques Davy (b. Nov. 25, 1556, Bern—d. Sept. 5, 1618, Paris), French cardinal, remembered especially for his part in the conversion of King Henry IV of France to Roman Catholicism.

The son of a Huguenot refugee from Saint-Lô, Normandy, who gave him an excellent humanist education, he returned to France in 1562 and was introduced to Henry III in 1576. He later abjured Protestantism, took holy orders, and, as a reader in Henry's service, developed a solid reputation as a Catholic churchman attached to the crown's interests.

After Henry's death in 1589, Duperron supported the claim of Charles, cardinal de Bourbon, but soon transferred his loyalty to Henry IV. As bishop of Évreux from 1591 he instructed the king in the Catholic religion, and Henry formally abjured his Calvinist faith in 1593. In 1594 Duperron was sent to Rome to obtain absolution for Henry from Pope Clement VIII, which was granted in 1595.

Duperron, detail from an engraving
By courtesy of the Bibliothèque Nationale, Paris

In 1600, at a conference at Fontainebleau, he eloquently defended the Catholic position against Protestants Philippe Duplessis-Mornay and Théodore-Agrippa d'Aubigné.

In 1604 Duperron was sent to Rome as chargé d'affaires and was made a cardinal. After Henry's death he served the regent, Marie de Médicis. During his life he published many philosophical and religious works as well as some dealing with diplomatic affairs. His collected works were published in 1622.

Dupin, Louis Ellies (b. June 17, 1657, Paris—d. June 6, 1719, Paris), French church historian whose history of Christian literature, *Nouvelle Bibliothèque des auteurs ecclésiastiques*, 58 vol. (1686-1704; "New Library of Ecclesiastical Writers"), broke with scholastic tradition by treating biography, literary and doctrinal criticism, and bibliography in one work and by writing in a modern language. The opinions he expressed in this work were strongly opposed by the renowned French historian and orator Jacques Bossuet and others. The work was censured by the archbishop of Paris in 1691, and, although Dupin retracted, it was suppressed in 1696.

An apologist for Gallicanism (the ecclesiastical doctrine advocating restriction of papal

Dupin, engraving
J.P. Ziolo

power), Dupin was exiled to Châtellerault, Fr., in 1713, charged with Jansenism (a heretical doctrine de-emphasizing the freedom of the will and teaching that redemption through Christ's death is limited to some) after he protested Pope Clement XI's anti-Jansenistic bull *Unigenitus*. He was freed by again retracting. His later years were spent on projects for the reunion of the Roman Catholic and Anglican churches. While visiting France in 1717, Tsar Peter I the Great commissioned Dupin to draft a plan for the reunion of the Eastern Orthodox and Roman churches. His works include a *Bibliothèque universelle des historiens*, 2 vol. (1707; "Universal Library of Historians"), and *L'Histoire de l'église en abrégé*, 4 vol. (1712; "A Brief History of the Church"). *Nouvelle Bibliothèque* was placed on the *Index of Forbidden Books* in 1757.

Dupleix, Joseph-François (b. 1697, Landrecies, Fr.—d. Nov. 10, 1763, Paris), colonial administrator and governor-general of the French territories in India who nearly realized his dream of establishing a French empire in India. Although he was an imaginative political visionary, he died in despair and comparative poverty.

His father, François, a director of the French East India Company, sent Dupleix on a voyage to India and America in 1715. His father's influence led to his appointment (1720) to the superior council of Pondicherry, the capital of French India. He was made superintendent of the French factory (trading station) in Chandernagore, Bengal, in 1731 and 11 years later was appointed governor-general of all French

establishments in India. When fighting between France and Britain broke out in the War of the Austrian Succession in 1744, the

Dupleix, engraving by Marie Champion de Cernel after a portrait by Sergent
H. Roger-Viollet

French proposed neutrality in India, but this was rejected by the British. In 1746, with the help of a French fleet, Dupleix took Madras but failed to take the neighbouring British fort of St. David; he twice defeated armies sent to relieve Britain's ally, the nawab Anwar-ud-Din of the Carnatic (modern Karnataka state).

The Treaty of Aix-la-Chapelle ended the war in Europe in 1748 and restored Madras to the British, but Dupleix embarked on further schemes for French aggrandizement in India. Sensing the military weakness of the various contending princes in South India, he made local alliances with them that were aimed at ruining the British East India Company. He supported Chanda Sahib's claim to the nawabship of the Carnatic, and, when the British supported a rival candidate, a largely private war ensued (1751) between the two companies. Mostly as the result of the exploits of Dupleix's chief rival, the brilliant young British soldier Robert Clive, all the French forces except those in the Deccan were defeated. Dupleix's grand schemes continued toppling for two more years, and the French finances were exhausted in the struggle. In 1754 Dupleix was recalled to Paris, where he sued (unsuccessfully) the French East India Company for money he claimed he had spent on its account. Dupleix remained discredited in France and died in obscurity. He had displayed great talents as an organizer and diplomat, but he lacked military acumen and the ability to work with others.

Duplessis, Maurice (Le Noblet) (b. April 20, 1890, Trois-Rivières, Que., Can.—d. Sept. 7, 1959, Schefferville, Que.), Canadian politician who controlled Quebec's provincial government as its premier from 1936 until his death, except for the war years of 1940-44.

Educated at Laval University in Quebec, Duplessis was admitted to the bar in 1913 and made king's counsel in 1931. He practiced law in Trois-Rivières and was elected to the Quebec legislature in 1927 as a Conservative. By 1933 he was head of the provincial Conservative Party. Advocating French-Canadian autonomy, he led his followers into a new nationalist party, the Union Nationale, which won the 1936 election. He became premier and attorney general. After questioning Canadian policy before World War II, he lost office in the 1939 election but was reelected in 1944.

Although Duplessis had campaigned on an anticorruption, anti-big business platform, he quickly established a powerful political machine and made peace with the Canadian and U.S. interests he had denounced. By virtue of his commanding personality and his appeals to provincial interests, he and his Union Nationale swept the elections of 1948, 1952, and 1956. With his death, the Union Nationale went into rapid decline.

Duplessis-Mornay, Philippe: *see* Mornay, Philippe de.

Duplicate Bridge, also called **TOURNAMENT BRIDGE**, form of Contract Bridge played in all tournaments, in Bridge clubs, and often in the home; it is so called because each hand is played at least twice, although by different players, under the same conditions, with the same cards in each hand and the same dealer and vulnerability. Duplicate Bridge was designed to counter the major obstacle of Rubber Bridge—*i.e.*, that a run of good cards can nullify any difference between skillful and poor players. Since in Duplicate Bridge all players sitting in the same position will play the same cards throughout the course of a night, the object of play is not to amass the largest number of points, as in Rubber Bridge, but rather to bid and play the hands better than all the other pairs who play them; thus, it is immaterial whether one holds good or bad cards.

duplicating machine, a device for making duplicate copies from a master copy of printed, typed, drawn, or other material and utilizing various reproduction techniques to this end. The major types of duplicating machines are stencil (or mimeograph), hectograph, multilith (or offset lithograph), and imprinting (*qq.v.*). Regardless of the process used, all duplicating machines require the preparation of a master copy from which copies are made by a machine. Duplicating machines are thus differentiated from copying machines, in which copies are made from an original in an exposure-image-forming process.

Duport, Adrien (-Jean-François), Duport also spelled **DU PORT** (b. Feb. 5, 1759, Paris—d. Aug. 15, 1798, Appenzell, Switz.), French magistrate who was a leading constitutional monarchist during the early stages of the French Revolution of 1789.

A prominent member of the Parlement of Paris (one of the high courts of justice), Duport was elected for the nobility to the Estates-General of 1789. On June 25 he and 46 other representatives of the nobility joined the unprivileged Third Estate, which had already declared itself a revolutionary National Assembly. As one of the Assembly's most brilliant lawyers, Duport played a major role in creating the judicial machinery that supplanted the legal system of the ancien régime.

Nevertheless, by the spring of 1791, Duport and his two close associates, Antoine Barnave and Alexandre, comte de Lameth—the “triumvirate”—felt that further democratic reforms would endanger the monarchy and private property. They became secret advisers to King Louis XVI and formed the Club of the Feuillants with their royalist allies. Duport became president of the criminal court of Paris, but he fled to England—probably with the help of the democratic leader Georges Danton—soon after the fall of the monarchy on Aug. 10, 1792. He returned to France after the radical democrat Robespierre fell from power on 9 Thermidor (July 27, 1794). On the military coup d'état of 18 Fructidor, year V (Sept. 4, 1797), he fled to Switzerland.

Duport, Louis (-Antoine) (b. 1781/83, Paris—d. Oct. 19, 1853, Paris), French ballet dancer who refined classical technique, excelling particularly in multiple pirouettes and high, soaring leaps.

Duport was a child prodigy dancer and violinist. He danced in Paris from 1799 to 1806 and challenged Auguste Vestris's supremacy as leading male dancer at the Paris Académie (now Opéra). Duport danced in St. Petersburg (1808–12), where he was highly acclaimed for his performances in Charles Didelot's ballets, notably *Zéphyre et Flore*. He also danced in

Vienna, Naples, and London, giving his last performance in 1830. Until 1836 he directed productions at the Kärntnerthor Theatre in Vienna, then retired to Paris with a great fortune.

Dupplin Moor, Battle of (Aug. 12, 1332), battle fought about 7 miles (11 km) southeast of Perth, Perthshire, a victory for Edward de Balliol, a claimant to the Scottish throne, over forces led by Donald, earl of Mar, regent for the young King David II. Secretly encouraged by King Edward III of England, Balliol and other knights who had been disinherited by David's father, Robert I the Bruce, landed at Kinghorn in Fifeshire, where they routed the local troops. They marched to Dunfermline and then northward and, reaching the River Eann, forded it on the night of August 11–12. Dawn revealed the main Scottish force arrayed in two divisions ready to attack. Greatly outnumbered, Balliol adopted tactics later copied by Edward III at the Battles of Halidon Hill (1333) and Crécy (1346); most of his men at arms dismounted, while archers were posted at either flank. When the first Scottish division charged, flights of arrows drove its flanks in upon its centre. The charge of the second division failed to renew the Scottish momentum, and their men trod one another underfoot, more dying by suffocation than by the sword. Pursuing the fugitives, Balliol's men entered Perth, and he was crowned king at Scone the next month. Although King David temporarily left the country, Balliol never received widespread recognition. In 1339 he lost Perth, and in 1356 he resigned his kingdom to Edward III.

Duprat, Antoine (b. Jan. 17, 1463, Issoire, Fr.—d. July 9, 1535, Nantouillet), chancellor of France and cardinal known for his service as one of Francis I's most trusted advisers.

Educated as a lawyer, Duprat began his government service as a judge in 1490 and served as attorney in the Parlement of Toulouse in 1495. Later he became a master of requests (in charge of petitions to the king) to Louis XII's household (1503) and a president—eventually premier—of the Parlement of Paris (supreme court). A favourite of Louise of Savoy, mother of the future Francis I, he was entrusted with Francis' education. On the latter's accession to the throne, Duprat became chancellor of France. In this capacity he negotiated the Concordat of Bologna, which gave the king the power to choose his own bishops (1516).

After the concordat was signed, Duprat took holy orders and was given the bishoprics of Valence and Die (1522), Albi (1528), and Meaux (1534) and the archbishopric of Sens (1525). He was made cardinal in 1527 and papal legate in France in 1530. A determined

Duprat, detail from a lithograph, 1527
H. Roger-Viollet—Haringtung

adversary of the Reformation, he influenced Francis considerably on that problem.

Dupré, Giovanni (b. March 1, 1817, Siena, Tuscany—d. Jan. 10, 1882, Florence), Italian sculptor whose success was due to his lifelike and original interpretation of form when Italian sculpture was deteriorating into a mannered imitation of the works of Antonio Canova.

Dupré was the son of a carver in wood. His first work of importance was “Abel” (1842; Pitti, Florence). The grand duchess Marie of Russia commissioned him to execute a statue of “Cain” (1844; Pitti), and the grand duchess of Tuscany commissioned one of “Giotto” (1845; arcades of the Uffizi, Florence). The mourning “Sappho” (1857) was his most notable work of this period. A visit in 1856 to Naples and Rome, where he admired Canova's monument to Pius VI, influenced him toward Neoclassicism. His monuments, *e.g.*, that of Cavour in Turin, suffer from the conflict between his temperamental naturalism and the necessities of allegory and ideal grandeur. Dupré also executed many portrait busts.

Dupré, Jules (b. April 5, 1811, Nantes, Fr.—d. Oct. 6, 1889, L'Isle-Adam), French artist who was one of the leaders of the Barbizon group of landscape painters.

The son of a porcelain manufacturer, Dupré started his career in his father's works, after which he painted porcelain at his uncle's china factory at Sèvres. He first exhibited paintings in 1831 and in 1834 was awarded a second-class medal at the Salon. Visiting England in the same year, he learned, from the landscapes of John Constable, how to express movement in nature. The districts of Southampton and Plymouth, with their wide expanses of water, sky, and ground, provided

“The Duck Pond,” oil painting by Jules Dupré, c. 1846, in the Louvre, Paris
Lauros—Giraudon from Art Resource

his subjects. Late in life, he joined the artists' colony at Barbizon on the edge of the forest of Fontainebleau, where his style evolved, gaining in breadth, or largeness of treatment, and exhibiting greater simplicity in colour harmony.

Dupré, Marcel (b. May 3, 1886, Rouen, Fr.—d. May 30, 1971, Paris), foremost French organ virtuoso of his time, famed for his ability to improvise and influential as a teacher.

Dupré gave his first organ recital at age 10 and had his oratorio *Le Songe de Jacob (Jacob's Dream)* performed at 15. An organist at Saint-Sulpice and Notre-Dame, Paris, he gave (1920) a series of 10 recitals in which he played from memory the complete organ works of J.S. Bach. He toured as a virtuoso (U.S. debut, 1921), frequently improvising fugues and symphonies from themes suggested by musicians in the audience. His *Symphonie-Passion* and *Le Chemin de la croix (The Way of the Cross)* were first improvised in performance and later written down. His written compositions include a series of 76 chorales and a concerto for organ and orchestra. He also wrote several works on organ technique and improvisation. Dupré directed the American Conservatory at Fontainebleau, Fr. (1947–54), and the Paris Conservatory (from 1954).

Dupré, Marie-Jules (b. Nov. 25, 1813, Albi, Fr.—d. Feb. 8, 1881, Paris), French naval officer who served as governor of French Cochinchina (southern Vietnam) in 1871–74. Despite official policy opposing imperialistic expansion, Dupré attempted to establish French dominance in Tonkin (northern Vietnam) with the hope of promoting trade and of finding a commercial route into China.

Dupré graduated from the naval school in 1831 as a midshipman; he attained the grade of lieutenant commander in 1847 and became a commander in 1854. He served in the Crimean War and took part in expeditions to Syria and Cochinchina in 1860. In 1864 he was named governor of Réunion. By 1867 he had attained the rank of rear admiral. In 1870 he commanded a naval blockade of ports in China and Japan, which the French were trying to keep closed to the Germans.

Dupré became governor of Cochinchina in April 1871. When a French trader, Jean Dupuis, became involved in a dispute with Vietnamese authorities as the result of efforts to use the Red River as a commercial route in 1873, Dupré seized the opportunity to extend French influence, disregarding the reluctance of the government in Paris. Instead of sending a diplomatic mission to Hanoi, he exceeded his authority and sent a small force under the command of Lieutenant Commander Francis Garnier to Tonkin in response to Dupuis's appeal for help. After a brief period of success that included Garnier's capture of the Hanoi citadel, Dupré decided to seek some diplomatic agreement with the Vietnamese court rather than to rely on force. Before his envoy, Paul-Louis-Félix Philastre, had reached Hanoi, Garnier was killed. Dupré then disavowed his subordinates' actions.

After Garnier's death, Philastre negotiated a treaty by which the Vietnamese emperor, Tu Duc, agreed to recognize the French annexation, in 1867, of the three western provinces of Cochinchina and to open the northern centres of Hanoi, Haiphong, and Qui Nhon to foreign commerce. The treaty was ratified in 1874, but Tu Duc took advantage of continued antiexpansion feeling in France and ignored the treaty, and France failed to convey news of the treaty to China until the Chinese launched a bandit-suppression campaign in northwest Tonkin in 1877. When, by 1882, political attitudes in France had changed, the Vietnamese refusal to honour Philastre's treaty led to conflict, and in 1883–85 all of Vietnam passed under French rule.

Dupré's role in the affair of 1873, however,

had led to his recall from Cochinchina in 1874. Though chiefly remembered for his attempt to expand into Tonkin, he had been an energetic administrator of the internal affairs of his domain. He had sponsored a public-health program, planned realistic public-education policy, and presided over the establishment of the Collège de Stagiaires (College of Probationers) in Saigon for the legal training of French administrative personnel. He also had supported Philastre's efforts to preserve the Vietnamese legal code.

After his return to France, Dupré was appointed a vice admiral and named maritime prefect of Rochefort, and later of Toulon, a position that he held until his retirement in 1878.

Duprez, Gilbert (-Louis) (b. Dec. 6, 1806, Paris, Fr.—d. Sept. 23, 1896, Paris), French tenor, teacher of voice, and composer.

Duprez studied at the Paris Conservatory. In 1825 he made his debut at the Odéon Theatre, Paris, as Almaviva in Gioacchino Rossini's *Il barbiere di Siviglia (The Barber of Seville)*. After limited success at the Odéon, he went to Italy for further study and achieved considerable popularity, notably in Naples, where Gaetano Donizetti chose him for the role of Edgardo in the premiere of his *Lucia di Lammermoor* in 1835.

Duprez returned to France and established himself as the first Romantic tenor, known for his clarion high register and exaggerated acting. Between 1837 and 1847 he was a leading member of the Paris Opéra and created such roles as Benvenuto Cellini in Hector Berlioz' opera of the same name and Fernando in Donizetti's *La favorite*. He also sang in London and Germany and joined the Paris Conservatory, where he taught from 1842 to 1850. His success as a singing teacher led him in 1853 to found his own singing school. He composed six operas, which were produced between 1826 and 1865, and wrote several pedagogical and popular books, including *L'Art du chant* (1845; "The Art of Singing"), *Souvenirs d'un chanteur* (1880; "Memories of a Singer"), and *Récréations de mon grand âge* (1888).

"De," "la," and similar components of a name, when followed by a space, are alphabetized as separate words (e.g., De Forest, Lee).

When they are joined to the following part of a name, the combination is treated as a single word (e.g., DeForest, John William).

Dupuis, Jean (b. Dec. 8, 1829, Saint-Just-la-Pendue, Fr.—d. Nov. 28, 1912, Monte-Carlo), French adventurer, trader, and publicist who was associated with the unsuccessful effort to establish French influence in northern Vietnam in 1873.

Dupuis began his commercial career in Egypt in 1858 but in 1860 moved to China, where he established himself first in Shanghai and, a year later, in Hankow. Dupuis learned Chinese and developed good relations with local officials while running a moderately successful business selling military equipment. He later claimed that as early as 1864 he had begun a search for a river route to the southwestern Chinese province of Yunnan and concluded that the route would be provided by the Red River. The best evidence, however, suggests that Dupuis did not think of exploiting the Red River for commerce until a French expedition led by Ernest Doudart de Lagrée and Francis Garnier passed through Hankow in 1868. The group was returning from an ascent of the Mekong River into Yunnan, and its members pointed out to Dupuis that the Red River might be used for trade with that province.

In 1871 Dupuis traveled down the Red River from Yunnan into Vietnam. He planned to use the river for a large shipment of arms

to his Chinese customers, the army of Ma Ju-lung, in K'un-ming, the capital of Yunnan, and he went to Paris to seek official assistance. Although the French authorities would not provide overt backing, they did approve Dupuis's purchase of cannon in France and were ready to give some help with transport.

In November 1872 Dupuis sailed from Hong Kong with a well-equipped force, determined to carry his goods up the Red River, though he had no permission to do so from the Vietnamese government. By threats and bribery he overcame Vietnamese opposition to his plans and delivered his cargo in Yunnan. Returning to Hanoi, he found his Vietnamese associates imprisoned and his ships and men prevented from further commercial ventures on the Red River. He appealed to Admiral Marie-Jules Dupré, the governor of French Cochinchina (southern Vietnam), for assistance.

Garnier, after serving in the Franco-German War, returned to the Far East; in November 1873 Dupré sent him with a small force of men to Hanoi. Garnier's official orders called on him to extricate Dupuis, but secret instructions given orally by Admiral Dupré apparently sanctioned aggressive action in northern Vietnam. With Dupuis's cooperation, Garnier attacked the Hanoi citadel and extended tenuous control over other parts of the Red River delta. When Garnier was killed on December 21, Dupré, having risked open conflict with French governmental policy, disavowed Garnier's actions and refused to heed Dupuis's plea that a French force be maintained in northern Vietnam.

Dupuis was financially ruined by these events. He returned to France, where he became a tireless advocate of a French advance into northern Vietnam and of himself as the discoverer of the commercial possibilities of the Red River. Among the best known of his numerous publications were *Les Origines de la question du Tong-kin* (1896; "The Origins of the Tonkin Issue") and *Le Tonkin de 1872 à 1886: histoire et politique* (1910; "Tonkin from 1872 to 1886: History and Politics"). Despite his energy as an author and his earlier success in business, Dupuis faded into obscurity before his death in 1912.

Dupuit, Arsène-Jules-Étienne-Juvénal (b. May 18, 1804, Fossano, Piedmont, French Empire [now in Italy]—d. Sept. 5, 1866, Paris, Fr.), French engineer and economist who was one of the first to analyze the cost-effectiveness of public works.

Dupuit studied at the École Polytechnique ("Polytechnic School") in Paris and then joined the civil-engineering corps, rising to the rank of inspector general of bridges and highways. Through his professional work, Dupuit became interested in the economic problems associated with constructing public works and charging for their use. He concentrated on the benefits of public works over and above their cost to users. He was one of the first to develop the concept of a demand curve, and he pioneered the use of the concept of diminishing marginal utility. In determining the cost-benefit of public works, he was led to the concept that was later, by British economist Alfred Marshall, termed consumer surplus, *i.e.*, the welfare enjoyed by a consumer in excess of the price paid.

Dupuit is undoubtedly the founder of cost-benefit analysis of public works. He also analyzed price elasticity, leading to, among other ideas, the development of what has become known as the "Laffer curve" of taxation.

Dupuy, Charles-Alexandre (b. Nov. 5, 1851, Le Puy, Fr.—d. July 23, 1923, Ille-sur-Têt), French political figure whose governments during the period of the Dreyfus Affair failed to cope successfully with critical issues

arising from the political and social tensions that emerged during the long controversy.

A philosophy professor before his election to the Chamber of Deputies (1885) from the Haute-Loire *département*, Dupuy joined Jules

Charles-Alexandre Dupuy, engraving by Navellier, c. 1893

H. Roger-Viollet

Ferry's moderate republicans. He served as minister of education from December 1892 to April 1893; he then formed his own government in April 1893 but resigned at the end of November and on December 5 was elected president of the Chamber. During his first week of office the anarchist Auguste Vaillant threw a bomb at him, and Dupuy's calm words, "The debate continues, gentlemen," won him much credit. He became premier and minister of the interior in May 1894 and was by Pres. Sadi Carnot's side when the latter was assassinated at Lyon in June.

His Cabinet remained in office until January 1895, and it was under it that Capt. Alfred Dreyfus (*q.v.*) was arrested and, two months later, condemned (December 1894). In November 1898, and after the Dreyfus case had at last been remitted to the judgment of the Supreme Court of Appeal, Dupuy formed a government of republican concentration. A special law was passed that transferred the decision from the criminal section to the Court of Appeal sitting as a whole (*toutes chambres réunies*). The latter decided that there must be a new court-martial, for the *bordereau*, the document that had led to Dreyfus' court-martial, was the work of Maj. F.W. Esterhazy. This infuriated the anti-Dreyfusards, who staged demonstrations and insulted Pres. Émile Loubet at Auteuil. Dupuy resigned on June 12, 1899. From June 1900 until his death he was senator for Haute-Loire.

Dupuy, Pierre (b. Nov. 27, 1582, Agen, Fr.—d. Dec. 14, 1651, Paris), historian and librarian to King Louis XIV of France. He was first to catalog the royal archives (*Trésor des chartes*) and, with his brother Jacques, the king's library.

Pierre Dupuy, engraving by Robert Nanteuil

J.E. Bulloz

Little is known of Dupuy's life except that he travelled with his brothers all over France and amassed a collection of some 20,000 books and 1,200 manuscripts, many of great value, which they presented to the King in 1657. Dupuy's works, mostly documentations of legal problems, include *Traité des droits et libertés de l'Eglise gallicane* (1639; "Treatise on the Rights and Privileges of the Gallican Church") and books on the conflict (c. 1300) between Pope Boniface VIII and the French king Philip IV the Fair over the divine right of kings. Dupuy was also employed on the commission constituted to discover the legal titles of the king of France over the bishoprics of Metz, Toul, and Verdun, and a book on that subject (1655) is attributed to him.

Dupuytren, Guillaume, Baron (b. Oct. 5, 1777, Pierre-Buffière, near Limoges, Fr.—d. Feb. 8, 1835, Paris), French surgeon and pathologist best known for his description and development of surgical procedures for alleviating "Dupuytren's contracture" (1832), in which fibrosis of deep tissues of the palm

Dupuytren, lithograph by F.S. Delpech
Giraudon—Art Resource/EB Inc.

causes permanent retraction of one or more fingers.

In 1802 Dupuytren joined the staff of the Hôtel Dieu, which he attended for more than 30 years, becoming its surgeon in chief. He was surgeon to Louis XVIII, who created him a baron, and to Charles X.

Dupuytren was the first to excise the lower jaw (1812). He introduced a new classification of burns and provided the first clear description of the pathology of congenital dislocation of the hip (1826). He devised surgery for cancer of the uterine cervix and for the creation of an artificial anus (1828). Among his other triumphs were ligations of the subclavian artery (1812 and 1829), treatment of aneurysms by compression (1818), and surgical treatment of wry neck (1822).

Dupuytren's contracture, flexion deformity of the hands caused by thickening of the fascia, or fibrous connective tissue, of the palm. The proliferation of connective tissue causes the tendons of one or more fingers to shorten and tighten, leaving the finger permanently flexed. Disability may be as slight as inability to extend the ring finger completely or as severe as complete curling of the hand into a closed fist. The contracture does not affect neighbouring nerves and other structures. Dupuytren's contracture may be inherited or may occur as a symptom of scleroderma or rheumatoid arthritis. In some severe cases, incision and removal of some of the connective tissue may release the contracture.

Duque de Caxias, city, Rio de Janeiro state, southeastern Brazil, suburb of the city of Rio de Janeiro. Until 1931 it was known as Meriti Station and from 1931 to 1943 as Caxias; it became the seat of the district of Caxias in 1931 and seat of the municipality of Duque de Caxias in 1943. The Duquecaxiense Academy of Letters is located there. The duke for whom the city was named was Luis Alves de Lima e Silva, soldier and patron of the Brazilian

army. It is a commercial and manufacturing centre, although the industries, including a large petroleum refinery, are located outside the city. Pop. (1996 prelim.) 710,624.

Duque de Estrada, Diego (b. Aug. 15, 1589, Toledo, Spain—d. after 1637, Sardinia), Spanish soldier and adventurer.

The son of a soldier of rank, he was left an orphan when very young and was educated by a cousin. While still young he was betrothed to his cousin's daughter. One night he found an intruder in the house, a gentleman with whom he was acquainted, and in a fit of jealousy killed both him and the young lady. The prevailing code of honour was considered a sufficient justification for Duque de Estrada's violence, but the law looked upon the act as an assassination, and he had to flee. After leading a vagabond life in the south of Spain, he was arrested at Ecija, was brought to Toledo, and was tortured with extreme ferocity in order to extort a general confession as to his life during the past months. He had the strength not to yield to pain and was finally able to escape from prison, partly by the help of a nun in a religious house which faced the prison, and partly by the intervention of friends.

He made his way to Naples, where he entered the service of the Duke of Osuna, at that time viceroy. Although Duque de Estrada saw much fighting with both the Turks and the Venetians, his most noteworthy act was his employment in the conspiracy against Venice. He was in the party of disguised Spanish soldiers who were sent by the viceroy into the town to destroy the arsenal and who were warned in time that the conspiracy had been betrayed, and therefore escaped. After the fall of his patron, Duque de Estrada resumed his vagabond life, serving in Transylvania and in the Thirty Years' War. In 1633 he entered the order of San Juan de Dios, and died at some time after 1637 in Sardinia, where he is known to have taken part in the defense of the island against an attack by the French. He left a book of memoirs, *Comentarios de el desengañado de si Mismo prueba de todos estados, y eleccion del Mejor de ellos* ("The Commentaries of one who knew his own little worth, the touchstone of all the state of man, and the choice of the best").

Duquesne, Abraham, MARQUIS DU QUESNE (b. 1610, Dieppe, Fr.—d. Feb. 1/2, 1688, Paris), French naval officer during the administrations of Richelieu and Colbert who decisively defeated the combined fleets of Spain and Holland in 1676.

Duquesne served as a captain in the royal navy under two great commanders, Henri d'Escoubleau de Sourdis and Armand de Maillé-Breze. From 1644 to 1647 he was an admiral in the service of the Swedish Queen Christina; later he returned to France and loyally supported the crown during the Fronde.

Early in the Dutch Wars (1672–78), Duquesne, a staunch Calvinist, was deprived of his command after being accused of reluctance to obey orders after the Battle of Solebay and for his refusal to renounce his Protestantism. Later in the war, however, Duquesne was chosen to help the Sicilian rebels against the Spaniards. He fought his way into Messina and took Agosta (Augusta) before returning to France for reinforcements and supplies. He then routed the combined Spanish and Dutch fleets in two engagements off Agosta and Palermo (April and June, 1676).

In 1681 Duquesne received the title of marquis. His Protestantism prevented his being made admiral, but, despite the revocation of the Edict of Nantes (1685), he was allowed to retire in peace.

Duquesnoy, François (b. 1597, Brussels—d. July 12, 1643, Livorno, Tuscany), Flemish-born Roman sculptor whose relatively restrained works reveal the influence of

"St. Susanna," marble statue by Duquesnoy, completed 1633; in the Church of Santa Maria di Loreto, Rome

Anderson—Alinari from Art Resource

his close friend the painter Nicolas Poussin and helped to counter the influence of the more extravagantly emotional art prevailing in 17th-century Rome.

Duquesnoy was one of a family of sculptors and must have learned something of the art of Peter Paul Rubens while still in the family's Flemish workshop. He went to Rome in 1618 and during 10 years of obscurity was engaged in the restoration of classical sculpture. At the same time he produced original small-scale works in bronze, ivory, and wood. In 1627–28 he worked with Gian Lorenzo Bernini on the baldachin (altar canopy) for St. Peter's and in 1629 received commissions for his two outstanding monumental figures in marble. "St. Andrew," one of four colossal statues beneath the dome of St. Peter's, is in a restrained style still close to that of Bernini; but "St. Susanna," which was not completed until 1633 for the choir of Santa Maria di Loreto, Rome, shows a characteristic synthesis of the classical ideal and a sensitive study of nature. Much of Duquesnoy's output was in the form of small relief sculptures. His rendering of *putti* on the altar (1642) in the Cappella Filomarina in Sant' Apostoli, Naples, was particularly renowned.

Dur Sharrukin (Akkadian: "Sargon's Fortress"), modern KHORSABAD, ancient Assyrian city located northeast of Nineveh, in Iraq. Built between 717 and 707 BC by the Assyrian king Sargon II (reigned 721–705), Dur Sharrukin exhibits careful town planning. The city measured about one mile square (2.59 square km); its outer walls were pierced by seven fortified gates. An inner wall enclosed a temple to Nabu (a god of vegetation and the patron of the art of writing), the royal palace, and the elaborate dwellings of important officials. Soon after the city was finished, however, Sargon was killed in battle, and Dur Sharrukin was quickly deserted.

Excavations at the site (the first archaeological excavations in Mesopotamia) were begun by the French consul Paul-Émile Botta in 1843 and were later continued (1858–65) by his successor, Victor Place, and by an American expedition (1928–35) from the University of

Chicago. In addition to excellent wall reliefs, ivories, and monumental winged-bull statues uncovered at the site, one of the most valuable

Winged bull with a human head, guardian figure from the gate of the Palace at Dur Sharrukin; in the Louvre

Cliche Musees Nationaux Paris

finds was the Assyrian King List, which recorded Assyrian kings from about 1700 BC to about the middle of the 11th century BC.

Dur Untashi (Iran): see Choghā Zanbil.

Dura-Europus, also spelled DOURA-EURO-PUS, ruined Syrian city, located in the Syrian desert near Dayr az-Zawr. Excavations were carried out first by Franz Cumont (1922–23) and later by M. Rostovtzev (1928–37). Dura was originally a Babylonian town, but it was rebuilt as a military colony about 300 BC by the Seleucids and given the alternative name of Europus after the native city in Macedonia of its reputed founder, Seleucus I Nicator. About 100 BC it fell to the Parthians and became a prosperous caravan city. It was annexed by the Romans in AD 165; under them it was a frontier fortress. Shortly after AD 256 it was overrun and destroyed by the Sasanians.

The remains at Dura-Europus give an unusually detailed picture of the everyday life there; and the inscriptions, reliefs, and architecture provide abundant information about the fusion of Greek and Semitic culture. Two structures dating to the 3rd century AD were found to contain extensive wall paintings.

duralumin, strong, hard, lightweight alloy of aluminum, widely used in aircraft construction, discovered and patented in 1910 by

"City of Glendale," a dirigible built of duralumin, reportedly the first all-metal, steam-driven dirigible, built c. 1929 in California

Bettmann/Corbis

Alfred Wilm, a German metallurgist; it was originally made only at Düren in Germany. The original composition has been varied for particular applications; it may contain about

3 or 4 percent copper, 1/2 to 1 percent manganese, 1/2 to 1 1/2 percent magnesium, and, in some formulations, some silicon. After heat treatment and aging, these alloys are comparable to soft steel in strength.

Duralumin alloys are relatively soft, ductile, and workable in the normal state; they may be rolled, forged, extruded, or drawn into a variety of shapes and products. Their light weight and consequent high strength per unit weight compared to steel suit them for aircraft construction. Because duralumin loses strength in welding, a special laminated sheet form called alclad is used for aircraft construction; it has thin surface layers of pure aluminum or a corrosion-resistant aluminum alloy covering the strong duralumin core.

duramen (botany): see heartwood.

Duran, Profiat, Hebrew name ISAAC BEN MOSES HA-LEVI, pseudonym EFOD, or EFODI (b. c. 1350. Perpignan?, France—d. c. 1415). Jewish philosopher and linguist, the author of a devastating satire on medieval Christianity and of a notable work on Hebrew grammar.

Duran was the descendant of a scholarly Jewish family of southern France. He was educated in Germany and then took a position as tutor in Catalonia. There, in 1391, in a wave of Spanish religious persecution, he was compelled to profess Roman Catholicism. Like many other ostensibly converted Spanish Jews, he continued his own religious observances in secret, and, after leaving Spain, he openly resumed the practice of Judaism.

Earlier, however, he had planned to travel to Palestine with another forcibly converted Spanish Jew, but the journey was abandoned when Duran received a letter from his fellow convert indicating his desire to remain a Roman Catholic and urging Duran also to remain true to Christianity. Duran's response, the celebrated letter *Al tehi ka'avotkha* ("Be Not Like Thy Fathers"), portrayed with subtle irony what he saw as the irrationality of Christian doctrine and summarized with feigned naiveté the worst abuses of the contemporary church. So artful was the satire that the epistle, widely circulated in Spain, was initially greeted by Christians as a defense of their religion. Once its true nature was understood, copies of the work were publicly burned. (It was later published at Constantinople in 1554).

In conjunction with the letter, Duran also wrote an anti-Christian polemic, *Kehimat ha-Goyim* ("Shame of the Gentiles"), in about 1397, which discredited the Gospels and other early Christian writings.

Duran's lasting reputation is based not so much on his polemical writings as on his Hebrew grammar, *Maaseh Efod* (1403), a work of the highest scholarship. His other written works include a history of Jewish martyrs.

Duran, Simeon ben Zemah, also called (by acronym) RASHBAZ (b. 1361, Majorca, Balearic Islands [now part of Spain]—d. 1444, Algiers [Algeria]), first Spanish Jewish rabbi to be paid a regular salary by the community and author of an important commentary on *Avot* ("Fathers"), a popular ethical tractate in the Talmud, the rabbinical compendium of law, lore, and commentary. Before the 14th century, the rabbinical post had been almost invariably honorary; Duran set a precedent in accepting a salary. His commentary *Magen Avot* ("The Shield of the Fathers"), which influenced the great medieval Jewish philosopher Joseph Albo, is important for reducing the Thirteen Articles of Faith of Moses Maimonides (1135–1204) to three essential dogmas: the existence of God, the divine origin of Jewish law, and the reality of divine reward and retribution.

Durance, Latin *DRUENTIA*, principal river draining the French side of the Alps toward the Mediterranean. From its origin in the Montgenèvre region, Hautes-Alpes *département*, to its confluence with the Rhône below Avignon, it is 189 mi (304 km) long. The Claireée and Guisane rivers, both of which are longer and more powerful streams than the Durance, join it above and in Briançon, through which it flows as a torrent. Receiving other tributaries, it passes through spectacular gorges and a stony valley to skirt Embrun. There it is tamed by the Serre-Ponçon Dam, 16 mi downstream, which has formed a lake covering 10.5 sq mi (27 sq km) in the valleys of the Durance and of the converging Ubaye River.

After entering the Alpes-de-Haute-Provence *département*, it is joined by the wild Buech torrent above Sisteron. Dammed again below the town, it forms another artificial lake above the Château-Arnoux Dam, after which it is joined by the Bléone and the Asse rivers. After receiving the Vernon River, the Durance turns west along the departmental border of Bouches-du-Rhône and Vaucluse to join the Rhône River. Several other large dams were constructed on the lower Durance and its tributaries, and extensive hydroelectric-power and irrigation-water supply projects were established after World War II.

Durand, Asher B(rown) (b. Aug. 21, 1796, Jefferson Village, N.J., U.S.—d. Sept. 17, 1886, Jefferson Village), U.S. painter, engraver, and illustrator, one of the founders of the Hudson River school (*q.v.*) of landscape painting.

"Kindred Spirits," oil painting by Asher B. Durand, 1849; in the New York Public Library

By courtesy of the New York Public Library, Astor, Lenox and Tilden Foundations

He was apprenticed in 1812 to an engraver; by 1823 his reputation was established with his engraving of John Trumbull's painting "Declaration of Independence." For the next decade he continued to do engraved reproductions of paintings by American artists (*e.g.*, "Ariadne" by John Vanderlyn). He also illustrated gift books, or annuals, and engraved a popular series of 72 portraits of famous contemporary Americans.

With his brother Cyrus Durand (1787–1868), he formed a partnership for a banknote engraving company. Cyrus invented machines for the mechanical drawing of lines that revolutionized the art of currency engraving, while Asher's graphic work for the Federal Bureau of Printing and Engraving was influential in establishing the design tradition and many of

the pictorial and ornamental devices for U.S. paper currency.

After 1835 he devoted himself chiefly to portraiture, painting several U.S. presidents and other Americans of political and social prominence. In 1840–41 he visited Europe to study the work of the old masters. After his return, he painted Romantic landscapes of the Hudson River area, the Adirondack Mountains, and New England in a precise style. He was among the earliest Americans to work from nature out-of-doors. His best known work, "Kindred Spirits" (1849; New York Public Library), shows two of his friends, landscape painter Thomas Cole and poet William Cullen Bryant, in a minutely realistic Catskill forest setting.

Durand was one of the founders of the National Academy of Design (1826) and was its president, 1845–61.

Durand, Guillaume, also called *WILLIAM DURANDUS*, or *DURANTI* (b. c. 1230, Puymisson, Fr.—d. Nov. 1, 1296, Rome), French prelate who was a renowned canonist and medieval liturgist.

After receiving a doctorate in canon law at Bologna, Italy, Durand taught briefly there and later at Modena, Italy. Some time after 1260 he was appointed auditor (a judge commissioned to hear cases of appeal brought to the Holy See). At the second Council of Lyon (1274), he helped draft the statutes proclaimed in council by Pope Gregory X. In 1278, when Bologna and the Romagna were incorporated into the Papal States, Durand was one of the first group of commissioners sent there; subsequently he held various posts in the ecclesiastical and temporal administrations of the new province, becoming its governor general in 1283. He was consecrated (1286) bishop of Mende, in southern France, but did not take possession of his see until 1291.

Durand's fame as a writer rests chiefly on his *Speculum iudiciale* (first published 1271–76, revised and reissued c. 1289–91), an encyclopaedic treatise of canon law (and, to some extent, civil law) from the viewpoint of court procedure. The book remains valuable for its information on the judicial practice of the medieval church courts, especially of the Roman curia. Of his liturgical works, the *Rationale divinorum officiorum* (c. 1285–91), a general treatise on the liturgy and its symbolism, is considered one of the most important medieval books on divine worship. The *Speculum* was printed at least 39 times between 1473 and 1678, and the *Rationale* even more.

Durand Line, boundary established in the Hindu Kush in 1893 running through the tribal lands between Afghanistan and British India, marking their respective spheres of influence; in modern times it has marked the border between Afghanistan and Pakistan. The acceptance of this line—which was named for Sir Mortimer Durand, who induced 'Abdor Raḥmān Khān, amir of Afghanistan, to agree to a boundary—may be said to have settled the Indo-Afghan frontier problem for the rest of the British period.

After the British conquered the Punjab in 1849, they took over the ill-defined Sikh frontier to the west of the Indus River, leaving a belt of territory between them and the Afghans that was inhabited by various Pashtun tribes. Questions of administration and defense made this area a problem. Some of the British, members of the so-called stationary school, wanted to retire to the Indus; others, of the forward school, wanted to advance to a line from Kābul through Ghazni to Qandahār (Kandahār). The Second Anglo-Afghan War (1878–80) discredited the forward advocates, and the tribal area was divided into roughly equal spheres of influence. The British established their authority by indirect rule up to the Durand Line, at the cost of a number of tribal wars; the Afghans left their side untouched. In

the mid-20th century the area on both sides of the line became the subject of a movement for Pashtun independence and establishment of an independent state of Pakhtunistan. In 1980 approximately 7.5 million Pashtuns were living in the area around the Durand Line.

Durand-Ruel, Paul (b. 1831, Paris—d. Feb. 5, 1922, Paris), French art dealer who was an early champion of the Barbizon artists and the Impressionists.

Durand-Ruel began his career in his father's art gallery, which he inherited in 1865. At the outset he concentrated on buying the work of the Barbizon artist—particularly Corot, Daubigny, and Dupré—and for many years was the only dealer to do so. In 1848 he bought every painting by Théodore Rousseau that he could locate; he was unable to sell a single one of them for the next 20 years. He also advanced money to Jean-François Millet, providing his sole support for many years.

In the early 1870s Durand-Ruel met Monet and Pissarro. Though they and the other Impressionists had been denounced by the art establishment and shunned by the buying public, Durand-Ruel courageously bought their work and that of Renoir, Degas, Sisley, Manet, and Puvis de Chavannes as well.

In 1886 Durand-Ruel went to New York City to exhibit the works of his painters at the National Academy of Design. The show was so well received that he established a branch of Durand-Ruel in New York City the following year. As a result of his persistence and foresight he gained a reputation as the principal agent for the success of the Impressionist painters.

Durandus of SAINT-POURÇAIN, French DURAND DE SAINT-POURÇAIN (b. c. 1270, Saint-Pourçain, Auvergne—d. Sept. 10, 1334, Meaux, Fr.), French bishop, theologian, and philosopher known primarily for his opposition to the ideas of St. Thomas Aquinas.

Durandus entered the Dominican order and studied at Paris, where he obtained his doctorate in 1313. Shortly afterward Pope Clement V summoned him to Avignon as a lecturer in theology. He became successively bishop of Limoux (1317), of Le Puy (1318), and of Meaux (1326). His attack on the teachings of Aquinas came at a time when Aquinas already was accepted as the official theological doctor of the Dominican order. Durandus taught that a philosopher should prefer the conclusions of his own reason to any authority except in articles of faith; the acceptance of truths of faith, on the other hand, did not depend on reason at all. This separation of reason and faith undermined the position of Scholastic philosophy generally, because much of it represented an attempt to bolster articles of faith by speculative reasoning.

In some of his differences with Aquinas, Durandus took a position similar to Nominalism (the view that only individual things exist and not universal classes such as man, tree, animal, etc.). This approach had theological implications that sometimes brought on Durandus the censure of church authorities. His major works are a commentary, published posthumously in 1508, on the *Sentences* of the 12th-century Italian theologian Peter Lombard and *De origine potestatum et iurisdictionum* (1506; "On the Origins of Powers and Jurisdictions"), written in 1328 to support Pope John XXII in his jurisdictional dispute with King Philip VI of France.

Durandus, William: *see* Durand, Guillaume.

Durang, John (b. Jan. 6, 1768, York, Pa.—d. 1822, Philadelphia), the first U.S.-born professional dancer of note, who was best known for his hornpipe dance. In 1784, when Durang was 17 years old, he made his debut as a performer in Lewis Hallam's "lecture" and patriotic extravaganza. Plays and dances were banned by law at that time, and the

euphemism lecture was used for such events. Thus began Durang's dance career, and although he did study ballet with visiting European dancers, he was not a trained classical dancer.

The French acrobat and violinist Alexander Placide was influential in Durang's career. Placide's versatility was reflected in the many talents of Durang as acrobat, actor, juggler, writer, director, and stage manager. Another Frenchman, Jean-Baptiste Francisqui, who was the director of the Old American Company, also influenced Durang. Durang danced in his company, often with the ballerina Mme Anna Gardie from Santo Domingo. Francisqui's productions were Durang's inspiration for the ballets and pageants that he created in his later years.

Durango, state, north central Mexico. It is bounded by the states of Chihuahua (north), Coahuila and Zacatecas (east), Jalisco and Nayarit (south), and Sinaloa (west). The western portion of the state's 47,560 sq mi (123,181 sq km) of territory lies within the mineral-laden Sierra Madre Occidental; semiarid plains, used for ranching, comprise the eastern portion. Coursing eastward from the Sierra Madre, the Río Nazas, the largest river in the state, flows for approximately 375 mi (600 km); when swollen by spring rains, it is the main source of water for commercial crops of cotton, wheat, corn (maize), tobacco, sugarcane, vegetables, and fruits. Along its lower course is the Laguna cotton district, a large state-operated cooperative enterprise that Durango city, shares with Coahuila.

The state is rich in mineral resources. Although mining has been carried on for years, the deposits of silver, gold, sulfur, tin, coal, mercury, antimony, copper, and other minerals have been only partially exploited. Cerro del Mercado, a hill (700 ft [210 m] high) of nearly pure hematite iron ore 2 mi from Durango city, the state capital, supplies the local mills. The Caldelaria silver mine, near San Dimas, has long been famous for its output. Other mining districts are Mapimí, Cuencamé, Nombre de Dios, Papasquiaro, and San Juan del Río. An inadequate internal transportation network has hindered the exploitation of the mineral resources.

First explored by Europeans in 1562–63, Durango shared the colonial history of Chihuahua as a major part of Nueva Vizcaya; the two became sovereign and separate states in 1823. In their frontier areas, they were subject to Indian uprisings until late in the 19th century.

Railroads of the National Railways of Mexico traverse the state northeast to southwest, and another line crosses its eastern section. Durango is also crossed by two branches of the Pan-American Highway and has air routes. Pop. (2001 est.) 1,482,800.

Durango, in full DURANGO DE VICTORIA, city, capital of Durango state, north central Mexico. It lies in a fertile valley of the Sierra Madre, 6,197 ft (1,889 m) above sea level. North of the city is the Cerro del Mercado, a hill of nearly pure iron ore representing one of the world's largest deposits.

Although first settled in 1556, it was not officially founded until 1563. It was the political and ecclesiastical capital of Nueva Vizcaya, which included Durango and Chihuahua until 1823. The city, long known as a health resort, especially for the thermal springs nearby, is an important commercial and mining centre, with diversified local industries that include cotton and wool mills, glassworks, iron foundries, flour mills, sugar refineries, and tobacco factories. The Juárez University of Durango (1957) is located in the city, and because General Guadalupe Victoria International Airport is nearby, Durango is easily accessible by air as well as by highway and railroad. Pop. (2001 est.) 411,800.

Durango, city, seat (1881) of La Plata county, southwestern Colorado, U.S., on the Animas River in the foothills of the La Plata Mountains at an altitude of 6,505 ft (1,983 m). Founded in 1880 during a mining boom by the Denver and Rio Grande Western Railroad, it was incorporated in 1881 and named for Durango, Mex. It developed as a shipping point for farm produce (including livestock) and local natural resources (timber, coal, oil and gas, gold, silver, lead, uranium, vanadium). The city is also a tourist centre and the headquarters of the San Juan National Forest. The Durango–Silverton narrow-gauge railway (1882; now used for sight-seeing), Mesa Verde National Park, the Southern Ute Tourist Centre, and Purgatory Ski Area are local features of interest. Durango is the seat of Fort Lewis College (1911) and has some light manufacturing. Pop. (2000) 13,922.

Durānī (Afghan history): see Durrānī.

Durant, city, seat (1907) of Bryan county, southern Oklahoma, U.S., in the Red River Valley, a few miles north of the Texas border. Settled c. 1870 and named for a well-known Choctaw family, its growth was assured after the arrival of the Missouri–Kansas–Texas Railroad in 1872. It developed as a service centre for a diversified farming area, and in 1909 Southeastern State College (now Southeastern Oklahoma State University) was established there. Its economy has been sustained by oil, gas, and industry (including peanut and cotton processing and the manufacture of utility truck bodies, clothing, and cement blocks). With the completion of Lake Texoma, impounded on the Red River by Denison Dam (1943), 14 mi (22 km) west, Durant has also become the focus of a recreation area. Ft. Washita, on the east side of the lake (1843), was used as a Confederate military post during the Civil War. Pop. (2000) 13,549.

Durant, Will and Ariel, in full respectively WILLIAM JAMES DURANT and ARIEL DURANT, née ADA, or IDA, KAUFMAN (respectively b.

Will and Ariel Durant
AP/Wide World Photos

Nov. 5, 1885, North Adams, Mass., U.S.—d. Nov. 7, 1981, Los Angeles; b. May 10, 1898, Prosurorov, Russia—d. Oct. 25, 1981, Los Angeles), American husband-and-wife writing collaborators whose *Story of Civilization*, 11 vol. (1935–75), established them among the best known writers of popular philosophy and history.

Will Durant's writing career began with the publication of *Philosophy and the Social Problem* (1917). His second book, *The Story of*

Philosophy (1926), sold more than 2,000,000 copies in less than three decades and was translated into several languages. The following year his only novel, *Transition*, appeared. It is largely an autobiographical account of his own early social, religious, and political disillusionments. In 1970 Durant published *Interpretations of Life: A Survey of Contemporary Literature*. This work, an expansion of the notes of a lifetime of reading modern literature, is informal and anecdotal and is aimed at the general reader.

In 1913, while teaching at the Ferrer Modern School in New York City, Durant married one of his pupils, Ada (or Ida) Kaufman, whom he called Ariel; she later adopted the name legally. Though she had been involved in the writing of every volume of *The Story of Civilization*, Ariel Durant was not given formal recognition as Will Durant's collaborator until 1961, with publication of the seventh volume, *The Age of Reason Begins*. She continued as coauthor with her husband of the subsequent volumes in the series, including the Pulitzer Prize-winning 10th volume, *Rousseau and Revolution* (1967). They described their work together in *A Dual Autobiography* (1977).

Durant, William Crapo (b. Dec. 8, 1861, Boston—d. March 18, 1947, New York City), American industrialist and founder of General Motors Corporation, which later became one of the largest corporations in the world in terms of sales.

After establishing a carriage company in Michigan in 1886, Durant took over a small firm in 1903 and began to manufacture Buick motorcars. He brought together several automotive manufacturers to form the General Motors Company in 1908, but financial problems cost him control of the company in 1910. With Louis Chevrolet, however, he established the Chevrolet Motor Company, which acquired control of General Motors in 1915. From that base, Durant, as president, created the General Motors Corporation and launched a successful expansion program. Post-World War I difficulties again forced him out of General Motors in 1920, and he formed a new firm, Durant Motors, Inc., in 1921. This and later ventures, some of which were large, were generally unsuccessful.

Durante, Francesco (b. March 31, 1684, Naples—d. Aug. 13, 1755, Naples), Italian composer of religious and instrumental music who was especially known for his teaching.

Durante studied in Rome and probably in Naples and in 1710 taught at the San Onofrio Conservatory. He was chapelmaster at the Conservatorio dei Poveri in Naples (1728–39) and from 1742 taught at the Santa Maria di Loreto Conservatory. In 1745 he succeeded L. Leo as principal teacher at San Onofrio. There was much rivalry between Leo's students and his own pupils, among whom were many outstanding composers of the Neapolitan school of 18th-century opera: Jommelli,

Durante, engraving by Henrik van Winter
J.P. Zolo

Piccinni, Pergolesi, Paisiello, Traetta, Vinci, and others. His compositions include motets, masses, oratorios, and a setting of the Lamentations of Jeremiah, as well as harpsichord pieces and music for strings.

Durante, Jimmy, byname of JAMES FRANCIS DURANTE, byname SCHNOZZOLA, OF THE SCHNOZ (b. Feb. 10, 1893, New York, N.Y., U.S.—d. Jan. 29, 1980, Santa Monica, Calif.), American comedian whose career in every major entertainment performance medium spanned more than six decades.

As a boy, Durante wanted to become a saloon pianist. His father, a barber, bought him a piano and provided intermittent lessons. Although Durante left school in seventh grade for a miscellany of jobs, he kept up his piano study, and when he was 17 he realized his dream by playing the piano at Diamond Tony's Saloon in Brooklyn's Coney Island.

With the vaudevillians Eddie Jackson and Lou Clayton, he opened the Club Durant in New York in 1923. The partners performed there and in other clubs throughout the 1920s. Durante had roles in such Broadway productions as *Show Girl* and *The New Yorkers* and in the movie *Roadhouse Nights* (1929). He starred in several radio programs during the 1940s, including "The Jimmy Durante Show" and "The Camel Comedy Caravan." His closing line—"Good night, Mrs. Calabash, wherever you are!"—became as famous as his felt hat, cane, and his persistent malapropisms and mispronunciations; the line was used to close his various television shows during the 1950s, such as "The Four-Star Revue," "The All-Star Revue," and "The Jimmy Durante Show." His outside nose became his trademark.

His Broadway career included a role in *Junbo*, a circus extravaganza; in 1962 he had a role in the film version of *Junbo*. The following year he acted in the film *It's a Mad, Mad, Mad, Mad World*.

Duranti, William: see Durand, Guillaume.

Durão, José de Santa Rita (b. 1722?, Cata Prêta, Brazil—d. Jan. 24, 1784, Lisbon, Port.), Brazilian epic poet, best known for his long poem *Caramuru*. Durão was a pioneer in his use of the South American Indians as subjects of literature.

After an education at the Jesuit college in Rio de Janeiro, Durão obtained the degree of doctor of theology (1756) at the University of Coimbra, Portugal. Two years later he entered the Gratian convent of the Order of St. Augustine, where he offended his superiors by his openly expressed regard for the Jesuits, who had been expelled from Portugal and Brazil in 1759. He was forced in consequence to leave the country, and after detention in Spain as a spy (1762–63) he went to Rome, where he acted as a papal librarian and associated with the Roman literati. In 1778 he returned to Portugal as professor of theology at Coimbra but soon retired to the Gratian convent and became its prior.

In 1781 he published in Lisbon his epic *Caramuru: Poema épico do descobrimento da Bahia* ("Caramuru: Epic Poem of the Discovery of Bahia"), a poetic treatment in 10 cantos, frankly fictitious, of the discovery of Bahia (northeastern Brazil) by Diego Alvares. *Caramuru* ("Dragon of the Sea") is the name bestowed on Diego Alvares by the Indians. The poem is notable for its descriptions of South American scenery and Indian life and the love it expresses for Brazil. Embittered by its failure to win immediate recognition, Durão burned most of his other works.

Duras, Marguerite, pseudonym of MARGUERITE DONNADIEU (b. April 4, 1914, Gia

Dinh, Cochinchina [Vietnam]—d. March 3, 1996, Paris, France), French novelist, screenwriter, scenarist, playwright, and film director, internationally known for her screenplays of *Hiroshima mon amour* (1959) and *India Song* (1975). The novel *L'Amant* (1984; *The Lover*; film, 1992) won the prestigious Prix Goncourt in 1984.

Duras spent most of her childhood in Indochina, but at the age of 17 she moved to France to study at the University of Paris, Sorbonne, from which she received *licences* in law and politics. She favoured leftist causes and for 10 years was a member of the Communist Party. She began writing in 1942. *Un Barrage contre le Pacifique* (1950; *The Sea Wall*), her third published novel and first success, dealt semiautobiographically with a poor French family in Indochina. Her next successes, *Le Marin de Gibraltar* (1952; *The Sailor from Gibraltar*) and *Moderato Cantabile* (1958), were more lyrical and complex and more given to dialogue.

This splendid instinct for dialogue led Duras to produce the original screenplay for Alain Resnais's critically acclaimed film *Hiroshima mon amour*, about a brief love affair in post-war Hiroshima between a Japanese businessman and a French actress. She directed as well as wrote the 1975 film adaptation of her play *India Song*, which offers a static, moody portrayal of the wife of the French ambassador in Calcutta and her several lovers. Some of her screenplays were adaptations of her own novels and short stories.

Duras turned regularly to a more abstract and synthetic mode, with fewer characters, less plot and narrative, and fewer of the other elements of traditional fiction; her name was even associated with the *nouveau roman* ("new novel") movement, though she denied such a connection. The semiautobiographical story of *L'Amant*, about a French teenage girl's love affair with a Chinese man 12 years her senior, was revised in the novel *L'Amant de la Chine du Nord* (1991; *The North China Lover*). Among her other novels were *L'Après-midi de Monsieur Andesmas* (1962; *The Afternoon of Monsieur Andesmas*), *Le Ravissement de Lol V. Stein* (1964; *The Ravishing of Lol V. Stein*), *Détruire, dit-elle* (1969; *Destroy, She Said*), *L'Amour* (1971; "Love"), *L'Été 80* (1980; "Summer 80"), and *La Phée d'été* (1990; *Summer Rain*). Collections of her plays were included in *Théâtre I* (1965), *Théâtre II* (1968), and *Théâtre III* (1984).

Durazno, in full SAN PEDRO DE DURAZNO, city, central Uruguay, on the Yi River. Long part of an unclaimed area between Spanish and Portuguese territories, Durazno was not formally founded until 1821, when José Fructuoso Rivera established a settlement called San Pedro de Durazno, a name concocted from Dom Pedro de Alcântara, prince regent of Brazil, and *durazno* ("peach tree"), for the local fruit trees. During the fight for Uruguayan independence, Durazno was a republican headquarters.

A processing and trade centre for the cattle industry, the city has a livestock agricultural school, meat-packing plants, dairies, grain mills, and a cement factory. Pop. (1996) 30,600.

Durazzo (Albania): see Durrës.

Durban, formerly PORT NATAL, largest city of KwaZulu/Natal province, South Africa, and chief seaport of South Africa, located on Natal Bay of the Indian Ocean. European settlement began with a band of Cape Colony traders led by Francis G. Farewell, who charted the port in 1824 and named the site Port Natal. Land

was ceded to the group by Shaka, the Zulu king (whose right to take that action is disputed), and the Old Fort (now a museum) was built. Durban was founded in 1835 on the site of Port Natal and was named for Sir Benjamin D'Urban, the governor of the Cape Colony. In the late 1830s and early '40s the Boers clashed with the British over control of Durban. It became a borough (town) in 1854 and was created a city in 1935.

Durban, S. Af.

Kord.com/AG E. FotoStock

Sprawling along the coast, Durban is overlooked to the south by the Bluff (hills separating the landlocked bay from the sea) and stretches across the Umgeni River to the heights of Durban North. Its civic and business centre is on flat land, rising gently to the slopes of the residential district of the Berea, a ridge of hills encircling the harbour and beach. Durban's numerous parks include the Botanic Gardens with its orchid house, Jameson Park and its rose gardens, and Snake Park with its collection of poisonous reptiles. It has the University of Durban-Westville (founded 1961), originally for Indian students (although non-Indians were admitted from 1979), a branch of the University of Natal (founded 1910), and the Durban-Umlazi campus of the University of Zululand (1979). There are several museums and black and Indian markets.

Development of Durban's harbour, one of the world's major commercial ports, began in 1855. Serving the Witwatersrand industrial region, it is a major container port and point of entry for bulk raw materials, capital goods, and industrial equipment. Minerals, coal, sugar, and grain are exported, and oil is refined and piped to Johannesburg. After World War I Durban changed from a prim Victorian town to a modern metropolis with skyscrapers and multistoried buildings. It is the headquarters of South Africa's sugar industry and a centre of highly diversified manufacturing activity. Tourism is important and is based on the city's proximity to KwaZulu/Natal's game and nature reserves and on the beaches and their facilities, such as an esplanade and an oceanarium. Durban (with adjacent Pine-town) contains one of the largest concentrations of Indians in South Africa. Ntuzuma, Umlazi, and Embumbulu districts to the immediate west have been developed as black (mostly Zulu) commuter suburbs. Many blacks were moved from Durban to these areas in the late 1970s. Pop. (1991) city, 715,700; Durban-Pinetown-Inanda metropolitan area, 1,137,400.

D'Urban, Sir Benjamin (b. 1777, Halesworth, near Norwich, Norfolk, Eng.—d. May 25, 1849, Montreal, Quebec, Can.), British general and colonial administrator chiefly remembered for his frontier policy as governor in the Cape Colony (now in South Africa).

As a soldier D'Urban began his service in 1793 and fought in the Napoleonic Wars, where he won distinction in the Peninsula

lar War as a quartermaster general. In 1820 D'Urban was sent to the West Indies as governor of Antigua, and later on to the newly created colony of British Guiana (1831; now Guyana).

Arriving in Cape Colony in January 1834, D'Urban assumed the dual role of governor and commander in chief. His administration was complicated by the exodus of Dutch farmers to the far north and east (known as the Great Trek) and the outbreak of the Cape Frontier War of 1834–35 created by incursions of Bantu-speaking Xhosa peoples. He drove back the invaders and annexed the territory between the Keiskamma and Great Kei (Groot-Kei) rivers. Although he was popular with the colonists, D'Urban's treatment of the Africans disturbed the missionaries and humanitarians, who had great influence with Lord Glenelg, the colonial secretary. D'Urban was dismissed as governor in 1838 but continued in his military capacity in South Africa until 1846. The following year he was transferred to command the British forces in Canada.

darbar (Persian: "court"), Hindi *DARBĀR*, in India, a court or audience chamber, and also any formal assembly of notables called together by a governmental authority. In British India the name was specially attached to formal imperial assemblies called together to mark state occasions.

The three best-known darbars were held in Delhi in 1877, 1903, and 1911. They celebrated Queen Victoria's assumption of the title of Empress of India (1876), the coronation of King Edward VII (1902), and the visit of King George V and Queen Mary to India (1911).

Düren, city, North Rhine-Westphalia *Land* (state), western Germany. It lies along the Ruhr River, on the northeastern slopes of the Eifel Hills. A Frankish settlement first mentioned in 748, it grew from the Villa Duria of Pepin III the Short, the king of the Franks. It was subsequently the seat of dioceses and synods under Charlemagne and the base for several of his Saxon campaigns. After passing to the dukes of Jülich in about 1242, it was destroyed (1543) in a war between William V of Jülich and the Holy Roman emperor Charles V and was later rebuilt. Almost totally destroyed again in World War II, Düren has been largely reconstructed.

The annexations in the early 1970s of Gurzenich and Birkesdorf enlarged the city's area by more than half. Düren produces paper, metal goods, textiles, glass, sugar, and chemicals. Pop. (1989 est.) 83,120.

Dürer, Albrecht (b. May 21, 1471, Imperial Free City of Nürnberg [Germany]—d. April 6, 1528, Nürnberg), painter and printmaker generally regarded as the greatest German Renaissance artist. His vast body of work includes altarpieces and religious works, numerous portraits and self-portraits, and copper engravings. His woodcuts, such as the *Apocalypse* series (1498), retain a more Gothic flavour than the rest of his work.

Education and early career. Dürer was the second son of the goldsmith Albrecht Dürer the Elder, who had left Hungary to settle in Nürnberg in 1455, and of Barbara Holper, who had been born there. Dürer began his training as a draughtsman in the goldsmith's workshop of his father. His precocious skill is evidenced by a remarkable self-portrait done in 1484, when he was 13 years old (Albertina, Vienna), and by a "Madonna with Musical Angels," done in 1485, which is already a finished work of art in the late Gothic style. In 1486, Dürer's father arranged for his apprenticeship to the painter and woodcut illustrator Michael Wohlgemuth, whose portrait Dürer would paint in 1516. After three years in Wohlgemuth's workshop, he left for a period

of travel. In 1490 Dürer completed his earliest known painting, a portrait of his father (Uffizi, Florence) that heralds the familiar characteristic style of the mature master.

Dürer's years as a journeyman probably took the young artist to the Netherlands, to Alsace, and to Basel, Switz., where he completed his first authenticated woodcut, a picture of "St. Jerome Curing the Lion" (Kunstmuseum, Basel). During 1493 or 1494 Dürer was in Strasbourg for a short time, returning again to Basel to design several book illustrations. An early masterpiece from this period is a self-portrait with a thistle painted on parchment in 1493 (Louvre, Paris).

First journey to Italy. At the end of May 1494, Dürer returned to Nürnberg, where he soon married Agnes Frey, the daughter of a merchant. In the autumn of 1494 Dürer seems to have undertaken his first journey to Italy, where he remained until the spring of 1495. A number of bold landscape watercolours dealing with subjects from the Alps of the southern Tirol were made on this journey and are among Dürer's most beautiful creations. Depicting segments of landscape scenery cleverly chosen for their compositional values, they are painted with broad strokes, in places roughly sketched in, with an amazing harmonization of detail. Dürer used predominantly unmixed, cool, sombre colours, which, despite his failure to contrast light and dark adequately, still suggest depth and atmosphere.

The trip to Italy had a strong effect on Dürer; direct and indirect echoes of Italian art are apparent in most of his drawings, paintings, and graphics of the following decade. While in Venice and perhaps also before he went to Italy, Dürer saw engravings by masters from central Italy. He was most influenced by the Florentine Antonio Pollaiuolo, with his sinuous, energetic line studies of the human body in motion, and by the Venetian Andrea Mantegna, an artist greatly preoccupied with classical themes and with precise linear articulation of the human figure.

Dürer's secular, allegorical, and frequently self-enamoured paintings of this period are often either adaptations of Italian models or entirely independent creations that breathe the free spirit of the new age of the Renaissance. Dürer adapted the figure of Hercules from Pollaiuolo's "The Rape of Deianira" for a painting of "Hercules and the Birds of Stymphalis" (Germanisches Nationalmuseum, Nürnberg). A purely mythological painting in the Renaissance tradition, the "Hercules" is

Dürer, "Self-portrait in Furred Coat," oil on wood panel, 1500; in the Alte Pinakothek, Munich
Alte Pinakothek, Munich, photograph Blauel/Gnam—ARTOTHEK

exceptional among Dürer's works. The centre panel from the "Dresden Altarpiece," which Dürer painted in about 1498, is stylistically similar to the "Hercules" and betrays influences of Mantegna. In most of Dürer's free adaptations the additional influence of the more lyrical, older painter Giovanni Bellini, with whom Dürer had become acquainted in Venice, can be seen.

The most striking painting illustrating Dürer's growth toward the Renaissance spirit is a self-portrait, painted in 1498 (Prado, Madrid). Here Dürer sought to convey, in the representation of his own person, the aristocratic ideal of the Renaissance. He liked the way he looked as a handsome, fashionably attired young man, confronting life rather conceitedly. In place of the conventional, neutral, monochromatic background, he depicts an interior, with a window opening on the right. Through the window can be seen a tiny landscape of mountains and a distant sea, a detail that is distinctly reminiscent of contemporary Venetian and Florentine paintings. The focus on his own figure in the interior distinguishes his world from the vast perspective of the distant scene, another world to which the artist feels himself linked.

Italian influences were slower to take hold in Dürer's graphics than in his drawings and paintings. Strong late Gothic elements dominate the visionary woodcuts of his *Apocalypse* series (the Revelation of St. John), published in 1498. The woodcuts in this series display emphatic expression, rich emotion, and crowded, frequently overcrowded, compositions. The same tradition influences the earliest woodcuts of Dürer's *Great Passion* series, also from about 1498. Nevertheless, the fact that Dürer was adopting a more modern conception, a conception inspired by classicism and humanism, is indicative of his basically Italian orientation. The woodcuts "Samson and the Lion" (c. 1497) and "Hercules Conquering Cacus" and many prints from the woodcut series *The Life of the Virgin* (c. 1500–10) have a distinct Italian flavour. Many of Dürer's copper engravings are in the same Italian mode. Some examples of them that may be cited are "Fortune" (c. 1496), "The Four Witches" (1497), "The Sea Monster" (c. 1498), "Adam and Eve" (1504), and "The Large Horse" (1505). Dürer's graphics eventually influenced the art of the Italian Renaissance that had originally inspired his own efforts. His painterly style, however, continued to vacillate between Gothic and Italian Renaissance until about 1500. Then his restless striving finally found definite direction. He seems clearly to be on firm ground in the penetrating half-length portraits of Oswolt Krel (Alte Pinakothek, Munich), in the portraits of three members of the aristocratic Tucher family of Nürnberg—all dated 1499—and in the "Portrait of a Young Man" of 1500 (Alte Pinakothek). In 1500 Dürer painted another self-portrait (Alte Pinakothek, Munich) that is a flattering, Christlike portrayal.

During this period of consolidation in Dürer's style, the Italian elements of his art were strengthened by his contact with Jacopo de' Barbari, a minor Venetian painter and graphic artist who was seeking a geometric solution to the rendering of human proportions; it is perhaps due to his influence that Dürer began, around 1500, to grapple with the problem of human proportions in true Renaissance fashion. Initially, the most concentrated result of his efforts was the great engraving "Adam and Eve" (1504) in which he sought to bring the mystery of human beauty to an intellectually calculated ideal form. In all aspects Dürer's art was becoming strongly classical. One of his most significant classical endeavours is his painting "Altar of the Three Kings" (1504),

which was executed with the help of pupils. Although the composition, with its five separate pictures, has an Italian character, Dürer's intellect and imagination went beyond direct dependence on Italian art. From this maturity of style comes the bold, natural, relaxed conception of the centre panel, "The Adoration of the Magi" (Uffizi), and the ingenious and unconventional realism of the side panels, one of which depicts the "Drummer and Piper" and the other "Job and His Wife" (Wallraf-Richartz-Museum, Cologne).

Second journey to Italy. In the autumn of 1505, Dürer made a second journey to Italy, where he remained until the winter of 1507. Once again he spent most of his time in Venice. Of the Venetian artists, Dürer now most admired Giovanni Bellini, the leading master of Venetian early Renaissance painting, who, in his later works, completed the transition to the High Renaissance. Dürer's pictures of men and women from this Venetian period reflect the sweet, soft portrait types especially favoured by Bellini. One of Dürer's most impressive small paintings of this period, a compressed half-length composition of the "Young Jesus with the Doctors" of 1506, harks back to Bellini's free adaptation of Mantegna's "Presentation in the Temple." Dürer's work is a virtuoso performance that shows mastery and close attention to detail. In the painting the inscription on the scrap of paper out of the book held by the old man in the foreground reads, "Opus quinque dierum" ("the work of five days"). Dürer thus must have executed this painstaking display of artistry, which required detailed drawings, in no more than five days. Of even greater artistic merit than this quickly executed work are the half-length portraits of young men and women painted between 1505 and 1507, which seem to be entirely in the style of Bellini. In these paintings there is a flexibility of the subject, combined with a warmth and liveliness of expression and a genuinely artistic technique, that Dürer otherwise rarely attained.

In 1506, in Venice, Dürer completed his great altarpiece "The Feast of the Rose Garlands" for the funeral chapel of the Germans in the church of St. Bartholomew. Later that same year Dürer made a brief visit to Bologna before returning to Venice for a final three months. The extent to which Dürer considered Italy to be his artistic and personal home is revealed by the frequently quoted words found in his last letter from Venice (dated October 1506) to Willibald Pirckheimer, his long-time humanist friend, anticipating his imminent return to Germany: "O, how cold I will be away from the sun; here I am a gentleman, at home a parasite."

Development after the second Italian trip. By February 1507 at the latest, Dürer was back in Nürnberg, where two years later he acquired an impressive house (which still stands and is preserved as a museum). It is clear that the artistic impressions gained from his Italian trips continued to influence Dürer to employ classical principles in creating largely original compositions. Among the paintings belonging to the period after his second return from Italy are "Martyrdom of the Ten Thousand" (1508) and "Adoration of the Trinity" (1511), which are both crowd scenes. Drawings from this period recall Mantegna and betray Dürer's striving for classical perfection of form through sweeping lines of firmly modeled and simple drapery. Even greater simplicity and grandeur characterize the diptych of "Adam and Eve" (1507; Prado), in which the two figures stand calmly in relaxed classical poses against dark, almost bare, backgrounds.

Between 1507 and 1513 Dürer completed a "Passion" series in copperplate engravings, and between 1509 and 1511 he produced the *Small*

Passion in woodcuts. Both of these works are characterized by their tendency toward spaciousness and serenity. During 1513 and 1514 Dürer created the greatest of his copperplate engravings: the "Knight, Death and Devil," "St. Jerome in His Study," and "Melencolia I"—all of approximately the same size, about 24.5 by 19.1 cm (9.5 by 7.5 inches). The extensive, complex, and often contradictory literature concerning these three engravings deals largely with their enigmatic, allusive, iconographic details. Although repeatedly contested, it probably must be accepted that the engravings were intended to be interpreted together. There is general agreement, however, that Dürer, in these three master engravings, wished to raise his artistic intensity to the highest level, which he succeeded in doing. Finished form and richness of conception and mood merge into a whole of classical perfection. To the same period belongs Dürer's most expressive portrait drawing—one of his mother.

Service to Maximilian I. While in Nürnberg in 1512, the Holy Roman emperor Maximilian I enlisted Dürer into his service, and Dürer continued to work mainly for the emperor until 1519. He collaborated with several of the greatest German artists of the day on a set of marginal drawings for the emperor's prayer book. He also completed a number of etchings in iron (between 1515 and 1518) that demonstrate his mastery of the medium and his freedom of imagination. In contrast to these pleasing improvisations are the monumental woodcuts, overloaded with panegyrics, made for Maximilian. In these somewhat stupendous, ornate woodcuts, Dürer had to strain to adapt his creative imagination to his client's mentality, which was foreign to him.

Besides a number of formal show pieces—a painting entitled "Lucretia" (1518; Alte Pinakothek), and two portraits of the emperor (c. 1519)—during this decade Dürer produced a number of more informal paintings of considerably greater charm. He also traveled. In the fall of 1517 he stayed in Bamberg. In the summer of 1518 he went to Augsburg where he met Martin Luther, who had in the previous year posted his 95 Theses denouncing the sale of papal indulgences on the door of the Wittenberg Castle Church. Dürer later became a devoted follower of Luther. Dürer had achieved an international reputation as an artist by 1515, when he exchanged works with the illustrious High Renaissance painter Raphael.

Final journey to the Netherlands. In July 1520 Dürer embarked with his wife on a journey through the Netherlands. In Aachen, at the October 23 coronation of the emperor Charles V, successor to Maximilian I (who had died in 1519), Dürer met and presented several etchings to the mystical and dramatic Matthias Grünewald, who stood second only to Dürer in contemporary German art. Dürer returned to Antwerp by way of Nijmegen and Cologne, remaining there until the summer of 1521. He had maintained close relations with the leaders of the Netherlands school of painting. In December 1520 Dürer visited Zeeland and in April 1521 traveled to Bruges and Ghent, where he saw the works of the 15th-century Flemish masters Jan and Hubert van Eyck, Rogier van der Weyden, and Hugo van der Goes, as well as the Michelangelo Madonna. Dürer's sketchbook of the Netherlands journey contains immensely detailed and realistic drawings. Some paintings that were created either during the journey or about the same time seem spiritually akin to the Netherlands school—for example, the portrait of Anna Selbdritt (Metropolitan Museum of Art, New York City), a half-length picture of St. Jerome (1521; Museu Nacional de Arte Antiga, Lisbon), and the small portrait of Bernhard von Resten, previously Bernard van Orley (Gemäldegalerie, Dresden).

Final works. By July, the travelers were back in Nürnberg, but Dürer's health had started to decline. He devoted his remaining years mostly to theoretical and scientific writings and illustrations, although several well-known character portraits and some important portrait engravings and woodcuts also date from this period. One of Dürer's greatest paintings, the so-called "Four Apostles" (St. John, St. Peter, St. Paul, and St. Mark), was done in 1526. This work marks his final and certainly highest achievement as a painter. His delight in his own virtuosity no longer stifled the ideal of a spaciousness that is simple, yet deeply expressive.

Dürer died in 1528 and was buried in the churchyard of Johanniskirchhof in Nürnberg. That he was one of his country's most influential artists is manifest in the impressive number of pupils and imitators that he had. Even Dutch and Italian artists did not disdain to imitate Dürer's graphics occasionally. The extent to which Dürer was internationally celebrated is apparent in the literary testimony of the Florentine artist Giorgio Vasari (1511–74), in whose *Lives of the Most Eminent Italian Architects, Painters and Sculptors*, the importance of Albrecht Dürer, the "truly great painter and creator of the most beautiful copper engravings," is repeatedly stressed. Like most notable Italian artists, Dürer probably felt himself to be an "artist-prince," and his self-portraits seem incontrovertibly to show a man sure of his own genius. (Eb.R./Ed.)

BIBLIOGRAPHY. Peter Strieder, *The Hidden Dürer* (1978), is a popular biography and introduction to his works. Francis Russell, *The World of Dürer, 1471–1528* (1967, reissued 1981), a vol. in the "Time-Life Library of Art," provides a general introduction to his background, life, and followers. Marcel Brion, *Dürer* (1960), is a critical biography. Heinz Lüdecke, *Albrecht Dürer* (1972), examines Dürer in relation to contemporary social and political concerns. Classic works include Heinrich Wölfflin, *The Art of Albrecht Dürer* (1971; originally published in German, 1905); and Erwin Panofsky, *The Life and Art of Albrecht Dürer*, 4th ed. (1955, reissued 1971). Peter Strieder, *Albrecht Dürer: Paintings, Prints, Drawings* (1982), includes biographical data and covers Dürer's work in all media. Walter Strauss (ed.), *Albrecht Dürer: Woodcuts and Wood Blocks* (1980), is an extensive reference, reproducing all Dürer's work in this medium in chronological order, discussing each at length. Walter Strauss, *The Complete Drawings of Albrecht Dürer*, 6 vol. (1974), is a comprehensive collection, also arranged chronologically, and fully documented. Christopher White, *Dürer: The Artist and His Drawings* (1971), examines Dürer's skill as a draughtsman. Walter Koschatzky, *Albrecht Dürer: The Landscape Water-colours* (1973), discusses the 32 surviving landscapes. Fritz Koreny, *Albrecht Dürer and the Animal and Plant Studies of the Renaissance* (1988), illuminates Dürer's genius by comparing his work with contemporary copyists and imitators.

D'Urfey, Thomas (b. 1653, Exeter?, Devon, Eng.—d. February 1723, London), English dramatist, satirist, and songwriter with a light satirical touch whose plays were very popular

D'Urfey, detail of an engraving by C. Pye after a drawing by J. Thurston. By courtesy of the trustees of the British Museum, photograph J.R. Freeman & Co. Ltd.

in their time; his comedies, with complicated plots carried forward by lively dialogue, to some extent pointed the way to sentimental comedy of the later 18th century.

Patronized by King Charles II, whom he entertained as a jester and singer, and more cautiously by James II, D'Urfey changed his religious and political allegiance on the accession of William and Mary and was, in turn, favoured by them. He befriended such literary figures as the essayists Richard Steele and Joseph Addison. D'Urfey wrote 32 plays between 1676 and 1688. He also wrote some 500 songs, many of which were inserted in contemporary ballad operas.

Durfort FAMILY, French noble family of prominence in the 17th and 18th centuries.

The family, which can be traced back to the 11th century, claims as a member Guy Aldonce I de Durfort (1605–65), Marquis de Duras, who raised three famous sons: Jacques Henri I (1625–1704), marshal of France (1675) and Duke de Duras (1689); Guy Aldonce II (1630–1702), marshal of France (1676) and Duke de Quintin (1691); and Louis (1638–1709), who went to England and became 2nd Earl of Feversham in 1677. Jacques Henri's second son, Jean Baptiste (1684–1770), became marshal of France in 1741 and in 1775 was succeeded by his son, Emmanuel Félicité (1715–89), whose grandson, Amédée Bretagne Malo (1771–1838), married the author Claire de Kersaint (1779–1829).

Durg, formerly DRUG, city, central Chhattisgarh state, central India, just east of the Seonāth River, part of the Durg–Bhilai Nagar urban agglomeration. The city is an agricultural market and is heavily engaged in milling rice and pigeon peas (*Cajanus cajan*). Its name is derived from the Hindi term *durga* ("fort"); there are remains of an ancient fortress used by the Marāṭhās as a base of operations in subjugating Chhattisgarh. The city has several colleges affiliated with Pandit Ravishankar Shukla University. Pop. (1991) city, 150,645; Durg–Bhilai Nagar urban agglom., 166,932.

Durgā (Sanskrit: "the Inaccessible"), in Hindu mythology, one of the many forms of Sakti (the goddess), and the wife of Siva (Shiva). Her

Pramod Chandra

best-known feat was the slaying of the buffalodemon Mahiṣāsura. According to legend she was created for this purpose out of flames that issued from the mouths of Brahmā, Vishnu, Śiva, and the lesser gods. She was born fully grown and beautiful; nevertheless, she presents a fierce menacing form to her enemies. She is usually depicted in painting and sculpture riding a lion (sometimes shown as a tiger), with 8 or 10 arms, each holding the special weapon of one or another of the gods, who gave them to her for her battle against the buffalodemon. The Durgā-pūjā, held annually in September–October, is one of the greatest fes-

tivals of northeastern India. A special image of the goddess is made that is worshipped for nine days, then immersed in water, all accomplished with large processions and much public and private festivity.

Durgāpur, city, southern West Bengal state, northeastern India, just north of the Dāmodar River. Connected by road and rail with Calcutta (Kolkata), Burdwān, and Asansol, Durgāpur is one of India's chief steel-producing centres. The main steel plant went into operation in 1962, and the population grew dramatically. Other major industries include a coal washery, an alloy and special steel plant, a coal-mining machinery plant, brick and tile manufacturing, and several large thermal-power units. Coke gas produced there is conveyed to Calcutta by pipeline. The Dāmodar provides canal irrigation and industrial power in the area. The city has an engineering college and a government college affiliated with the University of Burdwān and a school of music affiliated with Rabindra Bhārati University at Calcutta. Pop. (1991) 425,836.

Durham, administrative, geographic, and historic county of northeastern England, on the North Sea coast. The administrative, geographic, and historic counties cover somewhat different areas. The administrative county comprises seven districts: Chester-le-Street, Derwentside, the city of Durham, Easington, the borough of Sedgefield, Teesdale, and Wear Valley. The geographic county includes the entire administrative county, the unitary authorities of Darlington and Hartlepool, and the portion of the unitary authority of Stockton-on-Tees (including the historic core of Stockton) north of the River Tees. The historic county includes the entire geographic county except for the part of the Teesdale district south of the River Tees, which belongs to the historic county of Yorkshire. The metropolitan boroughs of Gateshead, South Tyneside, and Sunderland in the metropolitan county of Tynes and Wear also belong to the historic county of Durham.

There are two upland regions in the geographic county of Durham. In the west the limestones of the Pennines—reaching an elevation of 2,452 feet (747 m) at Burnhope Seat—dip gently eastward and arc dissected by the valleys of the Rivers Wear and Tees. Basaltic rocks arc exposed at High Force waterfall and near Stanhope. In the east the limestone East Durham Plateau—which rises to more than 700 feet (213 m) at its southwestern edge—forms a gently rolling landscape. Separating these upland areas are the glacial drift-covered lowlands of the Wear valley. The Tees lowlands extend across the south of the county. The topography supports varied forms of agriculture. In the western uplands, thin soils and ill-drained peat permit only sheep grazing, but stock raising is possible in the valleys. In the lower eastern region, mixed farming, especially dairying, predominates.

A number of sites provide evidence of the region's occupation by agricultural peoples from Neolithic times through the Iron Age. In the Roman period Durham was a military outpost supporting the defense of Hadrian's Wall, which was erected to contain the peoples of what, in large part, became Scotland. The Romans withdrew in the 5th century, and the future county of Durham became part of the Anglo-Saxon kingdom of Bernicia by the end of the 6th century. During the 7th century Bernicia became part of the kingdom of Northumbria, which was in turn conquered by the Danes in the 9th century. In the later Middle Ages Durham's marginal position between Scotland and England made it susceptible to invasions and rebellions. In return for leading the defense of northern England, the bishop-princes of the Durham county palatine, residing in the fortified cathedral city of Durham, enjoyed kingly powers that gave them com-

plete control of the area. During the 16th century Durham participated in armed rebellions against the Reformation.

The historical county of Durham was relatively unimportant economically until the 19th century, when the Industrial Revolution prompted exploitation of its extensive coalfield and made it one of the key areas of industrial growth in Britain. The county was the site of the world's first passenger railway, which began operation in 1825 and ran between Stockton and Darlington. Darlington became a centre of locomotive production and railway engineering. Other Durham cities—including Gateshead, Hartlepool, Jarrow, South Shields, and Sunderland—developed as centres of heavy industry, particularly iron and steel production and shipbuilding.

Economic depression between World Wars I and II, followed by a steady decline of the traditional heavy industries, demonstrated the need for diversification. In 1945 Durham became part of the North East Development Area. By the end of the 20th century, coal mining had ceased in the geographic county of Durham. However, such industries as electronics have become important. The city of Durham serves as the county town (seat) and is the educational centre of the county, with one of Britain's most prestigious universities. Area administrative county, 862 square miles (2,232 square km); geographic county (including the entire unitary authority of Stockton-on-Tees), 1,054 square miles (2,731 square km). Pop. (1998 est.) administrative county, 506,400; geographic county (including Stockton-on-Tees), 880,700.

Durham, urban area and city (district), administrative and historic county of Durham, northeastern England.

The historic core of the city is located on a peninsula in a bend of the River Wear. This natural defensive site, chosen by William the

The Cathedral Church of Christ and Blessed Mary the Virgin at Durham, Eng.

A.F. Kerling

Conqueror (reigned 1066–87) as a fortress and bulwark against the Scots to the north, soon became a seat of the feudal prince-bishops of Durham, entrusted with the defense of northern England. The castle, built to protect the narrow neck of the peninsula on its northern side, was until 1836 one of the palaces of the bishop. Early in the 12th century the peninsula was fortified by a wall, much of which has been preserved. Besides its defensive role, medieval Durham was also a place of pilgrimage, because it held the remains of St. Cuthbert, a 7th-century ecclesiastic, in the Romanesque cathedral (begun in 1093 and dedicated to Christ and Blessed Mary the Virgin). The his-

toric city centre was designated a World Heritage site in 1986.

The strong ecclesiastical hold on the city during the Middle Ages reflected the wide secular powers of the bishopric. The fortified part on the peninsula was in early times governed by the constable (law officer) of the bishops' castle. On the east side of the river, Elvet was held by a Benedictine monastery established at Durham in 1083 (suppressed in 1540). The bishops controlled nearby St. Nicholas and Framwellgate. To the north, St. Giles was created a borough in the 12th century.

The bishops of Durham played an important part in establishing the city as an educational centre. Durham School was founded in the 15th century; and a bishop was associated with the creation of the University of Durham in 1832 and the appropriation of the castle to the university's use in 1836. Originally compactly situated on the peninsula, the university has also expanded to a site south of the river. The Gulbenkian Museum of Oriental Art and Archaeology, part of the university's School of Oriental Studies (opened 1960), contains important collections of East Asian material.

Modern Durham, reflecting its history, remains a religious and educational centre but also serves as the county town (seat). Development of marketing and service sectors in the local economy has been impeded by the proximity of the city to the metropolitan areas of Tyne and Wear and Teesside. Durham has several small factories specializing in organ construction and carpet manufacture. It has never been an industrial city, however; instead it has always served as an administrative and cultural centre for the region. Surrounding the historic urban area at the centre of the city are suburban areas and open countryside. Area city (district) 72 square miles (187 square km). Pop. (1991) Durham urban area, 36,937; (1998 est.) city (district), 90,300.

Durham, town (township), Stafford county, southeastern New Hampshire, U.S., on the Oyster River just southwest of Dover. Settled in 1635, it was known as the parish of Oyster River until it was incorporated in 1732 and named for Durham, Eng. A series of savage Indian attacks began in 1675; in 1694 the town was burned, and more than 100 residents were killed or captured. During the American Revolution a large supply of gunpowder and weapons seized from the British in New Castle was hidden in the Durham Meetinghouse; a tablet now marks the site. The town is an agricultural trade centre and the seat of the University of New Hampshire (founded 1866). The home (built c. 1740) of John Sullivan, Revolutionary general and the state's chief executive in 1786, 1787, and 1789, still stands on the riverbank. Pop. (2000) 9,024.

Durham, city, seat (1881) of Durham county, north-central North Carolina, U.S. With nearby Chapel Hill and Raleigh, it forms one of the state's major urban areas. The first settlement (about 1750) there was called Prattsburg for William Pratt, a landowner. When Pratt refused to give land for a North Carolina Railroad station, Bartlett Durham donated a plot about 2 miles (3 km) west. The town that grew up there was known as Durhamville, Durham Station, and Durham's before becoming Durham. It was the site of the surrender (April 26, 1865) of Confederate general Joseph E. Johnston to Union General William T. Sherman, which effectively ended the American Civil War. It was incorporated in 1866 and again in 1869, after North Carolina was readmitted to the Union.

The tobacco industry, which transformed Durham into a flourishing manufacturing centre by 1900, was pioneered by Robert F. Morris in 1858; John R. Green began making his

Davidson Building on the Duke University campus, Durham, N.C.

famous Bull Durham blend after the Civil War. The leading role in the industry's development, however, was played by the Duke family after their factory opened there in 1874. It also developed an important textile industry. Both of these are now secondary to high technology, such as the manufacture of electronic and precision equipment.

Durham became an educational, medical, and research centre in large part through the philanthropy of the Duke family. Duke University, which was established by James Buchanan Duke in 1924, was constructed around Trinity College. North Carolina Central University (1910), part of the University of Carolina system, and Durham Technical Community College (1961) are in the city as well. Research Triangle Park, just south of Durham, is central to the region's cultural, scientific, and educational activities. Bennett Place State Historical Site, just northwest, commemorates the location of Johnston's surrender to Sherman. Pop. (2000) city, 187,035, Raleigh-Durham-Chapel Hill MSA, 1,187,941.

Durham, John George Lambton, 1st earl of, also called (1828–33) **BARON DURHAM** (b. April 12, 1792, London—d. July 28, 1840, Cowes, Isle of Wight, Eng.), British reformist Whig statesman sometimes known as "Radical Jack," governor general and lord high commissioner of Canada, and nominal author of the *Report on the Affairs of British North Amer-*

Durham, detail of an oil painting by T. Phillips (1819 replica); in the National Portrait Gallery, London

ica (1839), which for many years served as a guide to British imperial policy. The "Durham Report" was largely written by his chief secretary in Canada, Charles Buller (1806–48).

The son of a great landowner in Durham County, Lambton sat in the House of Commons from 1813 to 1828, when he was raised to the peerage as Baron Durham. (He was created an earl in 1833.) By his second marriage he became the son-in-law of Charles Grey, 2nd Earl Grey, a leading Whig and future prime

minister (1830–32), but his proposals for wide extension of the franchise and other radical measures were distasteful to Grey and other orthodox Whigs.

In 1830 Durham entered Grey's Cabinet as lord privy seal, and with Lord John Russell (afterward 1st Earl Russell and twice prime minister) and two others, he drafted the first parliamentary Reform Bill (1831; not enacted). After the passage of the third Reform Bill the following year, Durham was sent on diplomatic missions to Russia, Prussia, and Austria and then resigned as lord privy seal (1833). From July 1835 to June 1837 he was ambassador to Russia.

Appointed governor general and lord high commissioner of Canada, Durham arrived at Quebec in May 1838. Faced with French-Canadian hostility, virtual anarchy in Lower Canada (in the modern province of Quebec), and possible expansion of the United States into Canada, he was given almost dictatorial powers.

Durham organized a new and more conciliatory executive council, and on June 28, 1838, the day of Queen Victoria's coronation, he proclaimed an amnesty for all French-Canadian rebels except for 24 of their leaders. For his moderation he was reviled in England. The prime minister, Lord Melbourne, disavowed Durham's actions, whereupon the governor general resigned and issued a self-justifying proclamation.

After returning to England, Durham submitted his memoranda to the colonial office on Jan. 31, 1839. He advocated the union of Lower Canada with Upper Canada (in present Ontario), with a large measure of self-government in order to preserve Canadian loyalty to Great Britain and thereby to forestall the annexation of Canada by the United States. Accepting the theory of imperial government put forth by Buller and Edward Gibbon Wakefield, Durham prescribed a Cabinet of colonists whose recommendations on internal affairs were to be executed by the governor general. Foreign policy and international trade were to continue to be regulated from London. He also strongly recommended that the French-Canadians be harassed into abandoning their language and become completely assimilated to the Anglo-Canadians.

durian (*Durio zibethinus*), tree of the family Bombacaceae and its fruit. The durian is cultivated in Indonesia, the Philippines, Malaysia, and southern Thailand. The tree has oblong, tapering leaves, rounded at the base, and yellowish green flowers.

The fruit is spherical and 15 to 20 centimetres (6 to 8 inches) in diameter. It has a hard external husk, or shell, covered with coarse spines, and contains five oval compartments, each filled with a cream-coloured, custard-like pulp, in which are embedded from one to five chestnut-sized seeds.

The pulp is edible, and the seeds may be eaten if roasted. The ripe fruits are eaten by many animals. Although the durian has a mild, sweet flavour, it also has a pungent odour, which has been compared to that of Limburger cheese. It is seldom exported.

duricrust, surface or near-surface of the Earth consisting of a hardened accumulation of silica (SiO₂), alumina (Al₂O₃), and iron oxide (Fe₂O₃), in varying proportions. Admixtures of other substances commonly are present and duricrusts may be enriched with oxides of manganese or titanium within restricted areas. Thus, siliceous, ferruginous, and aluminous crusts constitute duricrusts proper. Encrusted layers of calcium carbonate, gypsum, and salt, however, are often considered forms of duricrust.

The term duricrust (Latin *durus*, "hard") was first applied in Australia to layered materials at or near the Earth's surface, such as laterites, bauxites, and quartzites. These crusts are not of themselves landforms but represent the chemical alteration of the upper parts of

plains and other features of low relief. In this sense, they are soils of an extreme type.

Classification of duricrusts. Two partial classifications use compound names ending in *-crete* to indicate the kind of cementation, or in *-crust*, to indicate the basic chemical content (Table, first two columns). Both classifications are defective, although the working distinction between silcrests and ferricrusts is useful. A more serviceable classification (Table, third column) adapts and extends the nomenclature developed by soil scientists in Africa. The type boundaries that fall within duricrusts proper must be considered transitional.

Where best preserved, duricrusts proper are the most continuous and extensive types of those listed in the Table. Representing the end-products of weathering, denudation, and soil formation, they occur mainly on erosional platforms such as pediments or as cappings and residuals on stream divides. The crusts usually form parts of deep-weathering profiles that may be as thick as 120 metres (400 feet). Alternatively, they occur at the bases of cliffs and scarps, in river terraces, or on valley bottoms, usually near to and lower than residual cappings. Except at the wasting or developing edges of crusts, the thickness ranges from about 0.5 m to at least 12 m. This contrasts with the platelike weathering rinds as thick as 15 centimetres (6 inches) that are often associated with cavernous (alveolar) weathering, particularly in arid areas.

Distribution of duricrusts. Duricrusts are concentrated in intertropical to subtropical areas, with notable extratropical extensions, especially in South Africa and Australia. They normally are absent from equatorial rain forests. Many are fossil crusts, in the sense that they relate to past climatic, biologic, and geomorphic environments and are not forming under present conditions in these areas.

Other types of crust are associated with sub-humid to arid climates, although not necessarily with the arid climatic zones of today. Crusts of calcium carbonate (calccrusts) and calcium sulfate (gypcrusts), up to 4 m thick occur in basins of inland drainage, where they form initially as evaporites (*see* evaporite). Alternatively, calccrusts form as surface to subsurface soil horizons, or zones, at and near the extreme end of the calcium-rich soil range. Gypsum-rich horizons, common in many desert and semidesert soils, seem not resistant enough to erosion to become crusts. Calcsilitic crusts, which result from the silification of calccrusts or other surficial limestones, have been little studied in this context. Salcrusts (salt crusts) form in depressions along desert coasts or wherever saline groundwater emerges, but unless they crystallize into rock salt these crusts also lack resistance to erosion and can be ephemeral.

In Australia, India, Africa, and South America, the main expanses of duricrust tend to mantle pediments and plains in varying states of dissection, although some crusts occur in valleys in terrain of high relief. Allitic crusts yield commercial bauxite. Detrital and valley-floor duricrusts occur in all these countries, chiefly adjacent to the margins of residual caps. These crusts include economic reserves of manganese ore in western Africa and silicified terrace gravels in southern Australia. Possible combinations of terrain, weathering, erosion and dissection of duricrusts and continued or renewed duricrust formation are highly complex. Additionally, some duricrusts now lie buried beneath continental (nonmarine) sediments.

Rough limits to present-day ferricrust formation are the 500- to 700-millimetre (20- to 27.5-inch) isohyet (contour of equal rainfall values), below which iron is not readily mobilized, and the 1,200-mm, isohyet, above which dehydration is unusual. High mean annual temperatures, on the order of 20° to 25° C (68° to 77° F), also are necessary. Duricrusts that occur beyond the indicated limits are generally fossil (related to former climatic regimes), and many within these limits also are fossil. Ages determined by stratigraphic or radiometric methods are as great as 50,000- to 23,000,000 years in western Africa and more than 23,000,000 years in Australia, but duricrust formation is occurring today in some places. Phenomena related to fossil crusts include the deep weathering of the southern Piedmont area of the United States and of massifs in western and northwestern Europe during the Tertiary Period (between 2,500,000 and 65,000,000 years ago), and the Tertiary formation of residual bauxite at latitude 65° N in Siberia.

Factors involved in duricrust formation. The formation of crusts involves great loss of weathered material. A generalized example from the tropical weathering of a nepheline-syenite (intrusive igneous rock) shows a reduction of silica (SiO₂) from 55 percent in the fresh rock to 5 percent in the duricrust, but an increase of alumina (Al₂O₃) from 1 percent to 45 percent, of iron oxide (Fe₂O₃) from 5 percent to 23 percent, and of combined water from 1 percent to 25 percent.

The circulation of nutrients between plants and soil in tropical forests involves excess uptake by the plants, and this in turn promotes deep weathering. Within the deep-weathering profile, silt-size material is broken down or leached out. Clay minerals tend to be dispersed and moved downward, especially where high rainfall and vigorous plant growth lower the electrolyte concentration. The remaining oxides tend to aggregate into forms in which spheroidal microstructures are common.

Mechanisms that are capable of promoting dehydration and hardening of ferricrusts, whether before, during, or after stripping of the overlying soil, include the destruction of forest and lowering of the water table, both of which can occur in several ways. Aside from clearance by humans, forest destruction, for example, may be caused by climatic change and downcutting by fluvial processes.

Silcrete formation requires the selective concentration of silica, a fact that has led some experts to consider silcrests as the lower parts of ferricrust profiles. The distributional contrast between silcrests and ferricrusts is clear, however, and the transition between the types is well documented. Silcrests often, but not invariably, result from the silicification of sandstones and quartzitic conglomerates. They occur in areas that are currently drier than those with ferricrusts, but the fossil nature of many, plus the deep-weathering profiles to which they usually belong, presumably indicate humid climates at the time of formation and inhibit direct reference to existing controls. Like ferricrusts, silcrests are usually taken to have originated below the ground surface, possibly under a layer of erodible, fine material.

Mobilization, migration, and concentration of ions. Soil-formation processes of selective concentration of oxides of iron and aluminum, and in some circumstances of silica, include ion exchange as a most important factor. Although not yet completely understood, this involves the exchange of ions held by negative charges with other ions in the electrolyte (soil solution). Ion exchange is influenced by the fit of ions into a mineral structure. Relevant processes include hydration (adsorption of water), hydroxylation (adsorption of H⁺ and OH⁻ ions), oxidation (combination of oxygen, with loss of electrons to weathering agents), and reduction (depletion of combined oxygen). Ion exchange is controlled by the cation exchange capacity (CEC) expressed as the amount of exchangeable cations in milliequivalents per 100 grams clay at pH 7. Low CEC values are typical of kaolinitic clays and of actual or potential duricrusts.

Soil water will separate into oppositely charged ions, H⁺ and OH⁻, and the CO₂ of the atmosphere and soil will yield HCO₃⁻ and free H⁺ ions in solution. These products promote displacement of some metal cations, especially those in mineral silicates, largely by H⁺ ions that combine with OH⁻ in removable solutes. The H⁺ ions are small and highly charged in relation to their size and can readily enter many crystal lattices; OH⁻ ions neutralize the small charges of Na⁺, K⁺, and the larger charges of Ca⁺⁺ and Mg⁺⁺. Positive charges in soil particles are partly related to hydrous oxides of iron, aluminum, and manganese. Negative charges, increasing with falling pH, are neutralized by positive ions, among which Al(OH)₂⁺ is one of the more significant. Negatively charged colloidal SiO₂ and colloidal Al₂O₃ and positively charged Fe₂O₃ probably interact at high concentrations of H⁺ ions to form clay minerals. Among these, the most stable are the one-to-one layer silicates of the kaolin family, in which each silicon-oxygen sheet is condensed with one aluminum hydroxide sheet.

At least part of the ion-exchange process involves organisms and organic substances. Chelating agents, complex amino acids, and allied compounds inactivate ions of aluminum and iron and hold them firmly in lattice structures. The ions then behave as if they were not present, except when acidity markedly decreases and they are redeposited. Manganese and silicon can be similarly treated. The combined processes of solution and eluviation (soluviation) and of chelation and eluviation

(cheluviation) appear to act powerfully in the formation of oxide-rich plinthite prior to duricrust formation. In the mobilization and fixing of iron, as in the general production of organic acids, bacteria also play a part. Some act to form soluble iron, others oxidize soluble ferrous iron ($\text{Fe}(\text{OH})_2$) to insoluble ferric iron (Fe_2O_3); and soil microorganisms, including bacteria, are specifically involved in the production of a number of prominent chelating agents.

Rock type, terrain, and water table fluctuations. Duricrusts occur on a wide range of igneous, metamorphic, and sedimentary rocks, including granites, basalts and gabbros, arenites, and argillites. There is only the roughest of tendencies for duricrust chemistry to be controlled by bedrock chemistry, even in similar climates, although nephelinesyenites characteristically weather into allitic (aluminum-rich) crusts, basic igneous rocks into ferritic (iron-rich) to tiallitic (titanium-aluminum) crusts, and arenites and argillites, in some areas, into silitic (silica-rich) crusts. Ferritic crusts are more highly indurated, more variable in structure, and less strongly hydrated than aluminous crusts. Although structures in silitic crusts vary from pea-sized nodules to blocky and massive, with natural, subsurface erosion pipes at lower levels, these crusts are not hydrous.

Profile drainage is influential; ready leaching and alkaline to neutral conditions favour removal of silica and concentration of aluminum and also of titanium if available. Nearness to the water table promotes concentration of iron, whereas poor site drainage and acidity possibly favour accumulation of silica. Known distributions, however, suggest geographic contrasts between ferricrust and silicrust formation rather than lithological control, which appears to be effective only in transitional belts.

Terrain requirements for duricrust formation include gentle slopes or situations where groundwater can supply oxides of iron and manganese or both of these. Well-preserved fossil crusts on pediments or plains with maximum slopes of 8° to 10° (and average slopes of 2° or less) suggest feeble lateral movement of groundwater and relative enrichment of crusts by leaching. This contrasts with the active translocation responsible for the absolute enrichment of crusts at the base of scarps and on valley floors. Also indicative of groundwater action are the light-coloured and mottled zones of many deep-weathering profiles; the former are regarded as the result of kaolinization in a reducing (de-ionizing) environment, and the latter from seasonal fluctuation of the groundwater level. Incapacity of these zones to supply the iron content of numerous crusts confirms relative enrichment.

Effects of climate and time. Calcrusts, gypcrusts, and salcrusts are referable to dry climates, but duricrusts proper, at least in present and late Holocene occurrences (the Holocene Epoch began about 10,000 years ago), are referable to humid tropical climates, probably with seasonal dryness, coincident wet and warm seasons, and soil temperatures averaging 25° to 30°C (about 75° to 85°F). Under these conditions, 50 percent or more of the original rock volume can be lost during weathering, but the preservation of structures in some profiles indicates downward thickening rather than overall diminution.

A span of 30 to 50 years will convert a drying ferallitic clay to a ferallitic duricrust; but extrapolation from known values suggests that up to 15,000,000 years may be required to form really deep-weathering profiles. Such time spans seem to be well within the range of duration of humid tropical forests in the Tertiary, however.

Climatic change presumably is responsible for the presence of duricrusts in equatorial areas that now receive more than 1,200 mm mean annual precipitation. The former northward extension of aridity in Africa, with Kalahari sand extending 1,600–3,000 kilometres (1,000–1,900 miles) beyond its present limit, is well documented. Similarly, former climates of the current humid tropical type are probably responsible for the presence of fossil crusts outside the tropics and for relict Tertiary deep weathering. Such climates seem explicable in terms of reduced pole-to-Equator temperature gradients.

Although dehydration and hardening of duricrusts are often called irreversible, this is not true over the long term. Apart from disaggregation of eroding caps, residual ferricrusts can be attacked by renewed soil-formation processes, which remobilize iron and produce red-yellow soils called "lateritic podzolics" in older classifications.

Durkheim, Émile (b. April 1858, Épinal, Fr.—d. Nov. 15, 1917, Paris), French social scientist who developed a vigorous methodology combining empirical research with sociological theory. He is widely regarded as the founder of the French school of sociology.

Durkheim

By courtesy of Presses Universitaires de France

Childhood and education. Durkheim was born into a Jewish family of very modest means. It was taken for granted that he would study to become a rabbi, like his father. The death of his father before Durkheim was 20, which burdened him with heavy responsibilities, and the increased rivalrous tensions between France's eastern provinces and Germany, may have contributed to making Durkheim a severely disciplined young man. As early as his late teens Durkheim became convinced that effort and even sorrow are more conducive to the spiritual progress of the individual than pleasure or joy.

His outstanding success at school designated him clearly as a candidate to the renowned École Normale Supérieure in Paris—the most prestigious teachers' college in France. While preparing for the École Normale at the Lycée Louis le Grand, Durkheim took his board at the Institution Jauffret in the Latin Quarter, where he became acquainted with another gifted young man from the provinces, Jean Jaurès, later to lead the French Socialist Party and at that time inclined like Durkheim toward philosophy and the moral and social reform of his countrymen.

Durkheim passed the stiff competitive examination for the École Normale one year after Jaurès, in 1879. It is clear that his religious faith had vanished by then. His thought had become altogether secular but with a strong bent toward moral reform. Like a number of French philosophical minds during the Third Republic, he looked to science and in particular to social science and to profound educational reform as the means to avoid the perils of social disconnectedness or "anomie," as he was to call this condition in which norms for conduct were either absent, weak, or conflicting.

He enjoyed the intellectual atmosphere of the École Normale—the discussion of metaphysical and political issues pursued with eagerness and animated by the utopian dreams of young men destined to be among the leaders of their country. He soon enjoyed the respect of his peers and of his teachers, but he was impatient with the excessive stress then laid in French higher education on elegant rhetoric and surface polish. His teachers of philosophy struck him as too fond of generalities and of monotonous worship of the past.

Fretting at the conventionality of formal examinations, he passed the last competitive examination in 1882, but without the brilliance that his friends had predicted for him. He then accepted a series of provincial assignments as a teacher of philosophy at the state secondary schools of Sens, Saint-Quentin, and Troyes between 1882 and 1887. In 1885–86 he took a year's leave of absence to pursue research in Germany, where he was impressed by Wilhelm Wundt, pioneer experimental psychologist. In 1887 he was appointed as lecturer at the University of Bordeaux, where he subsequently became professor and taught social philosophy until 1902.

Analytic methods. Durkheim was familiar with several foreign languages and reviewed volumes in German, English, and Italian at length in the learned journal *L'Année Sociologique*, which he founded in 1896. But it has been noted, at times with disapproval and amazement, by non-French social scientists, that he travelled little and that, like many French scholars as well as the notable British anthropologist Sir James Frazer, he never undertook any fieldwork. The vast information he studied on the tribes of Australia or of New Guinea or on the Eskimos was all collected by other anthropologists, travellers, or missionaries.

This was not, in Durkheim's case, due to provincialism or lack of attention to the concrete. He did not resemble the French philosopher Auguste Comte in making venturesome and dogmatic generalizations and disregarding empirical observation. He did, however, maintain that concrete observation in remote parts of the world does not always lead to illuminating views on the past or even on the present. To him facts had no meaning for the intellect unless they were grouped into types and laws. He claimed repeatedly that it is from a construction erected on the inner nature of the real that knowledge of concrete reality is obtained, a knowledge not perceived by observation of the facts from the outside. He thus constructed concepts such as that of the sacred or of totemism, exactly in the same way that Karl Marx developed the concept of class.

In truth, Durkheim's vital interest did not lie in the study for its own sake of so-called primitive tribes, but rather in the light such a study might throw on the present. The outward events of his life as an intellectual and as a scholar may appear undramatic. Still, much of what he thought and wrote stemmed from the events that he witnessed in his formative years, in the 1870s and 1880s, and in the earnest concern he took in them.

The Second Empire, which collapsed in the French defeat of 1870 at the hands of Ger-

many, had seemed an era of levity and dissipation to the earnest young Durkheim. France, with the support of many of its liberal and intellectual elements, had plunged headlong into a war for which it was unprepared; its leaders proved incapable. The left-wing Commune that took over Paris after the French defeat in 1871 led to senseless destruction, which appeared to Durkheim's generation, in retrospect, as evidence of the alienation of the working classes from capitalist society.

The bloody repression that followed the Commune was taken as further evidence of the ruthlessness of capitalism and of the selfishness of the frightened bourgeoisie. Later, the crisis of 1886 over Georges Boulanger, the minister of war who demanded a centralist government to execute a policy of revenge against Germany, was one of several events that testified to the resurgence of nationalism, soon to be accompanied by anti-Semitism. Such major French thinkers of the older generation as Ernest Renan and Hippolyte Taine interrupted their historical and philosophical works after 1871 to analyze those evils and to offer remedies.

Durkheim was one of several young philosophers and scholars, fresh from their École Normale training, who became convinced that progress was not the necessary consequence of science and technology, that it could not be represented by an ascending curve, and that complacent optimism could not be justified. He perceived around him the prevalence of "anomie," a personal sense of rootlessness fostered by the absence of social norms. Material prosperity set free greed and passions that threatened the equilibrium of society.

These sources of Durkheim's sociological reflections, never remote from moral philosophy, were first expressed in his very important doctoral thesis, *De la division du travail social* (1893; *The Division of Labour in Society*), and in *Le Suicide* (1897; *Suicide*). In Durkheim's view, ethical and social structures were being endangered by the advent of technology and mechanization. He believed that societies with undifferentiated labour (*i.e.*, primitive societies) exhibited mechanical solidarity, while societies with a high division of labour, or increased specialization (*i.e.*, modern societies), exhibited organic solidarity. The division of labour rendered workers more alien to one another and yet more dependent upon one another; specialization meant that no individual labourer would build a product on his or her own.

Durkheim's 1897 study of suicide was based on his observation that suicide appeared to be less frequent, where the individual was closely integrated into a society; in other words, those lacking a strong social identification would be more susceptible to suicide. Thus, the apparently purely individual decision to renounce life could be explained through social forces.

Effect of the Dreyfus affair. These early volumes, and the one in which he formulated with scientific rigour the rules of his sociological method, *Les Règles de la méthode sociologique* (1895; *The Rules of Sociological Method*), brought Durkheim fame and influence. But the new science of sociology frightened timid souls and conservative philosophers, and he had to endure many attacks. In addition, the Dreyfus affair—resulting from the false charge against a Jewish officer, Alfred Dreyfus, of spying for the Germans—erupted in the last years of the century, and the slurs or outright insults aimed at Jews that accompanied it opened Durkheim's eyes to the latent hatred and passionate feuds hitherto concealed under the varnish of civilization. He took an active part in the campaign to exonerate Dreyfus. Perhaps as a result, Durkheim was not elected to the Institut de France, although his stature as a thinker suggests that he should have been named to that prestigious learned society. He was, however, appointed to the

University of Paris in 1902 and was made a full professor there in 1906.

More and more, Durkheim's thought became concerned with education and religion as the two most potent means of reforming humanity or of molding the new institutions required by the deep structural changes in society. His colleagues admired Durkheim's zeal on behalf of educational reform. His efforts included participating in numerous committees to prepare new curriculums and methods; working to enliven the teaching of philosophy, which too long had dwelt on generalities; and attempting to teach teachers how to teach.

A series of courses that he had given at Bordeaux on the subject of *L'Évolution pédagogique en France* ("Pedagogical Evolution in France") was published posthumously in 1938; it remains one of the best informed and most impartial books on French education. The other important work of Durkheim's later years, *Les Formes élémentaires de la vie religieuse* (1912; *The Elementary Forms of Religious Life*), dealt with the totemic system in Australia. The author, despite his own agnosticism, evinced a sympathetic understanding of religion in all its stages yet ultimately subordinated religion to the service of society by concluding that religion's primary function was to maintain the social order. French conservatives—who in the years preceding World War I turned against the Sorbonne, which they charged was unduly swayed by the prestige of German scholarship—railed at Durkheim, who, they thought, was influenced by the German urge to systematize, thereby making a fetish of society and a religion of sociology.

In fact, Durkheim did not make an idol of sociology as did the positivists schooled by Comte, nor was he a "functionalist" who explained every social phenomenon by its usefulness in maintaining the existence and equilibrium of a social organism. He did, however, endeavour to formulate a positive social science that might direct people's behaviour toward greater solidarity.

The outbreak of World War I came as a cruel blow to him. For many years he had expended too much energy on teaching, on writing, on outlining plans for reform, and on ceaselessly feeding the enthusiasm of his disciples, and eventually his heart had been affected. His gaunt and nervous appearance filled his colleagues with foreboding. The whole of French sociology, then in full bloom thanks to him, seemed to be his responsibility.

Death and legacy. The breaking point came when his only son was killed in 1916, while fighting on the Balkan front. Durkheim stoically attempted to hide his sorrow, but the loss, coming on top of insults by nationalists who denounced him as a professor of "apparently German extraction" who taught a "foreign" discipline at the Sorbonne, was too much to bear. He died in November 1917.

Durkheim left behind him a brilliant school of researchers. Never a tyrannical master, he had encouraged students to go farther than himself and to contradict him if need be. His nephew, Marcel Mauss, who held the chair of sociology at the Collège de France, was less systematic than Durkheim and paid greater attention to symbolism as an unconscious activity of the mind. Social anthropologist Claude Lévi-Strauss also occupied the same chair of sociology and resembled Durkheim in the way he combined reasoning with intensity of feeling, yet, unlike Durkheim, he went on to become a leading proponent of structuralism.

Durkheim's influence extended beyond the social sciences. Through him, sociology became a seminal discipline in France that broadened and transformed the study of law, economics, Chinese institutions, linguistics, ethnology, art history, and history. (H.M.P.)

BIBLIOGRAPHY. Among the most comprehensive treatments of Durkheim and his works is Steven Lukes, *Émile Durkheim, His Life and Work: A His-*

torical and Critical Study (1972, reprinted 1992). Anthony Giddens, *Émile Durkheim* (1978), is an incisive examination of the subject's life and major works. Harry Alpert, *Émile Durkheim and His Sociology* (1939, reissued 1993), offers a good account of Durkheim's life. Gianfranco Poggi, *Durkheim* (2000), and Mustafa Emirbayer (ed.), *Émile Durkheim: Sociologist of Modernity* (2003), offer contemporary assessments of Durkheim's works.

Durlas (Ireland): see Thurles.

Durmitor, mountain massif in Montenegro, Serbia and Montenegro, part of the Dinaric ranges and a national park region that includes 15 peaks of more than 6,600 ft (2,000 m) in height, the highest, Bobotov Kuk, reaching 8,274 ft (2,522 m). Between the peaks are deep valleys and glacial lakes; dense pine and fir forests surround the lakes. The highest settlement in Serbia and Montenegro, Zabljak, is a tourist centre; winter sports are popular. Livestock breeding is carried on in the valleys.

Durnovo, Pyotr Nikolayevich (b. 1845, Moscow province, Russia—d. Sept. 24 [Sept. 11, old style], 1915, Petrograd), Russian statesman and security chief under tsars Alexander III and Nicholas II, who brutally suppressed the revolution of 1905. He is also noted for a remarkable memorandum he wrote in 1914 in which he accurately foresaw the course of the coming World War, including the collapse of the Russian Empire.

Durnovo resigned from military service to enter the government. His rise thereafter was rapid, and he became director of the Russian police in 1883. During his tenure in this post he was instrumental in breaking up the terrorist organization that had assassinated Alexander II. Dismissed in 1893 after a sex scandal, Durnovo returned to the government in 1900, this time as assistant minister of the interior, becoming acting minister under the moderate prime minister S.Y. Witte in late October at the height of the Russian Revolution of 1905.

A determined rightist, Durnovo quickly won the confidence of Nicholas II by dint of his effective suppression of the St. Petersburg and Moscow soviets. Durnovo was dismissed along with Witte in 1906 in the aftermath of the disorders, but he was soon appointed to the State Council, and he quickly became the leader of its conservative elements. Serving on the council until his death in 1915, he opposed all efforts to dilute the power of the monarchy.

Duroc, breed of pig developed between 1822 and 1877 from the Old Duroc pig of New York and the Red Jersey pig of New Jersey; it was formerly called the Duroc-Jersey. The Duroc proved particularly suitable for feeding in the United States Corn Belt; by the 1930s it was the predominant breed in the United States, a distinction it held intermittently throughout the century. Exportation has been extensive, especially to the temperate regions of North and South America. Red is the preferred and predominant colour for the Duroc.

Duroc, Géraud-Christophe-Michel, DUC (duke) DE FRIOUL (b. Oct. 25, 1772, Pont-à-Mousson, Fr.—d. May 23, 1813, Markersdorf, near Görlitz, Silesia), French general and diplomat, one of Napoleon's closest advisers.

The son of Claude de Michel, chevalier du Roc, who was a cavalry officer, Duroc went to the Châlons artillery school, emigrated in 1792, but changed his mind, returned to France, entered the Metz school (1793), and was drafted to the artillery of the army of Italy. In 1796 Napoleon took Duroc as his aide and made him a major in Egypt, a colonel in Syria, and, after the coup d'état of 18 Brumaire (Nov. 9, 1799), senior aide-de-camp. All contemporaries praised this reserved, unambitious man who, as his best friend, so often checked Napoleon's angry impulses.

From 1804 he was grand marshal (lord high steward of the empire) and kept good order in the palaces. Furthermore, he was often on diplomatic missions, and it was he who signed the treaties of Fontainebleau and Bayonne (1807–08) determining the French intervention in Spain. He was also general of division (1803), led a division at the Battle of Austerlitz, and was in all the campaigns. He was usually consulted by Napoleon on questions of promotion and became the best channel by which Napoleon's lieutenants could approach him.

Duroc, portrait by Jacques-Louis David, in the Musée Léon Bonnat, Bayonne, Fr.

Giraudon—Art Resource

On his journey back from Russia in 1812, the emperor chose Armand de Caulaincourt as his immediate companion; Duroc followed in another sledge. Back in France, Duroc was made a senator in 1813. He had heavy work in the organization of the new French army and was with it at the battles of Lützen and Bautzen (1813). In the outposts in Silesia he came, by chance, under artillery fire and was mortally wounded. Napoleon deeply regretted his death.

Durocher, Leo, in full LEO ERNEST DUROCHER (b. July 27, 1905, West Springfield, Mass., U.S.—d. Oct. 7, 1991, Palm Springs, Calif.), American professional baseball player and manager.

Durocher played a year each in Atlanta and St. Paul before joining the New York Yankees in 1928. He was a superb fielder at shortstop but a mediocre hitter, and he was sold to the Cincinnati Reds in 1930. He was traded to the St. Louis Cardinals in 1933 and became a star with that team when they won the World Series in 1934.

Durocher was traded to the Brooklyn Dodgers in 1937 and became that team's captain in 1938. He managed the Dodgers in 1939–46 and 1948 and led them to a pennant in 1941. (He was suspended for the entire 1947 season because of his truculence.) Durocher managed the New York Giants in 1948–55 and led them to two pennants (1951 and 1954) and a World Series win in the latter year. He quit the Giants in 1955 to become a baseball commentator on television but returned as coach of the Los Angeles Dodgers in 1961–64. He then managed the Chicago Cubs in 1966–72 and the Houston Astros in 1972–73. Durocher, who is known for the phrase “nice guys finish last” (in fact he said, “the nice guys over there arc in seventh place”), was elected to the Baseball Hall of Fame in 1994.

Durrāni, also spelled DURĀNĪ, formerly ABDĀLĪ, one of the two chief tribal confederations of Afghanistan, the other being the Ghilzay. In the time of Nāder Shāh the Durrāni were granted lands in the region of Qandahār, which was their homeland; and they moved there from Herāt.

In the late 18th century the Durrāni took

up agriculture. Under Ahmad Shāh Durrāni and Timur Shāh, the Durrāni constituted the most significant political and military support of the monarchy. The later 18th-century policy of reducing their power aroused Durrāni resistance and served as one of the principal causes of the 18th- and early 19th-century civil wars.

Durrāni, Ahmad Shāh: see Ahmad Shāh Durrāni.

Durrell, Lawrence, in full LAWRENCE GEORGE DURRELL (b. Feb. 27, 1912, Julundur, India—d. Nov. 7, 1990, Sommières, France), English novelist, poet, and writer of topographical books, verse plays, and farcical short stories, widely regarded as one of the most original English novelists of the period after World War II.

Durrell spent most of his life outside England and had little sympathy with the English character. He was educated in India until he reached age 11 and moved in 1935 to the island of Corfu. During World War II he was in Egypt as press attaché to the British embassies in Cairo and Alexandria, and after the war he spent time in Yugoslavia, Rhodes, Cyprus, and the south of France.

Durrell wrote several books of poetry and prose before the publication of *The Alexandria Quartet*, a novel in four parts—*Justine* (1957), *Balthazar* (1958), *Mountolive* (1958), and *Clea* (1960). The lush and sensuous tetralogy became a best-seller and won high critical esteem. The first three volumes described, from different viewpoints, a series of events in Alexandria before World War II; the fourth carried the story forward into the war years. By its subjective narrative structure *The Alexandria Quartet* demonstrates one of its main themes: the relativity of truth. More important is the implied theme: that sexual experience, the practice of art, and love are all ways of learning to understand and finally to pass beyond successive phases of development toward ultimate truth and reality.

Durrell's later novels, *Tunc* (1968) and its sequel, *Nunquam* (1970), were less well received than his earlier fiction. *The Avignon Quintet*—consisting of *Monsieur*; or, *The Prince of Darkness* (1974), *Livia*; or, *Buried Alive* (1978), *Constance*; or, *Solitary Practices* (1982), *Sebastian*; or, *Ruling Passions* (1983), and *Quinx*; or, *The Ripper's Tale* (1985)—received mixed reviews.

Many critics regarded Durrell's poetry and topographical books as his most enduring achievements. He first gained recognition as a poet with *A Private Country* (1943), and his reputation was established by *Cities, Plains and People* (1946), *The Tree of Idleness* (1953), and *The Ikons* (1966). His *Collected Poems 1931–74* appeared in 1980.

In *Prospero's Cell* (1945), *Reflections on a Marine Venus* (1953), and *Bitter Lenons* (1957), Durrell describes three Greek islands: Corfu, where he lived with his first wife in 1937–38; Rhodes, where in 1945–46 he acted as press officer to the Allied government; and Cyprus, his home from 1952 to 1956. His last book, *Caesar's Vast Ghost: Aspects of Provence*, was published in 1990.

BIBLIOGRAPHY. Biographical and critical works include Harry T. Moore (ed.), *The World of Lawrence Durrell* (1962); Alan W. Friedman, *Lawrence Durrell and The Alexandria Quartet* (1970); G.S. Fraser, *Lawrence Durrell*, rev. ed. (1973); and John A. Weigel, *Lawrence Durrell*, rev. ed. (1989).

Dürrenmatt, Friedrich (b. Jan. 5, 1921, Konolfingen, near Bern, Switz.—d. Dec. 14, 1990, Neuchâtel), Swiss playwright, novelist, and essayist whose tragicomic plays were central to the post-World War II revival of German theatre.

Dürrenmatt, who was educated in Zürich and Bern, became a full-time writer in 1947.

His technique was clearly influenced by the German expatriate writer Bertolt Brecht, as in the use of parables and of actors who step out of their roles to act as narrators. Dürrenmatt's vision of the world as essentially absurd gave a comic flavour to his plays. Writing on the theatre in *Theaterprobleme* (1955; *Problems of the Theatre*), he described the primary conflict in his tragicomedies as humanity's comic attempts to escape from the tragic fate inherent in the human condition.

His plays often have bizarre settings. His first play, *Es steht geschrieben* (1947; “It Is Written”), is about the Anabaptist suppression in Münster in 1534–36. In it, as in *Der Blinde* (1948; “The Blind Man”) and *Ronulus der Grosse* (1949; *Ronulus the Great*), Dürrenmatt takes comic liberties with the historical facts. *Die Ehe des Herrn Mississippi* (1952; *The Marriage of Mr. Mississippi*), a serious play in the guise of an old-fashioned melodrama, established his international reputation, being produced in the United States as *Fools Are Passing Through* in 1958. Among the plays that followed were *Der Besuch der alten Dame* (1956; *The Visit*); *Die Physiker* (1962; *The Physicists*), a modern morality play about science, generally considered his best play; *Der Meteor* (1966; *The Meteor*); and *Porträt eines Planeten* (1970; *Portrait of a Planet*).

In 1970 Dürrenmatt wrote that he was “abandoning literature in favour of theatre,” no longer writing plays but working to produce adaptations of well-known works. In addition to plays, Dürrenmatt wrote detective novels, radio plays, and critical essays.

Durrës, Italian DURAZZO, Serbo-Croatian DRAČ, primary seaport of Albania, lying on the Adriatic coast, west of Tiranë.

Founded as Epidamnus by Greeks from Corcyra and Corinth in the 7th century BC, it was seized by the Illyrian king Glaucias in 312 BC. It later passed to the Romans, who called it Dyrrhachium and made it the terminus of their military highway (Via Egnatia), which led past Elbasan and Lake Ohrid across the Balkan Peninsula to Thessalonica (now Thessaloniki, Greece) and the east. It thereby became the most important port of Illyricum. In the 4th century AD it became capital of Epirus Nova (a Roman province), and an archbishopric was created there in 449. Several well-preserved Roman arenas have been excavated in the old quarter of the city.

The town was besieged by the Ostrogoth Theodoric in 481 and attacked by Bulgars in the 10th and 11th centuries. It was captured in 1082 by the Norman adventurer Robert Guiscard and, after passing to the Byzantines, fell (1185) to King William II of Sicily. Early in the 13th century, Durrës passed to the Venetians, in 1258 to King Manfred of Sicily, and in 1272 to Charles I of Anjou, king of Naples and Sicily. It was annexed (1333) by Achaea, a Greek principality, and was captured in 1336 by the forces of Stefan Dušan, king of the Serbs. Upon Dušan's death (1355) it passed to the Albanian family of Thopias. It was ceded to Venice in 1392, but the Turks captured it in 1501 and held it until their defeat in the First Balkan War (1912–13). It was declared capital of an independent Albania in 1913 but was occupied in 1914 by Prince Wilhelm zu Wied, who was sponsored by a conference of European powers. The town was taken in World War I by Austrian and then Italian forces, the latter withdrawing in 1920. On April 7, 1939, Durrës was the main port of disembarkation for Fascist Italy's invasion of Albania.

The port of Durrës has become a main channel for the import of foodstuffs into Albania. The port installations, destroyed by the Germans in 1944, have been rebuilt, and railway lines link the harbour with Tiranë and other parts of the interior. The city's industries

include shipbuilding and the manufacture of tobacco, plastic, and leather products. Pop. (1989 prelim.) 83,300.

durukuli, also spelled DOUROUCOULI, also called OWL MONKEY, or NIGHT MONKEY (*Aotus*, or *Aotes*, *trivirgatus*), nocturnal Central and South American monkey. The durukuli is of the family Cebidae and is a round-headed animal with small ears and dense, soft, grizzled gray or brown fur. It is distinguished by large, yellow-brown eyes surmounted by white markings that separate three dark bands on the crown. The durukuli is about 25–50 cm (10–20 inches) long, excluding its bushy, nonprehensile tail of about the same length. A loud-voiced forest dweller, it lives in small family groups that sleep together in tree hollows. It emerges at night to feed on insects, fruit, and small animals.

durum wheat, also called DURUM (species *Triticum durum*), hard wheat (*q.v.*) producing a glutinous flour. The purified middlings of durum wheat are known as semolina, used for pasta products.

Duruy, Victor (b. Sept. 11, 1811, Paris, France—d. Nov. 25, 1894, Paris), French scholar and public official who, as national minister of education (1863–69), initiated extensive and controversial reforms.

Duruy taught at the Collège Henri IV from 1833 to 1861. He wrote textbooks and works on ancient Roman and Greek civilization, among them *Histoire des Romaines* . . . , 2 vol. (1843–44). He assisted Napoleon III with his biography of Julius Caesar and was appointed minister of education by him in 1863. Duruy's controversial proposal to introduce free, compulsory primary education was ahead of its time in France and failed, partly because Napoleon III declined to support it. But he did manage to introduce secular secondary education for girls, add modern languages and contemporary history to lycée and college curricula, reorganize teacher training, and begin a kind of extension-course service for the provinces.

Duruy became a senator in 1869 and later returned to academic work, becoming a member of the Académie Française in 1884. His *Histoire des Grecs*, 3 vol. (1886–89), and an enlarged edition in 1891 of *Histoire de France de 1453 à 1815* (1856) renewed his reputation as a scholar.

Durüz (Islāmic sect): see Druze.

Durüz, Mount ad-, Arabic JABAL AD-DURÜZ, also spelled JEBEL ED-DRUZ, French LE DJEBEL DRUZE, mountain just east of as-Suwaydā', southern Syria. Mount ad-Durüz rises to 5,900 feet (1,800 m). The name in Arabic means Mountain of the Druzes.

The Druze, a sect derived from the Isma'īlīte branch of Shi'ite Islām, have been settled in the area of Mount ad-Durüz since the 11th century. There are some 120 Druze villages located on or near the mountain, among them Sālah (Roman Salamanestha), the largest on the eastern slope, and Qanawāt (Roman Canatha), on the west, the seat of the highest ranking *jawwād* (spiritual leader) in the locality. Qanawāt is a place of pilgrimage for the Druze. The entire area of Mount ad-Durüz, which is located strategically on the north-south trade route, contains the remains of many Roman towns and forts.

Dury, John, Dury also spelled DURIE (b. 1596, Edinburgh, Scot.—d. Sept. 26, 1680, Kassel, Hesse-Kassel [Germany]). Scottish Protestant clergyman who was a leading advocate of union of the Lutheran and Reformed churches.

Dury was educated at Sedan, Leyden, and Oxford. By 1630 he had already begun working for unity between the churches, traveling among the courts and churches of the German states. His life became a constant round

of travels, discussions, correspondence, and publishing in the pursuit of his cause. In 1645 he married a wealthy Irish woman. In 1654 he won the support of Oliver Cromwell and the English universities for a fresh effort and traveled through Switzerland, Germany, and the Low Countries, without success. He established a home in Kassel in 1661 and lived there until his death, still campaigning for the union of the churches. He wrote that the only fruit of his efforts was "that I see the miserable condition of Christianity, and that I have no other comfort than the testimony of my conscience."

Duryea, Charles E.; and Duryea, J. Frank, in full CHARLES EDGAR DURYEA and JAMES FRANK DURYEA (respectively b. Dec. 15, 1861, Canton, Ill., U.S.—d. Sept. 28, 1938, Philadelphia, Pa.; b. Oct. 8, 1869, Washburn, Ill., U.S.—d. Feb. 15, 1967, Saybrook, Conn.), inventors of one of the first automobiles—the first that was actually built and operated in the United States.

Charles Duryea entered the rapidly growing bicycle business and displayed a marked inventive talent. In 1886 at the Ohio state fair, he saw a stationary gasoline engine that seemed to him to be sufficiently compact to power a carriage or wagon. By 1891 he had completed a design, and with his brother Frank he then constructed a car and engine in a rented loft in Springfield, Mass. In later years a controversy marred relations between the brothers; Charles claimed that the model was completed to an operable state under his guidance, while Frank asserted that he perfected the engine and transmission while Charles was in Illinois. In any case the car made a successful run in the streets of Springfield on Sept. 22, 1893.

An improved version, largely the work of Frank Duryea, appeared in 1895 and won several races. Thirteen copies of it were manufactured and sold, but the company failed, and the brothers went separate ways. Charles made a number of vehicles, some three-wheeled, and Frank developed the Stevens-Duryea, one of the best known of the early standard makes, a high-priced limousine that continued in production into the 1920s.

Dušan, Stefan (Serbian emperor): see Stefan Dušan.

Duse, Eleonora (b. Oct. 3, 1858, near or in Vigevano, Lombardy, Austrian Empire [now in Italy]—d. April 21, 1924, Pittsburgh, Pa., U.S.), Italian actress who found her great interpretive roles in the heroines of the Italian playwright Gabriele D'Annunzio and of the Norwegian playwright Henrik Ibsen.

Eleonora Duse

By courtesy of the Library of Congress, Washington, D.C.

Most of Duse's family were actors who played in the same touring troupe, and she made her first stage appearance at the age of four in a dramatization of Victor Hugo's *Les Misérables*.

By the age of 14, when she played Juliet at Verona, her talents were already being recognized by critics; but after her family died she moved from one company to another, without a great deal of success, until her appearance at Naples in 1878. This marked the turning point of her career. Her performance there of the title role in Emile Zola's *Thérèse Raquin* won great acclaim, with audiences and critics united in the opinion that a woman's anguish had never before been played with such truth.

In 1882 Duse took an opportunity to watch Sarah Bernhardt perform. The French actress's success in modern roles gave Duse the idea also of appearing in plays by contemporary French dramatists (for she had discovered that Italian audiences were bored by the stale pieces that formed the traditional repertory), and so for three years she acted in a number of plays by the younger Alexandre Dumas. The first of these was Lionette in *La Princesse de Bagdad*, in which she scored a triumph. She followed it up with Cesarine in *La Femme de Claude*. In 1884 she created the title role of Dumas's latest play, *Denise*, and also the part of Santuzza in Giovanni Verga's *Cavalleria rusticana*. With Cesare Rossi, a prominent actor-manager, she toured South America in 1885, but after her return to Italy she formed her own company, the Drama Company of the City of Rome, and with it toured throughout Europe as well as the United States.

In 1894 she met and fell in love with a rising young poet, Gabriele D'Annunzio, and he wrote for her a number of plays. D'Annunzio told the story of their love in his novel *Il Fuoco* (1900; *The Flame of Life*). Aside from D'Annunzio's plays, Duse found an inexhaustible source of self-expression in the dramas of Ibsen. She never tired of playing Nora in *A Doll's House*, Rebecca West in *Rosmersholm*, Ella Rentheim in *John Gabriel Borkman*, and, above all, Ellida in *The Lady from the Sea*. To the title role in *Hedda Gabler* she brought a demonic quality, a touch of the fantastic—deeply troubling to Ibsen when he saw her perform it—as though she had gone beyond the frontiers of realism.

The British playwright George Bernard Shaw was one of the many critics fascinated by Duse's ability to produce an illusion "of being infinite in variety of beautiful pose and motion." He confessed that "in an apparent million of changes and inflexions" he had never seen her at an "awkward angle" (*Dramatic Opinions and Essays*, 1907). She had a thousand faces; her physical command, range, and choice of gesture were superb; and she had a different way of walking for each part. Yet the total effect was of more than "naturalistic" acting: Duse acted not only the reality, she also commented on the characters she played—she "knew" far more about Nora, for instance, than Ibsen's heroine could possibly have known about herself. One of her critics wrote that Duse played what was between the lines; she played the transitions. A tremor of her lips could reveal exactly what went on in her mind; and, where the character's inner life was lacking, because the dramatist had failed his task, she supplied motivation herself. To watch her was to read a psychological novel.

In 1909 Duse quit the stage, mainly for reasons of health. Financial losses incurred during World War I, however, obliged her to emerge from retirement in 1921. Her acting powers were undiminished, but her health was still not good and interfered with her late career. In 1923 she appeared in London and Vienna before she embarked upon her last tour of the United States. The tour ended in Pittsburgh, where she collapsed. Her body was taken back to Italy, and, in compliance with her request, she was buried there in the small cemetery of Asolo.

The most fluent and expressive actress of her day, Eleonora Duse created afresh every role she played and was different in each of them. Her gift was in marked contrast to the talented contemporary star of the French theatre, Sarah Bernhardt, a great technician who always strove to project her own personality from the stage, whatever character she might be playing.

(A.M.N./Ed.)

BIBLIOGRAPHY. E.A. Rheinhardt, *The Life of Eleonora Duse* (1930, reprinted 1969), is a biography that reads like a novel and is basically uncritical—no attempt is made to analyze her acting style. Eva Le Gallienne, *The Mystic in the Theatre* (1966; reissued 1973), is one artist's attempt to evoke the ephemeral fascination of another and the only study that pays attention to Duse's technique and the spiritual aspects of her art. More recent treatments include John Stokes, Michael R. Booth, and Susan Bassnett, *Bernhardt, Terry. Duse* (1988); and William Weaver, *Duse* (1984).

Dušek, Jan Ladislav (Bohemian musician): see Dussek, Jan Ladislav.

Dushan, Stephen (Serbian emperor): see Stefan Dušan.

Dushanbe, also spelled DUŠANBE, formerly (until 1929) DYUSHAMBE, or DIUSHAMBE, or (1929–61) STALINABAD, city and capital of Tajikistan. It lies along the Varzob (Dushanbinka) River in the Gissar valley, in the south-west of the republic. It was built in the Soviet period on the site of three former settlements, of which the largest was named Dyushambe (Tajik *dush*, meaning "Monday," its bazaar day). Dyushambe was for long a part of the khanate of Bukhara, and it suffered severely in the fighting that followed the overthrow of the emir by Soviet troops in 1920. In 1924 the site was chosen to serve as the capital of the new Tajik Autonomous S.S.R. (from 1929 to 1991 Tajik S.S.R., thereafter Tajikistan), and rapid industrial and population growth followed. The planned city has wide, straight, tree-lined streets, large public buildings, and several squares and parks. Except in the centre, most of the buildings are one-story because of the danger of earthquakes. The summer heat is mitigated by breezes from the mountains to the northeast.

An important transport junction, Dushanbe accounts for much of the republic's industrial output. The city's light industries include a large textile combine and plants producing automatic looms, electric cable, and domestic refrigerators. The city houses the Tajik Academy of Sciences (1951), the Tajik State University (1948), and medical, teacher-training, agricultural, and polytechnic institutes, as well as embroidery workshops; there are also several theatres. The population is predomi-

nantly Russian and Tajik; other nationalities include Tatars and Ukrainians. Pop. (1998 est.) 513,000.

Dushman, Saul (b. July 12, 1883, Rostov, Russia—d. July 7, 1954, Toronto, Ont., Can.), Russian-American physical chemist, author of several standard scientific textbooks.

Dushman immigrated to America in 1891, later entering the University of Toronto and receiving his doctorate in 1912. That year he joined the General Electric Research Laboratory, where he rose to the post of assistant director (1928–48). During the 1920s, he conducted significant research in thermionics, the study of the electrically charged emissions of incandescent substances. His first book, *The Production and Measurement of High Vacuum* (1922), was for many years a standard reference. He wrote *Quantum Theory and Atomic Structure* (1931) and *Elements of Quantum Mechanics* (1938) to provide chemists with a basic knowledge of physics. He achieved international recognition for *Scientific Foundations of Vacuum Technique* (1949). Dushman's *The Fundamentals of Atomic Physics* (1951) was designed to spread an understanding of new developments in the physical sciences.

Dussek, Jan Ladislav, Dussek also spelled DUŠEK, or DUSIK (b. Feb. 12, 1760, Čáslav, Bohemia [now in Czech Republic]—d. March 20, 1812, St. Germain-en-Laye, France), Bohemian pianist and composer, best known for his piano and chamber music.

Dussek, detail of a drawing by Pierre Condé, 19th century

The Andre Meyer Collection—J.P. Ziolo

The son of a cathedral organist, Dussek studied music with his father and showed great skill as a pianist and organist at an early age. He sang in the choir at Iglau (Jihlava) and later studied theology at Prague. After working as an organist, in 1782 he made his debut as a virtuoso pianist in the Netherlands, where he attained a great reputation and wrote a large number of "accompaniment sonatas" for pianoforte and strings. In Hamburg that same year he studied under C.P.E. Bach. He subsequently toured as a pianist in Berlin, St. Petersburg, and Paris and in Italy. He made a successful debut in 1790 in London. There he established a music shop, but the business failed, and in 1799 Dussek fled from England to escape his creditors. He subsequently stayed in Hamburg and Berlin and lived in the household of Charles-Maurice de Talleyrand in Paris from about 1807 until his death.

As a pianist Dussek possessed great dexterity and could elicit a singing tone that was much praised by his contemporaries. He is said to have been the first pianist to place his piano sideways on the platform, so that the public could see a profile view of the performer.

Dussek's own musical compositions include a considerable number of pianoforte sonatas and concerti and numerous chamber works for piano and strings. His piano sonatas represent him at his best; and, though his works are largely forgotten, he influenced the growth of piano technique, both as pianist and as composer.

Düsseldorf, Regierungsbezirk (administrative district), west-central North Rhine-Westphalia Land (state), western Germany. Düsseldorf is bordered by The Netherlands to the west and the *Regierungsbezirke* of Münster to the northeast, Arnsberg to the east, and Köln to the south. The district occupies an area of 2,042 square miles (5,288 square km) and consists of the northern portion of the larger historic region of the Rhineland (*q.v.*). Düsseldorf *Regierungsbezirk* takes its name from that of the capital city of the Land and administrative seat of the district.

Germany's two largest axes of population, aligned north-south along the Rhine River and east-west along the Ruhr River and foothills of the Middle Rhine Highlands, intersect in the district of Düsseldorf. One of Europe's leading industrial regions, the area owes its development to the immense Ruhr bituminous coalfield, which is situated largely between the Ruhr and Lippe rivers and extends west of the Rhine and east into Münster and Arnsberg. A dense network of roads, railroads, and inland waterways serves the Rhine-Ruhr industrial complex, which is centred primarily on iron and steel processing, chemical manufacturing, and engineering. Düsseldorf is the most densely populated *Regierungsbezirk* in Germany. Three cities in the Ruhr complex of Düsseldorf—Essen, the largest city in North Rhine-Westphalia, Düsseldorf, and Duisburg—have populations of more than 500,000. Essen's highly diversified industries produce iron and steel, machinery, chemicals, glass, electrical equipment, and consumer goods. The city of Düsseldorf produces iron and steel and is a banking and administrative centre. Duisburg, located at the confluence of the Rhine and Ruhr rivers, is the largest inland port in Europe and produces iron and steel, machinery, chemicals, and textiles.

The northern extent of Bergisches Land, an area that was once the county and duchy of Berg, lies southeast of the Rhine-Ruhr intersection. This region's economy is largely dependent on the Ruhr coalfield. Light forms of iron and steel processing constitute its major economic activity. Products are generally of the highly finished variety, such as cutlery from Solingen, hand tools from Remscheid, and locks and keys from Velbert. Wuppertal is the chief city of Bergisches Land and is an important textile centre specializing in the manufacture of synthetic fibres.

The Lower Rhineland borders the Rhine-Ruhr complex to the west and north. Market gardens cultivated on the Rhine plain near the city of Düsseldorf supply fresh fruits and vegetables to the *Regierungsbezirk's* large urban centres. South of Düsseldorf, fertile loess-covered plains support large crops of wheat and sugar beets. North and west of Düsseldorf are less densely populated plains in which dairy farming and food processing are the primary sources of income, though the cities of Mönchengladbach and Krefeld are important textile centres.

The majority of the population of Düsseldorf *Regierungsbezirk* are descendants of the Rheinfranken (Rhineland Franks) and speak a Lower Franconian dialect. Cultural identity in the urban areas, however, has dissipated as a result of heavy immigration from a variety of foreign areas, including eastern Europe, the eastern Mediterranean, and The Netherlands. Roman Catholics and Protestants are about equally represented in the district. Higher education in the district is centred at

universities in Essen, Düsseldorf, Wuppertal, and Duisburg. Pop. (1989 est.) 5,108,646.

Düsseldorf, city, capital (1946) of North Rhine-Westphalia *Land* (state), western Germany. It lies mainly on the right bank of the Rhine River, 21 miles (34 km) northwest of Cologne. It is the administrative and cultural centre of the industrial Rhine-Ruhr area. First mentioned in 1159, Düsseldorf ("Village on the Düssel," a small tributary of the Rhine) was chartered in 1288 by the count of Berg and was the capital of the duchies of Berg and Jülich from 1511 until it passed to the Palatinate-Neuberg line in 1609. Although the town suffered considerably in the Thirty Years' War and the War of the Spanish Succession, it revived under the elector palatine Johann Wilhelm II (Jan Wellem). After being the capital of the short-lived Napoleonic grand duchy of

Portion of Der Neue Zollhof office complex, Düsseldorf, Ger.

Doris Puklekowski—AKG Berlin

Berg (1805–13), the town passed to Prussia in 1815. Rapid commercial and economic growth followed the establishment of iron and steel industries in the 1870s. After the widespread devastation suffered during World War II, many of the city's old buildings were repaired and many new buildings erected.

Düsseldorf's moated and tree-lined shopping street called the Königsallee is well known. Notable landmarks in the city include the 13th–14th-century St. Lambertuskirche, whose crooked tower has become the town symbol, and the old town hall (1567–88). Of the castle of the electors palatine, burned in 1872, only the tower survives. Other reminders of Düsseldorf's illustrious past include Jägerhof Castle (1752–63), which houses the town historical collection; Benrath Castle (1755–73), built by Nicolas de Pigage; and the remains of the palace of Frederick I Barbarossa.

In the nearby Neanderthal valley is the Feldhofer Cave, where the remains of Neanderthal man were first discovered in 1856. Düsseldorf claims the first German skyscraper, the Wilhelm-Marx-Haus (1924). Among the city's numerous cultural institutions, the museum of ceramics, the *Land* museum, and the city library (housing a collection of works by and about a native son, the poet Heinrich Heine) are particularly notable. The University of Düsseldorf was founded in 1965; there is also an academy of art (founded 1767), a conservatory, and several technical institutes.

Düsseldorf has three harbours on the Rhine and one of the nation's busiest civil airfields, at Lohausen. The city is a banking and wholesale centre and is the administrative seat of many of the Ruhr's businesses. Its industries include iron, steel, chemicals, glass, and textiles. Pop. (1998 est.) 570,969.

Düsseldorf school, painters who studied at the Düsseldorf academy (now Düsseldorf State Academy of Art) and whose work showed the

influence of its insistence on hard linearism and elevated subject matter. The academy of painting in Düsseldorf was founded in 1767 and attracted students from throughout Europe and the United States from the early 1830s through the 1860s.

During the period of its greatest allure, the academy was directed by Wilhelm von Schadow, and many followers of the Nazarenes (a group that looked to pre-Renaissance styles and emphasized religious subject matter) were on the faculty. This, in large measure, accounts for the melodramatic compositions that the school's students of history painting exhibited. The Düsseldorf school's basic style combines elements of the linearism and drawing techniques of the Neoclassicists with the subject matter and gesture of the Romantics. Colour and texture were suspect, and a concentration on drawings and organized composition was stressed. Emanuel Leutze's "Washington Crossing the Delaware" (1851; Metropolitan Museum of Art, New York City) is an example of this style.

In the mid-19th century the American contingent of students at Düsseldorf was so large that the academy was looked on as a normal experience for the American art student. Such notable American painters as George Caleb Bingham, Albert Bierstadt, and Worthington Whittredge all studied there and subsequently passed on the hard-edged, meticulous lines of the Düsseldorf school to countless other American painters.

Dust Bowl, a section of the Great Plains of the United States that extended over southeastern Colorado, southwestern Kansas, the panhandles of Texas and Oklahoma, and northeastern New Mexico.

The term Dust Bowl was suggested by conditions that struck the region in the early 1930s. The area's grasslands had supported mostly stock raising until World War I, when millions of acres were put under the plow in order to grow wheat. Following years of overcultivation and generally poor land management in the 1920s, the region—which receives an average rainfall of less than 20 inches (500 mm) in a typical year—suffered a severe drought that lasted several years in the early 1930s. The region's exposed topsoil, robbed of the anchoring, water-retaining roots of its native grasses, was carried off by heavy spring winds. "Black blizzards" of windblown soil blocked out the sun and piled the dirt in drifts. Occasionally the dust storms swept completely across the country to the East Coast. Thousands of families were forced to leave the region at the height of the Great Depression in the early and mid-1930s.

The wind erosion was gradually halted with federal aid; windbreaks were planted and much of the grassland was restored. By the early 1940s the area had largely recovered.

dust devil, also called SAND DEVIL, small, brief whirlwind commonly occurring in a desert in the early afternoon. *See* tornado.

Dusun, also called KADAZAN, largest indigenous ethnic group in the Sabah region of the island of Borneo that is part of Malaysia. The Dusun inhabit northern Borneo and are grouped along the coastal plain from Kudat to Beaufort and in the hills around Tambunan. The Dusun are of Proto-Malay stock; they migrated from Asia and were originally headhunters. In the late 20th century they numbered about 315,000 and made up about one-third of the population of Sabah. They speak Kadazan, an Austronesian language. Originally the Dusun lived in large kinship groups in longhouses with each village including 150–200 persons. Many now have individual huts for smaller family units. Irrigated wet rice is the principal crop, supplemented by slash-and-burn agriculture, including dry rice, corn (maize), and sweet potatoes. They were

the first native group in Borneo to use the plow. The western Dusun form much of the labour force in local rubber production. Dusun society is based on patrilineal descent groups; marriage within a descent group is forbidden. The Dusun are animists, though many have converted to Roman Catholicism; priestesses conduct a variety of agricultural and communal rituals.

Dutch barge dog: *see* Keeshond.

Dutch bond, also called FLEMISH BOND, form of bonding courses of stones or bricks in walling. *See* bond.

Dutch cheese: *see* cottage cheese.

Dutch East India Company, byname of UNITED EAST INDIA COMPANY, Dutch VEREENIGDE OOST-INDISCHE COMPAGNIE, trading company founded by the Dutch in 1602 to protect their trade in the Indian Ocean and to assist in their war of independence from Spain. The company prospered through most of the 17th century as the instrument of the powerful Dutch commercial empire in the East Indies. It was dissolved in 1799.

The Dutch government granted the company a trade monopoly in the waters between the Cape of Good Hope and the Straits of Magellan with the right to conclude treaties with native princes, to build forts and maintain armed forces, and to carry on administrative functions through officials who were required to take an oath of loyalty to the Dutch government. Under the administration of forceful governors-general, most notably Jan Pieterzoon Coen (1618–23) and Anthony van Diemen (1636–45), the company was able to defeat the British fleet and largely displace the Portuguese in the East Indies.

In 1619 the company changed the name of Jacatra (now Jakarta) to Batavia and used it as a base to conquer Java and the outer islands. By the late 17th century the company had declined as a trading and sea power and had become more and more involved in the affairs of Java. By the 18th century the company had changed from a commercial-shipping enterprise to a loose territorial organization interested in the agricultural produce of the Indonesian archipelago. Toward the end of the 18th century the company became corrupt and seriously in debt. The Dutch government eventually revoked the company's charter and took over its debts and possessions in 1799.

Dutch East Indies, also called NETHERLANDS EAST INDIES, Dutch NEDERLANDS OOST-INDIË, or NEDERLANDSCH-INDIË, one of the overseas territories of The Netherlands until December 1949, now Indonesia. This territory was made up of Sumatra and adjacent islands, Java with Madura, Borneo (except for North Borneo, which is now part of Malaysia and of Brunei), Celebes with Sangihe and Talaud islands, the Moluccas, and the Lesser Sunda Islands east of Java (excepting the Portuguese half of Timor and the Portuguese enclave of Oé-Cusse). Netherlands New Guinea (renamed Irian Jaya) was also ceded to Indonesia in August 1962; this comprised the territory on the island of New Guinea west of 141° E, with the offshore islands of Waigeo, Salawati, and Misool.

During World War II the entire Dutch East Indies, excepting a part of southern Netherlands New Guinea, was occupied by Japan. The years 1945–49 formed a transition period in which The Netherlands unsuccessfully tried to regain control of the islands; the islands achieved independence as the new nation of Indonesia in 1949.

Dutch elm disease, widespread fungoid killer of elms, first described in The Netherlands. The causal fungus, *Ceratocystis ulmi*,

was probably introduced into Europe from Asia during World War I. The disease was first identified in the United States in 1930. A federal eradication campaign in the late 1930s and early '40s sharply reduced the numbers of infected elms but could not stop the disease's spread into regions wherever the very susceptible American elm (*Ulmus americana*) grows.

English elm afflicted with Dutch elm disease
A to Z Botanical Collection—EB Inc

The leaves on one or more branches of a stricken tree suddenly wilt, turn dull green to yellow or brown, curl, and may drop early. Young, rapidly growing elms may die in one to two months; older or less vigorous trees sometimes take two years or more to succumb. A brown to black discoloration occurs in the white sapwood of wilting branches just under the bark. Because symptoms are easily confused with other diseases, especially elm phloem necrosis and diebacks, positive diagnosis is only possible through laboratory culturing. The fungus can spread up to 50 feet (15 m) from diseased to healthy trees by natural root grafts. Overland spread of the fungus normally occurs by the smaller European elm bark beetle (*Scolytus multistriatus*), less commonly by the American elm bark beetle (*Hylurgopinus rufipes*). Female beetles seek out dead or weakened elm wood to excavate an egg-laying gallery between the bark and the wood. If the fungus is present, tremendous numbers of fungal spores (conidia) are produced in the galleries. When young adult beetles emerge through the bark, many carry the spores on and in their bodies. The infection of healthy elms occurs when beetles feed in the leaf axils and young twig crotches of healthy trees. Some spores are dislodged and get into these trees' water-conducting vessels (xylem), in which they reproduce rapidly by yeastlike budding. The weakened elm is quickly colonized by hordes of beetles, and the cycle is repeated.

The control of Dutch elm disease largely involves the exclusion of beetles. All dead, weak, or dying elm wood with tight bark should be burned, debarked, or buried before elms leaf out in early spring. A single, annual dormant spray that coats all bark surfaces with long-lasting insecticide (e.g., methoxychlor) can kill many beetles before they deposit fungus spores. Claims of fungal control have been made for certain fungicides that are injected into the sapwood. Such measures appear to be more protective than curative. Although other species of elms, as well as species of the related

Zelkova and *Planera*, are susceptible in varying degrees, the smooth leaf (*Ulmus carpinifolia*), Chinese (*U. parvifolia*), and Siberian (*U. pumila*) elms have shown good resistance, and experiments with hybrids of American and Asiatic elms have met with much success.

Dutch language, the Netherlandic (Netherlandish) language as spoken in The Netherlands, together with the same language in northern Belgium, which is popularly called Flemish. In the European Middle Ages, the language was called *Dietsc*, or *Duutsch*, historically equivalent to German *Deutsch* and meaning simply "language of the people," as contrasted with Latin, which was the language of religion and learning. The form *Duutsch* was borrowed into English and gives modern "Dutch." The official name of the language is *Nederlands*, or Netherlandic. In The Netherlands it is also called *Hollands* (Hollandish), reflecting the fact that the standard language is based largely on the dialect of the old province of Holland (now North Holland and South Holland). See Netherlandic language.

Dutch literature, the body of written works in the Netherlandic language as spoken in The Netherlands and northern Belgium. Although the Flemish literature of Belgium is an integral part of Dutch literature, it is treated separately in the MACROPAEDIA article Belgian Literature.

A brief account of Dutch literature follows. For full treatment, see MACROPAEDIA: Dutch Literature.

The development of Dutch language and literature was gradual. Among the oldest Dutch texts to have survived are the early 10th-century "Wachtendonck Psalm Fragments" in Middle Low Franconian. Most medieval literature in Dutch, however, originated in what is now Belgium, and one of the earliest writers claimed by the Dutch, Heinrich von Veldeke, is also claimed by the Germans. The northern provinces gained prominence in the 14th century with Melis Stoke's rhyming chronicles and the religious writings of the *Devotio Moderna* ("Modern Devotion") movement. The lively prose of Dirc Potter's *Der minnen loep* ("The Lens of Love") was produced in the early 15th century, and for 200 years the crafted poetry and allegorical plays of the *rederijkerskamers*, or "chambers of rhetoric" (organized centres of culture), dominated literary life.

The Netherlands' revolt against Spanish rule in the 16th century produced a number of popular political songs, or *Geuzenliederen*. Jan van Hout became the first Dutch Renaissance poet. Dirk Volckertszoon Coornhert's pithy prose and Henric Laurenszoon Spiegel's difficult poetry were concerned with questions of moral philosophy. After the northern provinces gained independence from Spain, the Dutch republic rapidly became a major political and economic power in Europe and overseas. Culturally, too, the 17th-century "Golden Age" displayed an extraordinary wealth of talent. Gerbrand Adriaenszoon Bredero wrote touching lyrics and starkly realistic comedies such as *Spaanschen Brabander* (1617; *The Spanish Brabander*), and Pieter Corneliszoon Hooft moved from Petrarchan love sonnets to classical drama and on to majestic historical prose. Whereas Joost van den Vondel's poems were direct and personal, his biblical tragedies, such as *Lucifer* (1654) and *Jeptha* (1659), struck a balance between Baroque grandeur and Aristotelian classicism. The wit, crudition, and versatility of Constantijn Huygens' verse is unparalleled in Dutch, although Jacob Cats, who wrote didactic poetry, and the more intimate Jan Luyken were perhaps more widely read.

In the early 18th century, French classicism proved a stifling influence, but the poet Hubert Poot combined elegance with naturalness. Justus van Effen's spectacular prose proved

more momentous, as did Betje Wolff and Aagje Deken's epistolary novel *Sara Burgerhart* (1782). By the end of the century the poets Antony Staring and Willem Bilderdijk foreshadowed the Romantic era. The first half of the 19th century was the heyday of the Dutch historical novel, as practiced by Jacob van Lennep, Aernout Drost, and Anna Bosboom-Toussaint, while Everhardus Johannes Potgieter, R.C. Bakhuizen van den Brink, and Conrad Busken Huet raised critical standards in the periodical *De Gids* ("The Guide"). The homely humour of Nicolaas Beets's *Camera obscura* (1839) found a receptive audience, but it is the revolutionary and hard-hitting novel *Max Havelaar* (1860) by Multatuli (pseudonym of Eduard Douwes Dekker) that became the lasting landmark of 19th-century Dutch prose. Toward the end of the century the periodical *De Nieuwe Gids* ("The New Guide") heralded a more general literary revival, with the poets Willem Kloos, Albert Verwey, and Herman Gorter; the dramatist Herman Heijermans; and the prose writers Lodewijk van Deyssel, Frederik van Eeden, Louis Marie Anne Couperus, and Marcellus Emants.

In the first decades of the 20th century the wry Nescio (pseudonym of J.H.F. Grönloh), the Neoromantic Arthur van Schendel, and the restless J.J. Slauerhoff continued this line, while the major poets were Jan Hendrik Leopold, A. Roland Holst, Hendrik Marsman, J.C. Bloem, and Martinus Nijhoff. In the interwar period Menno ter Braak and Edgar du Perron were mainly known for their essays, and about mid-century the outstanding figures were the prolific novelist Simon Vestdijk and the strikingly original poet Gerrit Achterberg. In the postwar years Willem Frederik Hermans, Harry Mulisch, and Gerard Reve were the leading prose writers, and among the poets, Lucebert (pseudonym of L.J. Swaanswijk) and Gerrit Kouwenaar came to the fore in the 1950s, later followed by Rutger Kopland, J. Bernlef, and H.C. ten Berge.

Dutch metal, brass with a yellow colour simulating that of gold. The percentage of copper ranges from 85 to 88, the remainder being zinc. As the zinc content becomes higher, the colour becomes paler. Highly ductile and malleable. Dutch metal is used in bronzing and in preparing imitation gold leaf. Gilding with Dutch metal is far less costly than gilding with gold, but the coating of Dutch metal tarnishes rapidly unless coated with lacquer. See also brass.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Dutch Reformed Church, Afrikaans NEDERDUTSE GEREFORMEERDE KERK (NGK), South African denomination that traces its beginnings to the Reformed tradition of the first white settlers who came to South Africa from the Netherlands in the mid-17th century. It is the main church of the Afrikaans-speaking whites, and its present membership covers about 40 percent of the Republic of South Africa's white population. Two smaller Reformed denominations are sometimes grouped as Dutch Reformed churches, namely, the more liberal Dutch Reformed Church (Nederduits Hervormde Kerk; NHK) and the more conservative Reformed Church of South Africa (Gereformeerde Kerk van Suid-Afrika). The NGK is governed by a general synod that meets every four years. Headquarters are in Cape Town.

The turbulent history of the church is closely intertwined with that of the country. While its 1857 synod resolved it is "desirable and scriptural (that) wherever possible our members from among heathen be received and incorporated in our existing congregations," subse-

quent resolutions led to the establishment of so-called daughter churches, notably the Dutch Reformed Church in Africa (also known as the Bantu Church) in 1859, the Dutch Reformed Mission Church (for Coloured, or racially mixed, persons) in 1881, and the Indian Reformed Church in Africa in 1947. The NGK until 1986 supported the government's policy of apartheid (separate development for the races) and had commissioned several studies to develop theological justification for it. Their findings were rejected by Reformed churches in Europe and the United States, and the NGK was excluded from membership in the World Alliance of Reformed Churches (WARC) at Ottawa in August 1982. At the same time, the WARC pronounced apartheid to be a heresy in violation of the Scriptures. The NGK withdrew from the World Council of Churches in 1961 and severed relations with the Netherlands Reformed Church in The Netherlands in 1978. In 1986, however, the Dutch Reformed Church denounced its own former attempts at the biblical justification of apartheid, and in 1989 it condemned apartheid as a sin.

Dutch Reformed Church in Africa, Afrikaans NEDERDUITSE GEREFORMEERDE KERK IN AFRIKA, denomination formed in 1859 by the all-white Dutch Reformed Church in South Africa for its black African mission congregations. It has the same structure, doctrine, traditions, and customs as the mother church, which retains extensive control over it by supplying 80 percent of its budget. Its clergy may not serve white congregations; intercommunion between the two churches is prohibited even as a symbol of ecumenical unity. Leaders of the Dutch Reformed Church in Africa protest apartheid (separate development for the races) in church and society and have endorsed the World Alliance of Reformed Churches' exclusion in 1982 of the mother church, an act that commits the daughter church eventually to the severance of all ties. The Dutch Reformed Church's decision in 1989 to condemn apartheid averted an irreparable split between it and its African daughter church, however. The headquarters of the Dutch Reformed Church in Africa are in Bloemfontein, S.Af.

Dutch Reformed Mission Church in South Africa, Afrikaans NEDERDUITSE GEREFORMEERDE SENDINGKERK IN SUID-AFRIKA, denomination established in 1881 by three congregations that separated from the white Dutch Reformed Church in South Africa to form the nucleus of a semiautonomous denomination for people of racially mixed parentage (Coloureds). The church parallels the mother church in structure, doctrine, and customs. Efforts to end its financial dependency on the white church and curtail the latter's influence mounted after the mid-20th century. At its Synod of 1962, the Dutch Reformed Mission Church declared its membership open to all races, including white opponents of apartheid. Headquarters are in Kakamas, Cape Province, S.Af.

Dutch Republic, formally REPUBLIC OF THE UNITED NETHERLANDS, Dutch REPUBLIEK DER VERENIGDE NEDERLANDEN (1588–1795), state whose area comprised approximately that of the present Kingdom of The Netherlands and which achieved a position of world power in the 17th century. The republic consisted of the seven northern Netherlands provinces that won independence from Spain from 1568 to 1609, and it grew out of the Union of Utrecht (1579), which was designed to improve the military capability of its signatories within the larger union of the rebelling provinces. As the southern provinces (later Belgium and Luxembourg) were recovered by Spain, however, the provinces bound by the Utrecht pact became a new, independent state.

For the next two centuries political control of the decentralized state shifted repeatedly between the province of Holland and the princes of Orange, who held the office of stadholder and represented a greater degree of centralization. This internal political stress, however, did not prevent the ascendancy of the Dutch Republic in the 17th century. In this "Golden Age" the republic developed a world colonial empire far out of proportion to its resources, played a notable role in the coalition wars against Louis XIV of France, emerged as a centre of international finance, and served as a notable cultural centre.

The republic experienced an equally spectacular decline in the 18th century. It was exhausted by its long land wars, its fleet was in a state of neglect, and its colonial empire stagnated and was eclipsed by that of England. In 1795 the republic collapsed under the impact of a Dutch democratic revolution and invading French armies.

Dutch War, also called FRANCO-DUTCH WAR (1672–78), the second war of conquest by Louis XIV of France, whose chief aim in the conflict was to establish French possession of the Spanish Netherlands after having forced the Dutch Republic's acquiescence. The Third Anglo-Dutch War (1672–74) formed part of this general war.

After having signed (1670) the secret Treaty of Dover with England against the Dutch, Louis mounted an invasion of the Dutch Republic in May 1672 that was supported by the British navy. The French were able to quickly occupy three of the seven Dutch provinces, but then the Dutch opened the dikes around Amsterdam, flooding a large area, and their army, under William III of Orange, rallied behind this "Water Line." By autumn William had begun land operations against the French invaders. Meanwhile, the Dutch navy, under Admiral M.A. de Ruyter, managed to stave off attacking English and French fleets in battles off Sole Bay in 1672 and off Ostend and Kijkduin in 1673, each time frustrating an invasion of the republic. England then made peace with the Dutch in the Treaty of Westminster of February 1674. In 1673 Spain, the Holy Roman emperor, and Lorraine took the side of the Dutch against France, and so by the end of 1673 the French had been driven out of the Dutch Republic.

But from 1674 to 1678 the French armies, with Sweden as their only effective ally, managed to advance steadily in the southern (Spanish) Netherlands and along the Rhine, defeating the badly coordinated forces of the Grand Alliance with regularity. Eventually the heavy financial burdens of the war, along with the imminent prospect of England's reentry into the conflict on the side of the Dutch, convinced Louis to make peace despite his advantageous military position. The resulting Treaties of Nijmegen (1678–79) between France and the Grand Alliance left the Dutch Republic intact and France generously aggrandized in the Spanish Netherlands.

Dutch Wars: see Anglo-Dutch Wars.

Dutch West India Company, byname of WEST INDIA COMPANY, Dutch WEST-INDISCHE COMPAGNIE, Dutch trading company, founded in 1621 mainly to carry on economic warfare against Spain and Portugal by striking at their colonies in the West Indies and South America and on the west coast of Africa. While attaining its greatest success against the Portuguese in Brazil in the 1630s and '40s, the company depleted its resources and thereafter declined in power. It was dissolved in 1794.

Governed by a board representing various regions of the Netherlands, the company was granted a monopoly of the trade with the Americas and Africa and the Atlantic regions between them. With military and financial support from the States General (the Dutch

national assembly), the company acquired ports on the west African coast to supply slaves for plantations developed in the West Indies and South America. The company's trade, however, was never sufficient to finance operations against Spain, Portugal, and England in areas where the latter were well equipped to defend themselves.

Using booty acquired from the capture by the Dutch seaman Piet Heyn of part of a Spanish treasure fleet off Cuba in 1628, the company challenged the Portuguese hold on Brazil beginning in 1630 and attained its greatest success during the administration of Count John Maurice (1636–44). The effort proved too costly, however, and the Dutch company capitulated to the Portuguese in 1654.

The company also established several colonies in the West Indies and Guiana between 1634 and 1648, including Aruba, Curaçao, and Saint Martin, but later lost many of them to the French. The Dutch colony in North America, New Netherland (New York after 1644), became a province of the company in 1623. A combination of low Dutch immigration, autocratic administration, and underinvestment, however, damaged the ability of New Netherland to compete with the neighbouring English colonies, and it was ceded to the English in 1667.

The Dutch West India Company was much less successful than the Dutch East India Company, its counterpart in Southeast Asia. The West India Company was taken over by the state in 1791 and was dissolved in the wake of the French invasion of the Dutch Republic in 1794.

Dutchman's-breeches (species *Dicentra cucullaria*), plant of the fumitory family (Fumariaceae) named for its sprays of tremulous,

Dutchman's-breeches (*Dicentra cucullaria*)

John H. Gerard

yellow-tipped white flowers that fancifully resemble the wide-legged, traditional pantaloons worn by Dutch men. The plant is native throughout eastern and midwestern North America, usually in open woodlands. The gray-green foliage grows from white underground tubers and is not as tall as the flowering stalk, which also springs directly from the ground. It grows best in the shady wild garden, preferably in a wind-free location.

Dutchman's-pipe, also called PIPE VINE (species *Aristolochia durior*), climbing vine of the birthwort family (Aristolochiaceae), native to central and eastern North America. The heart-shaped or kidney-shaped leaves are about 15 to 35 cm (about 6 to 14 inches) wide. The yellowish brown or purplish brown tubular

flowers resemble a curved pipe and are about 8 cm (3 inches) long. Dutchman's-pipe is a

Dutchman's-pipe (*Aristolochia durior*)

A.J. Huxley

rapid grower that is often planted as a screen or an ornamental on porches and arbours.

Dutra, Eurico Gaspar (b. May 18, 1885, Cuiabá, Brazil—d. June 11, 1974, Rio de Janeiro), soldier and president of Brazil (1945–50), whose administration was noted for its restoration of constitutional democracy.

Dutra was commissioned a second lieutenant in the cavalry in 1910 and received routine assignments and promotions for the next 22 years. He consistently supported the established government against all revolutionary movements. Dutra thus opposed Getúlio Dornelles Vargas, who seized power in a coup in 1930, but he later defended Vargas in the 1932 São Paulo revolt and became one of the principal figures in devising the 1937 constitution for Brazil under Vargas' rule. Eight years later (October 1945), when Vargas attempted to prevent elections, Dutra led a successful coup and was elected president in December with the support of the Social Democratic Party. He also gained the support of rural workers and, on Vargas' recommendation, of the Brazilian Labor Party.

Dutra returned Brazil to respected democratic freedoms and strove to improve relations with the United States through the Organization of American States. His administration, however, lacked direction in its financial policy, and, with the resulting public discontent, Vargas won the 1951 election for president.

Dutrochet, Henri, in full RENÉ-JOACHIM-HENRI DUTROCHET (b. Nov. 14, 1776, Néon, France—d. Feb. 4, 1847, Paris), French physiologist who discovered and named the phenomenon of osmosis (the passage of solvent through a semipermeable membrane) and was the first to recognize the role of green pigment in the use of carbon dioxide by plant cells.

Dutrochet studied medicine in Paris (M.D., 1806) and then served as a military medical officer in Spain for several years before giving up the practice of medicine to devote his career to scientific research. When Dutrochet noticed the similarity of physical and chemical processes in plants and animals, he directed his studies toward plant and animal physiology. He was the first to investigate thoroughly the mechanisms of respiration, light sensitivity, and geotropism (orientation in response to gravitation) in plants; and his classical experiments on osmosis included recognition of its role in internal plant transport and diffusion through semipermeable membranes. He constructed an osmometer (a device to measure osmotic pressure), developed a technique to detect heat production in muscle tissue and in

individual plants, showed that mushrooms are the reproductive bodies of the mycelium (mass of fungal filaments), and was one of the first to recognize the importance of individual cells in the functioning of an organism.

Dutrochet's most valuable contributions to science were his emphasis on the similarity of basic processes in all living organisms and his belief that all such processes can be explained in terms of physical and chemical forces.

Dutt, Michael Madhusudan (Bengali poet); see Datta, Michael Madhusudan.

Dutt, Utpal (b. March 29, 1929, Barisal, Bengal [now in Bangladesh]—d. Aug. 19, 1993, Calcutta, India), Indian actor, director, and writer who was a radical figure in Bengali theatre and cinema for over 40 years.

Dutt was educated in Calcutta, where he founded the Calcutta Little Theatre Group in 1947. He twice toured with the Shakespearean International Theatre Company (1947–49; 1953–54) and was acclaimed for his passionate portrayal of Othello. From 1954 he wrote and directed controversial Bengali political plays, notably *Angar* (1959). He was perhaps best known for such political dramas, which he often produced on open-air stages in rural Bengal, as well as for his commitment to communist ideology. He was arrested in 1965 and detained for several months because the ruling Congress Party feared that his play *Kallol* was provoking antigovernment protests in West Bengal. During the 1970s three of his plays drew crowds despite being officially banned.

Dutt appeared in some 200 films and had considerable success as a director, particularly for *Megh* (1961), *Jhar* (1978), and *Mother* (1984). An intense, dramatic actor, he did some of his best work with the directors Satyajit Ray (*Jana Aranya; Agantuk*), Mrinal Sen (*Bhuban Som; Chorus*), and James Ivory (*Shakespeare Wallah; The Guru*). He also published books on Shakespeare and the revolutionary theatre.

Duṭṭhagāmaṇi, also spelled DUṬUGŪMUNU (d. 77 BC, Anurādhapura, Ceylon [now Sri Lanka]), king of Ceylon (101–77 BC) who is remembered as a national hero for temporarily ending the domination of the Indian Tamil Hindus over the Sinhalese, most of whom were Buddhist.

The elder son of a petty Sinhalese king in the southeast, Duṭṭhagāmaṇi made plans to campaign against the Tamils in northern Ceylon by organizing 10 young chiefs to attack. His father opposed the plan and had him bound in chains; he escaped, however, and went into exile until after his father's death. He twice fought his brother, Saddhā Tissa, and won the crown, as well as the state elephant Kaṇḍula, which was instrumental in his later victories. Saddhā Tissa penitently returned and pledged his loyalty to Duṭṭhagāmaṇi's campaign. Duṭṭhagāmaṇi then led his troops and Kaṇḍula north to Anurādhapura, where he defeated and killed the Tamil leader Eḷāra. He later defeated Indian-recruited troops led by Eḷāra's nephew Bhalluka and restored Sinhalese control of the entire island.

Duṭṭhagāmaṇi constructed the huge Brazen Palace in Anurādhapura and commenced building the Ruanveli *dāgaba*, a colossal stupa (shrine) containing the Buddha's begging bowl and many of his bones. Duṭṭhagāmaṇi died before the shrine was completed.

Dutton, Clarence Edward (b. May 15, 1841, Wallingford, Conn., U.S.—d. Jan. 4, 1912, Englewood, N.J.), American geologist and pioneer seismologist who developed and named the principle of isostasy. According to this principle, the level of the Earth's crust is determined by its density; lighter material rises, forming continents, mountains, and plateaus, and heavier material sinks, forming basins and ocean floors.

Dutton joined the U.S. Army as a second

lieutenant in 1862. After the Civil War, he developed an interest in geology. In 1875 he joined the naturalist John Wesley Powell in the U.S. Geographical and Geological Survey of the Rocky Mountain region and spent 10 years exploring the plateaus of Utah, Arizona, and New Mexico. There he investigated volcanic action and the uplifting, sinking, twisting, and folding of the Earth's crust.

Dutton's study of the earthquake that affected Charleston, S.C., in 1886 led him to publish a report (1889) in which he advanced a method for determining the depth of the focal point of an earthquake and for measuring with unprecedented accuracy the velocity of waves. He proposed his principle of isostasy in the paper "On Some of the Greater Problems of Physical Geology" (1892). In 1904 he published the semipopular treatise *Earthquakes in the Light of the New Seismology*. Late in his career Dutton concluded that lava is liquefied by the heat released during decay of radioactive elements and that it is forced to the surface by the weight of overlying rocks.

duumviri (ancient Roman magistrates); see duoviri.

Duun, Olav (b. Nov. 21, 1876, Fosnes, Jøa Island, Norway—d. Sept. 13, 1939, Tønsberg), novelist who is one of the outstanding names in 20th-century Norwegian fiction.

Duun, a former cattle herder and fisherman, entered a seminary at the age of 26. He worked as a folk-school teacher until 1926, when he retired to Holmestrand on the Oslo Fjord to devote himself to writing. His many novels analyze the psychological and spiritual characteristics of peasant life. His masterpiece is a series of novels, collectively entitled *Juvikfolke* (1918–23; "The People of Juvik"), describing the development of a peasant family through several generations and symbolically tracing the development of the Norwegian people from a state of un-self-conscious primitivism to a state of civilized humanism complicated by throwbacks to their earlier violent heritage. The novels in the series have been translated as *Trough of the Waves* (1930), *The Blind Man* (1931), *The Big Wedding* (1932), *Odin in Fairyland* (1932), *Odin Grows Up* (1934), and *Storm* (1935).

Duun wrote in Landsmål, an amalgam of peasant dialects that developed into Nynorsk, one of the official languages of Norway. Although this was not the usual literary language, Duun's works have been influential in raising Nynorsk to literary eminence.

Duvalier, François, byname PAPA DOC (b. April 14, 1907, Port-au-Prince, Haiti—d. April 21, 1971, Port-au-Prince), president of Haiti whose 14-year regime was of unprecedented duration in that country.

François Duvalier, 1963

AP/Wide World Photos

Duvalier graduated in 1934 from the University of Haiti School of Medicine, where he served as a hospital staff physician until 1943, when he became prominently active in the U.S.-sponsored anti-yaws campaign.

A contributor to the daily *Action Nationale* (1934), Duvalier was markedly influenced by

the mystic scholar Lorimer Denis and became a member of Le Groupe des Griots, a circle of writers who embraced black nationalism and voodoo as the key sources of Haitian culture.

A supporter of President Dumarsais Estimé, Duvalier was appointed director general of the National Public Health Service in 1946, and he directed the anti-yaws campaign in 1947–48. He was appointed underminister of labour in 1948 and the following year became minister of public health and labour, a post that he retained until May 10, 1950, when President Estimé was overthrown by a military junta under Paul E. Magloire, who was subsequently elected president. Duvalier returned to his former work with the American Sanitary Mission in 1951–54 and began organizing the resistance to Magloire. By 1954 he had become the central opposition figure and went underground.

After the resignation of Magloire in December 1956, Duvalier's followers participated in most of the six governments that were formed in the succeeding 10 months. Running on a program of popular reform and black nationalism, Duvalier was elected president in September 1957. Setting about to consolidate his power, he reduced the size of the army and, with his chief aide, Clément Barbot, organized the Tontons Macoutes ("Bogeymen"), a private force responsible for terrorizing and assassinating alleged foes of the regime.

When Duvalier was stricken by a heart attack in 1959, Barbot acted in his stead. Upon recovery, the president promptly imprisoned his aide. His manipulation of legislative elections in 1961 to have his term extended to 1967 and other corrupt and despotic measures precipitated a termination of U.S. aid to Haiti. That summer he had Barbot murdered, after the latter, on his release from prison, had attempted an insurrection. Other attempts to overthrow Duvalier were equally unsuccessful.

Late in 1963 Duvalier moved further toward an absolutist regime, promoting a cult of his person as the semidivine embodiment of the Haitian nation. In April 1964 he was declared president for life. Although diplomatically almost completely isolated, excommunicated by the Vatican until 1966 for harassing the clergy, and threatened by conspiracies against him, Duvalier was able to stay in power longer than any of his predecessors. His regime of terrors quelled political dissent, at the same time achieving for Haiti an unusual degree of political stabilization. On Duvalier's death, power was transferred to his son, Jean-Claude ("Baby Doc").

Duvalier, Jean-Claude, byname BABY DOC, French BÉBÉ DOC (b. July 3, 1951, Port-au-Prince, Haiti), president of Haiti from 1971 to 1986.

The only son of François ("Papa Doc") Duvalier, Jean-Claude succeeded his father as president for life in April 1971, becoming at age 19 the youngest president in the world. Partly because of pressure from the United States to moderate the tyrannical and corrupt practices of his father's regime, Duvalier instituted budgetary and judicial reforms, replaced a few older cabinet members with younger men, released some political prisoners, and eased press censorship, professing a policy of "gradual democratization of institutions."

Nevertheless, no sharp changes from previous policies occurred. No political opposition was tolerated, and all important political officials and judges were still appointed by the president. Under Duvalier, Haiti continued a semi-isolationist approach to foreign relations, although the government actively solicited foreign aid to stimulate the economy. Duvalier graduated from secondary school in Port-au-Prince and briefly attended law school at the University of Haiti. In 1980 he married Michele Bennett, who later supplanted Duvalier's hard-line mother, Simone, in Haitian

politics. In the face of increasing social unrest, however, Duvalier and his wife left the country early in 1986, and a six-member council replaced him.

Duvall, Gabriel (b. Dec. 6, 1752, Marietta, near Buena Vista, Md. [U.S.]—d. March 6, 1844, Prince George's county, Md., U.S.), associate justice of the U.S. Supreme Court (1811–35).

By the time that Duvall was admitted to the bar at the age of 26 he had already served for three years as clerk of the Maryland convention. He continued to serve in similar posts and, after its formation, in the state government.

Duvall was elected to Congress in 1794. In 1796 he was named to the Maryland Supreme Court and in 1802 was named by President Thomas Jefferson to be the first comptroller of the U.S. Treasury. He was appointed to the U.S. Supreme Court in 1811 by President James Madison.

Being the colleague of Chief Justice John Marshall and Justice Joseph Story, Duvall wrote relatively few opinions. He is best remembered for his support of the rights of slaves in *Mima Queen and Child v. Hepburn* and *Le Grand v. Darnall*. Despite deafness and failing health, he kept his seat for a number of years to prevent the appointment of a political figure to the court. He resigned in 1835 after being informed that his replacement would be Roger B. Taney.

Duve, Christian René de (b. Oct. 2, 1917, Thames Ditton, Surrey, Eng.), Belgian cytologist and biochemist who discovered lysosomes (the digestive organelles of the cell) and peroxisomes (organelles that are the site of metabolic processes involving hydrogen peroxide). For this work he shared the Nobel Prize in Physiology or Medicine in 1974 with Albert Claude and George Palade.

In the course of research on the action of insulin upon liver tissue in 1949, de Duve observed a delay in the action of enzymes that break down cell material, suggesting the enzymes were enclosed within a membranous envelope. He calculated the probable size of this organelle, christened it the lysosome, and later identified it in electron microscope pictures. He refined the cell fractionation techniques of Claude to isolate the lysosomes and peroxisomes for study.

In 1947 de Duve joined the faculty of the Catholic University of Louvain, Belg., where he had received his M.D. in 1941 and a master's degree in chemistry in 1946. From 1962 he simultaneously headed research laboratories at Louvain, where he became emeritus professor in 1985, and at Rockefeller University, New York City, where he was named emeritus professor in 1988.

Duven (of Millbank), Joseph Duveen, Baron (b. Oct. 14, 1869, Hull, Yorkshire, Eng.—d. May 25, 1939, London), British international art dealer who wielded enormous influence on art tastes in his time, especially in the United States.

The son of Sir Joseph Joel Duveen, of Dutch-Jewish descent, who established the family art business in London in 1877, Duveen began as a young man to buy and sell art on an unprecedented scale. Before 1914 he had established a virtual monopoly of old masters on both sides of the Atlantic. His principal headquarters were in New York City, where he built up the collections of such American collectors as Benjamin Altman, Henry Huntington, Joseph E. Widener, Henry Clay Frick, John D. Rockefeller, and Andrew Mellon. Largely as a result of Duveen's efforts, the great Italian, Dutch, French, and English

masters became widely represented in American museums.

For his services to British art, for the Duveen Wing at the Tate Gallery in London, and for adding a gallery to the British Museum to house the Elgin Marbles, he was knighted in 1919, made a baronet in 1926, and raised to the peerage in 1933. He died without male issue, and the titles became extinct.

Duveneck, Frank (b. Oct. 9, 1848, Covington, Ky., U.S.—d. Jan. 3, 1919, Cincinnati, Ohio), American painter, sculptor, and art teacher, who helped awaken American interest in European naturalism.

Duveneck studied with Wilhelm Dietz at Munich and was greatly influenced by the works of Frans Hals, Rembrandt, and Peter Paul Rubens. An exhibition in Boston in 1875 first attracted attention to his work, which was characterized by dark, earthy colours and broad, painterly brushwork clearly reminiscent of the European masters Duveneck so admired.

Many young American artists studied under him at Munich and Florence between 1878 and 1888 and at Cincinnati, where he was dean of the art academy for many years after 1888. The Cincinnati museum owns the largest collection of his works.

Duvergier de Hauranne, Jean, ABBÉ DE SAINT-CYRAN (b. 1581, Bayonne, France—d. Oct. 11, 1643, Paris), French abbot of Saint-Cyran and a founder of the Jansenist movement. His opposition to Cardinal de Richelieu's policies caused his imprisonment.

Duvergier studied theology at Louvain, Belg., then settled in Paris after taking holy orders. His friendship with Cornelius Otto Jansen, a young champion of Augustinianism, led him to oppose the Louvain Jesuits who stood for Scholasticism. The two studied together from 1611 to 1616, after which Jansen returned to Louvain (1617), and Duvergier became confidential secretary to the bishop of Poitiers, where he met Cardinal de Richelieu. He was ordained priest in 1618 and was made sinecure abbot of Saint-Cyran (1620); thereafter, he was generally called Saint-Cyran.

As western Touraine was the headquarters of French Protestantism, Duvergier aimed his learning against the Huguenots. He dreamed of reforming Roman Catholicism on Augustinian lines. His zeal soon forced him out of Paris, where his attempt to gain the support of influential people led to his friendship with the Arnauld family, leading proponents of Jansenism. In 1637 he established a community that became known as the Solitaires (hermits) in the former convent at Port-Royal des Champs near Versailles.

Under the pseudonym of Petrus Aurelius, Duvergier attacked the Jesuits' precarious utilitarianism and their defiance of episcopal authority. This work so annoyed Richelieu, whom he openly opposed, that Duvergier was imprisoned (May 14, 1638) in Vincennes until Richelieu's death (1642).

Duvel, Jean (b. 1485, Langres, France—d. 1561), French engraver whose style and subject matter had roots in the Middle Ages and in Florentine Mannerism and foreshadowed the highly charged work of late 16th-century France. He painted religious and mystical works at a time when his contemporaries were predominantly concerned with court art.

Very little is known about Duvel. He was a goldsmith and spent most of his life in Langres and Dijon and possibly in Geneva. There is also some evidence that he worked for the French kings Francis II and Henry II.

Duvel's earliest dated engraving, "Annunciation" (1520), is in a pure Italian style. The architectural setting is truly classical, and

the figures reflect a knowledge of contemporary Roman art. His engraving "Judgment of Solomon" is undated but is probably an early work based on Raphael's cartoon of Elymas the sorcerer and borrowings from northern Italian engravings. The depth of Duvet's understanding of High Renaissance Italian art suggests that he must have visited Italy and seen the works of Raphael and his colleagues.

Duvet's two best-known later works are the unicorn series and the "Apocalypse." The former, probably done in the early 1540s, earned the artist the title of Master of the Unicorn. The unicorn engravings point stylistically toward his later works, with less defined space, congested composition, and a touch of the grotesque in the heads.

Duvet's "Apocalypse" reflects the full realization of his imagination. The 24 engravings were published in 1561, but the first plate (a self-portrait) is dated 1555. In subject matter he borrows from the German Albrecht Dürer's wood engravings, yet his style is highly individual. Duvet's work starts from the visionary source of his subject matter and allows that to dictate his composition. He does not try to make his visions believable, and thus he is not interested in space or accurate depictions of spatial relationships. In addition, human figures are distorted in any way that may enhance the symbolic expression of the work.

Duveyrier, Henri (b. Feb. 28, 1840, Paris, Fr.—d. April 25, 1892, Sèvres), French explorer of the Sahara whose observations of the Tuareg people contributed to African ethnology; his explorations, which took him from Morocco to Tunisia through the region south of the Atlas Mountains, also were useful in the development of plans for French colonial expansion.

In his youth Duveyrier met Heinrich Barth, the famed German explorer-geographer of western Africa. When he was 19, having learned to speak Arabic, Duveyrier began a journey of nearly three years' duration through the northern Sahara. After returning to France he published *Exploration du Sahara: Les Touâreg du nord* (1864; "Exploration of the Sahara: The Tuareg of the North").

On subsequent travels Duveyrier added considerably to the knowledge of the regions immediately to the south of the Atlas Mountains and explored the shallow salt lakes of Algeria and Tunisia. Duveyrier devoted special attention to the customs and speech of the Tuareg—pastoralists and brigands with a penchant for poetry—among whom he lived for months at a time. He also published *La Tunisie* (1881; "Tunisia") as well as a work on the Sanūsī Muslims (1884).

Duvivier, Julien (Henri Nicolas) (b. Oct. 8, 1896, Lille, Fr.—d. Oct. 29, 1967, Paris), motion-picture director who emerged as one of the "Big Five" of the French cinema in the 1930s. Duvivier's use of "poetic realism," which characterized the works of the avant-garde filmmakers of that decade, won him international acclaim.

Duvivier, who was educated at a Jesuit college and had a brief career as an actor on the Paris stage, began his film career as an assistant to such film directors as Marcel l'Herbier and Louis Feuillade and as an occasional script writer. Neither his first film, *Ilaceldama* (1919), nor the 20 other features he directed during the 1920s gained him much of a following, but with *Au bonheur des dames* (1929; "To the Happiness of the Ladies") Duvivier began a series of films that made his reputation. They included *Poil de carotte* (1932; "Carrot Top"), *Maria Chapdelaine* (1934), *Pépé le Moko* (1937), and *Un Carnet de bal* (1937). Then, in 1938 Duvivier was invited to Hollywood to direct *The Great Waltz*, a lav-

ish, popularized version of Johann Strauss's life.

During World War II Duvivier returned to the United States, where he directed *The Tales of Manhattan* (1942), *Flesh and Fantasy* (1943), and *The Impostor* (1944). Returning to Europe after the war, Duvivier directed a number of successful films such as the British *Anna Karenina* (1948), *Sous le ciel de Paris* (1950; *Under the Paris Sky*, 1951), *Le Petit Monde de Don Camillo* (1951; *The Little World of Don Camillo*), and *Diaboliquement Vôtre* (1967; *Diabolically Yours*).

Duwaym, Ad-, also spelled ED-DUEIM, city, central Sudan, on the western bank of the White Nile, about 87 miles (140 km) southwest of Wad Madani and located at an elevation of 1,253 feet (382 m). It is an agricultural centre for the surrounding area, which produces cotton, cereals, oilseeds, peanuts (groundnuts), wheat, fruits, and vegetables. Industries include mechanized mills producing oils from sesame seeds and peanuts, soap factories, and food processing units. Ad-Duwaym is linked by road with Küsti and Tandaltî; both are stations on the Kassalâ-Nyala railway. A ferry service on the White Nile connects the city with Al-Qutaynah. Pop. (2001 est.) 92,200.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Duxbury, town ("township"), Plymouth county, eastern Massachusetts, U.S., on Duxbury Bay (an inlet of Cape Cod Bay), 30 miles (48 km) southeast of Boston. It embraces the villages of Millbrook and South Duxbury. Settled around 1628, it counts among its founders the Pilgrim colonists Myles Standish, William Brewster, and John Alden. Named after Duxbury Hall in Lancashire, England, seat of the Standish family, it was chartered in 1637, becoming the second town in the Plymouth Colony. Following the Revolution, shipbuilding and fishing were significant activities. The town, now mainly residential, still maintains a provincial atmosphere, with tourism and local shops providing the main source of income. Colonial monuments include the Alden House (1653; last home of John and Priscilla Alden), the Standish Monument State Reservation, and the Old Burying Ground with the graves of Standish and Alden. Pop. (2000) 14,248.

Duy Tan, original name VINH SAN (b. 1899—d. Dec. 26, 1945), emperor of Vietnam from 1907 to 1916 and symbol of the Vietnamese anticolonialist movement against the French before and during World War I; he became an officer and decorated hero in the French army during World War II.

Vinh San was the son of Emperor Thanh Thai, who was deposed by the French. Seeking a more compliant figure to be their puppet king, the French proclaimed Vinh San emperor on Sept. 5, 1907. Upon his accession, he assumed the name Duy Tan, or reform(s), the Chinese characters of which were the same as the name of a radical nationalist organization, Duy Tan Hoi ("Reformation Society"), founded about that time by the Vietnamese patriots Nguyen Tham and Phan Boi Chau.

Duy Tan was sympathetic to the plans of the Vietnamese liberation leaders, who needed the symbol and sanction of royalty to win popular support. He cooperated with rebel plans to stage revolts in the provinces of Thua Thien, Quang Nam, and Quang Ngai in central Vietnam in 1916. Details of the plot, however, leaked to the French. The attacks were unsuccessful, and Duy Tan was caught trying to escape to a mountain sanctuary; on May 13, 1916, he was dethroned by the French and exiled to Réunion island, off the coast of Madagascar, in the Indian Ocean.

During World War II Duy Tan served in Europe with the Free French Army as Major Vinh San. He was among the early followers of the Free French leader General Charles de Gaulle and was awarded the highest French honours for bravery, most importantly cited as "Companion of the French Liberation." He was killed in an airplane crash and is buried in what is now the Central African Republic.

Duyckinck, Evert Augustus (b. Nov. 23, 1816, New York, N.Y., U.S.—d. Aug. 13, 1878, New York City), American biographer, editor, and critic who with such works as the two-volume *Cyclopaedia of American Literature* (1855, supplement 1866), written with his younger brother George Long Duyckinck (1823–63), focused scholarly attention on American writing and contributed to the advance of American literature in the mid-19th century.

Duyckinck was the son of a publisher. He graduated from Columbia College in 1835 and, like his brother, studied law for two years and was admitted to the bar but never practiced. He spent 1838–39 in Europe studying literature and upon his return to New York City was coeditor of *Arcturus: A Journal of Books and Opinion*. In 1847 he was briefly the editor of the *Literary World: A Journal of American and Foreign Literature, Science, and Art*. The following year he and his brother bought the journal and edited it together, making it the most influential literary weekly of the time, until 1853, when, despite its high quality, it failed financially.

Duyckinck came to know most of the important writers of the day and fostered the careers of many—among them Herman Melville. The *Cyclopaedia of American Literature* included biographical and critical data on writers since colonial times and selections from their works. He also wrote several popular biographical compilations, including the *Lives and Portraits of the Presidents of the United States and Portrait Gallery of Eminent Men and Women of Europe and America*, 2 vol. (1873). His important collection of some 18,000 books is in the New York Public Library.

Duyun (China): see Tu-yün.

Dvaita (Sanskrit: "Dualism"), an important school in the orthodox Hindu philosophical system of Vedānta. Its founder was Madhva, also called Anandatîrtha (c. 1199–1278), who came from the area of modern Karnataka state, where he still has many followers. Already during his lifetime, Madhva was regarded by his followers as an incarnation of the wind god Vāyu, who had been sent to earth by the lord Vishnu to save the good, after the powers of evil had sent the philosopher Śaṅkara, an important proponent of the Advaita ("Nondualist") school.

In his expositions, Madhva shows the influence of the Nyāya philosophical school. He maintains that Vishnu is the supreme God, thus identifying the Brahman of the *Upaniṣads* with a personal God, as Rāmānuja (c. 1050–1137) had done before him. There are in Madhva's system three eternal, ontological orders: that of God, that of soul, and that of inanimate nature. The existence of God is demonstrable by logical proof, though only scripture teaches his nature. He is the epitome of all perfections and possesses a nonmaterial body, which consists of *saccidānanda* (being, spirit, and bliss). God is the efficient cause of the universe, but Madhva denies that he is the material cause, for God cannot have created the world by splitting himself nor in any other way, since that militates against the doctrine that God is unalterable; in addition, it is blasphemous to accept that a perfect God changes himself into an imperfect world.

The individual souls are countless in number and are of atomic proportions. They are a "portion" of God and exist completely by the

grace of God; in their actions they are totally subject to God. It is God, too, that allows the soul, to a limited extent, freedom of action in a way commensurate with one's past acts (karma).

Ignorance, which for Madhva as for many other Indian philosophers means mistaken knowledge (*ajñāna*), can be removed or corrected by means of devotion (*bhakti*). Devotion can be attained in various ways: by solitary study of the scriptures, by performing one's duty without self-interest, or by practical acts of devotion. This devotion is accompanied by an intuitive insight into God's nature, or it may be a special kind of knowledge. *Bhakti* may itself become a goal; for the devotee, his adoration of Vishnu is more important than the release that ensues from it.

The present-day following of Dvaita has as its centre a monastery at Udipi, in Karnataka state, which was founded by Madhva himself and has continued under an uninterrupted series of abbots.

Dvaravati, ancient kingdom of Southeast Asia that flourished from the 6th to the 13th century. It was the first Mon kingdom established in what is now Thailand and played an important role as a propagator of Indian culture. Situated in the lower Chao Phraya River valley, Dvaravati extended westward to the Tenasserim Yoma (mountains) and southward to the Isthmus of Kra.

The Mon, a Mongoloid people from western China, entered the area in the 1st millennium BC, penetrating westward from the upper Mekong River. Dvaravati emerged as an independent entity late in the 6th century AD, maintaining its independence until late in the 11th century. Rarely politically dominant and continually under the shadow of stronger neighbours, Dvaravati was prevented by geographic barriers from establishing close political ties with other Mon states to the west in southern Myanmar (Burma) and with the Mon state in northern Thailand. Dvaravati experienced political domination by neighbouring peoples on three separate occasions: in the 10th century, when the Burmese conquered the Mon state of Thaton west of the Tenasserim Yoma; from the 11th to the 13th century, when the Khmer empire (Cambodia) arose in the east; and finally, in the late 13th century, when Dvaravati was absorbed by the Thai empire. Subjugation did not, however, mean extinction. The Dvaravati Mon retained their customs and a relative degree of racial homogeneity under their own rulers.

Dvaravati was historically important as a transmitter of Indian culture. Having had early commercial and cultural contact with India, the Mon assumed the role of disseminators of the main features of Indian culture. They were the most receptive of Southeast Asian peoples to Indian art and literature. Indian influence was apparent in matters of sculpture, writing, law, and governmental forms.

Despite political domination, Dvaravati exerted another important force in relation to its conquerors. Whereas contacts with India had contributed to the development and character of Mon civilization, the Dvaravati Mon in their turn became the teachers of their conquerors, the Khmer, the Burmese, and the Thai. All three conquerors were influenced by Dvaravati in writing systems, art forms, government, religious terminology, and scholarship.

dvija (Sanskrit: "twice-born"), in the Hindu social system, members of the three upper varnas, or social classes—the Brahmins (priests and teachers), Kshatriya (warriors), and Vaiśya (merchants)—whose sacrament of initiation is regarded as a second or spiritual birth. The initiation ceremony (*upanayana*; *q.v.*) invests the male caste members with a sacred thread, a loop worn next to the skin over the left shoulder and across the right hip. The low-

est Hindu varna, the Śūdra (the artisan and labouring class), has no initiation ceremony, and its members are considered to be non-Aryan in origin. Theoretically they are not allowed to study or even to listen to the Vedas, the sacred revealed scriptures of the Indo-Aryans.

Dvořák, Antonín (Leopold) (b. Sept. 8, 1841, Nelahozeves, Bohemia, Austrian Empire [now in Czech Republic]—d. May 1, 1904, Prague), first Bohemian composer to achieve worldwide recognition, noted for turning folk material into the language of 19th-century Romantic music.

Dvořák, detail of a portrait by Max Švabinský, c. 1900; in the Antonín Dvořák Museum, Prague

By courtesy of the Antonín Dvořák Museum, Prague

Life. Dvořák was born in Nelahozeves, a Bohemian (now Czech) village on the Vltava River north of Prague. He came to know music early, in and about his father's inn, and as a youngster became an accomplished violinist contributing to the amateur music-making that accompanied the dances of the local couples. In 1857 a perceptive music teacher, understanding that young Antonín had gone beyond his own modest abilities to teach him, persuaded the elder Dvořák to enroll his son in an organ school in Prague. Later, without his father's financial assistance, Dvořák completed a two-year course and played the viola in various inns and with theatre bands, augmenting his small salary with a few private pupils.

The 1860s were trying years for Dvořák, who was hard pressed for both time and the means, even paper and a piano, to compose. In later years he said he had little recollection of what he wrote in those days, but about 1864 two symphonies, an opera, chamber music, and numerous songs lay unheard in his desk. The varied works of this period show, however, that his earlier leanings toward the music of Ludwig van Beethoven and Franz Schubert were becoming increasingly tinged with the influence of Richard Wagner and Franz Liszt. In November 1873, at a time when a few successful concerts of his works had begun to make his name well known in Prague, he married Anna Cermáková and began an unusually happy family life.

In 1875 Dvořák was awarded a state grant by the Austrian government, and this award brought him into contact with Johannes Brahms, with whom he formed a close and fruitful friendship. Brahms not only gave him valuable technical advice but also found him

an influential publisher in Fritz Simrock, and it was with his firm's publication of the *Moravian Duets* (composed 1876) for soprano and contralto and the *Slavonic Dances* (1878) for piano duet that Dvořák first attracted worldwide attention to himself and to his country's music. The admiration of the leading critics, instrumentalists, and conductors of the day continued to spread his fame abroad, which led naturally to even greater triumphs in his own country. In 1884 he made the first of 10 visits to England, where the success of his works, especially his choral works, was a source of constant pride to him, although only the *Stabat Mater* (1877) and *Te Deum* (1892) continue to hold a position among the finer works of their kind. In 1890 he enjoyed a personal triumph in Moscow, where two concerts were arranged for him by his friend Peter Ilich Tchaikovsky. The following year he was made an honorary doctor of music of the University of Cambridge.

Dvořák accepted the post of director of the newly established National Conservatory of Music in New York in 1892, and, during his years in the United States, he traveled as far west as Iowa. Though he found much to interest and stimulate him in the New World environment, he soon came to miss his own country, and he returned to Bohemia in 1895. The final years of his life saw the composition of several string quartets and symphonic poems and his last three operas.

Works. Bedřich Smetana, Dvořák's senior by 17 years, had already laid the foundations of the Czech nationalist movement in music, but it was left to Dvořák to develop and extend this in an impressive series of works that quickly came to rank in popularity with those of his great German contemporaries. The reasons for Dvořák's popularity lie in his great talent for melody and in the delightfully fresh Czech character of his music, which offered a welcome contrast to the heavier fare of some of his contemporaries.

Dvořák's technical fluency and abundant melodic inspiration helped him to create a large and varied output. He composed in all the musical genres and left works that are regarded as classics in all of them, with the possible exception of opera. All Dvořák's mature symphonies are of high quality, though only the sombre *Symphony No. 7 in D Minor* (1885) is as satisfactory in its symphonic structure as it is musically. (It should be explained that Dvořák's mature symphonies were long known as No. 1 to 5, even though he had written four earlier [and unnumbered] ones. All nine of his symphonies have since been renumbered from the traditional order to their actual order of composition.) Dvořák's *Symphony No. 9 in E Minor (From the New World)* (1893) remains his best-known work, partly, no doubt, because it was thought to be based on Negro spirituals and other influences gained during his years in the United States. Although this may be true to some extent, the music is also characteristically Bohemian in its themes. However, the *Symphony No. 9* is in no way superior to the *Symphony No. 6 in D Major* (1880) or the *Symphony No. 8 in G Major* (1889) and is actually less characteristic of the composer than these other works. Of the four concerti Dvořák wrote, only the *Cello Concerto in B Minor* (1895) can safely be called a classic.

In spite of the fact that his work in the medium is sometimes overstrained, Dvořák's chamber music is also of high quality. The *Piano Quintet in A Major* (1887) is one of the glories of chamber music, and the string quartets, Opuses 51 (1879), 105 (1895), and 106 (1895), the *String Sextet*, Opus 48 (1878), and the *Dumky Trio*, Opus 90 (1891), also rank high. The choral works, so popular when they

first appeared, have suffered the fate of most late 19th-century choral music, yet the *Stabat Mater* (1877) and *Te Deum* (1892) are among the better examples of their kind. Opera remained the one medium that proved recalcitrant to Dvořák's genius, though he wrote 10 of them, notably *Rusalka* (1900). Many of Dvořák's most attractive works are among his miscellaneous, less-ambitious ones—the *Slavonic Dances* (1878, 1886) and other piano duets, the *Symphonic Variations* (1877), the *Bagatelles* (1878), the *Gypsy Songs* (1880), and the *Scherzo Capriccioso* (1883).

Dvořák's chief faults are his overdiscursive and repetitive manner, occasional lapses in taste, and the weakness of design of his larger works. Such shortcomings, however, amount to little in the light of the astonishing fertility of his melody and the simplicity and directness with which he achieves his ends. As might be gathered from his music, Dvořák had an attractive personality; he was a humble and deeply religious family man of simple tastes and a great lover of nature. (D.M.L.-J.)

BIBLIOGRAPHY. Biographies and discussions of his compositions may be found in Otakar Šourek, *Antonín Dvořák: His Life and Works* (1952); Alec Robertson, *Dvořák* (1945, reissued with revisions, 1974), informative and scholarly; John Clapham, *Antonín Dvořák: Musician and Craftsman* (1966), an admirable and erudite study of the composer's working methods, and *Dvořák* (1979), a biography; Gervase Hughes, *Dvořák: His Life and Music* (1967), which discusses Dvořák's compositions within a biographical framework and in relation to his sociological background; Václav Holzknecht, *Antonín Dvořák*, 2nd ed. (1971); Robert Layton, *Dvořák Symphonies and Concertos* (1978); and Hans-Hubert Schönzeler, *Dvorak* (1984).

Dvůr Králové nad Labem, city, Východočeský kraj (region), Czech Republic. The city lies just north of Hradec Králové, on the left bank of the Elbe (Czech: Labe) River. The name in both Czech and German (Königinhof an der Elbe) means "the court of the queen on the Elbe," recalling the founding of the town by King Wenceslas II at the end of the 13th century and the gift of the place to his queen, Elisabeth. It was the scene of a major Austrian defeat by the Prussians in 1866. The town is now a textile and linen centre. Pop. (1991 prelim.) 16,972.

To make the best use of the *Britannica*, consult the **INDEX** first

Dwangwa River, river in Malaŵi that is a tributary of Lake Nyasa. It rises in the western watershed of Malaŵi's central plateau and flows in a northeasterly direction for about 100 miles (160 km) until it enters the lake. The river's upper reaches exhibit ancient broad valleys and meanders, while the gorge cut for the river's descent to the lake is narrow and recent. Dwangwa's drainage into Lake Nyasa occupies a flat swampy area 25 miles (40 km) north of Nkhotakota.

dwarf, an individual who is much below the ordinary stature or size for his race or species. (For the physiology of dwarf human beings, see *dwarfism*. See also *pygmy*.)

Folklore In Teutonic and especially Scandinavian mythology and folklore, the term dwarf (Old Norse: *dvergr*) denoted a species of fairy inhabiting the interiors of mountains and the lower levels of mines. Dwarfs were of various types, all of small stature, some being no more than 18 inches (45 cm) high and others about the height of a two-year-old child. In appearance they were sometimes beautiful, but more usually they resembled grave old men with long beards and, in some cases, humped backs.

The mountain dwarfs were organized in king-

SCALA—Art Resource

doms or tribes, with their own kings, chieftains, and armies. They lived in subterranean halls, believed to be full of gold and precious stones. They were principally famous for their skill in all kinds of metalwork and the forging of magical swords and rings, but they were also credited with profound wisdom and secret knowledge, having power to foresee the future, assume other forms, and make themselves invisible.

Many legends show them as kindly beings, generous to those who pleased them but vengeful when offended. The Swiss dwarfs, or "earth-men," sometimes helped in agricultural work, found straying animals, and put out firewood or fruit for poor children to find. In Scandinavia and Germany also they were friendly to men, but occasionally they stole corn, teased cattle, and abducted children and young girls. Services rendered to them were often repaid by gifts of gold from their hoards; but those who stole their treasures either met with great misfortune thereafter or found the gold turned to dead leaves when they reached home.

Mine-dwelling dwarfs were usually more capricious and spiteful than their mountain brothers. They could be heard moving about the lower levels and were sometimes seen by miners, who took care to placate them by gifts of food.

History. In some societies dwarfs have served as favourites, jesters, or entertainers in the courts of sovereigns and the households of important persons. Household dwarfs were kept by the early pharaohs of Egypt and still abounded at the courts of the Ptolemies. They played no part in Homeric and classical Greece but flourished in imperial Rome, where slave children were sometimes stunted to increase their price. Household dwarfs functioned in medieval Europe, and during the Renaissance their vogue increased and individual dwarfs became famous. Isabella d'Este designed part of her palace for them and remembered two in her will. The painter Diego Velázquez familiarized posterity with the appearance of the dwarfs of Philip IV of Spain. In the 18th and 19th centuries, the tsars and noblemen of Russia kept innumerable dwarfs. Elaborate dwarf weddings were celebrated at court, and

in 1710 a dwarf couple spent their wedding night in the tsar's bedchamber.

Dwarfs occasionally held responsible positions but were primarily entertainers. In western Europe household dwarfs were still heard of in the 18th century; but the institution declined, and dwarfs such as Charles Stratton ("General Tom Thumb") who won money and reputation in the 19th century belong to a different category.

dwarf cornel (plant): see bunchberry.

dwarf mistletoe, any plant that is a member of the genus *Arceuthobium* (family Viscaceae), which contains about 8 to 15 species of small-flowered plants that are parasitic on coniferous trees. The species are distributed primarily throughout the Northern Hemisphere, though a few tropical species are present in the Caribbean, Mediterranean, and Southeast Asian areas.

The common dwarf mistletoe, *A. minutissimum*, is one of the smallest plants having specialized water-conducting tissues. Its flowering stems extend less than 3 mm (about 1/8 inch) from its host plant. The fruits of most *Arceuthobium* species are about 4 mm long, and each contains a bullet-shaped seed covered with a sticky substance. Pressure that builds up inside the maturing fruit causes the thick skin to rupture, shooting the seed away from the plant at a high velocity. As the sticky seed covering dries, it attaches the seed to the

Dwarf mistletoe (*Arceuthobium minutissimum*)

Delbert Wiens

surface on which it landed, usually the branch of a nearby tree. Dwarf mistletoes spread in this way throughout a forest without being transported by wind or animals. These parasites cause economic damage to many species of ornamental and timber trees.

dwarf star, any star of average or low luminosity, mass, and size. Important subclasses of dwarf stars are white dwarfs (see *white dwarf star*) and red dwarfs. Dwarf stars include most so-called main-sequence stars, among which is the Sun. The colour of dwarf stars can range from blue to red, the corresponding temperature varying from high (above 10,000 K) to low (a few thousand degrees).

dwarf yew: see American yew.

dwarfism, condition of growth retardation resulting in abnormally short adult stature and caused by a variety of hereditary and metabolic disorders. Traditionally, the term "dwarf" was used to describe individuals with disproportions of body and limb, while "midget" referred to those of reduced stature but normal proportions; today neither word is used, and "little people" has become the preferred term for persons with extreme growth retardation.

Among the common forms of hereditary dwarfism are achondroplasia, hypochondroplasia, and diastrophic dwarfism. In achondroplasia, the trunk is of normal size, but, because of a disturbance of the bone-producing cells of the growth plates (epiphyses) of the long bones, the limbs are extremely short; the head tends to be unusually large. Intelligence and life span are normal. Hypochondroplasia resembles achondroplasia except that the head is of normal size. Diastrophic dwarfism is

characterized by progressive, crippling skeletal deformities. There is a high risk of death from respiratory failure during early infancy; thereafter the prospect of a normal life span is good. Intelligence is unimpaired in diastrophic dwarfism.

Pituitary dwarfism, caused by a deficiency of pituitary growth hormone, is the chief endocrine form of dwarfism and may be hereditary; tumours, infections, or infarction (tissue death) of the pituitary can also induce dwarfism. In most cases, other endocrine and sexual functions remain normal. However, in panhypopituitarism all pituitary hormones are deficient, and sexual development is impaired.

In several hormonal disorders and hereditary conditions dwarfism is associated with subnormal intelligence. Inadequate production of thyroid hormone during gestation and early infancy results in a condition known as cretinism, which is characterized by growth retardation and severe mental retardation. Several of the mucopolysaccharidoses (disorders of mucopolysaccharide metabolism) are characterized by dwarfism, often with mental retardation. A number of infants having hereditary forms of dwarfism are stillborn or die soon after birth because of serious metabolic disorders.

Dwarfism may also result from inadequate nutrition during crucial phases of growth and development. A leading nutritional cause of dwarfism is vitamin-D-resistant rickets during childhood; intelligence is not affected by this condition.

Dwārka, town, southwestern Gujarāt state, west-central India. It lies on the western shore of the Okhāmandal Peninsula, a small western extension of the Kāthiāwār Peninsula. Dwārka, or the "City of Many Gates" (Sanskrit: Dvārakā, or Dvārāvātī), is also known as Jagat, or Jigat. Dwārka was the legendary capital of the god Krishna, who founded it after his flight from Mathura. Its consequent sanctity makes it one of the seven great places of Hindu pilgrimage, although the town's original temples were destroyed in 1372 by the Delhi emperors. Most of the town's revenue is derived from the pilgrimage traffic; millets, ghee (clarified butter), oilseeds, and salt, however, are shipped from the port. Pop. (2001) 33,626.

Dwiggins, William Addison (b. June 19, 1880, Martinsville, Ohio, U.S.—d. Dec. 25, 1956, Hingham, Mass.), American typographer, book designer, puppeteer, illustrator, and calligrapher, who designed four of the most widely used Linotype faces in the United States and Great Britain: Caledonia, Electra, Eldorado, and Metro.

After studying with Frederic Goudy in Chicago, Dwiggins moved in 1906 to Hingham, Mass., where he earned his living doing advertising and lettering. He served as acting director of Harvard University Press in 1917–18 and then turned to book design. He was associated in various capacities with the Mergenthaler Linotype Company, Yale University Press, and the publishing firm of Alfred A. Knopf, whose house style he helped to establish. Each of the hundreds of books he designed carried a brief colophon on the history of the type employed; there was an attempt to use contemporary typographic decoration; and the bindings, using designs made of repeated decorative units like early printers' fleurons, were extremely popular.

Dwiggins also designed many deluxe editions for George Macy's Limited Editions Club, illustrated a number of works, and wrote such books as *Layout in Advertising* (1928), *Mari-onette in Motion* (1939), and *Millennium I* (1945).

Dwight, John (b. c. 1637—d. 1703, London), first of the distinguished English potters, producer of works in stoneware.

After taking the degree of bachelor of civil

law at Christ Church, Oxford, Dwight was appointed registrar and scribe to the diocese of Chester. In 1665 he moved to Wigan and sometime between 1671 and 1674 moved to Fulham, London. In 1671 Dwight took out a patent for "transparent earthenware, commonly known by the names of porcelaine or china" and "stoneware, vulgarly called Cologne ware." He did not actually make porcelain; the partly translucent quality of his stoneware apparently led him to mistake it for that material. Between 1693 and 1696 he was involved in lawsuits with 19 other potters over infringements of his stoneware patent.

The most important works from Dwight's pottery are finely modeled stoneware busts and statues, including busts of Prince Rupert of the Rhine and Charles II, a recumbent half figure of his daughter, and various classical figures, all by an unknown modeler.

Dwight, Timothy (b. May 14, 1752, Northampton, Mass. [U.S.]—d. Jan. 11, 1817, New Haven, Conn., U.S.), American educator, theologian, and poet, who had a strong instructive influence during his time.

Educated by his mother, a daughter of the preacher Jonathan Edwards, Dwight entered Yale at age 13 and was graduated in 1769. He then pursued a variety of occupations, including school principal, Massachusetts legislator, and chaplain with the Continental Army. In 1783 he began a successful school in Greenfield Hill, Conn. There he became pastor of the Congregational Church.

In Connecticut, Dwight began to write poetry, such as *Greenfield Hill* (1794)—a popular history of and tribute to the village—and epics, including *The Conquest of Canaan* (1785)—a Biblical allegory of the taking of Connecticut from the British, which some critics regard as the first American epic poem. The poems are grandiose but morally inspiring. Dwight's political satire marks him as one of the Hartford wits (*q.v.*). Dwight served as president of Yale from 1795 to 1817; his administration had pervasive effects on the school, including the modernization of the curriculum. He fought religious apathy as an eloquent professor of theology; his sermons appear in *Theology; Explained and Defended*, 5 vol. (1818–19).

Dworkin, Andrea (b. Sept. 26, 1946, Camden, N.J., U.S.—d. April 9, 2005, Washington, D.C.), American feminist and author, an outspoken critic of sexual politics and of pornography in particular.

Dworkin began writing at an early age. During her undergraduate years at Vermont's Bennington College (B.A., 1968), she became involved with the student demonstrations against the Vietnam War. Her experience in the New York City Women's House of Detention following an arrest during one such demonstration led her to analyze critically what she perceived as the male subjugation of women. A number of books, such as *Woman Hating: A Radical Look at Sexuality* (1974) and *Our Blood: Prophecies and Discourses on Sexual Politics* (1976), followed, along with studies on pornography, which, according to Dworkin, is one of the main weapons men deploy to control women. In collaboration with the feminist lawyer Catherine A. MacKinnon, Dworkin wrote *Pornography and Civil Rights: A New Day for Women's Equality* (1988). Together they also drafted a controversial ordinance that defined pornography as a form of sexual discrimination and enabled victims of sexual assault to sue the makers and distributors of pornography in cases where a specific piece of pornography could be proved to be the direct cause of the assault. Several cities passed the ordinance in the 1980s, but it was later ruled unconstitutional by federal courts.

A lesbian, Dworkin also published in *Gay Community News* and other periodicals. In addition to her books on feminist theory, in-

cluding *Right-wing Women: The Politics of Domesticated Females* (1983) and *Letters from a War Zone* (1989), Dworkin also wrote a collection of short stories, the autobiographical novels *Ice and Fire* (1986) and *Mercy* (1991), and the autobiography, *Hearbreck: The Political Memoir of a Feminist Militant* (2002).

Dwyfor, former district (1974–96) of the county of Gwynedd, northwestern Wales. The area is now incorporated in the unitary council area and county of Gwynedd (*q.v.*).

dyarchy, also spelled DIARCHY, system of double government introduced by the Government of India Act (1919) for the provinces of British India. It marked the first introduction of the democratic principle into the executive branch of the British administration of India. Though much-criticized, it signified a breakthrough in British Indian government and was the forerunner of India's full provincial autonomy (1935) and independence (1947). Dyarchy was introduced as a constitutional reform by E.S. Montagu (secretary of state for India, 1917–22) and Lord Chelmsford (viceroy of India, 1916–21).

The principle of dyarchy was a division of the executive branch of each provincial government into authoritarian and popularly responsible sections. The first was composed of executive councillors, appointed, as before, by the crown. The second was composed of ministers who were chosen by the governor from the elected members of the provincial legislature. These latter ministers were Indians.

The various fields, or subjects, of administration were divided between the councillors and the ministers, being named reserved and transferred subjects, respectively. The reserved subjects came under the heading of law and order and included justice, the police, land revenue, and irrigation. The transferred subjects (*i.e.*, those under the control of Indian ministers) included local self-government, education, public health, public works, and agriculture, forests, and fisheries. The system ended with the introduction of provincial autonomy in 1935.

dybbuk, also spelled DIBBUK, plural DYBBUKIM, in Jewish folklore, a disembodied human spirit that, because of former sins, wanders restlessly until it finds a haven in the body of a living person. Belief in such spirits was especially prevalent in 16th–17th-century eastern Europe. Often individuals suffering from nervous or mental disorders were taken to a miracle-working rabbi (*ba'al shem*), who alone, it was believed, could expel the harmful dybbuk through a religious rite of exorcism.

Isaac Luria (1534–72), a mystic, laid the grounds for Jewish belief in a dybbuk with his doctrine of transmigration of souls (*gilgul*), which he saw as a means whereby souls could continue their task of self-perfection. His disciples went one step further with the notion of possession by a dybbuk. The Jewish scholar and folklorist S. Ansky contributed to worldwide interest in the dybbuk when his Yiddish drama *Der Dybbuk* (c. 1916) was translated into several languages.

Dyce, Alexander (b. June 30, 1798, Edinburgh—d. May 15, 1869, London), Scottish editor whose works, characterized by scrupulous care and integrity, contributed to the growing interest in William Shakespeare and his contemporaries during the 19th century.

As an undergraduate at the University of Oxford, Dyce edited a dictionary of the language of Shakespeare. After serving as a curate in Cornwall and Suffolk, he settled in London and devoted himself to literature. In addition to completing William Gifford's *Dramatic Works and Poems of James Shirley* (1833)

and revising his own *Works of John Ford* (1869), he edited the works of the dramatists George Peele, John Webster, Robert Greene, Thomas Middleton, Beaumont and Fletcher, and Christopher Marlowe. Dyce's six-volume edition of the works of Shakespeare (1857; rev. 1864–67) was a notable contribution to 19th-century Shakespearean scholarship.

An industrious editor of the poets, Dyce published many 17th- and 18th-century works and an edition of John Skelton (1843) that revived interest in this 16th-century poet.

Dyce, William (b. Sept. 19, 1806, Aberdeen, Aberdeen, Scot.—d. Feb. 14, 1864, London), Scottish painter and pioneer of state art education in Great Britain.

Dyce studied at the Royal Scottish Academy, Edinburgh, and the Royal Academy schools, London. One of the first British students of early Italian Renaissance painting, he visited Italy in 1825 and 1827–28, meeting in Rome a group of young German painters, the Nazarenes. He exhibited regularly at the Royal Academy, being elected associate of the Royal Academy in 1844 and academician in 1848. In 1830–37 in Edinburgh he made portraits for a livelihood. But his Italian studies led him to anticipate the English Pre-Raphaelites in the quest for a primitivist simplicity and repose in his painting that harked back to the art of 14th- and 15th-century Italy.

At the time of his death Dyce was engaged in painting a series of frescoes for the Houses of Parliament, of which remain the "Baptism of Ethelbert" in the House of Lords (1846) and the "King Arthur" series (1848; unfinished) in the queen's robing room.

Dyck, Anthonie van, Anthonie also spelled ANTONIE, or ANTON (painter); see Van Dyck, Sir Anthonie.

Dyckia, genus of usually stemless plants of the pineapple family (Bromeliaceae), consisting of about 80 South American species. These plants' long, stiff leaves, which grow in dense rosettes, are spiny-edged, sharp-tipped, and often fleshy. The small flowers usually are yellow or orange. Two species, *D. rariflora* and *D. sulphurea* (*D. brevifolia*), are commonly cultivated indoors as decorative plants. The leaves of both species are about 10–20 cm (about 4–8 inches) long and less than 0.8 cm

Dyckia
J.M. Langham

($\frac{1}{3}$ inch) wide. The flowers of *D. rariflora* are in a nearly stalkless cluster about 45 cm (17 inches) high that rises from the rosette. The flower stalk of *D. sulphurea* rises about 30 cm (12 inches) and bears 30 to 40 yellow blooms.

dye, any of a group of complex organic compounds that are intensely coloured and are utilized to colour other materials.

A brief treatment of dyes follows. For full treatment of their properties, see MACROPAEDIA: Chemical Compounds. For details on the methods of manufacturing dyes, see Industries, Chemical Process. For the principal uses of these substances, see Industries, Textile.

Dyes are used to colour textiles, paper, leather, and many other substances. During the process, dye molecules are deposited from solution onto the material in such a way that they cannot be subsequently removed by the solvent in which they were dissolved. Dyes are generally prepared synthetically from coal tar and petrochemicals.

The craft of dyeing is several thousand years old. The major dyes known to the ancients were those obtained from the madder and indigo plants, together with Tyrian purple (chemically, an indigo derivative), which was obtained from mollusks.

Many of the dyeing processes discovered during antiquity are still used today. An example is the application of an inorganic chemical called a mordant. This substance is applied to a material before the dye to help the dye adhere to the material by precipitating in it as an insoluble metal salt.

The first synthetic dye, mauveine, was discovered in 1856 by the British chemist William Henry Perkin. It was an unexpected product of a reaction with a coal-tar derivative. As a result, a large-scale coal-tar-dye industry arose during the latter part of the 19th century. The basic raw materials were organic substances containing so-called aromatic hydrocarbons in which carbon atoms are linked in six-membered rings. Aromatics are characteristic of most dyestuffs today, although the raw materials come from petroleum as well as from coal tar.

In addition to the aromatics, many dyestuffs contain a chemical subunit called a chromophore. The chromophore acts to produce strong absorption of radiation in the visible spectrum. Various categories of atomic groupings called auxochromes are also used to shift the absorption to make the colour more intense.

The chemical structure of dye molecules has proved to be relatively easy to modify, and a wide range of coal-tar dyes have become available. Developments in chemical synthesis have led to the production of many new dyes that adhere strongly to many different types of substances.

Fibres absorb dyes particularly well because they are porous and exert chemical forces on dye molecules. Dyes are held onto fibres by ionic forces, hydrogen bonding, or other attractive forces. One of the major advances in dye chemistry has been the development of fibre-reactive dyes. Here, the dye molecule forms a covalent chemical bond with the fibre that it colours. Such a bond is the strongest means of attaching a dye molecule to a fibre.

With natural materials such as cotton, wool, and silk, it is necessary to synthesize dyes that are suited to the specific chemical structures of those materials. On the other hand, it is possible to modify the chemical structure of synthetic fibres to alter their dyeing characteristics.

dye-transfer process, in photography, technique for preparing coloured photographic prints in which the colours of the subject are resolved by optical filters into three components, each of which is recorded on a separate gelatin negative. The three negatives are converted into relief positives in which the depth

of the gelatin is related to the intensity of the colour component; each image is then saturated with a dye of complementary colour, and the finished print is assembled by transferring the dyes one at a time, and in register, to a suitable surface.

Up to 150 prints can be obtained from a set of gelatin-relief positives simply by re-dyeing them and repeating the transfer. In the late 20th century, the development of a panchromatic matrix film made it possible to produce the relief positives directly from a colour negative.

Dyer, Sir Edward (b. October 1543, Sharpham Park, Somerset, Eng.—d. May 1607, London), English courtier and poet whose reputation rests on a small number of ascribed lyrics in which critics have found great dexterity and sweetness.

Educated at the University of Oxford, Dyer went to court under the patronage of the Earl of Leicester. Dyer was a friend of Sir Philip Sidney, on whose death he wrote an elegy showing personal grief and a morbid melancholy. He was employed on missions to the Netherlands (1584) and Denmark (1589) and was knighted in 1596. His contemporary reputation as a poet was high, but little of his work, published anonymously or under initials in collections, is certainly identifiable. His best-known poem is "My Mynd to Me a Kingdom Is."

Dyer, Sir James (b. 1512, Roundhill, Somerset, Eng.—d. March 24, 1582, Great Staughton, Huntingdonshire), chief justice of the English Court of Common Pleas from 1559, who originated the modern system of reporting law cases to serve as precedents. His method superseded the recording of cases in yearbooks (began in 1292), which were not intended as guides for future decisions.

Dyer's work, comprising three volumes of cases in the King's (Queen's) Bench and com-

Sir James Dyer, detail of a portrait by an unknown artist, 1575; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

mon pleas court, covers the years 1513–82, practically his whole lifetime, and thus is partly retrospective. His books were written in the Anglo-French then used in the English legal profession and were first translated into English by John Vaillant in 1794. Dyer was knighted in 1552.

Dyer, John (baptized Aug. 13, 1699, Aberglasney, Carmarthenshire, Wales—d. December 1757, Coningsby, Lincolnshire, Eng.), British poet chiefly remembered for "Grongar Hill" (1726), a short descriptive and meditative poem, in the manner of Alexander Pope's "Windsor-Forest," in which he portrays the countryside largely in terms of classical landscape. The poet describes the view from a hill overlooking the vale of Towy and uses this as a starting point for meditation on the human lot:

A little rule, a little sway,
A sunbeam in a winter's day,
Is all the proud and mighty have
Between the cradle and the grave.

Dyer's longest poem, *The Fleece* (1757), a blank-verse poem on the subject of tending sheep, is a typically 18th-century attempt to imitate Virgil's *Georgics*. Dyer also wrote *The Ruins of Rome* (1740), which again combines description and meditation.

Dyfed, former county of southwestern Wales, divided since 1996 into the counties of Carmarthenshire, Ceredigion, and Pembrokeshire. The administrative seat was Carmarthen. The county had six administrative districts (Carmarthen, Ceredigion, Dinewr, Llanelli, Preseli, and South Pembrokeshire) and covered an area of 2,227 square miles (5,768 square km).

Dygasiński, Adolf (b. March 7, 1839, Niegosławice, near Pińczów, Congress Kingdom of Poland—d. June 3, 1902, Grodzisk Mazowiecki, Pol., Russian Empire), Polish writer and poet.

A teacher by profession and a worshiper of science, Dygasiński is considered one of the outstanding Polish Naturalist writers. He published about 50 volumes of short stories of uneven literary quality, the best pieces of which deal with the lives of domestic and wild animals. His masterpiece is *Gody życia* (1902; "Feast of Life"), an allegorical prose poem about the struggle between a small bird and a powerful eagle-owl.

Dylan, Bob, original name ROBERT ZIMMERMAN (b. May 24, 1941, Duluth, Minn., U.S.), American folksinger who moved from folk to rock music in the 1960s, infusing the lyrics of rock and roll, theretofore concerned mostly with boy-girl romantic innuendo, with the intellectualism of classic literature and poetry.

Bob Dylan, 1960s
Michael Ochs Archives, Venice, Calif

Dylan grew up in the mining town of Hibbing, in northeastern Minnesota. Influenced by Hank Williams, Little Richard, and Elvis Presley, he played in series of rock and roll bands as a high school student. While briefly attending the University of Minnesota in Minneapolis, he was taken with Beat poetry and folksinger Woody Guthrie and began performing folk music in coffeehouses, adopting the last name Dylan (after the Welsh poet Dylan Thomas). Determined to meet Guthrie—who was confined to a hospital in New Jersey—Dylan relocated to New York City in January 1961 and began performing Guthrie's songs and other folk standards in Greenwich Village, earning the attention of, first, *New York Times* critic Robert Shelton and, then, of John Hammond, Sr., who signed him to Columbia Records. Dylan's second album, *The Freewheelin' Bob Dylan* (1963), featuring his first significant composition,

"Blowin' in the Wind," announced him as a major talent. His reputation soared as the title song of his next album, *The Times They Are A-Changin'* (1964), joined "Blowin' in the Wind" as anthems of the civil rights movement. Grounded in the folk tradition, particularly in the use of simple melodies, many of Dylan's own songs employed metaphorical and allegorical lyrics that showed a poetic artistry and imagination rarely found in previous American folk music.

In 1965 Dylan adopted electronically amplified instruments and many of the rhythms of rock and roll in what marked a major departure from his past songs of social protest and use of acoustic instruments. The landmark record albums *Highway 61 Revisited* (1965) and *Blonde On Blonde* (1966), with their powerfully introspective and melancholy lyrics and blues-derived rhythms, established Dylan as a leading figure in rock music and brought him to the pinnacle of his popularity. Following a motorcycle accident in 1966 and a period of seclusion, Dylan underwent another musical turnaround and released several albums (notably *Nashville Skyline*, 1969) that again surprised, with their muted, reflective tone and their use of country-and-western elements. During the 1970s and '80s Dylan continued to perform and to make influential recordings, notably on *Blood on the Tracks* (1975), *Desire* (1975), and *Infidels* (1983).

In a dramatic reversal, Dylan converted to Christianity in 1979 and for three years performed mostly religious music. He received a Grammy Award in 1980 for best male rock vocal performance with his "gospel" song "Gotta Serve Somebody." Within a few years, however, Dylan's open zeal for Christianity was waning.

Dylan was inducted into the Songwriters Hall of Fame in 1982 and into the Rock and Roll Hall of Fame in 1988. He made notable recordings during this period with the Traveling Wilburys, an all-star "supergroup" composed of Dylan, George Harrison, Tom Petty, Roy Orbison, and Jeff Lynne.

During the 1990s, Dylan received a Grammy Award for lifetime achievement, performed for the pope at the Vatican, was nominated for the Nobel Prize for Literature, received the John F. Kennedy Center Honors Award, and was made Commander in the Order of Arts and Letters (the highest cultural award presented by the French government). Although Dylan's contemporary work in much of the '80s and '90s met with a lukewarm response, he returned to prominence with *Time Out of Mind* (1997), which garnered three Grammy Awards, including album of the year, and *Love and Theft* (2001), which won another.

Having directed and starred in two films—the documentary *Eat the Document* (1972) and *Renaldo and Clara* (1978)—Dylan also wrote and starred in *Masked & Anonymous* (2003).

dynamical time, the time scale of dynamical astronomy (celestial mechanics). The orbital motions of celestial bodies subject only to Newton's laws of motion and law of gravitation, as modified by relativity, proceed as a function of dynamical time. In 1952 the International Astronomical Union (IAU) defined a dynamical time scale named Ephemeris Time (ET), which is based on the Earth's orbital motion as given by the American astronomer Simon Newcomb in his non-relativistic tables of the Sun (1898). In practice, however, ET was determined more accurately by observing the Moon's motions and then using a lunar ephemeris. For this operation an empirical, nongravitational term was used to correct for the disturbing effect exerted by the Earth-Moon tidal couple, as given in the nonrelativistic *Improved Lunar Ephemeris* of 1954.

Highly accurate observations made since about 1967 by means of radar, lasers, radioastronomy, spacecraft, and atomic clocks have since made improved, relativistic ephemerides necessary. In 1984 ET was replaced in national almanacs by Barycentric Dynamical Time (TDB), whose equations of motion refer to the barycentre, or centre of mass, of the solar system and include relativistic terms. Different theories of relativity are used in the various forms of TDB, and the IAU did not specify a particular ephemeris with which to numerically define TDB. The IAU also defined an auxiliary scale, Terrestrial Dynamical Time (TDT), for use in apparent geocentric ephemerides (i.e., those using equations of motion referring to the centre of the Earth). By definition, TDT = TAI + 32.184 seconds, with TAI denoting International Atomic Time. See also atomic time.

dynamics, branch of physical science and subdivision of mechanics that is concerned with the motion of material objects in relation to the physical factors that affect them.

A brief treatment of dynamics follows. For full treatment, see MACROPAEDIA: Mechanics.

Dynamics can be subdivided into kinematics, which describes motion, without regard to its causes, in terms of position, velocity, and acceleration; and kinetics, which is concerned with the effect of forces and torques on the motion of bodies having mass. The foundations of dynamics were laid at the end of the 16th century by Galileo Galilei who, by experimenting with a smooth ball rolling down an inclined plane, derived the law of motion for falling bodies; he was also the first to recognize that force is the cause of changes in the velocity of a body, a fact formulated by Isaac Newton in the 17th century in his second law of motion. This law states that the force acting on a body is equal to the mass of the body multiplied by the acceleration.

dynamite, blasting explosive, patented in 1867 by Swedish physicist Alfred Nobel, based on nitroglycerin but much safer to handle than nitroglycerin alone. By mixing the nitroglycerin with kieselguhr, a porous siliceous earth, in proportions that left an essentially dry and granular material, Nobel produced a solid that was resistant to shock but readily detonable by heat or percussion. Later, wood pulp was substituted as the absorbent, and sodium nitrate was added as an oxidizing agent to increase the strength of the explosive. Nobel also invented gelatinous dynamite, a mixture of nitrocellulose and nitroglycerine. Ammonium nitrate was later substituted for part of the nitroglycerine to give a safer and less expensive explosive called extra dynamite. See also explosive.

dynamo: see electric generator.

dynamo theory, geophysical theory that explains the origin of the Earth's main magnetic field in terms of a self-exciting (or self-sustaining) dynamo. In this dynamo mechanism, fluid motion in the Earth's outer core moves conducting material (liquid iron) across an already existing, weak magnetic field and generates an electric current. (Heat from radioactive decay in the core is thought to induce the convective motion.) The electric current, in turn, produces a magnetic field that also interacts with the fluid motion to create a secondary magnetic field. Together, the two fields are stronger than the original and lie essentially along the axis of the Earth's rotation.

The dynamo theory was proposed by the German-born American physicist Walter M. Elsasser and the British geophysicist Edward Bullard during the mid-1900s. Although various other mechanisms for generating the geomagnetic field have been proposed, only the dynamo concept is seriously considered today.

dynamometer, device for measuring mechanical force, or power, transmitted by a rotating shaft. Since power is the product of torque (turning force) and angular speed, all power-measuring dynamometers are essentially torque-measuring devices; the shaft speed is measured separately.

Among force-measuring devices are a flexible metallic ring that bends when a force is applied in such a manner as to tend to collapse it—the amount of bending being a measure of

Elements of a typical Prony brake

the applied force—and a hydraulic “load cell” that measures compressive loads in terms of fluid pressure.

Power-measuring dynamometers may be transmission dynamometers or absorption dynamometers. The former utilize devices that measure torque, in terms of the elastic twist of the shaft or of a special torquemeter inserted between sections of the shaft. The torque is produced by the useful load that the prime mover, motor, or machine is carrying.

Absorption dynamometers, on the other hand, produce the torque that they measure by creating a constant restraint to the turning of a shaft by either mechanical friction, fluid friction, or electromagnetic induction. A Prony brake (see Figure) develops mechanical friction on the periphery of a rotating pulley by means of brake blocks that are squeezed against the wheel by tightening the bolts until the friction torque FR balances the torque WL . A water brake creates a resistance by circulating water between a rotating impeller and a stationary shell while an electric dynamometer generates and absorbs direct-current electricity or eddy currents. In each case, the element that exerts the restraining influence is freely cradled so that its tendency to rotate with the rotating body can be arrested and the arresting force measured at a known distance from the axis of rotation. The torque is the product of the spring load or weight and the distance from the axis of rotation.

dynamophone (musical instrument): see telharmonium.

dyne, unit of force in the centimetre-gram-second system of physical units, equal to the force that would give a free mass of one gram an acceleration of one centimetre per second per second, or approximately 2.248×10^{-6} pound. One dyne equals 0.00001 newton.

Dyott, Thomas W. (b. 1771, England—d. Jan. 17, 1861, Philadelphia), British-born American patent-medicine king, glassmaker, temperance advocate, and reformer. His “picture bottles” have special value as antiques.

A druggist’s apprentice in London, Dyott arrived in Philadelphia in the 1790s almost penniless and rented a basement room where by day he polished shoes and by night manufactured shoeblack. In 1807 he opened a drugstore, added “M.D.” to his name, and soon became the largest dealer of “family medicines” in the country. Among his better-selling products were Infallible Worm Destroying Lozenges and Vegetable Nervous Cordial. As his medicines required many bottles, in 1833 he purchased the Kensington (Pennsylvania) Glass Works, where he employed 400 workers. Here he found an outlet for his

Utopian ambitions. No liquor was permitted in Dyottville, or “Temperanceville,” as the factory community was called, although the “doctor’s” own medicines had a high alcoholic content. Workers rose to a daylight bell, had set times for baths, were served refreshments during breaks, and after supper and an hour’s leisure, attended night school and prayers. When the bank Dyott had established failed, he was sentenced to a short term in the penitentiary. Afterward, he returned to his drugstore and rebuilt his fortune before his death.

The Kensington output consisted of whiskey flasks, patent-medicine and pickle bottles, snuff jars, demijohns, and carboys in “bottle colours,” ranging from clear and aquamarine to dark olive, amber, and sage green. The popular and widely imitated George Washington, Jenny Lind, and Louis Kossuth bottles originated there.

dysautonomia (neurological disease): see Riley-Day syndrome.

dysentery, infectious disorder characterized by inflammation of the intestine, abdominal pain and straining, and diarrhea with stools that often contain blood and mucus.

There are two major types of dysentery: bacillary and amebic, caused, respectively, by bacteria and amoebas. Bacillary dysentery, or shigellosis, is caused by bacilli of the genus *Shigella*. Symptomatically, the disease ranges from a mild attack to a suddenly commencing severe course ending in death caused by dehydration and poisoning by the bacterial toxins. After an incubation period of one to six days, the disease has an abrupt onset with fever and the frequent production of watery stools that may contain blood. Straining and vomiting may also occur, and dehydration soon becomes obvious owing to the copious loss of body fluids. In advanced stages of the disease, chronic ulceration of the large intestine causes the production of bloody stools. The most severe bacillary infections are caused by *Shigella shigae* (also called *S. dysenteriae* type 1), which is found chiefly in tropical and subtropical regions. *S. flexneri*, *S. sonnei*, and *S. boydii* are other *Shigella* bacilli that cause dysentery. The treatment of bacillary dysentery is based on the use of such antibiotic drugs as tetracycline, oxytetracycline, and chlortetracycline. The copious administration of fluids and, in some cases, blood transfusions may be necessary in cases where the patient is severely dehydrated.

Amebic dysentery, or intestinal amebiasis, is caused by the protozoan *Entamoeba histolytica*. This form of dysentery is usually much more chronic and insidious than is the bacillary disease and is more difficult to treat because the causative organism occurs in two forms, a motile one and a cyst, each of which produces a different disease course. The motile form causes an acute dysentery, the symptoms of which resemble those of bacillary dysentery. The cyst form produces a chronic illness marked by intermittent episodes of diarrhea and stomach cramps or other abdominal pains. Bloody stools occur in some patients. The chronic type is much the more common of the two and is marked by frequent remissions and exacerbations of symptoms. The chronic form may also produce ulcerations of the large intestine. Both forms of amoebic dysentery are treated with emetine, diodoquin, and other drugs that specifically kill the amoebic parasites that thrive in the intestines.

The transmission of both bacterial and amebic dysentery occurs through the ingestion of food or water that have been contaminated by the feces of a human carrier of the infective organism. The transmission is often by infected individuals who handle food with unwashed hands. The spread of amebic dysentery is often accomplished by people who are carriers of the disease but who currently show

no symptoms. Dysentery is commonly found when people are crowded together and have access only to primitive sanitary facilities. It is one of the typical diseases found in prisoner-of-war camps, especially those in tropical climates.

dyslexia, a specific inability or pronounced difficulty in learning to read or spell, despite otherwise normal intellectual functions. Dyslexia is a chronic neurological disorder that inhibits a person’s ability to recognize and process graphic symbols, particularly those pertaining to language. It can have many different symptoms. Chief among these are extremely poor reading skills owing to no apparent cause, a tendency to read and write words and letters in reversed sequences (such cases may be identified by distinctive transpositions and other forms of misspelling), similar reversals of words and letters in the person’s speech, and illegible handwriting.

Dyslexia is found three times more often in boys than in girls and usually becomes evident in the early school years. The disorder tends to run in families. Only a minority of dyslexics remain nonreaders into adulthood, but many dyslexics continue to read and spell poorly throughout their lifetime. Dyslexics frequently perform above average on nonverbal tests of intelligence, however. Dyslexia is best treated by a sustained course of proper instruction in reading. The cause of the disorder is unknown, and even its diagnosis is a difficult task; dyslexia is usually diagnosed for children or adults who have reading difficulties for which there is no apparent explanation. Recent research points to anomalies in the respective functioning of the left and right hemispheres of the brain as possibly being the cause of the disorder, but a conclusive explanation has yet to be found.

dysmenorrhea, also spelled **DYSMENORRHOEA**, pain or painful cramps felt before or during menstruation. Dysmenorrhea may be primary or secondary. Primary dysmenorrhea is caused by specific imbalances in the woman’s endocrine system during the menstrual cycle. Secondary dysmenorrhea denotes menstrual cramps caused by some other distinct organic disorder. In most cases dysmenorrhea is primary.

Primary dysmenorrhea may occur a few days before the period, at the onset of bleeding, or during the total episode. The pain varies from a severe incapacitating distress to relatively minor and brief intense cramps. Other symptoms may include irritability, fatigue, backache, headache, leg pains, nausea, vomiting, and cramping. The cause of primary dysmenorrhea was long unknown and was most often explained as being a product of psychological stress. Primary dysmenorrhea is now known to be caused by the endocrine system’s release of excessive amounts of prostaglandins; these are hormonelike substances that stimulate the uterus to contract, thus causing the familiar cramps of the disorder. Drugs that block prostaglandin formation can decrease the severity of uterine contractions and can eliminate pain for many sufferers. Menstrual cramps also often diminish in severity or even disappear permanently after childbearing.

Secondary dysmenorrhea is much less common. It can be caused by genital obstructions, pelvic inflammation or degeneration, abnormal uterine wall separation or development, chronic infection of the uterus, polyps or tumours, or weakness of the muscles that support the uterus. Often the pain is dull, aching, and persistent. Tumours produce sharper pains. Treatment is directed toward the underlying disorder.

Dyson, Sir Frank (Watson) (b. Jan. 8, 1868, Measham, near Ashby-de-la-Zouch, Leicestershire, Eng.—d. May 25, 1939, at sea, en route from Australia to England), British as-

tronomer who in 1919 organized observations of stars near the Sun, which provided evidence supporting Einstein's prediction of the bending of light in a gravitational field.

In 1894 Dyson became chief assistant at the Royal Greenwich Observatory and was a mem-

Dyson, 1927
BBC Hulton Picture Library

ber of eclipse expeditions to Portugal (1900), Sumatra (1901), and Tunisia (1905). His observations of the corona and chromosphere of the Sun were published in *Determination of Wave-Lengths from Spectra Obtained at the Total Solar Eclipses of 1900, 1901, and 1905* (1906). Dyson was elected a fellow of the Royal Society of London in 1901, and in 1905 he was appointed Astronomer Royal for Scotland. He returned to Greenwich in 1910 to become the ninth Astronomer Royal of England, and five years later he was knighted. In 1921 he was honoured for his investigations of the distribution and movements of stars and the relationship of these to the structure of the Galaxy. Dyson's *Eclipses of the Sun and Moon* (1937) was written with Richard van der Riet Woolley.

Dyson, Freeman (John) (b. Dec. 15, 1923, Crowthorne, Berkshire, Eng.), physicist and educator best known for his speculative work on extraterrestrial civilizations.

The son of a musician and composer, Dyson was educated at the University of Cambridge. As a teenager he developed a passion for mathematics, but his studies at Cambridge were interrupted in 1943, when he served in the Royal Air Force Bomber Command. He received a B.A. from Cambridge in 1945 and became a research fellow of Trinity College. In 1947 he went to the United States to study physics and spent the next two years at Cornell University, Ithaca, N.Y., and Princeton, where he studied under J. Robert Oppenheimer, then director of the Institute for Advanced Study. Dyson returned to England in 1949 to become a research fellow at the University of Birmingham, but he was appointed professor of physics at Cornell in 1951 and two years later at the Institute for Advanced Study. He became a U.S. citizen in 1957.

A longtime advocate of exploration and colonization of the solar system and beyond, Dyson studied ways of searching for evidence of intelligent extraterrestrial life. He wrote several books, including *Disturbing the Universe* (1979), an autobiography; *Weapons and Hope* (1984); *Origins of Life* (1985); and *Infinite in All Directions* (1988). He received the Britannica Award in 1990.

dyspareunia, painful or difficult sexual intercourse in the female. Disorders are generally physical rather than psychological. Dyspareunia may be caused by inflammation or infection of the vagina, vaginismus (*q.v.*; voluntary or involuntary contraction of the lower vaginal muscles), remnants of the hymen, insufficient lubrication of the vagina, infection, endometriosis, tumours, or other pathologic conditions (including those of the anus—such

as hemorrhoids—or in the urinary tract). It may also be partially or (rarely) fully the result of psychosexual conflicts; for example, pain experienced in the first few attempts at sexual intercourse may lead to aversion to it and fear even after the pain is no longer encountered.

Diagnosis of the underlying cause of dyspareunia may indicate treatment for infection or inflammation, sexual counseling and education on anatomy and sexual functioning, the use of lubricants, and, in some instances, surgical removal of tumours or treatment of endometriosis. The cooperation of both partners in treatment is usually desirable.

dyspepsia: see indigestion.

dysphasia (neuropathy): see aphasia.

dysphemia: see stuttering.

dysplasia, malformation of some bodily structure or tissue; the term most commonly denotes a malformation of bone that may occur in any part of the body. Several dysplasias are well-defined diseases in humans.

Chondroectodermal dysplasia (Ellis-van Creveld syndrome) is a very rare, congenital disorder. It is heritable (autosomal recessive). Affected individuals exhibit heart abnormalities (which may cause early death), extra digits, defective dentition, poorly formed nails, dwarfing, and often knock-knees and fusion of hand bones. The disorder reaches its highest known frequency among the Old Order Amish in Pennsylvania, in which 5 in every 1,000 births are affected.

Progressive diaphyseal dysplasia (Engelmann's syndrome) is an uncommon heritable (autosomal recessive) disorder beginning in childhood. The shafts of the bones and the skull vault become thickened; there is no pain, but individuals grow to be taller than normal, have weak muscles, are easily fatigued, and exhibit a stiff, waddling gait.

Epiphyseal dysplasia is a not uncommon disorder in which the ends of bones (the epiphyses) in children grow and ossify very slowly; dwarfing is a common result but may be limited to the lower limbs. Degenerative joint disease usually develops by middle age, but individuals may be otherwise healthy.

Stippled epiphyses (dysplasia epiphysealis punctata) is a very rare, little understood disorder in which spots of opaque material are observed in the epiphyseal cartilage at birth. Many infants die within the first year; those who live may show dwarfism, mental retardation, and congenital cataracts.

Metaphyseal dysplasia is a very rare, familial disorder in which the cortex of the shafts of long bones is thin and tends to fracture; affected persons may be otherwise healthy.

Hip dysplasia is a hereditary condition in dogs, especially in large breeds such as the German shepherd, Old English sheepdog, and St. Bernard. It includes a range of abnormalities involving the head of the thigh bone and the receiving socket in the hip bone.

dysprosium (Dy), chemical element, rare-earth metal of transition Group IIIB of the periodic table. A relatively hard and very reactive metal, it is oxidized by air and by water. Its high melting point and ability to absorb neutrons make it useful in control rods for nuclear reactors. Its compounds have been used for making laser materials, as components in some electronic equipment, and as phosphor activators.

P.-É. Lecoq de Boisbaudran first found this element (1886) associated with holmium and other heavy rare earths; Georges Urbain later (1906) was able to prepare a reasonably pure fraction. Some important mineral sources of dysprosium are xenotime, fergusonite, gadolinite, euxenite, polycrase, and blomstrandine. It occurs also in the products of nuclear fission. Commercial separation is performed by ion-exchange methods. The metal has been

prepared by thermoreduction of the anhydrous halides with alkali or alkaline-earth metals. Dysprosium metal at room temperature is crystallized in a hexagonal close-packed structure, below -168°C is ferromagnetic, and at very low temperatures is superconductive. The naturally occurring isotopes are all stable and have mass numbers 156, 158, 160, 161, 162, 163, and 164; the last four make up nearly 98 percent of natural dysprosium.

Chemically, dysprosium behaves as a typical trivalent rare earth and forms a series of pale yellow compounds. The Dy^{3+} ion is strongly paramagnetic; this property has been harnessed to produce magnetic cooling to very low temperatures.

Dyula, also spelled DIULA, DIOULA, or JULA, a people of western Africa, who speak a Mande language of the Nilo-Congo family. They are chiefly Muslims and have long been noted as commercial traders.

The Dyula were active gold traders as long ago as the time of the ancient African kingdom of Ghana and flourished under the empire of Mali, when they provided a link between the gold-producing forest lands in the south and the trading network of the western Sudan and North Africa. Kola nuts were another important trade item, and the Dyula were noted as skilled craftsmen. They began to disperse and settle into towns in about the 16th century. In the mid-19th century some of these towns expanded into larger states, but they had declined by 1900.

Today the Dyula are settled in the towns and villages in Côte d'Ivoire, Burkina Faso (formerly Upper Volta), and parts of Mali and Ghana. Some Dyula communities have become agricultural, but most remain active in commerce, at least in the dry season.

Dyushambe (Tajikistan): see Dushanbe.

Dzalamo (people): see Zaramo.

Dzauzhikau (Russia): see Vladikavkaz.

Dzerzhinsk, also spelled DZERZHINSK, formerly (until 1929) RASTYAPINO, city, Nizhegorod oblast (province), western Russia, on the Oka River above its confluence with the Volga at Nizhny Novgorod and on the Moscow-Nizhny Novgorod railway. Part of the Nizhny Novgorod metropolitan area, Dzerzhinsk and its satellite towns stretch for 15 miles (24 km) along the river. It is one of Russia's most important centres of the chemical industry, producing phosphate and nitrate fertilizers, materials for synthetic textiles, and plastics. The production of building materials and flour milling are also carried on, and there is a school of engineering. Pop. (1991 est.) 286,700.

Dzerzhinsky, Feliks Edmundovich, Polish FELIKS DZIERŻYŃSKI (b. Sept. 11 [Aug. 30, Old Style], 1877, Dzerzhinovo, near Minsk, Russian Empire [now in Belarus])—d. July 20, 1926, Moscow), Bolshevik leader, head of the first Soviet secret police organization.

Son of a Polish nobleman, Dzerzhinsky joined the Kaunas (Kovno) organization of the Lithuanian Social Democratic Party in 1895. He became a party organizer, and, although he was arrested by the Russian Imperial Police for his revolutionary activities five times between 1897 and 1908, he repeatedly escaped from exile in Siberia. Not only did he participate in the Russian Revolution of 1905 but he

also became a leader of the Polish-Lithuanian Social Democratic Party and was influential in convincing his colleagues to unite with the Russian Social Democrats in 1906. Afterward, Dzerzhinsky pursued his revolutionary activities within the Russian Empire and in western Europe. Arrested for the sixth time in 1912, he remained in captivity until after the February Revolution of 1917.

Dzerzhinsky was elected to the Bolshevik Party's Central Committee in July 1917, and he played an active role in the October Revolution (1917). On Dec. 20 (Dec. 7), 1917, he was named head of the new All-Russian Extraordinary Commission for Combating Counterrevolution and Sabotage (Cheka), which became Soviet Russia's security police agency. The Cheka helped stabilize V.I. Lenin's dictatorship by arbitrarily executing real and alleged enemies of the Soviet state. Dzerzhinsky, who organized the first concentration camps in Russia, acquired a reputation as an incorruptible, ruthless, and fanatical communist.

During the Russo-Polish War (1919–20), Dzerzhinsky was appointed to the Polish revolutionary committee that was intended to become the Bolshevik government of Poland. But after the Soviet army was forced to retreat from Poland, he again concentrated on Russian affairs. He remained head of the Cheka and commissar for internal affairs (after 1919) and became commissar for transport (1921). In 1924, after he had become a firm supporter of Joseph Stalin, Dzerzhinsky was given control of the Supreme Economic Council and was also elected a candidate of the Politburo. In 1926, during a debate at a Central Committee session, Dzerzhinsky collapsed and died.

Dzhalal-Abad, Kyrgyz JALAL-ABAD, city, western Kyrgyzstan. Though made a city in 1877, it remained essentially a large village. Given city status again in 1927, it now is a regional centre for food processing and other light industries and has a theatre and a museum. Pop. (1999) 70,401.

dzhalmán: see Selevin's mouse.

Dzhambul (Kazakhstan): see Auliye-Ata.

Dzhezkazgan, Kazakh ZHEZQAZGHAN, Russian ZHEZKAZGAN, city, central Kazakhstan, on a reservoir of the Kara-Kengir River. The city was created in 1938 in connection with the exploitation of the rich local copper deposits. In 1973 a large mining and metallurgical complex was constructed to the southeast to smelt the copper that until then had been sent elsewhere for processing. The city has a rail link with Karaganda. Its urban area includes the neighbouring mining town of Satpayev. Pop. (1999) 90,000.

Dzhirgalantu (Mongolia): see Hovd.

Dzhizak, Uzbek JIZZAX, city, eastern Uzbekistan. The city is located in a small oasis irrigated by the Sanzar River, northeast of Samarkand. One of the most ancient settlements of Uzbekistan, it was situated on the trade routes to the Mediterranean near Tamerlane's Gates, the only convenient passage through the Nuratau Mountains to the Zeravshan River valley. Today the city processes cotton and other local agricultural products together with building materials. Pop. (1999 est.) 126,400.

Dzierżoniów, German REICHENBACH, city, Dolnośląskie województwo (province), southwestern Poland, on the Pilawa River in Lower Silesia. The community was founded as Reichenbach in the 12th century and received town rights in the 13th. The duke of Ziębice (Münsterberg) pledged the town to Bohemia (1335), whence it passed to the Habsburgs. In 1742 it was surrendered, with Silesia, to Prussia; it returned to Poland in 1945 and was renamed for the Polish priest Jan Dzierżoń. The economy of Dzierżoniów was long based on heavy industry, though this activity had fallen into decline by the late 20th century. It is the major trading centre for its surrounding area. Pop. (2005 est.) 34,878.

Dzungarian Basin, Chinese (Wade-Giles) CHUN-KO-ERH P'EN-TI, or (Pinyin) JUNGGAR PENDI, extensive basin in the Uyghur Autonomous Region of Sinkiang, China.

The basin is located between the Mongolian Altai Mountains, on the Sino-Mongolian border, to the north, and the P'o-lo-k'o-nu and O-ha-pu-t'e mountains to the south; the latter run east and west immediately to the north of the Tien Shan ("Celestial Mountains"). To the east and southeast, respectively, the basin is bounded by the Baytag Bogd and Po-ko-ta mountains. The basin's western limit is defined by the Dzungarian Alatau and Tarbagatay (T'a-erh-pa-ha-t'ai) mountain ranges, which separate it from the Lake Balkhash depression in Kazakhstan.

The main pass through the western ranges is the so-called Dzungarian Gate (Chun-ko-erh Men), which leads to Lake Alakol and Lake Balkhash in Kazakhstan. In the far north the O-erh-ch'i-ssu River (Russian: Kara Irtysh) drains into Lake Zaysan across the Kazakhstan border. Otherwise, the Dzungarian Basin is an area of internal drainage, with the rivers from the Altai draining into Chi-li Lake and those from the southern ranges draining into Ma-na-ssu or Ai-pi lakes in the low-lying depression immediately southeast of the Dzungarian Gate. The whole depression lies between 1,650 and 3,300 feet (500 and 1,000 m) above sea level, with a general slope from northeast to southwest, where Ai-pi Lake lies at an elevation of little more than 620 feet (189 m).

The area is very dry and receives only 6–12 inches (150–300 mm) of precipitation annually. It also experiences great extremes of temperature. The surrounding mountains, however, receive much heavier precipitation, and much of the northern ranges and the Altai are forested. The east-central part of the basin is a desert (the Dzungarian Gobi) but is not totally barren. Surrounding it are zones of steppe (grassy plains) and semisteppe watered by seasonal watercourses that often peter out into saline marshes. There are few rivers in the basin.

The population consists mostly of Uighurs and various Turkic or Mongol peoples, the only native Han (Chinese) being the settlers on the southern oases and state farms and the industrial population.

e-mail: see electronic mail.

E region, also called **KENNELLY-HEAVISIDE LAYER**, ionospheric region that extends from an altitude of 90 kilometres (60 miles) to about 160 kilometres (100 miles). As in the D region (70–90 kilometres), the ionization is primarily molecular—*i.e.*, resulting from the splitting of neutral molecules—oxygen (O₂) and nitrogen (N₂)—into electrons and positively charged molecules. Unlike that of the D region, the ionization of the E region remains at night, though it is considerably diminished. The E region was responsible for the reflections involved in Marconi's original transatlantic radio communication in 1902. The ionization density is typically 10⁵ electrons per cubic centimetre during the day. Intermittent patches of stronger ionization are sometimes observed at the same general altitude.

E source (biblical literature): see Elohist source.

E¹ (mountain, Nepal-Tibet): see Lhotse.

Ea (Akkadian), Sumerian **ENKI**, Mesopotamian god of water and a member of the triad of deities completed by Anu (Sumerian An) and Bel (Enlil). From a local deity worshiped in the city of Eridu, Ea evolved into a major god, Lord of Apsu (also spelled Abzu), the fresh waters beneath the earth (although Enki means literally "lord of the earth"). In the Sumerian myth, "Enki and the World Order," Enki is said to have fixed national boundaries and assigned gods their roles. According to another Sumerian myth Enki is the creator, having devised men as slaves to the gods. In his original form, as Enki, he was associated with semen and amniotic fluid, and therefore with fertility. He was commonly represented as a half-goat, half-fish creature, from which the modern astrological figure for Capricorn is derived.

Ea, the Akkadian counterpart of Enki, was the god of ritual purification: ritual cleansing waters were called "Ea's water." Ea governed the arts of sorcery and incantation. In some stories he was also the form-giving god, and thus the patron of craftsmen and artists; he was known as the bearer of culture. In his role as adviser to the king, Ea was a wise god although not a forceful one. In Akkadian myth, as Ea's character evolves, he appears frequent-

Ea (seated) and attendant deities, Sumerian cylinder seal, c. 2300 BC; in the Pierpont Morgan Library, New York

ly as a clever mediator who could be devious and cunning. He is also significant in Akkadian mythology as the father of Marduk, the national god of Babylonia.

Eadbald (d. Jan. 20, 640), king of Kent, who succeeded his father Aethelberht in 616. He had not been influenced by the teaching of the Christian missionaries, and his first step on his accession was to marry his father's widow. After his subsequent conversion by Laurentius, archbishop of Canterbury, he built a church in Canterbury dedicated to the Virgin Mary. He arranged a marriage between his sis-

ter Aethelberg and Edwin of Northumbria, on whose defeat and death in 633 he received his sister in the company of Paulinus and offered the latter the bishopric of Rochester.

Eadbert, also spelled **EADBERHT** (Anglo-Saxon king): see Edbert.

Eadmer (English writer): see Edmer.

Eadred, also spelled **EDRED** (d. Nov. 23, 955, Frome, in modern Somerset, Eng.), king of the English from 946 to 955, who brought Northumbria permanently under English rule. Eadred was the son of the West Saxon king Edward the Elder (ruled 899–924), the half brother of King Athelstan (ruled 924–939), and the brother of King Edmund I (ruled 939–946). Upon Eadred's accession to power, the Northumbrians acknowledged his overlordship, but they soon proclaimed as their king Erik Bloodax, son of the Norwegian ruler Harald I Fairhair. In revenge Eadred ravaged all of Northumbria (948). The Northumbrians submitted to Eadred, but in 949 they accepted another Norse king, Olaf Sihtricson, as their

Eadred, shown on a 10th-century silver penny, in the British Museum

Peter Clayton

ruler. They overthrew Olaf in 952 in favour of Erik Bloodax, who in turn was expelled and killed in 954. The Northumbrians then resumed their allegiance to Eadred.

Eadric STREONA, Eadric also spelled **EDRIC** (d. 1017), ealdorman of the Mercians, who, though a man of ignoble birth, was advanced to the revived office of ealdorman by the English king Ethelred II, whose daughter Eadgyth Eadric married (1009).

Little is known of Eadric's origins. His appointment to the office of ealdorman was probably an attempt by Ethelred to unite south-central England under one command. He is generally considered an archtraitor in the struggle between the English and the Danes for sovereignty over England. Although there are several records of his minor betrayals and instances of bad counsel, Eadric committed his chief act of treachery in 1015, when he sided with Canute against Edmund Ironside as Ethelred, Edmund's father, lay dying. When at length peace was made, Canute restored to Eadric the earldom of Mercia; but at Christmas 1017, fearing further treachery, Canute had him slain.

Eads, James B., in full **JAMES BUCHANAN EADS** (b. May 23, 1820, Lawrenceburg, Ind., U.S.—d. March 8, 1887, Nassau, Bahamas), American engineer best known for his triple-arch steel bridge over the Mississippi River at St. Louis, Mo. (1874). Another project provided a year-round navigation channel for New Orleans by means of jetties (1879).

Eads was named for his mother's cousin James Buchanan, a Pennsylvania congressman who later became president of the United States. The boy spent a migrant youth with little formal education, for his father's never very successful business ventures took the family to Cincinnati, Ohio, then Louisville, Ky., and finally St. Louis. James Eads educated himself by reading the library of his first

employer, a St. Louis dry-goods merchant. At 18 he became purser on a Mississippi riverboat. Not long after, he began to consider means to recover by salvage the heavy losses from the frequent riverboat disasters. When he was 22, he invented a salvage boat, which he

Eads

By courtesy of the Library of Congress, Washington D.C.

called a submarine; actually it was a surface vessel from which he could descend in a diving bell he had also designed and walk the river bottom. He recovered lead and iron pigs and other valuable freight; on one occasion he retrieved a cargo that included a large crock of butter in a good state of preservation. So successful was his equipment that in 12 years of operations on the Mississippi and its tributaries he made his fortune.

Retiring from the river to marry and settle down, Eads set himself up briefly as a glass manufacturer, but the promising enterprise, the first glass factory in the West, was ruined by the Mexican War; by 1848 he was back in the salvage business. He built three new submarines, the third of which was capable of pumping out and raising a sunken hull from the bottom. Within a few years he had 10 boats in his fleet.

As the Civil War threatened, Eads foresaw the struggle that would take place for control of the Mississippi system, and he advanced a radical idea. He proposed that ironclad steam-powered warships of shallow draft be built to operate on the rivers. The U.S. government was slow to take up his offer to build such a flotilla; when it did, he built the ships in record time, working 4,000 men on day and night shifts seven days a week. The novel craft he set afloat spearheaded Grant's offensive against Forts Henry and Donelson, the first important Union victories of the war. They continued to play a conspicuous role under Andrew Foote and David Farragut at Memphis, Island No. 10, Vicksburg, and Mobile Bay. The vessels were the first ironclads to fight in North America and the first in the world to engage enemy warships. (The *Monitor* and *Merrimack*, both ironclads that battled in the American Civil War, were the first such vessels to close against each other in combat.) Immediately after the war, Eads was chosen to direct a construction project of extraordinary difficulty, the bridging of the Mississippi at St. Louis.

From his knowledge of the river and of the fabrication of iron and steel, he secured, against opposition, some of it unscrupulous, a contract for a steel triple-arch bridge over the river at St. Louis, which he began on Aug. 20, 1867. Its three spans, 502, 520, and 502 feet (152, 158, and 152 m), respectively, consisted of triangularly braced 18-inch (46-centimetre) hollow steel tubes linked in units and set in

piers based on bedrock. Since the rock lay some 100 feet (30 m) below the river surface, reaching it posed major problems. The work of digging through the mud bottom had to be carried on under compressed air, and some of the men developed decompression sickness (the bends). After two workers died on March 19, 1870, Eads established a floating hospital, provided nourishing food for his workers, insisted on slow decompression on emerging from the caissons, and installed a lift.

The steel used in construction of the bridge was subject to similar rigorous standards; it was inspected at the works and on the site. Indeed, its supplier, the famed industrialist Andrew Carnegie, was forced to take back some batches for rerolling three times, and some were still rejected as not conforming to the specified strength of 60,000 pounds (27,000 kg) per square inch. Many other problems arose. To construct his first steel arches without disturbing navigation on the river, Eads used timber cantilevers to support them, with the halves of each arch held back by cables passing over the top of towers built on the piers. To join the two halves of the middle arch, Eads's deputy, Colonel Henry Flad, had planned to hump the middle arch slightly to bring the two halves together; then, with the cantilevering removed, the arch would assume its normal shape. Eads, on the other hand, had prepared a wrought-iron plug fitted with threads; the last two arch ribs could be shortened by five inches each and cut with screw threads to receive the plug, which would close the distance between the ribs. Because of an unusual mid-September warm spell, which warped the bridge arches toward the north, Flad could not close the arches by the method he had chosen and, after trying to cool the steel tubes with ice packs, fell back on Eads's screw-plug connection. The first arch was closed on Sept. 17, 1873.

The Eads, or St. Louis, Bridge, the largest bridge of any type built up to that time, was recognized throughout the world as a landmark engineering achievement, with its pioneering use of structural steel, its foundations planted at record depths, and its cantilevering technique used for raising the arches. The bridge was officially opened on July 4, 1874.

Soon after, Eads's rare understanding of the Mississippi was enlisted at New Orleans to provide a year-round navigation channel for the city. Despite widespread skepticism, he successfully altered the sedimental behaviour of the river by building a series of jetties, and within five years, by 1879, he had created a practical channel for shipping. In this important work he employed a technique of carrying out the project at his own expense, simply on the basis of guarantees if successful. On the same conditions he sought to promote a ship-carrying railway across the Isthmus of Tehuantepec, in Mexico, as a more economic and viable alternative to a canal across the Isthmus of Panama. Two bills to promote the railway, however, failed in Congress.

James Buchanan Eads was the first U.S. engineer to be honoured with the Albert Medal of the Royal Society of Arts in London. He had been a consultant for Liverpool docks, as well as for installations in Toronto and in Veracruz and Tampico, Mex. Twice married, he had two daughters and three stepdaughters.

(W.H.G.A.)

BIBLIOGRAPHY. His writings are collected in Estill McHenry (ed.), *Addresses and Papers of James B. Eads* (1884). Florence L. Dorsey, *Road to the Sea: The Story of James B. Eads and the Mississippi River* (1947), is the standard work, a well-documented biography, based on research in technical and family papers. Louis How, *James B. Eads* (1900, reissued 1970), is by Eads's grandson. H.J. Hopkins, *A Span of Bridges* (1970), offers a good

account of the building of the bridge. Quinta Scott and Howard S. Miller, *The Eads Bridge* (1979), includes a photographic essay.

Eadward, also spelled EADWARD (Old English personal name): see under Edward.

Eadwig, also spelled EDWY (d. Oct. 1, 959), king of the English from 955 to 957 and ruler of Wessex and Kent from 957 to 959. The eldest son of King Edmund I (ruled 939–946) and the nephew of King Eadred (ruled 946–955), he was probably no more than 15 years old at the time of his accession.

Early historical sources are biased against Eadwig. According to one writer, he hated the great monastic reformer Dunstan because he made Eadwig return to his coronation feast which he had left in order to visit Aelfgifu, whom he later married. Although Eadwig drove Dunstan into exile, he evidently did not attempt to halt the monastic revival that the churchman had inspired. In 957 the Mercians and Northumbrians revolted and proclaimed Eadwig's brother Edgar as their king. For the next two years Eadwig controlled only the region south of the Thames.

eagle, any of many large, heavy-beaked, big-footed birds of prey belonging to the family Accipitridae (order Falconiformes). In general, an eagle is any bird of prey more powerful than a falcon. An eagle may resemble a vulture in build and flight characteristics but has a fully feathered (often crested) head and strong feet equipped with great curved talons. A further difference is in foraging habits: eagles subsist mainly on live prey. They are too ponderous for effective aerial pursuit but try to surprise and overwhelm their prey on the ground. Like owls, many decapitate their kills. Because of their strength, eagles have been a symbol of war and imperial power since Babylonian times.

Eagles are monogamous. They mate for life and use the same nest each year. They tend to nest in inaccessible places, incubating a small clutch of eggs six to eight weeks. The young mature slowly, reaching adult plumage in the third or fourth year.

The harpy eagles, named after the foul, malign creatures (part woman and part bird) of Greek mythology, are large, powerful, crested eagles of the jungles of South America and the South Pacific. They nest in the tops of the tallest trees and hunt macaws, monkeys, and sloths. The great harpy eagle (*Harpia harpyja*), which ranges from southern Mexico to Brazil, is about one metre (3.3 feet) long and bears a crest of dark feathers on its head. Its body is black above and white below except for a black chest band. It was becoming increasingly rare in the late 20th century, particularly in Mexico and Central America. The New Guinea harpy eagle (*Harpypopsis novaeguineae*) is about 75 cm (30 inches) long. It is gray-brown and has a long tail and a short but full crest. Very similar in appearance and habits is the monkey-eating eagle (*Pithecophaga jefferyi*) of the Philippines. It is about 90 cm (35 inches) long, brown above and white below, with a crest of long narrow feathers. It is an endangered species.

The harrier eagles, six species of *Circaetus* (subfamily Circaetinae, serpent eagles), of Europe, Asia, and Africa, are about 60 cm (24 inches) long and have short unfeathered legs. They nest in the tops of trees and hunt snakes.

The hawk eagles (genera *Spizastur*, *Spizastetus*, *Lophastetus*, and *Hieraastetus*, subfamily Accipitrinae) are lightly built eagles that have fully feathered legs and large beaks and feet. They hunt all kinds of small animals. *Spizastetus* species (as the ornate hawk eagle, *S. ornatus*, of tropical America) have short wide wings, long rounded tails, and ornamented heads. Bonelli's eagle (*Hieraastetus fasciatus*) of Mediterranean areas and parts of southern Asia, is about 60 cm (24 inches) long, dark

above and light below, has a broad tailband, and usually shows a white patch on the back.

The martial eagle (*Polemaetus bellicosus*) of Africa is heavily built, brown above with black throat and black-spotted white underparts. It has a short, barred tail and bright yellow eyes. It is large and strong enough to kill jackals and small antelopes, but its usual food is gallinaceous birds and hyraxes.

The sea eagles (sometimes called fish, or fishing, eagles), species of *Haliaeetus*, of which one of the best known is the bald eagle (*q.v.*), are very large eagles that live along rivers, big lakes, and tidewater throughout the world except South America. Some reach one metre (3.3 feet) long. All have exceptionally large high-arched beaks and bare lower legs. Under-surfaces of the toes are roughened for grasping

slippery prey. These birds eat much carrion but sometimes kill. They snatch fish from the water surface and often rob their chief competitor, the osprey. Asian species include the gray-headed, or greater, fishing eagle (*Ichthyophaga ichthyaeetus*) and the lesser fishing eagle (*I. naga*).

The serpent eagles, or snake eagles, *Spilornis* (six species, subfamily Circaetinae), eat mostly snakes, including large poisonous ones. They occur in Asia. Other birds called serpent eagles, notably the long-tailed members of the genera *Dryotriorchis* (e.g. African serpent eagle) and *Eutriorchis* (e.g., the endangered Madagascar serpent eagle) occur in Africa.

Verreaux's eagle (*Aquila verreauxi*) is an uncommon bird of eastern and southern Africa. It is black with white rump and wing patches. It reaches about 80 centimetres (31 inches) in length, and it subsists mainly on hyraxes. See also bateleur; golden eagle.

eagle owl (*Bubo bubo*), bird of the family Strigidae (order Strigiformes), characterized by its large size (often 70 centimetres [about 2.3 feet] long), two tufts of feathers on the head (ear tufts), and large orange eyes. The overall coloration is tawny, mottled with brown, lighter below. The eagle owl roosts and breeds within rocky niches and hollow trees. At twilight it perches on a branch while searching its territory for prey, mainly rodents, hares, rabbits, and large game birds.

The eagle owl, sometimes called the Eurasian eagle owl, inhabits Europe, Asia, and northern Africa but is only a straggler in most of Great Britain. It is a horned owl (*q.v.*), related to the great horned owl (*B. virginianus*) of America.

Several other *Bubo* species are also called eagle owls, among them the spotted eagle owl (*B. africanus*) of sub-Saharan Africa and the forest eagle owl (*B. nipalensis*) of southeast Asia.

Eagle Pass, city, seat (1856) of Maverick county, southwestern Texas, U.S., on the Rio Grande, bridged to Piedras Negras, Mex., 130 mi (210 km) southwest of San Antonio. It evolved as a garrison town laid out as El Paso de Aguila (Eagle Pass) near Camp California (on the Gold Rush Trail) and Ft. Duncan (established 1849, now restored in a city park). In the Civil War it was an outlet for Confederate goods that were blockaded elsewhere. It had special importance during the Mexican Revolution, and as Camp Eagle Pass it was under military authority until 1916. A port of entry, its economy depends on border trade, tourist traffic, farm and ranch business, and industries (notably oil and gas production). Inc. 1908. Pop. (1990) 20,651.

eagle ray, any of about two dozen species of exclusively marine rays constituting the family Myliobatidae (order Rajiformes), occurring in the major oceans. They have the enlarged, winglike pectoral fins characteristic of the order. Some species have a sharp-edged serrated spine at the base of the long, whiplike tail. Their teeth are flat, for crushing and grinding mollusks and crustaceans. Although they are bottom feeders, eagle rays frequently swim near the ocean's surface, occasionally jumping high out of the water in spectacular displays. The spotted eagle ray (*Aetobatus narinari*) has a wingspan of up to 2.1 metres (7 feet).

Eakins, Thomas (b. July 25, 1844, Philadelphia—d. June 25, 1916, Philadelphia), painter who carried the tradition of 19th-century American Realism to perhaps its highest achievement. He painted mainly portraits of his friends and scenes of outdoor sports, such as swimming and boating (e.g., "Max Schmitt in a Single Scull," 1871). Because of its frank and unsentimental nature, the work generally acknowledged as his masterpiece, "The Gross Clinic" (1875), which depicts a surgical operation, was received with distaste by his contemporaries.

Thomas Eakins, detail of a self-portrait, oil on canvas, 1902; in the National Academy of Design, New York

By courtesy of the National Academy of Design, New York

Early life and artistic training. Eakins was born in Philadelphia and, except for one extended study trip abroad and a brief trip to the West, virtually his entire life was spent in that city. From his father, a writing master, Eakins inherited not only the manual dexterity and sense of precision that characterizes his art but also the love of outdoor activity and the commitment to absolute integrity that marked his personal life. He did well in school, especially in science and mathematics.

As his interest in art developed, he studied at the Pennsylvania Academy of Fine Arts. Concerned particularly with the human figure, he reinforced his study of the live model at the academy by attending lectures in anatomy at Jefferson Medical College and eventually witnessing and participating in dissections.

Eakins went to France in 1866. He enrolled at the École des Beaux-Arts and studied with the leading academic painter Jean-Léon Gérôme for over three years. Unaffected by the avant-garde painting of the Impressionists, Eakins absorbed a solid academic tradition with its emphasis on drawing. After completing his study, Eakins went to Spain late in 1869, where he was greatly influenced by the 17th-century paintings of Diego Velázquez and José de Ribera. Perhaps reacting against the rigours of his academic training, he preferred artists who used paint and brush boldly to express their sense of life, creating what he called "big work." In Spain, his student days behind him, Eakins undertook his first independent efforts at oil painting.

Early career. Eakins returned to Philadelphia in the summer of 1870. His earliest artistic subjects were his sisters and other members of his family and the family of his fiancée, Katherine Crowell. Redolent with the character of each individual in an intimate and personal domestic setting—pensive young ladies at the piano, children engrossed with toys scattered on the floor, Katherine playing with a kitten in her lap—these rich, warm portraits seem to express in colour and mood the essence of what Lewis Mumford called "the Brown Decades." Close family ties were important to Eakins, and the intimate harmony of his home life was seriously disrupted and saddened by the death first of his mother and later of Katherine Crowell.

Eakins resumed the vigorous outdoor life of his earlier years—hunting, sailing, fishing, swimming, rowing. These activities, like his family circle, provided him with subject matter for his art. A candid realist, Eakins simply painted the people and the world that he knew best, choosing his subjects from the life that he lived. Like the poetry of his aged friend Walt Whitman, who lived across the Delaware River in Camden, N.J., Eakins' art was autobiographical, "a song of himself."

Eakins, in fact, often included himself as an observer in his own paintings—sculling in the background behind his friend in "Max Schmitt in a Single Scull," peering intently at a surgical operation in "The Agnew Clinic," or treading water next to his setter dog Harry and watching a group of students swimming in "The Swimming Hole." Each of the early outdoor scenes, natural and informal at first glance, was, in fact, carefully composed on a perspective grid, with each object precisely located in pictorial space. Each image is further informed by Eakins' personal knowledge of the scene depicted. Thus colour, composition, and the play of lights and darks subtly convey to the viewer a fuller understanding of and feeling for the concentrated energy of a sculler propelling his boat through the water, or the taut equilibrium of the moment when a hunter standing in his boat balances himself, sights his target, and slowly squeezes the trigger.

Eakins' masterpiece. In 1875 Eakins, who had yet to become well known, decided to paint a major picture for the Centennial Exposition to be held in Philadelphia the following year. He took as his subject a scene that had become familiar to him—Samuel Gross of Jefferson Medical College operating in his clinic before his students. Gross was a magnetic teacher and one of the country's greatest surgeons. Eakins often selected moments that reveal multiple aspects of a scene and in this picture depicts Gross as both surgeon and teacher. Gross stands in the centre of a sombre amphitheatre, starkly top-lighted by a flood of cool daylight cascading down from a skylight above; he is dressed in black street clothes. He has opened an incision in the leg of the anesthetized male patient stretched out before him. While his assistants probe the wound, the doctor turns, one hand holding a scalpel covered with blood, to tell his students what he has done and what he will do next. At the left a seated woman, perhaps the patient's mother, flings an arm across her face, shielding her eyes from the scene, her fingers clawing the air in anguish. Her emotion and the note of pain and suffering inherent in the subject contrast strikingly with the cool professionalism of Gross, whose calm features reflect assurance and determination as well as compassion. The painting objectively records a realistic drama of contemporary life, full of feeling but free of sentimentality. "The Gross Clinic" is generally agreed to be Eakins' masterpiece.

To Eakins' dismay "The Gross Clinic" was rejected for the art exhibition at the Centennial Exposition, and he had to exhibit it in a medical section. Critics and public alike responded to the painting unfavourably. While they could accept historical scenes of grisly martyrdoms or bloody massacres without qualm, "The Gross Clinic" represented blood and pain and suffering as immediate facts in Philadelphia. That was offensive and unacceptable. Viewers could not appreciate a picture that was neither entertaining nor ennobling but simply a frank statement of contemporary reality. The rejection of the painting was the first of many rebuffs Eakins was to receive from Victorian contemporaries who shared his world but not his values.

Mature period. From his earliest student days, Eakins had been primarily interested in studying and portraying the human figure. His early sculling scenes displayed the musculature of athletic men, and "The Gross Clinic" dealt directly with the subject of human anatomy. But Eakins found few subjects in contemporary Philadelphia that afforded opportunities for portraying the undraped human figure, especially females. He circumvented this by painting repeatedly a partly imaginary scene

of William Rush, a much earlier Philadelphia sculptor, carving his statue of the "Nymph with Bittern" from a naked female model in the presence of a chaperon, which provided him with a pictorial pretext for portraying a nude woman.

In the late 1870s Eakins began to teach at the Pennsylvania Academy of Fine Arts, where he became professor of drawing and painting in 1879. A popular and influential teacher, Eakins stressed anatomy and drawing from live, nude models as opposed to the study of plaster casts of antique sculpture. The fame of the Pennsylvania Academy as a centre for the best art instruction in the country spread among young artists. Yet notoriety accompanied repute, and objections were voiced increasingly from outside the academy to Eakins' unrestrained use of nude models in front of mixed classes. The suspicious were unable to accept Eakins' assurance that the relationship between artist and model was as innocent, objective, and professional as that between doctor and patient. Eakins continued to insist on the importance of teaching from nude human models and was finally forced to resign in 1886. Teaching had become a major part of his life, and this was another severe blow. He continued to teach sporadically at the newly formed Art Students League in Philadelphia and at the National Academy of Design in New York, and his personal relationships with young artists remained close. One bright moment during these difficult years occurred in 1884, when he married one of his pupils, Susan Macdowell.

As a corollary to his interest in anatomy, Eakins was fascinated with locomotion—human and animal figures in motion. A commission in 1879 to paint Fairman Rogers driving his four-in-hand coach through Fairmount Park in Philadelphia (Philadelphia Museum of Art) led him to an intensive study of horse anatomy, and he made a number of sculpted wax sketches of horses in motion. He developed a serious interest in sculpture, an aspect of his art that only became appreciated much later. His interest in locomotion led to familiarity with the experiments in sequential photography being made in California by Eadward Muybridge. By 1884 Eakins himself was experimenting with multiple-image photography of moving athletes and animals. And in later years his interest in the human figure in motion led him to make a series of impressive paintings of boxing scenes.

Eakins' interests ranged widely—sports, anatomy, locomotion, music, sculpture, photography—in directions often reminiscent of his great French contemporary Edgar Degas but without that artist's innovative stylistic concerns. There is no evidence, however, that Eakins was aware of the work of Degas. Eakins' art does demand comparison with that of Winslow Homer, the contemporary he most admired and his principal rival claimant to the title of the greatest American artist of the 19th century. Homer, also an objective realist, was similarly interested in outdoor sports and such sporting subjects as hunting, canoeing, and fishing. He also had a similar love for and identification with a specific place—in Homer's case, Prouts Neck, Maine. Homer's art is cool, detached, impersonal, and ultimately pessimistic in its view that man is at the mercy of a deterministic universe. Eakins' art, although often sad in its reflection of the buffeting each human receives in the course of his years, still is ultimately optimistic in its humanism, in its message that man, through his individual actions—a doctor with a knife, a sculler with an oar, a hunter with a gun, a boxer with his gloved fist, a musician with his instrument, a singer with her voice, a chess player with his pieces, a scientist with his in-

struments—can act, do things, have an effect in this world. Despite the wide variety of his subject matter, almost all of Eakins' art is portraiture, images of real people whom he knew and loved or respected. In his representations of the physical world, Eakins combined a technical ability to depict the external aspect of things with a probing for the essence of each scene. In his portraits of individuals, he similarly combined the faithful representation of the external and anatomical realities of each person with a deeper probing into the subject's inner being and character. The people he portrays have lived, and often their experiences are etched on their faces. The wear and tear of years is not glossed over but celebrated in staring eyes, wrinkles, and slumping torsos.

Significance and influence. Although always respected for his ability, Eakins remained throughout his years something of an outcast. His contemporaries, rather than allowing themselves to be shaken by his frank statements of the human condition and his joyous appreciation of the human body, ignored him. He sold few pictures, but fortunately a small private income matched his modest needs. Unfettered by the demands of clients, Eakins was free to paint what and, more importantly, whom he wished. His art was never compromised by the need to flatter patrons or sitters, and honesty was his only policy. Good friends and faithful followers rather than fame and fortune were his lot. Not until 1916, the year of his death, was one of his paintings acquired by a museum ("Pushing for Rail," Metropolitan Museum of Art, New York City), and the first major exhibition of his work was held the following year (Metropolitan Museum of Art). But Eakins' art had its long-range effect, serving as a model and an impetus for the burst of realism in American painting during the early years of the 20th century, especially in the work of George Bellows and the group called the Ashcan School of painters. And despite the increasing dominance of abstract art during the middle years of the 20th century, a pervasive and stubborn substream of realism surfaced periodically—Regionalism, Pop art, the figurative work of artists such as George Segal and Leonard Baskin—to manifest the continuing debt of American art to the achievement of Thomas Eakins.

(J.D.Pro.)

MAJOR WORKS. All paintings in oils unless otherwise noted. "A Street Scene in Seville" (1870; Mrs. John R. Garrett, Sr. Collection); "Home Scene" (1871; Brooklyn Museum, New York); "Max Schmitt in a Single Scull" (1871; Metropolitan Museum of Art, New York City); "Katherine" (1872; Yale University Art Gallery, New Haven, Conn.); "The Pair-Oared Shell" (1872; Philadelphia Museum of Art); "The Biglin Brothers Turning the Stake" (1873; Cleveland Museum of Art); "John Biglin in a Single Scull" (watercolour, 1873; Metropolitan Museum of Art); "Sailing" (1874; Philadelphia Museum of Art); "Pushing for Rail" (1874; Metropolitan Museum of Art); "The Gross Clinic" (1875; Jefferson Medical College, Philadelphia); "Will Schuster and Blackman Going Shooting" (1876; Yale University Art Gallery); "Chess Players" (1876; Metropolitan Museum of Art); "William Rush Carving His Allegorical Figure of the Schuylkill River" (1877; Philadelphia Museum of Art); "The Fairman Rogers Four-in-Hand" (1879; Philadelphia Museum of Art); "The Crucifixion" (1880; Philadelphia Museum of Art); "The Pathetic Song" (1881; Corcoran Gallery of Art, Washington, D.C.); "The Swimming Hole" (1883; Fort Worth Art Center Museum, Fort Worth, Texas); "Lady with a Setter Dog (Mrs. Eakins)" (1885; Metropolitan Museum of Art); "Walt Whitman" (1887; Pennsylvania Academy of the Fine Arts, Philadelphia); "Letitia Wilson Jordan Bacon" (1888; Brooklyn Museum); "Miss Van Buren" (c. 1889; Phillips Collection, Washington, D.C.); "The Agnew Clinic" (1889; University of Pennsylvania, Philadelphia); "Professor Henry A. Rowland" (1891; Addison Gallery of American Art, Andover, Mass.); "The Con-

cert Singer" (1892; Philadelphia Museum of Art); "Frank Hamilton Cushing" (1894-95; Thomas Gilcrease Institute of American History and Art, Tulsa, Okla.); "Taking the Count" (1898; Yale University Art Gallery); "Salutat" (1898; Addison Gallery of American Art); "Between Rounds" (1899; Philadelphia Museum of Art); "Benjamin Eakins" (1899; Philadelphia Museum of Art); "Mrs. William D. Frishmuth" (1900; Philadelphia Museum of Art); "The Thinker: Louis N. Kenton" (1900; Metropolitan Museum of Art); "Self-Portrait" (1902; National Academy of Design, New York); "Mrs. Edith Mahon" (1904; Smith College Museum of Art, Northampton, Mass.); "Monsignor Diomedeo Falconio" (1905; National Gallery of Art, Washington, D.C.).

BIBLIOGRAPHY. Lloyd Goodrich, *Thomas Eakins: His Life and Work* (1933), is the principal monograph on Eakins. Other books of interest on the subject are Fairfield Porter, *Thomas Eakins* (1959); and Sylvan Schendler, *Eakins* (1967). The largest collection of works by Thomas Eakins is to be found in the Philadelphia Museum of Art. There are also substantial collections at the Metropolitan Museum of Art in New York and at the Yale University Art Gallery.

Ealdred, also spelled ALDRED (d. Sept. 11, 1069, York, Eng.), Anglo-Saxon archbishop of York from 1060, played an important part in secular politics at the time of the Norman conquest and legitimized the rule of William the Conqueror (William I) by crowning him king on Christmas Day, 1066.

Ealdred became abbot of Tavistock, Devon, about 1027, and bishop of Worcester in 1046. Made archbishop of York by Pope Nicholas II, he was forced by Nicholas' successor, Alexander II, to relinquish the see of Worcester in 1062. As archbishop he hid considerable ecclesiastical building in the city of York and elsewhere.

In 1054 Ealdred went to Germany to negotiate with the emperor Henry III for the return from Hungary of the heir to the English throne, Edward, son of Edmund Ironside. He probably crowned Harold II as king of the English (Jan. 6, 1066). After the Battle of Hastings (Oct. 14, 1066), Ealdred was among those who wished to elect Edgar the Aetheling as successor to the slain Harold, but he soon joined Edgar in declaring allegiance to William I. With the approval of the papacy, Ealdred crowned the new king in Westminster Abbey.

Ealing, outer borough of Greater London, midway between central London and the western periphery. Its area is 21 sq mi (55 sq km). Ealing's name probably derives from the Saxon Gillings (Illing). The borough includes Acton, which became a popular health resort in Queen Anne's reign (1702-14); notable residents have included the novelist Henry Fielding, the actor David Garrick, and the financial dynasty of the Rothschilds. Bedford Park, founded in 1875, was the forerunner of the English "garden suburb."

In the 20th century, Ealing has attracted shops and many industries that make a variety of consumer goods. The community of Southall grew in the 1950s through overseas immigration from the newly independent, largely nonwhite, countries of the "New Commonwealth." Pop. (1982 est.) 282,000.

Ealing Studios, also called ASSOCIATED TALKING PICTURES, LTD., English motion-picture studio, internationally remembered for a series of witty comedies that reflected the social conditions of post-World War II Britain. Founded in 1929 by two of England's best known producers, Basil Dean and Reginald Baker, with the financial support of the Courtauld family, manufacturers of textiles, the company opened its own distribution outlet within two years and built the studios at Ealing near London. It produced several vaudeville-style musical comedies as well as serious feature films during the 1930s. It added

information and propaganda films and short subjects for the British Ministry of Information during World War II and often infused a documentary-like realism into its films.

In the decade after the war, the studio became well known for its highly successful comedies, which dealt with the exploits of unconventional, antibureaucratic individuals in realistic settings. The first of these films was *Passport to Pimlico* (1949). *Kind Hearts and Coronets* (1949) made Alec Guinness an international star and linked his name with the Ealing comedies. *Whisky Galore* (1949; U.S. title *Tight Little Island*) and *The Lavender Hill Mob* (1951) are other well-known productions in the Ealing style.

In 1944 the major portion of stock in the company had been sold to the Rank Organisation, Ltd., which controlled a large portion of the British film industry. The studio ceased production in 1955, and it was sold to the British Broadcasting Corporation.

EAM-ELAS, abbreviation of Greek ΕΘΝΙΚΟΝ ΑΠΕΛΕΦΘΕΡΟΤΙΚΟΝ ΜΕΤΟΠΟΝ-ΕΘΝΙΚΟΣ ΛΑΪΚΟΣ ΑΠΕΛΕΦΘΕΡΟΤΙΚΟΣ ΣΤΡΑΤΟΣ, English NATIONAL LIBERATION FRONT-NATIONAL POPULAR LIBERATION ARMY, communist-sponsored resistance organization (formed September 1941) and its military wing (formed December 1942), which operated in occupied Greece during World War II. Fighting against the Germans and the Italians as well as against other guerrilla bands, particularly EDES (*q.v.*), EAM-ELAS became the most powerful guerrilla band in the country. It also established an effective administrative apparatus, through which it ruled liberated areas.

By October 1944, when the Germans evacuated Greece, EAM controlled about two-thirds of the country. It participated in conferences in September 1944 that were designed to unite the rival resistance groups and the government-in-exile in a postwar government. When the new government ordered ELAS to disarm, however, the resistance group refused, causing an outbreak of hostilities in Athens (December 1944), mainly between ELAS and the British. A peace treaty was signed (Varkiza Peace Agreement, Feb. 12, 1945), providing for the surrender of ELAS. A large-scale guerrilla war was begun by the communists in 1946, however, and lasted until 1949.

Eames, Charles; and Eames, Ray, Ray Eames née KAISER (respectively b. June 17, 1907, St. Louis, Mo., U.S.—d. Aug. 21, 1978, St. Louis; b. 1916, Sacramento, Calif., U.S.—d. Aug. 21, 1988, Los Angeles, Calif.), American designers best known for the beauty, comfort, elegance, and delicacy of their mass-

producible furniture. They also wrote books, made motion pictures, and designed exhibitions, fabrics, and industrial and consumer products.

Charles Eames, who was also an architect, was for several years head of the experimental design department at Cranbrook Academy of Art, Bloomfield Hills, Mich. During that time (1939–41) he collaborated with the architect-designer Eero Saarinen on various design projects, one of which was a formfitting shell chair that won first place in the Organic Design Competition conducted in 1940–41 by the Museum of Modern Art, New York City. In 1940 he met and began working with Ray Kaiser, who was then studying painting with Hans Hoffman; Eames and Kaiser were married in 1941.

They moved to California, where he designed movie sets and did research in the uses of plywood, continuing the latter when, in 1943, he became director of research and development for the West Coast operations of the Evans Products Company. In 1946 the Museum of Modern Art invited Charles Eames to be the first designer to have a “one-man” exhibition of his furniture designs (he was often given sole credit for their joint efforts). The exhibition was highly successful, and the Herman Miller Furniture Company soon began mass production of their molded plywood furniture.

The Eameses continued their design activities in California, where they became involved in architectural projects, product design, film production, and exhibits. Their house, built in 1949 in Pacific Palisades, was outstanding for its elegant use of factory-produced elements. After 1955 they became increasingly active in the making of motion pictures, chiefly of an educational nature, one excellent example of which is *Powers of Ten* (1968).

During the 1960s Eames served as design consultant for a number of major U.S. corporations. The Eameses' contributions to the International Business Machines exhibit at the New York World's Fair (1964–65) were particularly notable. A decade later, under the aegis of the same company, they designed a large American Bicentennial exhibition called “Franklin and Jefferson.” The show was seen in Paris, Warsaw, and London, before appearing at the Metropolitan Museum of Art, New York City, and the Art Institute of Chicago.

After Charles's death in 1978, Ray continued to work on various design projects.

BIBLIOGRAPHY. John Neuhart, Marilyn Neuhart, and Ray Eames, *Eames Design: The Work of the Office of Charles and Ray Eames* (1989).

Eames, Emma (Hayden) (b. Aug. 13, 1865, Shanghai, China—d. June 13, 1952, New York, N.Y., U.S.), American lyric soprano, admired for her beauty and for the technical control and dramatic expressiveness of her voice.

Eames studied with Clara Munger in Boston, then with Mathilde Marchesi in Paris. Selected by Charles Gounod to sing Juliette in his *Roméo et Juliette*, she was so successful in this debut at the Paris Opéra in 1889 that she was called on to repeat the performance many times.

In 1891, having left the Paris Opéra because of jealous intrigues, Eames appeared for the first time with the Metropolitan Opera in New York City as Juliette and remained a leading member of the company until her resignation in 1909. She was also popular in London during those years—especially as Tosca, Donna Anna and Donna Elvira (*Don Giovanni*), and Aida. In 1911 she returned from a brief retirement to perform Desdemona and Tosca with the Boston Opera, after which she made periodic concert tours, often with her husband, the American baritone Emilio Edoardo de Gogorza. She received a number of honours and awards. In 1927 her autobiography, *Some Memories and Reflections*, was published.

EAN (chemistry): see effective atomic number.

ear, vertebrate organ of hearing and equilibrium that detects and analyzes noises by transduction (or the conversion of sound waves into electrochemical impulses) and maintains sense of balance (equilibrium).

A brief treatment of the ear and hearing follows. For a full treatment, see MACROPAEDIA: Sensory Perception.

The hearing apparatus of vertebrates is surprisingly uniform, considering the range of body types and habitats of vertebrates. In the evolution from jawless fishes to mammals and birds, the ear has become progressively complex and increasingly able to discriminate sound frequencies. The basic sound-sensitive structures of the fish ear are three interconnected, fluid-filled cavities derived from the lateral-line system. In amphibians the ear is basically like that of fishes, except that frogs have an additional cavity, the air-filled middle ear, with a membrane (the eardrum, or tympanic membrane) at the skin surface and connected to the inner ear by a small bone, the columella. In reptiles one structure is somewhat elongated (the start of a true cochlea, or inner ear), and the eardrum is withdrawn into the head. Snakes have lost the middle ear and the external opening but have retained the columella; they hear airborne sound poorly but are especially sensitive to vibrations of the ground.

The ear of birds is basically reptilian, but the cochlea is longer and more sensitive. Pitch discrimination is far more acute in birds, many of which perceive frequencies well above the range of human hearing.

The mammalian ear consists of three main parts: the outer ear, comprising a largely cartilaginous external projection called the pinna (lacking in cetaceans and phocid seals and reduced or lacking in many burrowing mammals) and the auditory canal; the middle ear, comprising the tympanic cavity, which is separated from the external ear by the eardrum (tympanic membrane) and contains the auditory ossicles, a chain of three tiny bones (the malleus, or hammer; the incus, or anvil; and the stapes, or stirrup); and the inner ear, or labyrinth, comprising a complex cavity in the petrous portion of the temporal bone—the bony labyrinth—and an inner membranous labyrinth, a delicate system of fluid-filled ducts and sacs (the semicircular canals, the vestibule, and the cochlea) that occupies only a small part of the available space. In hearing, sound waves in the air are directed by the pinna into the auditory canal. Vibrations of the eardrum, positioned across the end of the canal, are conducted and intensified by the auditory ossicles through the tympanic cavity to the oval window, a membrane in the outer wall of the vestibule. Through the oval window, the intensified vibrations are transmitted to the fluid of the inner ear. It is in the coiled cochlea that the vibrations of this fluid are converted by the hair cells of the organ of Corti into nerve impulses that are transmitted to the brain.

The inner ear also functions, independently of hearing, as the organ of equilibrium. Acceleration in space and rotation of the body cause an inertial lag of fluid in the semicircular canals, which stimulates sensory hairs. Continued stimulation of the hairs after body rotation has stopped is experienced as dizziness. Static pressures, such as gravitational forces, are detected by hair cells in two sacs within the vestibule, permitting perception of the orientation of the head.

Each of the ear's three sections can be afflicted by a particular set of diseases. The most common cause of progressive hearing

Molded plywood chair, with rubber cushioning between component parts, by Charles Eames, 1946

loss in human beings is otosclerosis, a disease of the bone enclosing the inner ear that causes fixation of the base of the stirrup in the oval window; this fixation prevents the conveyance of sound vibrations to the inner ear. The cause of otosclerosis is unknown, but it can often be corrected surgically. A common inner ear disease is congenital nerve deafness, which is caused by defective hearing nerves in the cochlea that usually become evident at or soon after birth. Resulting hearing impairment is most often severe, and there is no known medical or surgical treatment for the disease. The gradual decay of the hearing nerve in the inner ear due to old age is called presbycusis.

While the ear is, strictly speaking, a vertebrate organ, invertebrates possess certain analogous structures for hearing. Many arthropods have tactile hairs that are stimulated by sound energy, in addition to other forms of energy. Certain roaches and crickets possess cercal organs (tufts of hairs supplied with nerves) that are located at the tip of the abdomen and are sensitive to a wide range of sound frequencies. Tympanal organs, found on the abdomen, thorax, or first legs of certain members of the insect orders Orthoptera (crickets), Homoptera (cicadas), and Lepidoptera (moths), consist of a membrane at the body surface or in a trachea (respiratory tubule). Changes in the tension of the tympanal membrane induced by impinging sound waves are sensed by chordotonal, or scolophore, organs, highly specialized nervous structures that record tension changes in a variety of situations in the insect body.

ear shell, any of various marine snails of the subclass Prosobranchia (class Gastropoda) that constitute the genus *Haliotis* and family Haliotidae. The characteristic planispiral shell has a broad, oblique aperture, which gives it an ear-like shape. A series of perforations through the shell follow the spiral form. The inside of the shell is always nacreous, often in iridescent greens and blues. The snails live attached to rocks by a large adherent foot. They feed on algae and are found in the shallow waters of rocky shores worldwide. The larger species are called ormer in England, abalone in the United States, paua in New Zealand, and awabi in Japan. Several of these larger species are found on the western coast of North America and include the red, green, black, and pink abalones (*Haliotis refescens*, *H. fulgens*, *H. cracherodii*, and *H. corrugata*, respectively). Over exploitation has reduced stocks in many parts of the world; there are catch limits and even total protection in some areas. The shells of *Haliotis* have been extensively used for ornamental and decorative purposes from early times.

ear squeeze, also called AEROTITIS, AEROTITIS, BAROTITIS, or BARO-OTITIS, effects of a difference in pressure between the internal ear spaces and the external ear canal. These effects may include severe pain, inflammation, bleeding, and rupture of the eardrum membrane. Underwater divers and airplane pilots are sometimes affected.

The middle ear, the cavity behind the eardrum membrane, is connected with the nasal cavity (nasopharynx) by a thin, narrow tube known as the eustachian tube. Under normal conditions, when the external air pressure increases or decreases, air from the nose passes through the eustachian tube to equalize the pressure in the middle ear cavity; often, however, the eustachian tube becomes blocked by fluids from head colds, by small tumours, or by an excess of tonsillar tissue around the opening.

As a pilot in an unpressurized cabin ascends to higher altitudes and the external pressure decreases, air that is trapped in the middle

ear expands. Usually the expanding air forces its way out of the eustachian tube so that the pressure can be equalized. If the tube is sufficiently blocked, the expanding air in the middle ear causes the eardrum membrane to bulge outward, with eventual rupturing if the pressure cannot be relieved. A pilot descending from higher altitudes has the opposite problem; as he descends, the external pressure increases. In order to equalize pressure in the middle ear cavity, air must pass from the eustachian tubes to the middle ear. It is usually harder to equalize pressures on descent than on ascent, as a vacuum is created in the middle ear that more tightly seals the eustachian tubes. The methods that are commonly employed to equalize the pressure in the ears include swallowing, yawning, chewing, elevation of the roof of the mouth, and blowing with the nose and mouth sealed. As the pressure in the ears is brought to the same level as that outside, the pain is relieved, unless damage has already been done. If the pressure within the ears is not kept the same on descent as the external pressure, the drum membranes bulge inward, bleed, and eventually break. Rupture of an eardrum membrane relieves the pain and pressure, but it may also cause dizziness, partial hearing loss, and middle ear infections. Usually if there are no serious complications, the membrane heals in three to four weeks.

Underwater divers encounter the same difficulties. The deeper they descend under water, the greater the amount of pressure upon their body. As they go down, they normally have to equalize the pressure inside their ears to the external pressure every 10 to 15 feet (3 to 4.5 metres).

Earhart, Amelia (b. July 24, 1897, Atchison, Kan., U.S.—disappeared July 2 (?), 1937, near Howland Island, central Pacific Ocean),

Amelia Earhart
Culver Pictures

one of the world's most celebrated aviators, the first woman to fly alone over the Atlantic Ocean.

Earhart worked as a military nurse in Canada during World War I and as a social worker in Denison House, Boston, after the war. She achieved fame on June 17–18, 1928, as the first woman to cross the Atlantic, although she was only a passenger. She married the publisher George P. Putnam in 1931 but continued her career under her maiden name.

Determined to justify the renown that her 1928 crossing had brought her, Earhart crossed the Atlantic alone on May 20–21, 1932. This soon led to a series of flights across the U.S. and drew her into the movement that encouraged the development of commercial aviation. She also took an active part in efforts to open aviation to women and end male domination in the new field.

In January 1935 she made a solo flight from Hawaii to California, a longer distance than from the U.S. to Europe. Earhart was the first person to fly that hazardous route successfully; all previous attempts had ended in disaster. She set out in 1937 to fly around the world, with Fred Noonan of the U.S. as her navigator, in a twin-engine Lockheed Electra. After completing more than two-thirds of the

distance, her plane vanished in the central Pacific near the international dateline. Although her mysterious disappearance has since raised many questions and much speculation about the events surrounding it, the facts remain largely unknown. *Soaring Wings*, a biography written by her husband, appeared in 1939.

earl: (title of nobility): see count.

Earle, John, Earle also spelled EARLES (b. 1601?, York, Eng.—d. Nov. 17, 1665), Anglican clergyman, best known as author of *Micro-cosmographie. Or, A Peece of the World Discovered; in Essayes and Characters* (1628; enlarged 1629 and 1633).

An outstanding book of "characters," it avoids didacticism and displays genuine personalities, such as a "child," a "Good old Man," a "young raw Preacher," and a "Grave Divine." It is alive with its humour, perception, and epigrammatic brilliance. Earle's wit, learning, and tolerance were widely praised, and, though a Royalist Anglican, he tried to conciliate Nonconformists.

At the University of Oxford as student from c. 1616 and as fellow from 1620, he wrote occasional verse and tutored Lucius Cary (later Lord Falkland, a statesman, philosopher, and poet), to whose circle he belonged. He later tutored the future king Charles II and suffered exile during 1644–60. Meanwhile he translated into Latin the *Eikon Basilike* ("Royal Image"), an extremely popular book of meditations supposedly by Charles I and published about the time of his execution, and Richard Hooker's *Of the lawes of ecclesiasticall polittie*. After the Restoration, he became bishop successively of Worcester and of Salisbury.

Early, Jubal A(nderson) (b. Nov. 3, 1816, Franklin County, Va., U.S.—d. March 2, 1894, Lynchburg, Va.), Confederate general in the American Civil War (1861–65) whose army at one time threatened Washington, D.C., but whose series of defeats during the Shenandoah Valley campaigns of late 1864 and early 1865 led to the final collapse of the South. A West Point graduate, Early served in the Second Seminole War in Florida (1835–42) and the Mexican War (1846–48). In the period leading up to the Civil War, he strongly opposed secession, but when Virginia decided to withdraw from the Union in 1861, he felt obliged to conform to the action of his state.

As an officer in the Confederate Army of Northern Virginia, he rendered conspicuous service at the First Battle of Bull Run (July 1861), near Manassas, Va., and served throughout the Virginia campaigns of 1862–63 and at Gettysburg (July 1863). The climax of his career came in the summer of 1864 when Gen. Robert E. Lee placed him in command of all Southern forces in the strategic Shenandoah Valley. His first action was to drive the Union forces under Gen. David Hunter out of the state and to move

Early

By courtesy of the Valentine Museum, Richmond, Va

down the valley unopposed. He then crossed the Potomac River, reaching Hagerstown and Frederick in Maryland, and defeated a small Union force at the Battle of Monocacy (July

9, 1864). Two days later he led 8,000 troops past Silver Spring and brought them into sight of Washington before withdrawing.

Northern pride was wounded by Early's threat, and Gen. Ulysses S. Grant dispatched Gen. Philip Sheridan to clear the valley once and for all. Bowing to numerically superior forces, Early suffered three decisive defeats at Sheridan's hands between September 19 and October 19—at Winchester, Fishers Hill, and Toms Brook—after which the valley was laid waste. Early then carried out a well-planned attack at Cedar Creek but was forced to retreat up the valley to Waynesboro, where he experienced the final defeat (March 2, 1865) that ended Confederate resistance in that area and opened the way to Union capture of Richmond.

After the Confederate surrender (April 1865) Early went to Mexico and then Canada, where he published *A Memoir of the Last Years of the War of Independence in the Confederate States of America* (1866). In 1869 he returned to Virginia, where he practiced law and wrote historical essays.

Early American furniture, furniture made in the last half of the 17th century by American colonists. Furniture made by the earliest settlers, none of which is known to have survived, was probably crude and makeshift. The earliest known American-made furniture dates from the mid-17th century, when life in the colonies was becoming more settled. Many of these early pieces were massive in size and were based on Jacobean styles recalled from earlier days in England. In general, furniture styles followed those of England, with adaptations, after an interval of about 15 years. Instead of shaped legs or feet, American case furniture had legs and feet that were simply downward extensions of the rectangular styles. Decoration consisted of carved flower motifs or lunettes (crescent shapes) and chip carved (executed with mallet and chisel) scrolls and leaves, occasionally highlighted by painting, mainly in black, red, and yellow; but the carving was flatter, less finished, and more primitive than its English predecessors. Turned (shaped on a lathe) split balusters stained to look like ebony were also applied. Joinery was confined to simple rectangular panelling with mortise and tenon joints. Oak and pine were the commonest woods.

In view of the still-unsettled existence of the early colonists, chests assumed particular importance because of their portability. The Connecticut and Hadley chests were clearly variants, their carved leaf, flower, and vine ornament bearing a marked Dutch flavour. Important, too, in wealthier households, was the court cupboard for storing utensils and the press cupboard for storing clothes and linen. Trestle tables, which could be dismantled easily, were in everyday use; and the stretcher tables—large rectangular tables with turned baluster legs joined by stretchers—served as dining or centre tables among better furnishings. Joint stools (small rectangular stools with four turned legs joined with stretchers) were the commonest form of seating, but Brewster and Carver chairs also came into use, the most popular chairs being simplified versions of English turned chairs. Chairs with slung leather seats of the Cromwellian type were used in more comfortable homes by the late years of the century. Most early beds had simple, low turned posts and plain, low headboards.

Regional characteristics appeared at an early stage and are best represented in furniture surviving from the 17th century by the contrast between the chests from the Connecticut River valley mentioned above and the more austere varieties of the Massachusetts coastal settlements—sometimes painted but characterized particularly by severe, geometric carved lozenges and friezes of overlapping lunettes.

Early Christian art, also called PALEO-CHRISTIAN ART, or PRIMITIVE CHRISTIAN ART, architecture, painting, and sculpture from the beginnings of Christianity until about the early 6th century, particularly the art of Italy and the western Mediterranean. The Christian religion was part of a general trend in the late Roman Empire toward mysticism and spirituality. As Christianity developed, its art reflected the prevailing late antique artistic climate. Except for differences in subject matter, Christian and pagan works looked much the same; in fact, it is possible to show that the same workshop sometimes produced sculpture for both Christian and non-Christian purposes.

The earliest identifiably Christian art consists of a few 2nd-century wall and ceiling paintings in the Roman catacombs, which continued to be decorated in a sketchy style derived from Roman impressionism through the 4th century. They provide an important record of some aspects of the development of Christian subject matter. The earliest Christian iconography tended to be symbolic. A simple rendering of a fish was sufficient to allude to Christ. Bread and wine invoked the Eucharist. During the 3rd and 4th centuries, in the catacomb paintings and in other manifestations, Christians began to adapt familiar pagan prototypes to new meanings. The early figural representations of Christ, for instance, most often show him as the good shepherd by directly borrowing from a classical prototype. He was also sometimes depicted in the guise of familiar gods or heroes, such as Apollo or Orpheus. Only later, when the religion itself had achieved some measure of earthly power, did he take on imperial attributes. Narratives tended at first to be typological, often suggesting parallels between the Old and New Testaments. The earliest scenes from the life of Christ to be depicted were the miracles. The Passion, particularly the Crucifixion itself, was generally avoided until the religion was well established.

The beginnings of Early Christian art date to the period when the religion was yet a modest and sometimes persecuted sect, and its flowering was possible only after 313, when the future emperor Constantine the Great adopted Christianity, paving the way for it to become the state religion. Official recognition and imperial sponsorship brought popularity, riches, and many converts from all classes of society. Suddenly the church needed to produce art and architecture on a more ambitious scale in order to accommodate and educate its new members and to reflect its new dignity and social importance.

Churches and shrines were soon being built throughout the empire, many sponsored by Constantine himself. These buildings were usually basilicas, such as Old St. Peter's in Rome, or central-plan buildings (round or polygonal), such as the shrine of the Church of the Nativity in Bethlehem. Large-scale sculpture was not popular, but relief sculpture on sarcophagi, such as that of Junius Bassus (died 359), and ivory panels and book covers continued to be produced. The walls of the churches were decorated with paintings or mosaics to instruct the faithful. The church of Sta. Maria Maggiore in Rome has an extensive mosaic program of Old and New Testament scenes that was begun in 432. Painting also illustrated liturgical books and other manuscripts.

The art of this period had its roots in the classical Roman style, but it developed into a more abstract, simplified artistic expression. Its ideal was not physical beauty but spiritual feeling. The human figures thus became types rather than individuals and often had large, staring eyes, "the windows of the soul." Symbols were frequently used, and compositions were flat and hieratic, in order to concentrate on and clearly visualize the main idea. Although the art of the period intentionally

departed from earlier naturalism, it has great power and immediacy.

Early Netherlandish art, sculpture, painting, architecture, and other visual arts created in the several domains that in the late 14th and 15th centuries were under the rule of the dukes of Burgundy, coincidentally counts of Flanders. As "Burgundian" and "Flemish" describe only parts of the phenomenon, neither can posit for the whole, although Early Flemish art is a common term.

In 1363 John II of France titled his son Philip, surnamed the Bold, duke of Burgundy. By marriage to the heiress of Flanders, Philip added to his duchy, on the death of his father-in-law in 1384, the county of Flanders. The formidable Flemish-Burgundian alliance remained intact until 1482, when Philip the Bold's great-granddaughter Mary of Burgundy died.

Philip's capital was Dijon, which he embellished with works of art. In the chapel of the Carthusian monastery, the Chartreuse de Champmol, he planned a dynastic necropolis, and until the French Revolution his tomb and those of his son and grandson could be seen there. Claus Sluter (c. 1340/50–1406) was his chief sculptor. Sluter, the greatest realist of his day, carved portraits of the Duke and Duchess in kneeling positions (1385–93) for the portal of the monastery, and for the garden he designed an elaborate and symbolic fountain known as the Well of Moses (1395–1404/05). Six full-length, life-size, polychromed prophets flank the central pier. Among the painters in service at Dijon were Jean Malouel, Henri Bellechose, and Melchior Broederlam (flourished 1381–c. 1409). Broederlam was one of the first masters to explore the use of disguised symbolism in the representation of an ultra-naturalistic world, and in the scenes that he painted on a set of altar wings for Dijon there are several levels of implied meaning.

Under the Duke's grandson and namesake, Philip the Good (reigned 1419–67), patronage of the arts continued on an even larger scale. Not the least of the new duke's projects was his library, which eventually contained about 250 illuminated manuscripts. Realizing the propaganda value of art, Philip the Good filled his long reign with lavish spectacles such as triumphal processions and elaborate state banquets. Many artists spent large portions of their careers on these "temporary" achievements. The name of Jan van Eyck (c. 1395–1441) appears frequently in the ducal accounts. He travelled to several foreign countries, presumably to make portrait and reconnaissance drawings and once to paint a portrait of Isabella of Portugal (1428); the Duke approved of the portrait and subsequently married the Princess.

Van Eyck perfected an oil and varnish technique that other masters in Flanders adopted, enabling the brilliant colours of their paintings to survive unchanged. Of van Eyck's works, "The Adoration of the Lamb" (finished 1432), in Ghent, and "The Marriage of Giovanni Arnolfini and Giovanna Cenami (?)" (1434), in the National Gallery, London, were the most important and are the best known. There were many other painters whose works celebrated the wealth and intellectuality of 15th-century Flanders. Van Eyck's most important contemporary was the Master of Flémalle and, in the next generation, Rogier van der Weyden (1399/1400–1464) of Brussels succeeded him in the Duke's esteem. The gentle linearity and movement, reticent sentiment, and soft colouring in the paintings of van der Weyden were to have a profound influence on the art of neighbouring countries as well as on that of Quattrocento (q.v.) Italy in the later 15th century.

The meticulousness with which the early Flemish painters recorded nature, their innate sense of design, and their highly compressed symbolism was continued by their followers, each of whom added his own special direction to what he had inherited. Among the masters who were active up until the end of the Burgundian-Flemish political alliance are Petrus Christus (c. 1420–1472/73), Dirck Bouts (c. 1400–75), Hugo van der Goes (c. 1440–82), and Hans Memling (1430/35–1494).

Earnhardt, Dale, in full RALPH DALE EARNHARDT (b. April 29, 1951, Kannapolis, N.C., U.S.—d. Feb. 18, 2001, Daytona Beach, Fla.), American stock-car racer who was the dominant driver in the National Association for Stock Car Auto Racing (NASCAR) during the 1980s and '90s.

Ralph Earnhardt, Dale's father, raced stock cars in the American southeast during the 1960s and helped to foster his son's passion for the sport. The younger Earnhardt dropped out of high school in 1967 in order to pursue his interest in auto racing. He made his NASCAR Winston Cup debut at the 1975 World 600 in Charlotte, N.C. He continued as a part-time driver on the circuit until he landed a full-time position in the Winston Cup series in 1979. That year he collected 17 top-10 finishes and earned the Rookie of the Year title. The next year he raced to five victories and 19 top-five finishes in winning his first Winston Cup title. Earnhardt drove to six more Winston Cup titles (1986–87, 1990–91, 1993–94), equaling the career mark of Richard Petty.

Earnhardt was a popular, if controversial, athlete. He gained a reputation as an aggressive driver who relished the bumps and spin-outs of stock-car racing, and he became known as "the Intimidator."

Earnhardt died from injuries suffered during a crash in the final lap of the 2001 Daytona 500. His son Dale, Jr., also raced in the NASCAR Winston Cup series.

Earp, Wyatt (Berry Stapp) (b. March 19, 1848, Monmouth, Ill., U.S.—d. Jan. 13, 1929, Los Angeles, Calif.), legendary frontiersman of the American West, who was an itinerant saloonkeeper, gambler, lawman, gunslinger, and confidence man. The first major biography, Stuart N. Lake's *Wyatt Earp, Frontier Marshal* (1931), written with Earp's collaboration, established the rather fictionalized portrait of a fearless lawman.

Earp and his four brothers—James C. (1841–1926), Virgil W. (1843–1906), Morgan (1851–82), and Warren B. (1855–1900)—spent their early lives in Illinois and Iowa but, toward the end of the American Civil War (1864), moved with their parents to San Bernardino, Calif. In 1868 the family moved back to Illinois, Wyatt and Virgil working on a Union Pacific Railroad crew on the way home. After the Earps moved to Lamar, Mo., Wyatt married in 1870 and was elected local constable, but upon his wife's death of typhoid, he took off, drifting from Indian Territory to various towns in Kansas. He worked as a police officer in Wichita (1875–76) and Dodge City (1876–77), went off to the gold rush in the Black Hills (1877–78), and returned to Dodge City as assistant marshal (1878–79), where he became noted as both lawman and gambler and where he befriended such gunmen as Doc Holliday and Bat Masterson.

Leaving Dodge City with his second wife, he went to New Mexico and then California, working for a time as a Wells Fargo guard, and ended up in 1878 in Tombstone, Ariz. Most of the Earp family had congregated there, buying real estate and businesses; Wyatt became a gambler and guard in the Oriental Saloon, and his brother Virgil became town marshal.

By 1881 a feud had developed between the

Earps and a gang led by Ike Clanton. The feud was resolved in the celebrated gunfight at the O.K. Corral (Oct. 26, 1881), pitting the Clanton gang against three Earp brothers (Virgil, Wyatt, and Morgan) and Doc Holliday. Three of the Clanton gang were killed, but Ike and another member escaped. The townspeople then discharged Virgil Earp, on suspicion that the gunning was murder rather than crime fighting.

In March 1882 Morgan Earp was killed by unknown assassins, and Wyatt, his brother Warren, and some friends subsequently killed at least two suspects. Wyatt was accused of murder, and he fled, moving first to Colorado, then to several boomtowns in the West, and eventually to California. He settled there, where he supported himself variously by police work, gambling, mining, and real-estate deals.

earphone, small loudspeaker held or worn close to the listener's ear or within the outer ear. Common forms include the hand-held telephone receiver; the headphone (*q.v.*), in which one or two earphones are held in place by a band worn over the head; and the plug earphone, which is inserted in the outer opening of the ear. The conversion of electrical to acoustical signals is effected by any of the devices used in larger loudspeakers; the highest fidelity is provided by the so-called dynamic earphone, which ordinarily is made part of a headphone and equipped with a cushion to isolate the ears from other sound sources.

earplug, type of ear ornament usually inserted in pierced and distended earlobes. Earplugs were the direct forerunners of today's pierced earrings.

Whale's-tooth earplugs from Polynesia, 19th century; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, the Michael C. Rockefeller Memorial Collection of Primitive Art, bequest of Nelson A. Rockefeller, 1979

The Ainu of northern Japan have used plugs of fabric; in the New World, Mayan earplugs have been found made of thin jade, stone, bone, shell, wood, and metal in many sizes. The Berawan people of Borneo used plugs 3.75 inches (9.5 cm) in diameter, and the Masai of East Africa have a stone earplug that is 4.5 inches (11.4 cm) in diameter and weighs 2 pounds 14 ounces (1.3 kg).

earring, a personal ornament worn pendent from the ear, usually suspended by means of a ring or hook passing through a pierced hole in the lobe of the ear or sometimes by means of a screwed clip on the lobe. In general, earrings are worn in pairs, but a single earring has sometimes been worn. (The single earring was especially popular in Europe during the Renaissance and Baroque period.) In the late 20th century, multiple earrings per ear became popular.

In the Orient, earrings historically were worn by both sexes; in the West (including ancient Israel and Egypt), as a general rule, they were considered to be exclusively female ornaments. Among the Greeks and Romans earrings were worn only by women, and the practice of men wearing them often is spoken of in classical literature as a distinctly Oriental (*i.e.*, Middle Eastern) trait.

In the tombs of the Greek settlers on the Crimean Peninsula (4th century BC), earrings of marvelous complexity and beauty were found. Jewels of the same class, of exquisite beauty and workmanship, were found in the sepulchres of ancient Etruria. Earrings of com-

paratively simple forms, but set with pearls and other stones, were the mode in Rome.

In Europe, earrings tended to go out of fashion when the wig, coiffure, or headdress obscured the ears, as in the late 17th and 18th centuries. Use of these ornaments continued to be unfashionable in Europe and the Americas during the 19th century but were revived again in the 20th. Simplified methods of piercing the ears led to the renewed popularity of pierced earrings, sometimes worn along the margin of the ear as well as the lobe.

Earth, the third planet in distance outward from the Sun. Its single most outstanding feature is that its near-surface environments are the only places in the universe known to harbor life.

A brief treatment of Earth follows. For full treatment, see the MACROPAEDIA, which considers the various aspects of the subject in several different articles. For the relationship of Earth to other components of the solar system, see Solar System. For detailed coverage of the shape, structure, and composition of Earth, as well as of its gravitational and magnetic fields, see Earth. For specific information about surface features and the factors governing their formation, see Continental Landforms; Geomorphic Processes; Oceans; Plate Tectonics. For a description of the layers of air and water that envelop Earth, see Atmosphere; Hydrosphere. For a discussion of the so-called zone of life at Earth's surface, see Biosphere.

Basic planetary data. The mean distance of Earth from the Sun is about 149,600,000 km (92,960,000 miles). The planet orbits the Sun at a speed of 29.8 km (18.5 miles) per second, making one complete revolution in 365.256 days. As it revolves around the Sun, Earth spins on its axis and rotates completely once every 23 hours 56 minutes 4 seconds.

The fifth largest planet of the solar system, Earth has an equatorial circumference of 40,076 km (24,902 miles), an equatorial radius of 6,378 km (3,963 miles), a polar radius of 6,357 km (3,950 miles), and a mean radius of 6,371 km (3,959 miles). The planet's total surface area is roughly 509,600,000 square km (196,800,000 square miles), of which about 29 percent, or 148,000,000 square km (57,000,000 square miles), is land. The balance of the surface is covered by the oceans and smaller seas. Earth has a mass of 5.976×10^{24} kg (or roughly 6×10^{21} metric tons) and a mean density of 5.52 grams per cubic cm.

Earth has a single natural satellite, the Moon (*q.v.*). The latter orbits the planet at a mean distance of slightly more than 384,400 km (238,900 miles).

Earth's figure and gravity. The centrifugal force of Earth's rotation makes the planet bulge at the Equator. Because of this, Earth has the shape of an oblate spheroid, being flatter near the poles than near the Equator. Correspondingly, one degree of latitude is longer in high latitudes than it is in low ones.

The gravitational field, or gravity, of Earth is manifested as the force acting upon a free, unsupported body causing it to move in the general direction of the centre of the planet. Departures from the spherical shape and the effect of Earth's rotation cause gravity to vary with latitude. The mean gravitational acceleration at sea level is about 980 cm (32.2 feet) per second per second.

Atmosphere and radiation belts. Earth's atmosphere consists of a mixture of gases, chiefly nitrogen (78 percent) and oxygen (21 percent). Argon makes up much of the remainder, with traces of water vapour, carbon dioxide, methane, and various other gases also present. At lower altitudes, minute dust particles and water droplets occur in suspension.

Earth is surrounded by a magnetosphere, a region of strong magnetic forces that extends upward from about 140 km (90 miles) in the upper atmosphere. In the magnetosphere, the

magnetic field of Earth traps rapidly moving charged particles (*e.g.*, electrons and protons), the majority of which are emitted by the Sun in the form of the solar wind. Were it not for this shielding effect, such particles would bombard Earth's surface and destroy life. Concentrations of the trapped particles at high altitudes make up two doughnut-shaped zones called the Van Allen radiation belts. These belts play a key role in several geophysical phenomena, as, for example, auroras.

Hydrosphere. Earth is the only planet known to have liquid water. Together with ice and atmospheric water vapour, the liquid water constitutes the hydrosphere. Seawater makes up about 97 percent of the total volume of the hydrosphere and covers about 71 percent of Earth's surface. Significantly, seawater constituted the environment of the earliest terrestrial life-forms. The rest of the hydrosphere consists of fresh water, occurring principally in lakes and rivers and as ice at polar latitudes.

Surface features. Earth's surface is commonly subdivided into seven continental masses: Europe, Asia, Africa, North America, South America, Australia, and Antarctica. These continents are surrounded by oceanic waters, of which three major bodies are recognized: the Atlantic, Pacific, and Indian oceans. (The Arctic Ocean is considered an extension of the Atlantic.) The continents and oceanic basins may be further subdivided into major relief features, such as mountain systems, volcano chains, rift valleys, and plateaus on land and mid-oceanic ridges, trenches, submarine canyons, and clusters of guyots (flat-topped, deeply submerged mountains) on the ocean floor. Most such lower-order topographic features were formed as a result of vertical tectonic movements (*i.e.*, uplift and subsidence of Earth's crust) and the extrusion of molten-rock material called magma. Continental landforms of smaller scale, including pediments, caves, and cliffs, have been produced by denudational processes, which involve the weathering and erosion of rocks and the accumulation of the resultant sedimentary debris.

Structure and composition. Broadly speaking, Earth consists of two regions: a core composed largely of molten, iron-rich metallic alloy; and a solid shell of silicate minerals comprising both the mantle and overlying crust. In continental regions, the crust is made up chiefly of granitic rock, whereas the composition of the ocean floor corresponds mainly to that of basalt and gabbro. On average, the crust extends 35 km (22 miles) downward from the surface to the underlying mantle from which it is separated by the Mohorovičić discontinuity (often shortened to Moho). The mantle, consisting of rock material in which olivines, pyroxenes, and silicate perovskite predominate, ends at a depth of about 2,900 km (1,800 miles). About one-third of Earth's mass is contained in the core, most of which is liquid iron alloyed with some lighter, cosmically abundant components (*e.g.*, sulfur, oxygen, and perhaps even, controversially, hydrogen). A small, central part of the core, below a depth of about 5,100 km (3,200 miles), is solid.

More than 90 percent of the magnetic field measured at Earth's surface is thought to originate in the outer core in a self-sustaining process analogous to one that occurs in the dynamos (rotating generators) used by power stations. In this process, fluid motion in the outer core moves conducting material (liquid iron) across an already existing, weak magnetic field and generates an electric current. This current, in turn, produces a magnetic field that also interacts with the moving fluid to create a secondary magnetic field. Together the two fields are stronger than the original field. Thermal heating in the core is the energy source that drives the fluid motion.

Earth current: *see* telluric current.

Earth impact hazard, the danger of collision posed by astronomical small bodies whose orbits around the Sun carry them near Earth. These objects include the rocky asteroids and their fragments and the icy nuclei of comets.

Space near Earth contains vast numbers of objects in a range of sizes, but only the biggest—those that collide with Earth very infrequently on average—are thought to pose a great potential danger to human beings and possibly to all life on the planet. Interest in the subject was spurred in the early 1980s by evidence that the impact of an asteroid or comet about 10 km (6 miles) in diameter caused the mass extinction at the end of the Cretaceous Period 65 million years ago and that similar impacts may have triggered other mass extinctions. In addition to causing tremendous immediate devastation, such collisions are believed capable of throwing large amounts of fine debris high into the atmosphere, with a consequent decrease in sunlight and a prolonged drop in surface temperatures—a so-called impact winter—leading to loss of plant life and worldwide starvation and disease.

All objects that can someday cross Earth's orbit have the potential to collide with the planet. They include asteroids and comets in short-period orbits—together called near-Earth objects (NEOs)—and those long-period comets that make their closest approach to the Sun inside Earth's orbit. Short-period comets complete their orbits in less than 200 years and so likely have been observed before; they generally approach along the plane of the solar system. Most known Earth-approaching asteroids have orbits tilted by less than 20° to the plane of the solar system, and they have periods of less than about three years. Long-period comets have orbital periods greater than 200 years and usually much greater; they can approach from any direction.

The amount of damage caused by an impact with Earth is primarily a function of the object's mass and relative velocity. Together these determine the kinetic energy released, which is expressed in millions of tons (megatons) of TNT, the same units used to quantify the energy released by thermonuclear bombs. The energy released by an impact falls between about 10 megatons and 1 billion megatons. This corresponds to NEOs with diameters from about 50 metres (160 feet) to 20 km (12 miles) or to long-period comets with diameters about half as large. (Objects smaller than about 50 metres break up high in the atmosphere, limiting the damage.) The last destructive impact known, called the Tunguska event (*q.v.*), occurred at the low end of this energy range over Siberia in 1908.

Because there are far fewer large NEOs and long-period comets in space than smaller ones, the chances of a collision decrease rapidly with increasing size. An impact by a 1-km- (0.6-mile-) diameter NEO, the smallest believed capable of causing a global catastrophe (defined as leading to the death of one-fourth or more of the world's population), is estimated to occur about once per 100,000 years on average. By contrast, an impact by a 100-metre (300-foot) NEO, about the smallest believed capable of causing regional devastation, is estimated to occur about once every 1,000 years on average. The hazard posed by long-period comets is less certain.

Beginning in the 1990s, a number of loosely coordinated programs to search for potentially destructive NEOs were instituted, several sponsored by the U.S. National Aeronautics and Space Administration. Using reflecting telescopes and sensitive electronic detectors, they have as their objective the discovery of objects capable of causing global catastrophe were they to hit Earth. Many smaller NEOs down to about 100 metres are also expected to be detected as a by-product of these searches.

What can be done about an object found on a collision course with Earth depends on many

factors, the most important being the amount of lead time and the physical properties of the object. Scientists believe that a nonexplosive projectile sent to strike the object and so change its orbit is adequate for most situations. For the remainder, more aggressive measures, likely involving powerful thermonuclear devices, are thought to be necessary to achieve the same results. Because the physical properties of NEOs are poorly known, such measures could do more harm than good—*e.g.*, by breaking a large object into numerous smaller but still potentially destructive pieces. Validating these options requires additional theory, laboratory experiments, and safe tests involving actual NEOs in space. (E.F.T.)

Earth Mother, in ancient and modern non-literate religions, an eternally fruitful source of everything. Unlike the variety of female fertility deities called mother goddesses (*q.v.*), the Earth Mother is not a specific source of vitality who must periodically undergo sexual intercourse. She is simply the mother; there is nothing separate from her. All things come from her, return to her, and are her.

The most archaic form of the Earth Mother transcends all specificity and sexuality. She simply produces everything, inexhaustibly, from herself. She may manifest herself in any form. In other mythological systems she becomes a more limited figure. She becomes the feminine Earth, consort of the masculine sky; she is fertilized by the sky in the beginning and brings forth terrestrial creation. Even more limited reflections of the Earth Mother occur in those agricultural traditions in which she is simply the Earth and its fertility.

Earth sciences, the fields of study concerned with the solid Earth, its waters, and the air that envelops it. Included are the geologic, hydrologic, and the atmospheric sciences.

A brief treatment of the Earth sciences follows. For full treatment, *see* MACROPAEDIA: Earth Sciences, The.

Each of the three major families of the Earth sciences is conventionally divided into disciplines and subdisciplines.

Geologic sciences. In the geologic sciences, disciplines are frequently grouped under the heading of physical geology, which includes the study of minerals (mineralogy), of rocks (petrography and petrology), of structures in the solid Earth (structural geology), of sedimentary strata and their fossil content (stratigraphy and paleontology, respectively), and of landforms (geomorphology). The history of the development of these natural entities is broadly comprehended under the heading of historical geology.

Geophysics and geochemistry overlap many of the above-mentioned disciplines. Broadly speaking, geophysics is concerned with the physical properties and dynamics of the Earth in all its parts. Among the phenomena investigated by geophysicists are the Earth's fields of gravity and magnetism, the thermal properties of the Earth, the motions of fluids within and surrounding the planet, and the release of mechanical and thermal energy in earthquakes and volcanic activity. Geochemistry deals with the composition of the Earth and the chemical changes that occur in nature. Although both of these geologic sciences focus on changes affecting the Earth today, they also are concerned with determining the chain of events that led up to present conditions.

Economic geology, engineering geology, and various other so-called applied geosciences entail for the most part the practical application of the principles and techniques of geophysics and geochemistry. Also closely interlinked with the latter fields is astrogeology, a relatively new discipline that deals with other

planetary bodies of the solar system and their satellites, as well as with asteroids, meteoroids, and tektites.

The geologic sciences contribute significantly to modern society. Workers in these fields have led the exploration for accumulations of fossil fuels (e.g., oil, natural gas, and coal), deposits of industrial minerals, and concentrations of geothermal energy. Geologic surface maps, gravity measurements, seismic methods, and analyses of borehole samples have all become essential in petroleum prospecting. Knowledge about the periods of Earth history and plate tectonic environments helps economic geologists to define regional metallogenetic provinces and locate ore deposits of commercial value.

Seismological research plays a key role in explaining the characteristics of ground motions in earthquakes. Information of this kind, which is needed to predict ground motions in future quakes, enables engineers to design earthquake-resistant buildings, bridges, and other structures. Information provided by engineering geologists about the composition and structure of bedrock is important in selecting sites for such facilities as nuclear power plants and dams.

Hydrologic sciences. The hydrologic sciences deal with the occurrence, movement, and physical and chemical properties of water (in all its forms) within the Earth's hydrosphere. The component disciplines include the study of water close to the land surface (hydrology), of seas and oceans (oceanography), of lakes and inland seas (limnology), and of glaciers and ice caps (glaciology).

The hydrologic sciences are of fundamental importance because water is essential to many of humankind's most basic activities—agriculture, industry, power generation, and recreation. They provide much of the knowledge on which the development and management of available water resources are founded, and provide a better understanding of such serious problems as groundwater pollution and acid rain.

Atmospheric sciences. The atmospheric sciences focus on the structure and dynamics of the Earth's atmosphere. They have traditionally been divided into three areas: meteorology, climatology, and aeronomy. Meteorology is primarily concerned with short-term weather variations in the lower regions of the atmosphere. Climatology has to do with long-term weather conditions (those that occur over periods ranging from roughly a month to millions of years) on a global scale. Researchers in this field seek to explain why climate differs from region to region and how it is interrelated with other elements of the physical environment. Aeronomy involves studies of the atmospheric regions above the lower stratosphere, dealing with phenomena such as airglow, magnetospheric storms, auroras, and photochemical processes.

Of the varied applications of the atmospheric sciences, weather forecasting obviously has the most immediate impact. Today, weather forecasting is carried out with a worldwide network of ground-based stations and Earth-orbiting satellites specially equipped for meteorological measurements. High-speed computers are used to analyze the tremendous quantities of data so gathered to produce reasonably accurate short-range forecasts.

Another application that has attracted considerable interest in recent years is weather modification. Such deliberate alterations of atmospheric conditions include efforts to enhance precipitation, weaken hurricanes, and suppress hail and fog.

Earth Summit: see United Nations Conference on Environment and Development.

Earth tide, deformation of the solid Earth as it rotates within the gravitational fields of the Sun and Moon. Earth tides are similar to ocean tides. The Earth deforms because it has a certain degree of elasticity; were it perfectly rigid, there would be no Earth tides. Several tidal components mathematically can be shown to exist, but only four are large enough to be generally measurable; these are the lunar diurnal, the lunar semidiurnal, the solar diurnal, and the solar semidiurnal tides. Diurnal tides have a period of approximately 24 hours (1 day), and semidiurnal tides have a period of approximately 12 hours (1/2 day). The actual amplitudes of these tides in terms of vertical movement of the surface of the solid Earth are about one foot or less.

earthenware, pottery that has not been fired to the point of vitrification and is thus slightly

porous and coarser than stoneware and porcelain. The body can be covered completely or decorated with slip (a liquid clay mixture applied before firing) or it can be glazed. For both practical and decorative reasons, earthenware is usually glazed. To overcome its porosity (which makes it impracticable for storing liquids in its unglazed state, for example), the fired object is covered with finely ground glass powder suspended in water and is then fired a second time. During the firing, the fine particles covering the surface fuse into an amorphous, glasslike layer, sealing the pores of the clay body. There are two main types of glazed earthenware. One is covered with a transparent lead glaze; when the earthenware body to which this glaze is applied has a cream colour, the product is called creamware. The second type, covered with an opaque white tin glaze, is variously called tin-enameled, or tin-glazed, earthenware, majolica, faience, or delft.

A crude, soft earthenware, excavated at a Neolithic settlement at Çatalhöyük, on the Anatolian Plateau of Turkey, and thought to be about 9,000 years old, is the earliest known pottery. Earthenware is still widely used in the 20th century, much of the commercially produced ware being heatproof and coldproof and thus practicable for cooking and freezing as well as for serving.

earthfill dam, also called **EARTH DAM,** or **EMBANKMENT DAM,** dam built up by compacting successive layers of earth, using the most impervious materials to form a core and placing more permeable substances on the upstream and downstream sides. A facing of crushed stone prevents erosion by wind or rain, and an ample spillway, usually of concrete, protects against catastrophic washout should the water overtop the dam.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

earthflow, sheet or stream of soil and rock material saturated with water and flowing downslope under the pull of gravity; it represents the intermediate stage between creep and mudflow. Earthflows usually begin in a large basin on the upper part of a slope where debris and weathered material accumulate; the movement, usually set off by heavy rainfall, may be relatively slow or very fast, depending on the amount of water present, the angle of the slope, and other aspects of the terrain.

earthnut, also called **PIGNET,** or **HOGNUT** (*Conopodium majus*), European plant of the carrot family (Apiaceae), so called because of its edible tubers. It grows in woods and fields in the British Isles and from Norway, France, Spain, and Portugal to Italy and Corsica. The slender, smooth perennial, growing 750 mm to 1 m (30 to 39 inches) high, has much-divided leaves and small, white flowers in compound umbels. The tubers, reaching 25 mm (1 inch) in diameter, are more commonly used as food on the Continent than in Britain. The peanut, or groundnut, is sometimes called earthnut.

earthquake, any abrupt disturbance within the Earth that is tectonic or volcanic in origin and that results in the generation of elastic waves. The passage of such seismic waves through the Earth often causes violent shaking at its surface.

A brief treatment of earthquakes follows. For full treatment, see **MACROPAEDIA:** Earthquakes.

The origin and distribution of most major earthquakes can be explained in terms of the plate tectonics theory. This theory postulates that the Earth's surface is made up of a number of large, rigid plates that move relative to one another and interact at their boundaries. The severest earthquakes tend to occur at con-

Notable earthquakes in history

year	affected area	magnitude	intensity	approximate number of deaths	comments
c. 1500 BC	Knossos, Crete (Greece)	...	X	...	This quake accompanied the explosion of the nearby volcanic island of Thera.
27 BC	Thebes (Egypt)	This quake cracked one of the statues known as the Colossi of Memnon.
AD 62	Pompeii and Herculaneum (Italy)	...	X	...	These two Roman cities were buried by the eruption of Mount Vesuvius in AD 79.
115	Antioch (Antakya, Turkey)	...	XI	...	A centre of Hellenistic and early Christian culture, Antioch suffered many devastating quakes; this one almost killed the visiting Roman emperor Trajan.
1556	Shaanxi province (China)	...	IX	830,000	This may have been the deadliest earthquake ever recorded.
1650	Cuzco (Peru)	8.1	X	...	Many of Cuzco's Baroque monuments date to the rebuilding of the city after this quake.
1692	Port Royal (Jamaica)	2,000	Much of this haven for buccaneers and slave traders sank beneath the sea following the quake.
1693	southeastern Sicily (Italy)	...	XI	153,000	Syracuse, Catania, and Ragusa were almost completely destroyed.
1755	Lisbon, Portugal	...	XI	62,000	The Great Lisbon Earthquake was felt as far away as Algiers and caused a tsunami that reached the Caribbean.
1780	Tabriz (Iran)	7.7	...	200,000	This ancient highland city was destroyed and rebuilt, as it would be again in 1927.
1811–12	New Madrid, Mo., U.S.	8.8	XII	...	A series of quakes at the New Madrid Fault rerouted portions of the Mississippi River.
1812	Caracas (Venezuela)	9.6	X	26,000	A provincial town in 1812, Caracas recovered and eventually became Venezuela's capital.
1835	Concepción, Chile	8.5	...	35	British naturalist Charles Darwin, witnessing this quake, marveled at the power of the Earth.
1886	Charleston, S.C., U.S.	...	IX	60	This was one of the largest quakes ever to hit the eastern United States.
1895	Ljubljana (Slovenia)	6.1	VIII	...	Modern Ljubljana is said to have been born in the rebuilding after this quake.
1906	San Francisco, Calif., U.S.	8.3	XI	700	San Francisco still dates its modern development from the great 1906 earthquake and fire.
1908	Messina and Reggio di Calabria, Italy	7.5	XII	110,000	These two cities on the Strait of Messina were almost completely destroyed in what is said to be Europe's worst earthquake ever.
1920	Gansu province, China	8.5	...	200,000	Many of the deaths in this quake-prone province were caused by huge landslides.
1923	Tokyo-Yokohama, Japan	8.3	...	142,800	Japan's capital and its principal port suffered severely from the Great Kanto Earthquake.
1931	Hawke Bay, New Zealand	7.9	...	256	The bayside towns of Napier and Hastings were rebuilt in a distinctive Art Deco style.
1935	Quetta (Pakistan)	7.5	X	20,000	This was the most destructive quake to hit South Asia in the 20th century.
1948	Ashgabat (Turkmenistan)	7.3	X	176,000	Every year, Turkmenistan commemorates the utter destruction of its capital in this quake.
1950	Assam, India	8.7	X	574	The largest quake ever recorded in South Asia struck a lightly populated region.
1960	Valdivia and Puerto Montt, Chile	9.5	XI	5,700	The largest quake ever recorded in the world produced a tsunami that crossed the Pacific Ocean to Japan, where it killed more than 100 people.
1963	Skopje, Macedonia	6.9	X	1,070	The capital of Macedonia had to be rebuilt almost completely following this quake.
1964	Prince William Sound, Alaska, U.S.	8.5	...	131	Anchorage, Seward, and Valdez were damaged, but most deaths were caused by tsunamis in Alaska and as far away as California.
1972	Managua, Nicaragua	6.2	...	10,000	The centre of Managua was almost completely destroyed and has never been rebuilt.
1976	Guatemala City, Guatemala	7.5	IX	23,000	Rebuilt following a series of devastating quakes in 1917–18, the capital of Guatemala again suffered great destruction.
1976	Tangshan, China	8.0	X	240,000	This city was almost completely destroyed in the worst earthquake disaster in modern history.
1985	Michoacán state and Mexico City, Mexico	8.1	IX	10,000	The centre of Mexico City, built largely on the soft subsoil of an ancient lake, suffered great damage.
1988	Spitak and Gyumri, Armenia	6.8	X	25,000	This quake destroyed nearly one-third of Armenia's industrial capacity.
1989	Loma Prieta, Calif., U.S.	7.1	IX	62	This first sizable movement of the San Andreas Fault since 1906 collapsed a section of the San Francisco-Oakland Bay Bridge.
1994	Northridge, Calif., U.S.	6.8	IX	60	Centred in the urbanized San Fernando Valley, this quake collapsed freeways and some buildings.
1995	Kōbe, Japan	6.8	XI	6,000	The Great Hanshin Earthquake destroyed or damaged 200,000 buildings.
1999	Izmit, Turkey	7.8	X	15,000	The industrial city of Izmit and the naval base at Golcuk were heavily damaged.
1999	Nan-t'ou county, Taiwan	7.6	X	2,400	The Chi-chi earthquake was the worst to hit Taiwan since 1935.
2001	Bhuj, Gujarat state, India	8.0	X	20,000	This quake, possibly the deadliest ever to hit India, was felt across India and Pakistan.
2003	Bam, Iran	6.6	IX	26,000	This ancient Silk Road fortress city, built mostly of mud brick, was almost completely destroyed.
2004	Aceh province, Sumatra, Indonesia	9.0	...	200,000	The deaths resulting from this offshore quake actually were caused by a tsunami that killed more than 150,000 in Indonesia and others as far away as Sri Lanka and Somalia.

Data source: National Oceanic and Atmospheric Administration, National Geophysical Data Center, Significant Earthquake Database, a searchable online database using the Catalog of Significant Earthquakes 2150 B.C.–1991 A.D., with addenda.

vergent plate boundaries where one plate descends beneath the other. Most of these quakes originate more than 300 km (190 miles) below the surface and are associated with island arcs and trenches. Much seismicity also occurs near the margins where plates separate or slide past one another. Quakes at such sites tend to be of lower magnitude and are fairly shallow. In all such boundary regions, seismic waves are generated by the sudden fracturing of rock, which results when elastic strain accumulated during tectonic processes exceeds the strength of the rock.

Three major zones of seismicity have been identified: (1) the circum-Pacific belt, which lies along plate margins around the Pacific Ocean and includes the well-known seismically active areas of Japan, Indonesia, New Guinea, the Andes Mountains, the western part of Central America, and the San Andreas Fault region of California, (2) the trans-Asiatic belt, extending from Mediterranean Europe eastward through Asia to the Pacific, and (3) the mid-ocean ridges, which form a connected worldwide rift system.

Some earthquakes occur outside of these belts, away from plate boundaries. These intraplate earthquakes must be explained by mechanisms other than plate motions and suggest that stresses occasionally can exceed the strength of rock masses even within plates.

The location of an earthquake is determined with a seismograph. This instrument records

the oscillation of the ground caused by seismic waves that travel from their point of origin through the Earth or along its surface. A seismogram of a nearby earthquake is fairly simple, showing the arrival of *P* (or primary) waves, those that vibrate in the direction of propagation; slower-traveling *S* (or secondary) waves, those that vibrate at right angles to the direction of propagation; and surface waves, those of extremely high amplitude that skirt along the Earth's surface. In the case of distant earthquakes, the seismogram pattern tends to be more complex because it shows various types of seismic waves that originate from one point but are then reflected or refracted within the Earth's crust before reaching the seismograph. If the arrival times of various seismic waves are read on the seismogram at a recording station and compared with standard time-distance curves, then the distance to the centre of an earthquake can be ascertained.

The magnitude of an earthquake is usually expressed in terms of a logarithmic scale based on seismograph recordings of seismic-wave amplitudes. The numerical scale is so arranged that each increase in magnitude of one unit represents a 10-fold increase in earthquake size—*i.e.*, an earthquake of magnitude 8 is 10,000 times as large as one of magnitude 4. Whereas the latter would be capable of causing only slight damage, the former constitutes a devastating seismic event. The scales that are

commonly used are derivations of the Richter scale, which was introduced in southern California in 1935 and which, with successive refinements, held currency among seismologists for more than 40 years.

The magnitude of an earthquake differs from its intensity, which is the perceptible degree of shaking of the Earth's surface and the attendant damage at any given location. In general, a quake's intensity decreases with distance from its epicentre, but other factors, including surface geology, may have a significant bearing on its effects on man-made structures. The scale most often used to measure intensity is the 1931 modified Mercalli scale, which assigns 12 levels of intensity based on perceived violence of the earthquake and damage to structures and surface features.

Large earthquakes have caused some of the worst disasters in history. No other natural phenomenon is as destructive over so large an area in so short a time. The violent motions of the surface during large quakes can topple buildings. People are crushed and buried under the collapsing structures or are burned to death in ensuing building fires. Destructive, too, are the landslides and mudslides that may accompany an earthquake, as are tsunamis, the huge seismic sea waves induced by a disturbance in the adjacent seabed or by a submarine landslide triggered by an earthquake.

Much research has been devoted to earthquake prediction since the mid-1960s, most

notably by seismologists in China, Japan, Russia, and the United States. Various advances notwithstanding, no method has yet been devised to predict the time, place, or magnitude of earthquakes with a high degree of accuracy or consistency. Seismologists have found that major earthquakes are often preceded by certain measurable physical changes in the environment around their epicentres. These so-called precursor phenomena include the degree of crustal deformation in fault zones; occurrence of dilatancy (*i.e.*, an increase in volume) of rocks; and a rise in radon concentrations in wells. Continual monitoring and close scrutiny of these and other related phenomena are expected to improve prediction capability in the future.

earthshine, sunlight reflected from the Earth, especially that reflected to the Moon and back again. For a few days before and after New Moon, this doubly reflected earthshine is powerful enough to make the whole Moon visible.

At this time an observer on the Moon would see the Earth as a bright body, four times the diameter of the Moon as seen from Earth, al-

Earthshine on the Moon
By courtesy of Yerkes Observatory, Wisconsin

most completely illuminated by the Sun. The phases of the Earth and Moon are complementary, so that the Earth is near full when the Moon is near new, and the earthshine then is strongest.

earthworm, also called **ANGLEWORM**, any one of more than 1,800 species of terrestrial worms of the class Oligochaeta (phylum Annelida)—in particular, members of the genus *Lumbricus*. Seventeen native species and 13 introduced species (from Europe) occur in the eastern United States, *L. terrestris* being the most common. Earthworms occur in virtually all soils of the world in which the moisture and organic content are sufficient to sustain them.

An Australian species can grow as long as 3.3 metres (about 11 feet). *L. terrestris* grows to about 25 centimetres (10 inches). This species is reddish brown, but some earthworms (*e.g.*, *Allolobophora chlorotica*, native to Great Britain) are green. The reddish tinge of *L. terrestris* results from the presence of the pigment hemoglobin in its blood.

The earthworm body is divided into ringlike segments (as many as 150 in *L. terrestris*). Some internal organs, including the excretory organs, are duplicated in each segment. Between segments 32 and 37 is the clitellum, a slightly bulged, discoloured organ that produces a cocoon for enclosing the earthworm's eggs. The body is tapered at both ends, with the tail end the blunter of the two. Earthworms cannot see or hear, but they are sensitive to both light and vibrations.

Their food consists of decaying organisms; as they eat, however, earthworms also ingest large amounts of soil, sand, and tiny pebbles. It has been estimated that an earthworm in-

Earthworm (*Lumbricus terrestris*)

John Markham

gests and discards its own weight in food and soil every day.

Earthworms are hermaphroditic; *i.e.*, functional reproductive organs of both sexes occur in the same individual. The eggs of one individual, however, are fertilized by the sperm of another individual. During mating two earthworms are bound together by a sticky mucus while each transfers sperm to the other. The worms separate and form cocoons; the cocoon moves forward, picking up eggs at the 14th segment; at the 9th and 10th segments it picks up the sperm deposited by the other earthworm. The cocoon slides over the head, and fertilization takes place. Within 24 hours after the worms mate, the cocoon is deposited in the soil.

Miniature earthworms usually emerge from the cocoon after two to four weeks. They become sexually mature in 60 to 90 days and attain full growth in about one year.

Earthworms usually remain near the soil surface, but they are known to tunnel as deep as 2 m during periods of dryness or in winter. One Asian species is known to climb trees to escape drowning after heavy rainfall.

Earthworms provide food for a large variety of birds and animals. Indirectly they provide food for man by their beneficial effects on plant growth: they aerate the soil, promote drainage, and draw organic material into their burrows where it decomposes faster, thus producing more nutritive materials for growing plants. Earthworms also serve as fish bait; hence, the name **angleworm**.

earwax impaction, filling of the external auditory canal with earwax, or cerumen. Normally the wax produced by skin glands in the outer ear migrates outward. If the earwax is produced too rapidly, it may become hardened and accumulate, thus plugging the outer ear canal and preventing sound passage to the tympanic (eardrum) membrane. This hearing impairment is painless. Impacted earwax is often found in infants, because the large cotton swabs used to remove the wax often push it further into the baby's tiny ear canal. The problem also exists among industrial workers because of the surrounding dirt that gets into the ears. Persons who have an abnormal number of hairs in their ears are also susceptible, because the earwax becomes enmeshed in the hairs and fails to work its way out. The symptoms usually include sudden deafness. The wax is easily removed by a physician.

earwig, any insect of the order Dermaptera (about 1,100 species), characterized by large membranous hindwings that lie hidden under short, leathery forewings. The earwig varies from 5 to 50 millimetres (0.2 to 2 inches) in length and is flat, slender, and dark coloured. It has a shiny outer covering and simple biting mouthparts, and it undergoes incomplete metamorphosis (*i.e.*, egg, nymph, and adult stages). This nocturnal insect is usually herbivorous. Several species can fire a foul-smelling liquid, formed in abdominal glands and probably protective in function, for distances up to 10 centimetres.

The earwig has a pair of horny, forceps-like tail filaments, or pincers (cerci), at the posterior end of the abdomen; those of the male are larger and of a different shape than those of the female. It has been suggested that the pincers may function in defense, in catching insects and holding them while eating, in helping to fold the hindwings under the forewings, or during courtship fights for possession of a female. When alarmed or aggressive the earwig carries the cerci over its body in a scorpion-like manner. The name

Male (left) and female earwigs

Stephen Dalton

earwig is derived from the Anglo-Saxon word meaning "ear creature," probably because of a widespread ancient superstition that earwigs crawl into the ears of sleeping people.

easel painting, painting executed on a portable support such as a panel or canvas, instead of on a wall. It is likely that easel paintings were known to the ancient Egyptians, and the 1st-century-AD Roman scholar Pliny the Elder refers to a large panel placed on an easel; it was not until the 13th century, however, that easel paintings became relatively common, finally superseding in popularity the mural, or wall painting.

easement, in Anglo-American property law, a right granted by one property owner to another to use a part of his land for a specific purpose.

An easement may be created expressly by a written deed of grant conveying to another the right to use for a specific purpose a certain parcel of land. An easement may also be created when one sells his land to another but reserves for himself the right to future use of a portion of that land. An easement may also be created by implication, when, for example, a term descriptive of an easement is incidentally included in a deed (such as "passageway"—a section of land to be used for passage). An easement by implication also arises when the owner of two or more adjacent parcels of land sells one lot; the buyer acquires an easement to that visible property of the seller necessary to the buyer's use and enjoyment of his lot, such as a roadway or drainage duct. When created in this manner the easement also arises as an easement of necessity.

In most of the United States and England, statutes permit the creation of an easement by prescription, which arises by virtue of a long, continuous usage of the property of another by a landowner, his ancestors, or prior owners. The length of time necessary for such continued use to ripen into an easement by prescription is specified by the applicable state statute.

When use of the easement is restricted to either one or a few individuals, it is a private easement. Use of a public easement, such as public highways or a portion of private land dedicated by a present or past owner as a public park (also known as a dedication), is not restricted.

An owner of an easement is referred to as the owner of the dominant tenement. The owner on whose land the easement exists is the owner of the servient tenement.

Easington, district, county of Durham, north-eastern England, occupying an area of 55 sq mi (143 sq km) that extends north-south along the North Sea coast between the industrialized metropolitan counties of Tyne and

Wear to the north and Cleveland to the south. Easington district is a plateau 300 to 400 feet (90 to 120 m) high that descends to a narrow coastal plain having sandy and gravel beaches along the North Sea. Its thick glacial drift soils are underlain by dolomite that in turn covers coal deposits. Not until the 1820s did advances in mining techniques allow the deep-lying coal reserves to be worked. Easington's coal-mining industry peaked in the early 20th century and declined thereafter; it nevertheless remains the principal employer, and the district is the only one in the county of Durham where substantial amounts of coal are still mined. Most coal now comes from long galleries extending from the mainland below the North Sea. Seaham, founded in 1828, is the district's port, shipping mostly coal.

The new town of Peterlee, the district seat, was established in central Easington in 1948. Its original purpose was to replace the typical 19th-century housing of the nearby scattered mining villages and to create recreational and service facilities for the local inhabitants. With the subsequent local decline of the coal industry, Peterlee became a centre of light industry. Dairying is the most important agricultural pursuit. Pop. (1991 prelim.) 96,300.

East, Catherine, née Catherine Shipe (b. May 15, 1916, Barboursville, W.Va., U.S.—d. Aug. 17, 1996, Ithaca, N.Y.), American feminist and public official, a major formative influence on the women's movement of the mid-20th century.

East earned a degree in history at Marshall University in Huntington, W.Va., in 1943. After 24 years in the career services division of the Civil Service Commission, she worked as a researcher for the Labor Department from 1963 to 1975. In 1963 she also became executive secretary of the first presidential advisory commission on the status of women, and she held senior staff positions with successive advisory commissions until 1977. One of the outcomes of the first commission, in addition to the official report entitled *American Women*, was the formation in 1966 of the National Organization for Women (NOW). NOW founder Betty Friedan called East "the midwife of the contemporary women's movement" for catalyzing her and others to spearhead the drive to eliminate sexism in society. In the following decades East, who because of her work in the Labor Department had access to official data about women in the workplace, not only helped disprove the claims of those who opposed feminist legislation but also helped reconcile differences between women labour activists and feminists. For several years she coordinated study on women's issues at George Washington University and subsequently (1983–86) was legislative director of the National Women's Political Caucus, both in Washington, D.C. In the last decade of her life she lectured and consulted on women's issues.

East, Edward Murray (b. Oct. 4, 1879, Du Quoin, Ill., U.S.—d. Nov. 9, 1938, Boston, Mass.), American plant geneticist, botanist, agronomist, and chemist, whose experiments, along with those of others, led to the development of hybrid corn (maize). He was particularly interested in determining and controlling the protein and fat content of corn, both of which have significant influence upon that grain's value as animal feed.

East, a precocious youth, finished high school at age 15 and then worked in a machine shop for two years to earn money for college. Trained as a chemist, he developed an interest in genetics and in 1900 became an assistant to Cyril George Hopkins of the Illinois Agricultural Experiment Station at the University of Illinois, Urbana, where he worked on corn-breeding experiments intended to increase fat and protein content. After receiving an M.S. degree in 1904, he worked for four years as an

agronomist at the Connecticut Agricultural Experiment Station, where he continued his experiments with corn.

East's genetic investigations, with independent work by the geneticist and botanist George Harrison Shull, led to the development of hybrid corn. The commercial production of hybrid seed corn was made possible by the work of Donald F. Jones, a student of East. In 1909 East joined the faculty of Harvard University. He helped found the journal *Genetics* in 1916. Though he continued his work in genetics, his later contributions to the field were generally of a more theoretical nature. He wrote a number of books on science and international affairs.

East, Michael, East also spelled EASTE, EST, or ESTE (b. 1580?—d. 1648, Lichfield, Staffordshire, Eng.), English composer, especially known for his madrigals. (He was once thought to be a son of the music printer Thomas East, but late research suggests that they were, at most, distant relatives.)

East had some madrigals published as early as 1601 and again in 1604 and took a bachelor of music degree from the University of Cambridge in 1606. He had patrons in London for a time, was employed by Ely Cathedral from 1609 to 1614, and apparently, from 1618, lived in Lichfield, where for some time he was master of choristers for the cathedral. Over the years he published seven "sets of bookes" (1604, 1606, 1610, two in 1618, 1624, 1638) containing his madrigals, pastorals, anthems, "Neapolitanes," "fancies," various songs, and works for bass viols and treble viols. His compositions offer a valuable outline of the English musical tastes of the period (which were somewhat Italianate), but his music tended to be unoriginal and colourless.

East, Thomas, East also spelled EASTE, EST, or ESTE (b. c. 1540, London, Eng.—d. January 1609, London), prominent English music publisher whose collection of psalms (1592) was among the first part-music printed in score rather than as individual parts in separate books.

East was licensed as a printer in 1565 and later became an assignee in the music-publishing monopoly granted by Elizabeth I to the composers William Byrd and Thomas Tallis. His first publication was Byrd's *Psalms, Sonets and Songs of Sadnes and Pietie* (1588). In 1592 he edited *The Whole Booke of Psalmes, With Their Wonted Tunes*, harmonizations of psalm tunes by prominent musicians. His madrigal books included collections by Thomas Weelkes, John Wilbye, and Thomas Morley.

East Africa, eastern region of the continent of Africa, comprising the areas now occupied by the countries of Burundi, Kenya, Rwanda, Tanzania, Uganda, and Somalia. The more general term eastern Africa covers the area extending from The Sudan and Ethiopia in the north to the Zambezi River in the south; Mozambique is also sometimes included. See eastern Africa.

Following World War I, German East Africa (Deutsch-Ostafrika) was divided into British-administered Tanganyika (amalgamated since 1964 with Zanzibar as Tanzania) and Belgian-administered Ruanda-Urundi (now Rwanda and Burundi); the small Kionga (Quionga) triangle was allocated to Portuguese East Africa (now Mozambique). Until 1920 Kenya was generally known as the East Africa Protectorate.

World War II necessitated closer cooperation between the various territories and led to the establishment in 1948 of the East Africa High Commission, which, after the British-administered territories gained independence, in turn in 1961 developed into the East African Common Services Organization (EACSO), which became the East African Community in 1967.

Economic tensions led to a progressive erosion of these links, and by 1977 the community had ceased functioning.

East African lakes, group of lakes lying within the great East African Rift System that runs from the Red Sea in the north to the Zambezi River in the south.

A brief treatment of the East African lakes follows. For full treatment, see MACROPAEDIA: Africa.

The group includes lakes lying in Ethiopia, Kenya, Uganda, Zaire, Rwanda, Burundi, Tanzania, Zambia, Malaŵi, Mozambique, and Zimbabwe. The eight largest lakes are Victoria, Tanganyika, Nyasa (Malaŵi), Rudolf (Turkana), Albert (Mobutu Sese Seko), Kivu, Rukwa, and Edward. These range downward in size from Lake Victoria, covering 26,828 square miles (69,485 square km) to Lake Edward, 830 square miles (2,150 square km); surface elevations increase from Lake Rudolf at 1,230 feet (375 m) to Lake Naivasha at 6,180 feet (1,884 m) above sea level.

The lakes must have been formed after the landscapes in which they are set. In some lakes volcanic activity has played a part in blocking drainage and shaping shorelines. Raised beaches indicate that the lake levels were higher and their surfaces more extensive during rainy phases of the Pleistocene Epoch (1,600,000 to 10,000 years ago). The fossil record suggests that the organic content of Lakes Edward and George was sharply reduced during a period of intense volcanic activity.

The lakes lying in inland troughs at 2,000 feet (610 m) or less above sea level, have a hot, dry climate. At higher elevations, climatic conditions approach those of the flanking uplands. Sudden and dangerous storms can arise over the waters of the major lakes. Rainfall is closely correlated to variations in lake levels. Other factors affect longer-term level fluctuations, among them the intermittent blockage of outlets by silt consolidated by swampy growth.

Most lakes have a rich and varied fish life, although fish transplantation by humans has greatly modified some habitats. On land, vegetation varies from semidesert to patches of closed evergreen forest, with bushland and thicket, grassland, savanna, or open woodland occurring between the two extremes, depending on location; the creation of national parks and game reserves has increased wildlife populations. The lakes' two major resources are fishing and hydroelectric power. The major lakes are reasonably accessible by road and air, with the exception of Lake Rudolf, which has poor road connections.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

East African mountains, mountain region structurally related to the great East African Rift System, which extends from the Red Sea in the north to the Zambezi River in the south.

A brief treatment of the East African mountains follows. For full treatment, see MACROPAEDIA: Africa.

The region contains both continuous ranges and isolated peaks rising from the surrounding plateaus in Ethiopia, Kenya, Uganda, Zaire, Rwanda, Burundi, Tanzania, Zambia, Malaŵi, Mozambique, and Zimbabwe. The highest peaks rise from the surrounding plateaus to elevations above 16,000 feet (4,900 m) and, despite their proximity to the Equator, are ice-capped. Kilimanjaro, the highest mountain in Africa, reaches 19,340 feet (5,895 m) along Tanzania's northern border with Kenya. Other major East African mountains and ranges include Mount Kenya, the Aberdare Range, the Mau Escarpment, Mount Elgon, Mount

Meru, the Ruwenzori Range, and the Virunga Mountains; all but the Ruwenzori Range are of volcanic origin.

The Virunga Mountains, separating the basins of the Nile and the Congo rivers, is the only East African range to form a continental drainage divide. Soils range from the unaltered rock of the high peaks to the well-developed fertile soils at lower elevations. In a region of predominantly dry climate, the mountains are conspicuous as high-rainfall areas. Rainfall decreases above a cloud ceiling at about 10,000 feet (3,000 m). The altitudinal succession of vegetation is well developed on Mount Kenya, where plant life changes successively with increased elevation from surrounding savanna to cultivated land, to montane forest, to heather, and finally to an Alpine zone.

Elephant, rhinoceros, buffalo, antelope, bush pigs, and various monkeys and hyrax are among the main inhabitants of the montane forest, and leopard and antelope occur on the moorland and Alpine zones. Human habitation is mainly confined to the lower slopes. Minerals (notably copper), hydroelectric power, and forestry are the major resources. The mountains are an important tourist attraction, with a number of parks and game reserves.

East African Rift System, also called AFRO-ARABIAN RIFT VALLEY, one of the most extensive rifts on the Earth's surface, extending from Jordan in southwestern Asia southward through eastern Africa to Mozambique. The system is some 4,000 miles (6,400 km) long and averages 30–40 miles (48–64 km) wide.

The system consists of two branches. The main branch, the Eastern Rift Valley (often called the Great Rift Valley, or Rift Valley), extends along the entire length of the system. In the north the rift is occupied by the Jordan River, the Dead Sea, and the Gulf of Aqaba. It continues southward along the Red Sea and into the Ethiopian Denakil Plain to Lakes Rudolf (Turkana), Naivasha, and Magadi in Kenya. The rift is less obvious through Tanzania, because the eastern rim is much eroded, but it continues southward through the Shire River valley and Mozambique Plain to the coast of the Indian Ocean near Beira, Mozambique. The western branch of the system, the Western Rift Valley, extends northward from the northern end of Lake Nyasa (Lake Malawi) in a great arc that includes the Lakes Rukwa, Tanganyika, Kivu, Edward, and Albert (Mobutu Sese Seko). Most of the lakes in the rift system are deep and fjordlike, some with their floors well below sea level.

The plateaus adjacent to the rift generally slope upward toward the valley and provide an average drop of from 2,000 to 3,000 feet (600 to 900 m) to the valley floor. In some places, such as the Gikuyu and Mau escarpments, the drop averages more than 9,000 feet (2,700 m). The rift has been forming for some 30,000,000 years (as Africa and the Arabian Peninsula separated) and has been accompanied by extensive volcanism along parts of its length, producing such massifs as Kilimanjaro and Mount Kenya.

East Anglia, traditional region of England, the easternmost, consisting of the counties of Norfolk, Suffolk, and parts of the counties of Cambridgeshire and Essex. The traditional central town is the cathedral city of Norwich, which since 1961 has been the site of the University of East Anglia and its Centre of East Anglian Studies.

The area is low and undulating and almost entirely covered with glacial deposits. The valleys are shallow, and most are occupied by rivers (notably the Wensum and the Waveney) that drain into the North Sea.

The area's regional unity depends as much

on history as on physiography. It has been settled for thousands of years. Colchester, the oldest recorded town in England, was important in pre-Roman and Roman times. East Anglia was one of the kingdoms of Anglo-Saxon England, consisting of the north people (Norfolk), the south people (Suffolk), and adjacent communities. Raedwald (died between 616 and 628) was the first king of East Anglia about whom anything is known. The Sutton Hoo ship burial and the treasure that it contained, now housed in the British Museum, indicate the wealth of the East Anglian kings. During the medieval period East Anglia was known for its wool and the manufacture of woolen products, and from the 14th to the 18th century Norwich was the major weaving town in England.

The modern economy of the region is predominantly agricultural. Crops have replaced sheep as the mainstay. Barley is the major crop, and except in the extreme south it occupies more land than all the other crops combined; market gardening is also considerable in some areas. Along the coast are a number of important fishing ports and holiday resorts. Light industry has developed in most of the towns.

East Asian arts, the music and visual and performing arts of China, Korea, and Japan. The literature of these three countries is covered in separate articles under Chinese literature, Korean literature, and Japanese literature.

A brief treatment of East Asian arts follows. For full treatment, see MACROPAEDIA: East Asian Arts.

Ultimately, China can be seen as the source of many of the major aspects of the Korean and Japanese arts. Despite this assertion, however, those elements of Chinese culture and arts that were not simply adopted have undergone such significant acculturation—adaptation to geography, ethnicity, and religion—that they have become distinct and recognizable national arts.

Visual arts. The most important of the visual arts in China is calligraphy. Its expressive qualities exemplify all that is important in the visual arts, for the artist's goal is never simply representation or realism, but rather the revelation of essence. Painting and calligraphy are considered the only true fine arts in China because they alone require no physical labour, and they have no physical function. Sculpture is considered to be a craft, as are bronze casting, carving, and the making of pottery, textiles, metalwork, and lacquer ware. Each of these crafts was heavily influenced by the aesthetics—especially the rhythmic movement of line—of the painters and calligraphers. Chinese architecture is characterized by timber buildings, and a building typically consists of a platform, a post-and-lintel frame, a system of roof-supporting brackets, and a heavy, sloping roof.

Korean visual arts through the ages exhibit great simplicity of form, treatment, and use of decoration, as well as a concern for naturalism. Among the remarkable features of Korean art might be noted the use of stone in architecture and sculpture (particularly during the Great, or United, Silla period, 668–935) and the development of a celadon glaze that was outstanding in its quality and shading.

Japanese visual arts are characterized by their vibrancy, life, and colour. They have been strongly influenced by three elements: Chinese visual arts, indigenous themes and traditions, and Buddhist iconography. The Chinese style of ink-monochrome painting and calligraphy played a significant role in the development of Japanese art. Japanese artists assimilated this tradition, introducing the use of colour and an emphasis on decorative effect. The subject matter of Japanese art often has its origins in Japanese literature, and frequently

what appears to be a simple landscape or surface decoration is a complex literary allusion. The introduction of Buddhism in the mid-6th century had a profound effect on the imagery and style of the architecture and sculpture of Japan, as it had on Korean arts. In sculpture, especially, Buddhist subjects were almost always dominant. Chinese influences can be seen in Buddhist architecture dating from the 8th century. Ceramic styles also exhibit considerable continental influences, especially from the Korean peninsula.

Music and performing arts. East Asian music, unlike Western, or European, music, established pitch by means of an end-blown bamboo flute rather than the plucked string. Despite this difference, however, both music systems developed a pentatonic scale based on a 12-tone vocabulary. The preferred size of the Chinese musical ensemble is small, and East Asian composition emphasizes melody and rhythm over harmonics.

Early Chinese music is marked by use of wind and percussion instruments including the globular flute (*xun*), panpipe (*pai-xiao*), mouth organ (*sheng*), stone chime (*ging*), drum (*gu*), bell chime (*zhong*), and percussion idiophones (*zhu* and *wu*).

The rich variety of Chinese music today can be classified as vocal, balladic, dance, theatrical, or instrumental. Vocal music is characterized by a close fusion of melodic progression, the Chinese language, and an economic use of musical idioms; balladic music involves literary creativity fully supported by musical expressiveness; and dance music is characterized by polyrhythmic tempos and large instrumental ensembles. In the orchestral, ensemble, and solo instrumental music of China, multipart formal design dominates, and a four-stage development—consisting of an introduction (*gi*), an elucidation of the theme (*cheng*), a transition (*zhuan*), and a summing up (*he*)—is common.

The documented history of Japanese music began sometime before the 8th century. During the Heian period, the various kinds of music, imported and indigenous, were arranged in an order that remained unchanged until modern times. The general term *To-gaku* ("Tang music") embraced all music from and instrumentation typical of China and south and central Asia. All Korean, northeast Asian, and Manchurian music was incorporated into *Koma-gaku*. The term *mikagura* was used for the music of the imperial Shintō rites and some song dances of the earliest times. Though it continued to develop along its own lines, Japanese music remained strongly influenced by Chinese music and, later, Western styles. The three main traditional instruments are the koto (a zitherlike instrument with 13 strings), the samisen (which has 3 strings and resembles a banjo), and the *shakuhachi* (an end-blown wooden flute).

Early Korean music included many elements of Chinese court music, but aspects of indigenous music (of a ritual, shamanistic nature) were also present. Several early instruments survive, and the *kayakeum* board zither, an indigenous instrument, remains in use throughout the country. Narrative vocal music is important, with the *p'ansori* style being the dominant form.

In the related categories of East Asian dance and theatre, it is noteworthy that in the East Asian countries, music, dance, and drama are typically linked, and there is little evidence of separate evolution of form that can be seen in Western ballet and theatre. The several forms of East Asian performing arts include both masked and unmasked dances, masked dance theatre (as in Japanese *nō* and Korean *sandae*), danced processions, dance opera (Peking and other forms of Chinese opera), shadow theatre, puppet theatre (such as Japanese *bunraku*), and dialogue plays with music and dance (e.g., Japanese kabuki).

East Aurora, village, Erie county, western New York, U.S. It lies 12 miles (19 km) south-east of Buffalo and, oddly enough, 90 miles (145 km) west of Aurora. Settled in 1804, it was incorporated as Willink in 1849 and as East Aurora in 1874. Inspired by the English designer William Morris and his communal Kelmscott Press, the editor and publisher Elbert Hubbard established the Roycroft Press in East Aurora in 1893; he later added the Roycroft Shops. There he printed *The Philistine* magazine and his pamphlet *A Message to Garcia*. The Roycroft enterprises (closed in 1938) were known for their excellent craftsmanship and at one time employed hundreds of local people. East Aurora is now primarily residential. Pop. (2000) 6,673.

East Australian Current, surface oceanic current, a section of the counterclockwise flow in the Tasman Sea, southwestern Pacific Ocean. It is formed by water masses from the Coral Sea—equatorial water driven by monsoonal winds from January to March and eastward subtropical flow from April to December—which pass southeast between the Great Barrier and Chesterfield reefs (latitude 20° S), paralleling the east coast of Australia into the Tasman Sea. Narrowing as it approaches latitude 25° S, the current is strongest off Cape Byron, New South Wales. It weakens and begins to dissipate beyond 32° S, but its remnants continue to drift southward until, off Tasmania, they swing eastward and begin to flow north as the Tasman Current. At the surface its salinity is more than 35 parts per thousand, increasing to a maximum of 35.8 at a depth of 660 feet (200 m). Reaching depths greater than 3,300 feet (1,000 m), the East Australian Current transports about 1,100,000,000 cubic feet (30,000,000 cubic m) of water per second.

East Ayrshire, council area, southwestern Scotland. It covers an undulating lowland in the north and west that rises to forested and moor-covered uplands in the east and south, where Blackcraig Hill reaches an elevation of 2,298 feet (700 m). East Ayrshire forms part of the historic county of Ayrshire. Dairy farming is important in the lowlands, while cattle and sheep raising predominate in the uplands. Kilmarnock, the administrative centre and largest town, has a wide variety of industries including engineering and whisky distilling and blending. Area 483 square miles (1,252 square km). Pop. (1999 est.) 120,940.

East Berlin, German OST BERLIN, eastern part of the city of Berlin (*q.v.*) that served as the capital of the German Democratic Republic (East Germany) until the reunification of the German state in 1990.

East Cambridgeshire, district, administrative and historic county of Cambridgeshire, east-central England, occupying an area northeast of the city of Cambridge. Situated predominantly within the Fens, an expanse of reclaimed marshland, the district has a slightly elevated chalk upland in the southeast.

Prior to the draining of the Fens in the 17th century, Ely was an isolated locale on an island of glacial drift amid the marshlands; today the town of Ely, with its famous cathedral, is the district seat. The section of the Fens around Ely is an important area for sugar beet cultivation; cereals, onions, potatoes, and fruits are also intensively grown. Wicker Fen, 10 miles (16 km) south of Ely, is the only substantial remnant of undisturbed marshland in the Fens. A haunting place rising several feet above the adjacent cultivated lands, Wicker Fen's 730 acres (295 hectares) are a sanctuary for rare insects, birds, and plants. The Stained Glass Museum in the cathedral at Ely displays panels of painted glass representing the development of the craft from the 14th century to the present. Area 253 square miles (656 square km). Pop. (1998 est.) 72,900.

East Caucasian languages: *see* Dagestanian languages.

East Champāran (India): *see* Purba Champāran.

East Chicago, industrial city and port, Lake county, northwestern Indiana, U.S., adjoining Gary, Hammond, and Whiting. It is a part of the Chicago-Calumet industrialized metropolitan complex. Laid out in 1887, its industrial development was stimulated by construction of Indiana Harbor, connected with the Grand Calumet River by a 3-mile (5-km) ship canal and including an extensive system of docks. Its densely concentrated industries include steelworks, oil refineries, a refractory, and factories producing chemicals and industrial tanks. Inc. 1889. Pop. (2000) 32,414.

East China Sea, Chinese (Wade-Giles) TUNG HAI, or (Pinyin) DONG HAI, arm of the Pacific Ocean and part of the China Sea (*q.v.*). It covers about 290,000 square miles (752,000 square km) and is bounded by the islands of Cheju (north), Kyushu (northeast), the Ryukyu chain (east), and Taiwan (south) and by China (west). It is connected to the South China Sea by the Taiwan Strait. Its Chinese name means "eastern sea."

East Cleveland, city, suburb of Cleveland, Cuyahoga county, northeastern Ohio, U.S., just southeast of Lake Erie. The site was settled in 1801 by farmers, and East Cleveland township was organized in 1805. Portions of the township were later annexed by Cleveland, and the village, which was incorporated in 1895, became a city in 1911. Primarily residential, the city has some industrial development and is the site of Nela Park, headquarters of General Electric's lighting division and one of the first planned industrial research parks (built 1911–21). Its Forest Hill Park (shared with neighbouring Cleveland Heights) was once part of the summer estate of oil magnate John D. Rockefeller. Pop. (2000) 27,217.

East Dereham, also called DEREHAM, TOWN, Breckland district, administrative and historic county of Norfolk, England, 16 miles (26 km) west-northwest of Norwich. The site of a 7th-century Christian convent, it was destroyed by invading Danes. The parish church, dating from the 12th century, contains painted perpendicular-style ceilings, the former tomb of the church's presumed 7th-century founder, St. Withburga (in a ruined chapel), and the tomb of the 18th-century poet William Cowper. Cowper's house no longer exists, and its site is occupied by the Cowper Memorial Church. East Dereham is an agricultural centre, producing farm equipment and containing flour mills. Pop. (1991) 12,974.

East Detroit, former name of EASTPOINTE, city, Macomb county, Michigan, U.S., adjacent to the northeast corner of Detroit. It is primarily a residential suburb of Detroit with a large retail sector, but it does have some light manufacturing. First settled in 1837, it was on the military road (now Gratiot Avenue) connecting Fort Wayne (Detroit) with Fort Gratiot (Port Huron). Equidistant between Detroit and Mount Clemens, it was incorporated as Halfway Village in 1924. It adopted the name East Detroit in 1929, the year after it became a city, and was renamed Eastpointe in 1992. Pop. (2000) 34,077.

East Devon, district, administrative and historic county of Devon, southwestern England, adjacent to the English Channel. East Devon is historically known for its handmade lace and carpet-making industries. High-quality limestone has been quarried near the central coastal town of Beer for centuries; it was used for the finer carvings and pillars in many of Devon's medieval, Tudor, and Jacobean buildings. Modern East Devon is also known for its popular cliffside resorts, especially in the

southwest at Exmouth and Sidmouth, and for its intensively cultivated fruits and vegetables grown on the lower Exer, Clyst, and Otter river valleys in the western part of the district. Dairying is also economically important.

Bronze Age barrows (burial mounds) are commonplace in the hills south of Honiton and near the village of Dalwood. Sidmouth is the district seat. Area 315 square miles (815 square km). Pop. (1998 est.) 124,400.

East Dorset, district, administrative county of Dorset, southern England, in the northeastern corner of the county directly north of the English Channel resorts of Bournemouth and Poole. Most of the district is part of the historic county of Dorset, but its easternmost section, including St. Leonards, is in the historic county of Hampshire. East Dorset district is a low-lying plain descending from the southerly slopes of Cranborne Chase, a chalk ridge to the northwest. Dairy cattle and cereals are raised on the generally fertile soils of Cranborne Chase; the infertile sand-and-clay terrain farther southeast is given over to rough pasturage, heath, or woodland. Residential growth, extending north from Bournemouth and Poole onto the heathland of the extreme east and south, has occurred at West Moors, Ferndown, and farther west at the old parish (town) of Wimborne Minster, the district seat. The Badbury Rings 4 miles (6 km) northwest of the town are an ancient Iron Age fortification consisting of three concentric trenches that enclose a wooded hilltop. The Romans evidently used the rings as a juncture point for their road system. Area 137 square miles (355 square km). Pop. (1998 est.) 82,800.

East Dunbartonshire, council area, west-central Scotland. East Dunbartonshire's largest towns, Bearsden and Milngavie in the southwest and Kirkintilloch in the southeast, lie within the historic county of Dunbartonshire. The council area also includes a small area in the south around the town of Bishopbriggs in the historic county of Lanarkshire and a more extensive area in the northeast that belongs to the historic county of Stirlingshire, including Lennox Forest and the Campsie Fells.

The lowland area in the south of East Dunbartonshire consists mainly of residential suburbs of Glasgow. The north is a largely rural upland, including portions of the Kilpatrick Hills and the Campsie Fells. Agriculture is the principal economic activity in the north. Area 78 square miles (202 square km). Pop. (1999 est.) 110,690.

East End, traditional area of London, lying east of Shoreditch High Street, Houndsditch, Aldgate High Street, and Tower Bridge Approach. It extends eastward to the River Lea and lies mainly in the Inner London borough of Tower Hamlets, part of the historic county of Middlesex. In the Middle Ages the East End was part of the great parish of Stepney. The East End has long been known for its immigrant populations and its poverty, and in 1888 it gained notoriety for the Whitechapel Murders attributed to Jack the Ripper. Until the mid-20th century, the local economy depended largely on the London Docklands; major sources of income now include services and light manufacturing.

The area underwent considerable reconstruction following the air raids of World War II. Points of interest include historic Toynbee Hall, the Whitechapel Art Gallery, Spitalfields Market, and Petticoat Lane Market.

East Falkland, one of the two major islands of the Falkland Islands in the South Atlantic Ocean. It is 90 miles (140 km) long and 55 miles (88 km) wide and rises to Mount Usborne (2,312 feet [705 m]). The total area is

2,550 square miles (6,605 square km), excluding adjacent small islands. The town of Stanley is on the northeast shore. Pop. (1996) 2,352.

East Flanders, Flemish OOST-VLAANDEREN, French FLANDRE ORIENTALE, *province*, northwestern Belgium, extending southward from the Netherlands border. Drained by the Leie, Schelde (Escaut or Scheldt), and Dender (Dendre) rivers, it is divided into six administrative *arrondissements* (Aalst, Dendermonde, Eeklo, Ghent, Oudenaarde, and Sint-Niklaas). It was formerly part of the old county of Flanders, other parts of which are contained in West Flanders *province*, the French *département* of Nord, and the Dutch province of Zeeland. During the French Revolutionary and Napoleonic periods, it formed part of the *départements* of Lys and Scheldt.

An area of low hills, the *province* lies in interior Flanders, rising inland from the coastal plain. The soil is mixed sand and clay in the north, with more fertile alluvial clays in the south. In the northeast, to the west of the Schelde estuary, are the fertile reclaimed polderlands of the Waasland (Pays de Waes) region. Agriculture has been practiced intensively since the Middle Ages, much of it on a horticultural scale, for the holdings are small, particularly in the south. Ornamental plants and flowers are grown for export around Ghent; rye, potatoes, and vegetables are cultivated in the north. The Waasland supports market gardening, bush fruits, and dairy and poultry farms. The more fertile south produces wheat, oats, barley, flax, hops, chicory, sugar beets, and tobacco. Fodder crops and cattle and pig raising are widespread.

A textile region since the Middle Ages, inland Flanders has also long had a flourishing industrial and commercial economy. Cotton has replaced wool and linen as the most important textile product; other textiles (jute, rayon, and nylon) also are produced. The chief centre is Ghent (the capital), which accounts for much of the country's textile production. Other textile towns include Deinze, Ronse, Oudenaarde, Geraardsbergen, Aalst, Ninove, and Dendermonde, many of which also have metallurgical, chemical, food-processing, and leather industries. Sint-Niklaas and Eeklo are busy market towns. The *province* is well served by road and rail communications. Canals link Ghent with Brugge (Bruges), Ostend, and Terneuzen (Netherlands), and the rivers carry a heavy traffic.

Flemish-speaking East Flanders is one of Europe's most densely settled areas. Area 1,151 square miles (2,982 square km). Pop. (1999 est.) 1,359,702.

East Friesland, German OSTERFRIESLAND, cultural region bordering the North Sea and encompassing the coastal marshlands and East Frisian Islands (Ostfriesische Inseln) of northwestern Lower Saxony *Land* (state), north-central Germany. The region has close cultural ties with West Friesland in The Netherlands and North Friesland on the west coast of the Jutland Peninsula. The Frisians, traditionally known as a Germanic seafaring and commercial people, migrated to northern Germany from the Holland coast in the 12th century AD. The use of the old Frisian language, a dialect closely related to English, is diminishing in East Friesland; it is spoken only in a few small rural pockets, among these the marshy Saterland region west of Oldenburg. East Friesland is predominantly Protestant.

The modern economy is based on cattle farming and related dairy and meat industries. Farms tend to be localized on raised mounds (Würten), where early inhabitants were forced to build for protection against flooding, or the

farms are situated in linear strings (Marschufendörfer) along dikes and canals with their fields extending at right angles in long, narrow strips. The traditional single-story Frisian house is especially adapted to cattle farming. One vast, steeply sloping roof shelters the *Diele*, a large central threshing floor, and the living quarters and stables grouped around it. The *Diele* is entered at the gable end of the building.

East Galloway (Scotland): *see* Kirkcudbright.

East Germany, formally GERMAN DEMOCRATIC REPUBLIC, German OSTDEUTSCHLAND, or DEUTSCHE DEMOKRATISCHE REPUBLIK, European state (1945–90) that now constitutes the eastern portion of the Federal Republic of Germany. *See* Germany.

East Greenland Current, cold flow of water originating in the Arctic Ocean and flowing southward and southwestward along the east coast of Greenland. *See* Greenland Current.

East Greenland orogen, also called EAST GREENLAND GEOSYNCLINE, a linear orogenic (mountain) belt that developed from late Precambrian time to the middle Paleozoic Era (about 650 to 350 million years ago) along a portion of the eastern coast of Greenland. Deformation occurred during several phases of the Caledonian orogeny (mountain-building episode) between Late Silurian and Late Devonian times (roughly 421 to 360 million years ago). The deformation resulted in folding, westward thrusting, and development of angular unconformities beneath and within Devonian sedimentary rocks and was accompanied by the intrusion of Silurian and Devonian granites.

The East Greenland orogen represents the west flank of the Caledonian orogenic belt, the remainder of which is now exposed along the northwest coast of Norway and in northern Britain and Ireland.

East Greenwich, town (township), Kent county, central Rhode Island, U.S., on Greenwich Bay, south of Providence city. It was settled and incorporated as a town in 1677, following King Philip's (Indian) War. Called Dedford in 1686–89, it was renamed for Greenwich, Eng. Farming, fishing, pottery making, and tanning were early industries. During the American Revolution, the home of William Greene, governor of Rhode Island, served as the capitol; built in 1680 by Samuel Gorton, Jr., it was enlarged by Greene and is preserved. Notable buildings include General James Varnum's house (1773; restored with period furniture), the Town Hall (formerly Kent County Courthouse; 1804), and Windmill Cottage (1818), which was the subject of a poem by Henry Wadsworth Longfellow. Once the textile industry was important; manufactures now include electric and electronic machinery. Pop. (2000) 12,948.

To make the best use of the Britannica, consult the INDEX first

East Grinstead, town ("parish"), Mid Sussex district, administrative county of West Sussex, historic county of Sussex, England, lying south of London in the wooded countryside of the Weald. Its market charter dates to 1121, and the town centre contains old buildings, as well as modern shops that serve an extensive residential district. The Queen Victoria Hospital (founded 1889) became, after 1939, a world-renowned centre for plastic surgery. At nearby New Chapel, the first Mormon temple in Great Britain was completed in 1958. Pop. (1991) 27,058.

East Hampshire, district, administrative and historic county of Hampshire, southern England. The district, a rural area of chalk up-

lands, is where the most westerly extensions of the North Downs, Weald, and South Downs generally merge. The terrain, at elevations of 600 to 800 feet (180 to 240 m), is undulating with interspersed scarps and valleys.

The district's two principal parishes (towns), Alton and Petersfield (the district seat), have many important historical sites. Alton, in the north, is situated on the Pilgrims' Way (a prehistoric route between the English Channel and the chalk heartland of Britain). The novelist Jane Austen was born immediately to the southwest. Historic landmarks of Petersfield, in the southern part of the district, include a Norman church, Georgian houses, and an equestrian statue (1724) of William III (1650–1702). The village of Selborne was the home of Gilbert White (1720–93), the naturalist who wrote *The Natural History and Antiquities of Selborne*, the first work on natural history to attain the status of an English classic. Agriculture (the raising of vegetables, fruits, and hops) supplemented by dairy farming is the main economic activity in the district. Brewing industries operate in Alton and Horndean. Area 199 square miles (515 square km). Pop. (1998 est.) 111,300.

East Hampton, town (township), Suffolk county, southeastern New York, U.S. It lies on the southern shore of Long Island, 100 miles (161 km) east of New York City, and includes East Hampton village and Gardiners Island. Settled in 1648 by English yeomen from Kent and first called Maidstone, the town prospered as a whaling and fishing centre. Several colonial homes have survived. Lyman Beecher, father of the orator and preacher Henry Ward Beecher and Harriet Beecher Stowe (author of *Uncle Tom's Cabin*), was pastor (1799–1810) of the town's Presbyterian church. East Hampton village is now a fashionable summer resort. Historic buildings include the boyhood home (a colonial saltbox [c. 1680] with an old windmill [1804], now a museum) of John Howard Payne (1791–1852), who wrote "Home, Sweet Home"; Hook Mill, a windmill built in 1806; and Clinton Academy (1784), the first academy chartered by the state of New York. Inc. 1920. Pop. (2000) 19,719.

East Hartford, urban town (township), Hartford county, central Connecticut, U.S., across the Connecticut River from Hartford. The area, called Podunk by the Indians, was first settled in 1639 by John Crow. Organized as a parish in 1746 and originally part of Hartford, it was incorporated as a separate town in 1783 and experienced early industrial development (papermaking and the manufacture of gunpowder, glass, cotton goods, hats, and watches). Its area was reduced in 1823 when Manchester was separately incorporated. It now includes the villages of Hockanum and Burnside and is heavily industrialized. East Hartford is the location of the corporate headquarters of Pratt & Whitney, a major manufacturer of airplane engines. Pop. (2000) 49,575.

East Haven, urban town (township), New Haven county, southern Connecticut, U.S., on Long Island Sound just east of New Haven and separated from Branford (east) by Lake Saltonstall (about 3 miles [5 km] long). Originally a part of New Haven called Iron Works Village (because of the furnace established there in 1655 to process bog iron ore), it was renamed East Haven in 1707 and was incorporated as a separate town in 1785. It then included the entire eastern shore of New Haven Harbor and was primarily an agricultural community. In the 1880s its western portion was rejoined to New Haven, and so today East Haven consists of a narrow strip of land (7 miles [11 km] long and 1.5 miles [2.4 km] wide) extending inland with some tidal marshes along a limited coastal plain. Agriculture and truck gardening remain significant activi-

ties, but some light manufacturing has developed. East Haven has several colonial houses, and its Old Stone Congregational Church (1774) was built from local red sandstone. The Shore Line Trolley Museum displays electric street and interurban railway cars. Pop. (2000) 28,189.

East Hertfordshire, district, administrative and historic county of Hertfordshire, south-eastern England, at the northern edge of the Greater London Green Belt.

East Hertfordshire district is largely undulating and rural, characterized by medieval manor houses and thatched cottages. The River Lea, navigable to barge traffic from the London docks to the town of Hertford, drains the southwestern part of the district, and the River Stort forms the southeastern boundary before joining the Lea at the district's southern tip. Cereals are cultivated in the fertile northern and central parts, where the soil consists of unstratified glacial drift. Farther south the less-fertile heavy clays are used primarily as grazing land for dairy cows. There has been extensive residential development along the district's southern edge in towns such as Hertford, Ware, Hoddesdon, and Bishop's Stortford, which lie within commuting distance of London and its periphery.

The first English canal, the New River aqueduct, 23 miles (40 km) long, was built in 1613 from springs southeast of the town of Ware in the southern part of the district to Stoke Newington and Hornsey in North London to augment London's water supply; it is still in use, even though the Ware vicinity is no longer the source of the water. Malt breweries utilizing locally grown grain are located in Ware, Bishop's Stortford, and Sawbridgeworth. Other industries in the district include brush making, printing, and light manufacturing. Hertford is the administrative seat for the county of Hertfordshire but shares district administration with Bishop's Stortford. The Rhodes Memorial Museum (founded 1938) at Bishop's Stortford commemorates the life of Cecil Rhodes, the empire builder of British South Africa. Area 185 square miles (478 square km). Pop. (1998 est.) 127,100.

East India Company, also called ENGLISH EAST INDIA COMPANY, formally (1600–1708) GOVERNOR AND COMPANY OF MERCHANTS OF LONDON TRADING INTO THE EAST INDIES, or (1708–1873) UNITED COMPANY OF MERCHANTS OF ENGLAND TRADING TO THE EAST INDIES, English company formed for the exploitation of trade with East and Southeast Asia and India, incorporated by royal charter on Dec. 31, 1600. Starting as a monopolistic trading body, the company became involved in politics and acted as an agent of British imperialism in India from the early 18th century to the mid-19th century. In addition, the activities of the company in China in the 19th century served as a catalyst for the expansion of British influence there.

The company was formed to share in the East Indian spice trade. This trade had been a monopoly of Spain and Portugal until the defeat of the Spanish Armada (1588) by England gave the English the chance to break the monopoly. Until 1612 the company conducted separate voyages, separately subscribed. There were temporary joint stocks until 1657, when a permanent joint stock was raised.

The company met with opposition from the Dutch in the Dutch East Indies (now Indonesia) and the Portuguese. The Dutch virtually excluded company members from the East Indies after the Amboina Massacre (*q.v.*) in 1623 (an incident in which English, Japanese, and Portuguese traders were executed by Dutch authorities), but the company's defeat of the Portuguese in India (1612) won them trading concessions from the Mughal Empire. The company settled down to a trade in cotton and silk piece goods, indigo, and saltpetre, with

spices from South India. It extended its activities to the Persian Gulf, Southeast Asia, and East Asia.

After the mid-18th century the cotton-goods trade declined, while tea became an important import from China. Beginning in the early 19th century, the company financed the tea trade with illegal opium exports to China. Chinese opposition to this trade precipitated the first Opium War (1839–42), which resulted in a Chinese defeat and the expansion of British trading privileges; a second conflict, often called the "Arrow" War (1856–60), brought increased trading rights for Europeans.

The original company faced opposition to its monopoly, which led to the establishment of a rival company and the fusion (1708) of the two as the United Company of Merchants of England trading to the East Indies. The United Company was organized into a court of 24 directors who worked through committees and who were elected annually by the Court of Proprietors, or shareholders. When the company acquired control of Bengal in 1757, Indian policy was until 1773 influenced by shareholders' meetings, where votes could be bought by the purchase of shares. This led to government intervention. The Regulating Act (1773) and Pitt's India Act (1784) established government control of political policy through a regulatory board responsible to Parliament. Thereafter, the company gradually lost both commercial and political control. Its commercial monopoly was broken in 1813, and from 1834 it was merely a managing agency for the British government of India. It was deprived of this after the Indian Mutiny (1857), and it ceased to exist as a legal entity in 1873.

East Indiaman, large sailing vessel of the type built from the 16th to the 19th century for the trade between Europe and southern Asia. The first were Portuguese and Dutch; English Indiamen appeared late in the 16th century and eventually came to dominate the trade. The ships varied in size from about 400 to 1,500 tons and more; often they were larger than contemporary men-of-war. They were three-masted and invariably well armed for protection against piracy.

East Indies, the islands that extend in a wide belt along both sides of the Equator for more than 3,800 miles (6,100 km) between the Asian mainland to the north and west and Australia to the south. Historically, the term East Indies is loosely applied to any of three contexts. The most restrictive and best-known use is as a synonym for the islands that now constitute the Republic of Indonesia (formerly known as the Netherlands Indies, or Dutch East Indies); these include the Greater Sunda Islands (Borneo, Celebes, Java, and Sumatra), the Lesser Sunda Islands (stretching eastward from Bali to Timor), the Moluccas, and New Guinea (including Papua New Guinea on the eastern half of the island). In a second, larger sense, East Indies refers to the Malay Archipelago (including the Philippines), which now is more commonly called insular (or archipelagic) Southeast Asia. Finally, in its broadest context, the term East Indies encompasses the foregoing plus all of mainland Southeast Asia and India.

East Java (Indonesia): *see* Jawa Timur.

East Kazakhstan (Kazakhstan): *see* Vostochno-Kazakhstan.

East Kilbride, former district (1975–96) of the former region of Strathclyde, Scotland. East Kilbride is now incorporated in the unitary council area of South Lanarkshire (*q.v.*).

East Kilbride, burgh (town), South Lanarkshire council area, historic county of Lanarkshire, Scotland. It was Scotland's first post-World War II planned new town, built around the old pastoral village of East Kilbride to accommodate residential and commercial

growth from nearby Glasgow. The name suggests early Celtic association with St. Bride (Brigit). Industries include food processing, light engineering, and the manufacture of a variety of consumer goods. The National Engineering Laboratory is located there. Pop. (1991) 70,422.

East Lansing, residential and university city, Ingham county, south-central Michigan, U.S., on the Red Cedar River. The site was a remote area east of Lansing when Michigan State University, a pioneer land-grant school, was founded there as Michigan Agricultural College in 1855. First known as Collegeville, the city was redesignated East Lansing by the state legislature at the time of its incorporation in 1907. It now adjoins the state capital of Lansing. Pop. (2000) city, 46,525; Lansing–East Lansing MSA, 447,728.

East Lindsey, district, administrative and historic county of Lincolnshire, east-central England, along the North Sea in the eastern part of the county. East Lindsey's most significant physiographic component is the chalk upland of the Wolds, about 10 miles (16 km) wide and 500 feet (150 metres) high, in the north and centre of the district. To the west lies a fertile clay valley, and south of the Wolds is a section of the Fens (an extensive area of reclaimed peat and silt marshland); to the east lie the Lincoln Marshes, a flat plain interspersed with islands of fertile, unstratified glacial drift. The elevation of both the Fens and the Lincoln Marshes is only slightly above sea level, and embankments are necessary along the North Sea coast to prevent flooding. Sandy shores along the seaward side have given rise to holiday resorts at Skegness and Mablethorpe. The extremely arable soil in the mainly rural district allows a variety of crops to be grown, including wheat, barley, potatoes, and vegetables. Dairy cattle are grazed, especially in the valley to the west. Louth, the administrative headquarters and a light industrial centre at the eastern edge of the uplands, is dominated by the spectacular Perpendicular Gothic spire of its Church of St. James. Horncastle, in the western valley, was formerly known for its horse fairs. The poet Alfred, Lord Tennyson spent his childhood in the village of Somersby, in the upland area of open country east of Horncastle. Area 680 square miles (1,762 square km). Pop. (1998 est.) 124,800.

East Liverpool, city, Columbiana county, eastern Ohio, U.S. It lies along the Ohio River (there bridged to Newell and Chester, W.Va.), at a point where Ohio, Pennsylvania, and West Virginia meet. Founded in 1798 by Thomas Fawcett, an Irish Quaker, it was originally called St. Clair and then Fawcettstown. After it became a village in 1834, it was renamed for Liverpool, Eng. The city is known for its porcelain and pottery industry, which was established in 1840 to exploit local clay deposits. The construction of the New Cumberland Locks and Dam at Stratton, a few miles downstream, and its nearness to Great Lakes ports and highways make the city an important river terminal. A branch (1965) of Kent State University is in East Liverpool. Inc. city, 1882. Pop. (2000) 13,089.

East London, Afrikaans OOS-LONDEN, port city, Eastern Cape province, South Africa. It lies at the mouth of the Buffalo River along the Indian Ocean.

Buffalo Harbour, first visited by the British in 1836 and named Port Rex, was used as a supply base during the seventh Cape Frontier (Kaffir) War (1846). The next year, Fort Glamorgan (now a prison) was built, and the site was annexed to Cape Colony as the Port of East London. It prospered after the arrival

of German settlers in the late 1850s, becoming a town in 1873 and a city in 1914.

The city has beach resort facilities. Built mainly on the east bank of the river, it has wide straight streets and gardens. It is a terminus of the South African Railways line servicing the Orange Free State goldfields. There is a considerable fishing industry, and manufactures are diversified. The East London Museum (established 1921) has a noteworthy natural history collection. Pop. (1985) 85,699.

East Lothian, council area and historic county, southeastern Scotland. It lies on the southern coast of the Firth of Forth east of Edinburgh. Much of East Lothian is an undulating coastal lowland, but it extends inland to include part of the upland moors of the Lammermuir Hills. The council area and historic county occupy slightly different areas. A section of the Lammermuir Hills in the southeast belongs to the historic county of East Lothian but forms part of the Scottish Borders council area. In the west the area around Musselburgh is part of East Lothian council area but belongs to the historic county of Midlothian.

In the Middle Ages East Lothian (frequently called Haddingtonshire until the 20th century) formed part of the larger region known as Lothian. It lay in the path of the English invaders and suffered much destruction during the 14th, 15th, and 16th centuries. In this period the feudal castles of Dirleton, Tantallon, and Hailes were built. There were also nunneries at Haddington and North Berwick, friaries at Haddington, Luffness, and Dunbar, and the holy well at Whitekirk, a place of pilgrimage. The Protestant leader and theologian John Knox was a native of East Lothian, and its people turned to the Reformed church during the 16th century. The last battles fought in the county were those of Dunbar (1650) and Prestonpans (1745).

Conditions were more settled in the 18th century, and there was further development of agriculture. The land was enclosed and drained, industries developed, and woods were planted. The old settlements of group holdings gave way to centralized farms. Some new villages were established (Gifford in 1722 and Ormiston in 1732, both of which are of architectural interest), and Haddington and Dunbar developed as market towns.

Farming reached the height of prosperity in the 1870s. In the last years of the 19th century, golfing and holiday facilities were developed at North Berwick, Gullane, and Dunbar.

East Lothian's manufacturing now consists mainly of food processing, precision engineering, and electronics. Musselburgh and other towns in the west are residential suburbs of Edinburgh. Haddington is the administrative centre. Area 263 square miles (681 square km). Pop. (1999 est.) 90,430.

East Malaysia, wing of the 13-state federation of Malaysia; it consists of the states of Sabah and Sarawak on the northern part of the island of Borneo and is separated from mainland Peninsular, or West, Malaysia on the Malay Peninsula by some 400 miles (640 km) of the South China Sea. Pop. (1991 prelim.) 3,385,119.

East Moline, city, Rock Island county, northwestern Illinois, U.S., on the Mississippi River. With Moline and Rock Island, Ill., and Davenport and Bettendorf, Iowa, it forms a complex known as the Quad Cities. Originally called Port Byron Junction, it was settled in 1895 and developed as a centre of manufacture of farm implements, particularly combines. This industry remains central to the city's economy. Also produced are aluminum and industrial coatings; food processing and the nearby Rock Island Arsenal are important.

At Campbell's Island State Memorial an obelisk marks the site of a battle (1814) between troops led by Lieutenant John Campbell and Sauk and Fox Indians under Chief Black Hawk. Inc. 1907. Pop. (2000) 20,333.

East Northamptonshire, district, administrative and historic county of Northamptonshire, south-central England, in the north-eastern part of the county. The district is rural and agricultural in character except in the extreme south. It is covered with fertile glacial drift, and the gently rolling clay hills 200 to 300 feet (60 to 90 m) in elevation are bisected north-south for the length of the district by the River Nene. The four manufacturing towns at its southern end (Rushden, Irthlingborough, Higham Ferrers, and Raunds) grew as a result of the early development of leather-tanning and shoe-manufacturing industries, in association with such other nearby centres as Northampton. The contemporary economy of these locales, however, has become increasingly diversified and includes assorted light industries.

The two parishes (towns) of Oundle and Thrapston, farther north in the Nene valley, serve as local market centres for adjacent stone-built villages in this mixed-farming area. Remnants of the Rockingham Forest, a former royal hunting preserve, are in the western part of the district. Thrapston is the administrative centre. Area 197 square miles (510 square km). Pop. (1998 est.) 73,500.

East Nusa Tenggara (Indonesia): *see* Nusa Tenggara Timur.

East Orange, city, Essex county, northeastern New Jersey, U.S., adjoining Newark on the northwest. Originally settled in 1678 by 30 families from Newark, it was set off from Orange township and established as a municipality in 1863. Mainly a residential suburb, it nevertheless has an industrial section, which has been called Ampere since F.B. Crocker and S.S. Wheeler began manufacturing electric motors there in the 1890s. Other manufactures include signs, chemicals, and plastics. It is home to Upsala College (1893). Inc. 1899. Pop. (2000) 69,824.

East Pacific Rise, submarine linear mountain range on the floor of the South Pacific Ocean, roughly paralleling the west coast of South America.

The main portion of the rise lies generally about 2,000 miles (3,200 km) off the coast. Its northernmost outliers extend as far north as the mouth of the Gulf of California, where it joins the transform zone of the Pacific-North American Plate boundary. From its southernmost point, near about 55° S latitude and 130° W longitude, it continues in a west-southwesterly direction as the Pacific-Antarctic Ridge to near Antarctica south of New Zealand. The surface of the East Pacific Rise is generally smooth and flattish, and it drops sharply away at the sides. Its structure is largely of basic igneous crust, overlain or abutted by more or less flat-lying sediments. It rises from approximately 6,000 to 9,000 feet (1,800 to 2,700 m) above the surrounding seafloor and is extensively fractured by faults mostly occurring at intervals of roughly 200 miles (320 km).

The East Pacific Rise and its associated features to the north and southwest form the eastern and southern boundaries of the Pacific Plate, where it abuts (from north to south) the North American, Cocos, Nazca, and Antarctic plates. The crest of the East Pacific Rise is a centre of seafloor spreading; *i.e.*, new oceanic crust in the form of basaltic lava is welling up along the crest, cooling, and moving away from the crest in either direction. Offshore from Chile and Peru the rate of spreading is about 6.3 inches (16 cm) per year, one of the most rapid rates on Earth, though it decreases to about 2.4 inches (6 cm) at the mouth of the

Gulf of California. Associated with this volcanic activity are a number of hydrothermal vents, upwellings of heated seawater that often carry a variety of sulfide minerals. These vents support organisms that exist through chemosynthesis by sulfur-fixing bacteria.

East Point, city, Fulton county, northwestern Georgia, U.S., a southwestern suburb of Atlanta. Established as the eastern terminus for the Atlanta and West Point Railroad (completed 1853), it was an important defense post for the South during the American Civil War and was the site of forts and ammunition depots. Now industrialized, its manufactures include textiles, fertilizer, and metal products. Inc. 1887. Pop. (2000) 39,595.

East Providence, city, Providence county, eastern Rhode Island, U.S., on the eastern side of the Seekonk and Providence rivers, opposite Providence city. The site was long occupied by Wampanoag Indians before Roger Williams, the founder of Rhode Island colony, established himself there in 1636; he left at the request of Plymouth colony. About 1644 it was settled by a company from Weymouth as part of the Massachusetts town (township) of Rehoboth. In 1812 the western part of Rehoboth was set off as the township of Seekonk. It was subsequently decided that western Seekonk belonged to Rhode Island, and that part was incorporated as the township of East Providence in 1862. City status was attained in 1958. Although it is primarily residential, the city has industries, notably jewelry making and the manufacture of machinery. Pop. (2000) 48,688.

East Prussia, German OSTPREUSSEN, former German province bounded, between World Wars I and II, north by the Baltic Sea, east by Lithuania, and south and west by Poland and the free city of Danzig (now Gdańsk, Pol.). After World War II its territory was divided between the Soviet Union and Poland.

The name Prussia is linguistically of Baltic origin; its ancient inhabitants, exterminated by the Knights of the Teutonic Order, called themselves Prusi. When the Knights conquered the Polish province of Pomorze (Pomerania) in 1308, the name Prussia was extended westward to the whole territory administered by the Teutonic Order. In 1466 Poland recovered Pomorze; and, between that date and 1701 (when the elector of Brandenburg became king in Prussia), the country held directly by the crown of Poland was called Royal Prussia, to distinguish it from the land retained by the Knights as Poland's vassals. The latter became a secular duchy (Ducal Prussia) in 1525 and was freed from Polish suzerainty by the Treaty of Wehlau (1657). From 1815 the name East Prussia was given to the easternmost province of the kingdom of Prussia. The boundaries of this province remained unchanged until World War I. Its area was then 14,284 square miles (36,995 square km), and its population in 1910 was 2,064,175 and largely Lutheran. It had long since become a stronghold of Prussian Junkers, a military aristocracy who had vast estates there.

As a result of the Treaty of Versailles (1919), the Memel (Klaipėda) territory was taken from Germany (in 1924 it was incorporated into Lithuania); the district of Soldau (Działdowo) was given to Poland, while the regency of Marienwerder (Kwidzyn), which was formerly part of the province of West Prussia, joined East Prussia, now territorially separated from the rest of Germany by the Polish Corridor and Danzig.

After World War II, East Prussia was partitioned between Poland (the southern part) and the Soviet Union (the northern part), the frontier running north of Goldap, Bartenstein (Bartoszyce), and Braunsberg (Braniewo). With the exception of the Klaipėda territory, which was reincorporated into Lithuania, the

Post-World War I and post-World War II boundary changes of the area of former East Prussia and its major towns

northern part was incorporated into the Russian federation and colonized by Russians. Königsberg became Kaliningrad, Insterburg became Chernyakhovsk, and Tilsit became Sovetsk. In the southern part about 400,000 indigenous Poles remained, and immigrants from pre-1939 Poland replaced the Germans, who either had fled in 1944 or were expelled after the war ended.

East Rājasthān Uplands, highlands in southeastern Rājasthān state, northwestern India, with an area of about 23,200 square miles (60,000 square km), east of the Arāvālī Range. The uplands range in elevation from 820 feet (250 m) in the northeast to 1,620 feet (495 m) in the southwest and form the northern part of the Central Highlands. The East Rājasthān Uplands, formed by past fluvial erosion and by geologically recent desert erosion, are bounded by the Indo-Gangetic Plain on the north, the Mālwa region on the south, the Madhya Bharat Plateau on the east, and the Arāvālī Range on the west. The uplands are wide and stony, with a sandy central region. The valleys between the hill ranges are wide and stretch for many miles; flattened hilltops form small plateaus. Teak, sal (*Shorea robusta*), and acacia trees and bamboo grow on the lower slopes of hills, and grasslands and pastures are found on the hilltops. The Banās River, rising in the eastern flank of the Arāvālī, is the main waterway in the highlands; the Kari, Kathari, and Bāngangā rivers flow eastward.

Agriculture provides the main occupation of the uplands population; cereals, pulses (legumes), oilseeds, cotton, peanuts (groundnuts), sugarcane, and tobacco are grown. Most industries in the region are cottage industries.

East Riding of Yorkshire, also known as North Humberside and East Yorkshire unitary authority and geographic county, historic county of Yorkshire, eastern England. It extends from the Yorkshire Wolds in the north to the River Humber in the south and from the North Sea in the east to the River Derwent in the west. The unitary authority is the largest in area in England.

The geographic county extends the unitary authority to include the neighbouring city and

unitary authority of Kingston upon Hull. The regions take their name from the East Riding, a division of the historic county of Yorkshire.

From their white cliffs at Flamborough Head, the Yorkshire Wolds rise inland to an elevation of nearly 800 feet (240 m), sweeping in a crescent west and south to the Humber at Brough. The Wolds gradually descend to the low plain of Holderness in the southeast and to the alluvial plain of the Rivers Derwent, Ouse, and Aire in the southwest. The plain of Holderness terminates in a line of unstable clay cliffs along the coast of the North Sea to the east. Several villages and their surrounding fields have been inundated by the North Sea since Roman times, and seawalls protect the coastal resorts of Hornsea and Withernsea. Sediment from the River Humber has silted up many small harbours, such as Hedon, that were tidal in medieval times. Silt deposits to the south, such as Sunk Island, have been reclaimed as farmland. Similarly, marshland in the southwest along the Rivers Derwent, Ouse, and Aire has been drained and converted to cropland.

The barren Wolds and waterlogged plains of the region were sparsely settled during the Middle Ages and served mainly as rough pasture for sheep. Wool exports assured the prosperity of Hull as a medieval port. Drainage and other improvements in the 18th century made the region one of the most agriculturally productive in England and attracted a larger farming population. The industrialization of Yorkshire and the East Midlands during the 19th century promoted the growth of Hull as the region's major seaport. Today it is the largest city in the region.

The unitary authority and much of the geographic county remain largely rural and agricultural. The area produces large crops of cereals, sugar beets, vegetables, and fodder and supports a high density of livestock. Most of the geographic county's population and employment, however, are concentrated in Hull and in its suburbs. The main industries of this urban area, besides shipping, include food processing and chemical production. The extraction and processing of North Sea gas and oil play an important role in the region's economy. A terminal at Easington receives natural

gas from offshore fields. Road access to the rest of England improved markedly in 1981 with the completion of the Humber Bridge; 4,626 feet (1,410 m) in length, it is the longest suspension bridge in the United Kingdom. Beverley is the administrative centre of the unitary authority. Area unitary authority, 933 square miles (2,416 square km); geographic county, 960 square miles (2,487 square km). Pop. (1998 est.) unitary authority, 312,800; geographic county, 574,600.

East River, navigable tidal strait linking Upper New York Bay with Long Island Sound, New York City, U.S. It separates Manhattan Island from Brooklyn and Queens. About 16 miles (26 km) long and 600–4,000 feet (200–1,200 m) wide, it connects with the Hudson River via the Harlem River and Spuyten Duyvil Creek at the north end of Manhattan Island. Roosevelt (formerly Welfare), Wards, Randalls, and Rikers islands are in the East River. The Brooklyn, Manhattan, Williamsburg, Queensboro, Triborough, Bronx-White-stone, and Throgs Neck highway bridges and the Hell Gate railroad bridge span it; vehicular, railroad, and subway tunnels also pass under it. Port facilities are on southern portions of the river.

East Saint Louis, city, St. Clair county, southwestern Illinois, U.S. It lies along the Mississippi River opposite St. Louis, Mo. A ferry station was established on the site about 1797, and in 1817 a village was laid out. Originally known as Illinoistown, in 1861 it was renamed East St. Louis. Barge traffic down the Mississippi, the arrival of the railroad (1855), and the building of the Eads Bridge (1874) helped the city develop as a transportation centre. Meatpacking became a major industry after the opening of the National Stock Yards (1873), and manufacturing industries began to arrive in large numbers. Labour problems led to a race riot in 1917. By the early 20th century the city's industrial activities included oil refining and the manufacture of aluminum, chemicals, pigments, steel products, glass, and building materials. East St. Louis began to suffer a decline after World War II. By the 1960s changes in the city's racial composition were accompanied by a loss of industry and population and economic impoverishment. The opening of a riverboat casino in 1993 helped bring employment. Cahokia Mounds State Historic Site is northeast. Inc. 1888. Pop. (2000) 31,542.

East Saint Louis Race Riot of 1917 (July 2), bloody outbreak of violence in East St. Louis, Ill., stemming specifically from the employment of black workers in a factory holding government contracts. It was the worst of many incidents of racial antagonism in the United States during World War I that were directed especially toward black Americans newly employed in war industries. In the riot, whites turned on blacks, indiscriminately stabbing, clubbing, and hanging them and driving 6,000 from their homes; 40 blacks and 8 whites were killed.

On July 28 the National Association for the Advancement of Colored People (NAACP) staged a silent parade down Fifth Avenue in New York City, protesting the riot and other acts of violence toward black Americans. German propaganda magnified these incidents in an attempt to arouse antiwar sentiment in the American black community, and President Woodrow Wilson publicly denounced mob violence and lynchings, of which there had been 54 in 1916 and 38 in 1917.

East Scotia Basin, submarine trough of the eastern Scotia Sea, a part of the South Atlantic Ocean southeast of Argentina. Its midpoint lies about 1,300 miles (2,000 km) east of Tierra

del Fuego; the basin extends about 700 miles (1,100 km) east-west and about 300 miles (500 km) north-south. Bounded by the island of South Georgia to the north and by the South Sandwich Islands to the east, East Scotia Basin has an average depth of 5,000 feet (1,500 m) and lies within the 2,700-mile- (4,340-kilometre-) long loop made by the Scotia Ridge that supports these islands. The Antarctic Circumpolar Current flows from west to east in the basin. East Scotia Basin is separated from West Scotia Basin by a minor submerged rise running between South Georgia and the South Orkney Islands. Most of the basin floor is covered by oozes made up of the skeletons of diatoms and foraminifera; in some areas, manganese nodules are found.

East Sea (Pacific Ocean): see Japan, Sea of.

East Siberian Sea, Russian VOSTOCHNO-SIBIRSKOYE MORE, part of the Arctic Ocean between the New Siberian Islands (west) and Wrangel Island (east). To the west it is connected to the Laptev Sea by the Dmitriya Lapteva, Eterikan, and Sannikov straits; to the east Long Strait connects it with the Chukchi Sea. The East Siberian Sea, with an area of 361,000 square miles (936,000 square km), is covered by ice much of the year. Its greatest depth is 510 feet (155 m), but it is as shallow as 30 to 65 feet (9 to 20 m) in the western and central parts. There are several island groups. Chief ports are Pevek, in the Chukchi autonomous *okrug* (district), and Ambarchik, in Sakha (Yakutia) republic; navigation is limited to August and September.

East Staffordshire, borough (district), administrative county of Staffordshire, central England. Nearly all of East Staffordshire lies within the historic county of Staffordshire. East Staffordshire is essentially a gently rolling rural borough lying between the industrial areas of Stafford to the west, Birmingham to the south, and Derby to the east and the coal-field region to the north. It is drained to the east by the Rivers Trent and Dove.

The borough is an area of mixed farming, especially dairying. Its administrative headquarters, Burton upon Trent, is one of England's leading brewing centres; the Bass Museum there illustrates the history of brewing from the 18th century and the influence of the pub on social life. Area 151 square miles (390 square km). Pop. (2001) 103,770.

East Sussex, administrative and geographic county of southeastern England, bordering the English Channel. The administrative county contains the following districts: Eastbourne and Hastings (both boroughs), and Lewes, Rother, and Wealden. The county's administrative centre is in the town of Lewes. The geographic county also includes the unitary authority of Brighton and Hove. The region lies within the historic county of Sussex.

A ridge of chalk hills, the South Downs, crosses the county along the coast, reaching the sea in a line of imposing cliffs, notably at Beachy Head. To the north of these hills, whose northern face forms an abrupt scarp line, lie the ridges of the Weald, an area of sands and clays widely covered by woodland and heath. In the southeast of the county, beyond Beachy Head, lie the reclaimed marshes of Pevensey Levels, historically an important point of entry into Britain for early invaders. A further line of cliffs lies along the coast eastward past Hastings.

Along the coast, Hove, Brighton, Peacehaven, Seaford, Eastbourne, Bexhill, and Hastings form an ever-lengthening line of resorts. All these towns lie within commuting range of London via electric-rail services.

The county boasts a wealth of architectural remains, including 12th- and 13th-century

castles, abbeys, and churches. Herstonceux Castle (c. 1440) housed Britain's Royal Greenwich Observatory between 1948 and 1990. Area geographic county, 699 square miles (1,810 square km); administrative county, 666 square miles (1,725 square km). Pop. (2001) geographic county, 740,144; administrative county, 492,324.

East Syrian rite (liturgies): see Chaldean rite.

East Timor (Southeast Asian territory): see Timor, East.

East-West Schism (Christianity): see 1054, Schism of.

East York, former borough (1967–98), southwestern Ontario, Can. In 1998 it was amalgamated with the cities of North York, Toronto, Scarborough, York, and Etobicoke to become the City of Toronto. A planned industrial and residential urban complex, East York was established on Jan. 1, 1967, through the amalgamation of East York Township (created in 1924 from York Township) and the town of Leaside (settled by James Lea in 1819 and incorporated in 1913). The two communities were first linked in 1927 by a viaduct over the Don River. Area 8 square miles (21 square km). Pop. (2001) 115,185.

East Yorkshire: see East Riding of Yorkshire.

Eastbourne, district and borough, administrative county of East Sussex, historic county of Sussex, England, on the English Channel coast. It lies at the eastern end of the chalk South Downs, which reach the sea in high cliffs at Beachy Head (534 feet [163 m]). The modern resort town of Eastbourne dates from the early 19th century and the coming of the railway. The town's development—in a spacious, regular layout—took place on the estates of the duke of Devonshire and others. The Wish Tower and the Redoubt are defenses dating from the Napoleonic threat of invasion. Eastbourne also has grown as an attractive residential town, as well as a resort and conference centre. Area 18 square miles (46 square km). Pop. (2001) 89,667.

Eastchester, town (township), Westchester county, southeastern New York, U.S., between Yonkers to the west and New Rochelle to the east. Its first settlers issued their own code of laws called the Eastchester Covenant (1665). Eastchester Township was organized in 1788 and derived its name from Chester, Eng., and at one time extended from Scarsdale to Goose Island in the Bronx. The township includes the unincorporated village of Eastchester and the villages of Bronxville (1898) and Tuckahoe (1903). Pop. (2003 est.) 31,530.

Easter, Latin PASCHA, Greek PASCHA, principal festival of the Christian church that celebrates the Resurrection of Jesus Christ on the third day after his Crucifixion. The earliest recorded observance of an Easter celebration comes from the 2nd century, though the commemoration of Jesus' Resurrection probably occurred earlier.

The English word Easter, which parallels the German word Ostern, is of uncertain origin. One view, expounded by St. Bede the Venerable in the 8th century, was that it derived from Eostre, or Eostræ, the Anglo-Saxon goddess of spring and fertility. This view pre-sumes—as does the view associating the origin of Christmas on December 25 with pagan celebrations of the winter equinox—that Christians appropriated pagan names and holidays for their festivals. Given the determination with which Christians combated all forms of paganism, this appears a rather dubious presumption. There is now consensus that the word derives from the Christian designation of Easter week as *in albis*, a Latin phrase that was understood as the plural of *alba* ("dawn") and became *eostarun* in Old

"Resurrection of Christ," oil on wood by Raphael, 1499–1502; in the Museu de Arte, São Paulo, Brazil

High German, the precursor of the modern German and English term. The Latin and Greek *pascha* ("Passover") provides the root for *Pâques*, the French word for Easter.

The date of Easter and its controversies. Fixing the date on which the Resurrection of Jesus was to be observed triggered a major controversy in early Christianity. The dispute was not resolved until the 8th century. In Asia Minor, Christians observed the day of the Crucifixion on the same day that Jews celebrated Passover—that is, on the 14th day of the first full moon of spring, 14 Nisan (see Jewish calendar). The Resurrection, then, was observed two days later, on 16 Nisan, regardless of the day of the week. In the West, the Resurrection of Jesus was celebrated on the first day of the week, Sunday, when Jesus had risen from the dead. Consequently, Easter was always celebrated on the first Sunday after the 14th day of the month of Nisan. Increasingly, the churches opted for the Sunday celebration, and the Quartodecimans ("14th day" proponents) remained a minority. The Council of Nicaea in 325 decreed that Easter should be observed on the first Sunday following the first full moon after the spring equinox (March 21). Easter, therefore, can fall on any Sunday between March 22 and April 25.

Eastern Orthodox churches use a slightly different calculation based on the Julian rather than the Gregorian calendar (which is 13 days ahead of the former), with the result that the Orthodox Easter celebration usually occurs later than the Protestant and Roman Catholic celebrations. Moreover, the Orthodox tradition prohibits Easter from being celebrated before or at the same time as Passover.

In the 20th century, attempts were made to arrive at a fixed date for Easter, with the Sunday following the second Saturday in April specifically proposed. While this proposal has some supporters, it has not been instituted.

Liturgical observances. In the Christian calendar, Easter follows Lent, the period of 40 days (not counting Sundays) before Easter, which traditionally is observed by acts of penance and fasting. Easter is immediately preceded by Holy Week, which includes Maundy Thursday, the commemoration of Jesus' Last Supper with his disciples; Good Friday, the day of his Crucifixion; and Holy Saturday, or Easter Saturday, the transition between Crucifixion and Resurrection. Liturgically, Easter comes after the Great Vigil, which was originally observed sometime between sunset on Holy Saturday and sunrise on Easter Sunday. Later it would be celebrated in

Western churches on Saturday evening, then on Saturday afternoon, and finally on Sunday morning. In 1955 the Roman Catholic church set the time for the vigil at 10:00 PM, which allowed for the Easter Mass to be celebrated after midnight. In the Orthodox traditions, the vigil continues to be an important liturgical event, while in Protestant churches it is little known.

By the 4th century, the Easter vigil was well established in various liturgical expressions. It was characterized by a spirit of joyful anticipation of the Resurrection and—because of the belief that Jesus' Second Coming would occur on Easter—of the return of Jesus. In the Roman Catholic tradition, the vigil has four parts: the celebration of lights, which focuses on the Easter candle; the service of lessons, which are called the prophecies; the administration of the sacrament of baptism; and the Easter mass. The use of the Easter candle—to denote the appearance of light out of darkness through the Resurrection—was first recorded in the year 384; by the 10th century it had gained general usage. The prominence of baptism at Easter goes back to early Christianity, probably the 4th century, when baptism was administered only once a year, at Easter. In the Roman Catholic service the priest blesses the water to be used in the forthcoming year for baptism, with the faithful taking some of that water with them to receive protection from vicissitudes. Lutheran and Anglican churches use variations of this vigil service.

All Christian traditions have their own special liturgical emphases for Easter. The Easter sunrise service, for example, is a distinctive Protestant observance in North America. The practice may derive from the Gospel narrative of Jesus' Resurrection, which states that Mary Magdalene went to the tomb "while it was still dark" (John 20:1) or as dawn was breaking (Matthew 28:1 and Luke 24:1). It is a service of jubilation that takes place as the sun rises to dispel the darkness.

Easter customs. Easter, like Christmas, has accumulated a great many traditions, some of which have little to do with the Christian celebration of the Resurrection but derive from folk customs. The custom of the Easter lamb appropriates both the appellation used for Jesus in Scripture ("behold the lamb of God which takes away the sins of the world," John 1:29) and the lamb's role as a sacrificial animal in ancient Israel. In antiquity, Christians placed lamb meat under the altar, had it blessed, and then ate it on Easter. Since the 12th century, the ending of Lent has been celebrated with meals on Easter including eggs, ham, cheeses, and bread that have been blessed for the occasion.

The use of painted and decorated Easter eggs was first recorded in the 13th century. The church prohibited the eating of eggs during Holy Week, but chickens continued to lay eggs during that period, and the notion of specially identifying those as "Holy Week" eggs brought about their decoration. The egg itself became a symbol of the Resurrection. Just as Jesus rose from the tomb, the egg symbolizes new life emerging. In the Orthodox tradition, eggs are painted red to symbolize the blood Jesus shed on the cross. In the United States, Easter egg hunts are popular among children. In 1878 Lucy Hayes, the wife of President Rutherford B. Hayes, sponsored the first annual Easter egg roll on the White House lawn.

The custom of associating a rabbit with Easter arose in Protestant areas in Europe in the 17th century but did not become common until the 19th century. The Easter rabbit was said to lay the eggs as well as decorate and hide them. In a way, this was a manifestation of the Protestant rejection of Catholic Easter customs. In some European countries, however, other animals—in Switzerland the cuckoo, in Westphalia the fox—were said to bring the Easter eggs. (H.J.H.)

Easter cactus (*Rhipsalidopsis gaertneri*), popular spring-flowering cactus of the family Castaceae, with flattened stems, grown for its bright-red blossoms that appear about Easter time in the Northern Hemisphere. The related *R. rosea* is the so-called dwarf Easter cactus, a diminutive plant with fragrant rose-pink flowers in abundance. A period of cool temperature (10° C; about 50° F) during winter is essential to bring on the best flower buds.

These epiphytic cacti—native to rainforests of Brazil—often are considered as the genus *Rhipsalis*; they were formerly grouped with *Schlumbergera* species, the Thanksgiving and Christmas cacti.

Easter Fracture Zone, submarine fracture zone in the Earth's surface, in the southeastern Pacific Ocean. The fracture zone is incompletely mapped but may be as long as 3,700 miles (5,900 km), extending east-southeastward from east of the Tuamotu archipelago, at 20° S latitude and 131° W longitude, to the Peru-Chile Trench at the 26° S latitude. The fracture zone is associated with several volcanic islands, including Easter Island, for which it was named. Maximum relief of the fracture zone's ridges and troughs is about 9,800 feet (3,000 m). The Peru Basin north of the lineament is about 13,000 feet (4,000 m) deep, several thousand feet deeper than the seafloor to the south.

The fracture zone intersects the East Pacific Rise, and the crest of the rise north of the fracture zone is several hundred miles west of the southern crest. Seismic activity along the fracture zone is limited to this offset, or transform fault. Seafloor spreading is believed responsible for the formation of the fracture zone, which is a scar produced by transform faulting.

Easter Island, Spanish ISLA DE PASCUA, also called RAPA NUI, island in the eastern Pacific Ocean, 2,200 miles (3,600 km) west of Chile. It is a province that is administratively part of Chile's Valparaiso region.

A brief treatment of Easter Island follows. For full treatment, see MACROPAEDIA: Pacific Islands.

Easter Island is small and hilly, formed by a series of separate underwater volcanic eruptions, and has an area of 63 square miles (163 square km). The island is mostly covered with grassland. The climate is subtropical, and farming is the traditional occupation. Its mixed population is predominantly of Polynesian ancestry; almost all live in the village of Hanga Roa on the sheltered western coast. Cattle are raised, and some sweet potatoes, sugarcane, figs, bananas, gourds, taro, corn (maize), and

potatoes are grown. Tourism, however, has become the mainstay of the economy. There is no natural harbour, but anchorages are found off the coasts of neighbouring islands. There are a commercial airport, with flights from Santiago, Chile, and several small hotels on the island, but horses and four-wheel-drive

Easter Island

vehicles are needed for local transport because of a lack of paved roads.

Initially inhabited about AD 400 by Polynesians from the Marquesas, Easter Island has long been famous for the *rongorongo* hieroglyphs and remarkable monolithic stone statues in human form. The statues, carved from tuff, a soft volcanic stone, range in height from 10 to 40 feet (3 to 12 m), some weighing more than 50 tons. The non-Polynesian vestiges on Easter Island have given rise to much speculation, but the most recent archaeological work indicates that most of the statues were erected in the Middle Period (AD 1000-1600) and that environmental degradation and fighting among the islanders (culminating in the Peruvian slave raids of 1862-63, in which about one-third of the population was carried off) brought precipitous decline to the island's fortunes. When a few of the abducted islanders were returned, they brought smallpox and tuberculosis, and the island suffered further severe depopulation and cultural decline. With the introduction of Christianity in the later 1860s, the surviving Polynesian traditions were forgotten.

The first European to see Easter Island was the Dutch admiral Jakob Roggeveen, in 1722. In 1888 the island was annexed by Chile, which leased nearly all its territory for sheep raising. Sheep ranching came to an end in the mid-1980s, and the island is now administered by a civilian governor. Chile has declared the

Ahu Akivi statues, Easter Island

entire island a historic monument. Pop. (1989 est.) 2,095.

Easter Rising, also called **EASTER REBELLION** (1916), republican insurrection in Ireland against British government there, which began on Easter Monday, April 24, 1916, in Dublin. The insurrection was planned by Patrick Pearse, Tom Clarke, and several other leaders of the Irish Republican Brotherhood, which was a revolutionary society within the nationalist organization called the Irish Volunteers; the latter had about 16,000 members and was armed with German weapons smuggled into the country in 1914. These two organizations were supplemented by the Irish Citizen Army, an association of Dublin workers formed after the failure of the general strike of 1913, and by the small Sinn Féin party.

The uprising was planned to be nationwide in scope, but a series of mishaps led to its being confined, in the event, to Dublin alone. The British had learned of the planned uprising, and on April 21 they arrested the Irish nationalist Sir Roger Casement in County Kerry for arms running for the rebels. Eoin MacNeill, the leader of the Irish Volunteers, therefore canceled mobilization orders for the insurgents, but Pearse and Clarke went ahead with about 1,560 Irish Volunteers and a 200-man contingent of the Citizen Army. On April 24 their forces seized the Dublin General Post Office and other strategic points in Dublin's city centre, and Pearse read aloud a proclamation announcing the birth of the Irish republic. British troops soon arrived to put down the rebellion, and for nearly a week Dublin was paralyzed by street fighting. British artillery bombardments and fires compelled Pearse and his colleagues to surrender on April 29.

Pearse and 14 other leaders of the rebellion were court-martialed and executed by the British authorities in the weeks that followed. Though the uprising itself had been unpopular with most of the Irish, these executions excited a wave of revulsion against the British authorities and turned the dead republican leaders into martyred heroes. The Irish government collapsed, and, from then until the establishment (Dec. 6, 1921) of the Irish Free State, the British made several attempts to govern, none of which was very successful. The Easter Rising heralded the end of British power in Ireland. Eamon De Valera, because he was the senior survivor of the rising, dated much of his personal popularity with the Irish people from the time of that event.

Easter Vigil: *see* Holy Saturday.

eastern Africa, region of the African continent, extending southward from the Horn of Africa through the former German and British territories of East Africa. As defined by *Encyclopaedia Britannica*, the region includes the modern countries of the Horn of Africa (Djibouti, Eritrea, Ethiopia, and Somalia) and the countries of East Africa (Kenya, Tanzania, and Uganda). Area 2,471,068 square miles (6,399,920 square km). Pop. (2005 est.) 277,707,800.

A brief treatment of the eastern African region follows. For full treatment, *see* MACROPAEDIA: Eastern Africa.

The land. Eastern Africa consists largely of plateaus and has most of the highest elevations in the continent. The two most striking highlands are in Ethiopia and Kenya, respectively, where large areas reach elevations of 6,500 to 10,000 feet (2,000 to 3,000 m). Twin parallel rift valleys that are part of the East African Rift System run through the region. The Eastern, or Great, Rift Valley extends from the Red Sea's junction with the Gulf of Aden southward across the highlands of Ethiopia and Kenya and continues on into Tanzania. The

Western Rift Valley curves along the western borders of Uganda and Tanzania. Between the two rift valleys lies a plateau that comprises most of Uganda and western Tanzania and includes Lake Victoria. The volcanic massif of Kilimanjaro, the highest mountain in Africa, reaches 19,340 feet (5,895 m) in northeastern Tanzania. The Horn of Africa, a major peninsular extension of the African mainland into the Arabian Sea, contains the vast lowland coastal plains of Somalia.

The climate of eastern Africa is generally tropical, though average temperatures tend to be reduced by the region's high elevations. Precipitation also is affected by varying elevation: Uganda, Tanzania, and western Kenya receive plentiful rainfall, while Somalia, eastern Ethiopia, and northeastern Kenya receive less than 10 inches (250 mm) annually.

The region's vegetation ranges from woodlands and grasslands in the wetter regions to thornbushes in semiarid areas. The grasslands of Tanzania and Kenya are renowned for their wildlife, in particular large migratory herds of ungulates (*e.g.*, gnus, zebras, and gazelles) and predators (lions, hyenas, and leopards).

The people. Eastern Africa is populated by 160 different ethnic groups or more, depending on the method of counting. Most of the peoples of Ethiopia—and some of those in Tanzania and Kenya—speak languages belonging to the Cushitic branch of the Afro-Asiatic languages. Speakers of Nilo-Saharan languages populate Uganda and the rift valley portions of Kenya and Tanzania, while speakers of Bantu languages constitute much of the remainder of these nations' population.

The largest ethnic groups in eastern Africa are the Oromo, Cushitic speakers who occupy much of southern Ethiopia, and the related Somali, who occupy all of Somalia, southeastern Ethiopia, and much of Djibouti. The Afar are found in both Eritrea and Djibouti. The main ethnic groups of Eritrea, the Tigray and the Tigre, are speakers of Semitic languages. Both the Tigray and the Amhara, another Semitic-speaking group, dominate northwestern Ethiopia. The ethnic fabric in Kenya, Tanzania, and Uganda is much more fragmented, with many smaller peoples intermingled or occupying discrete territories. The largest numbers of Nilotic speakers belong to the Luo, Lango, Kalenjin, Masai, and Karamojong peoples, while the principal Bantu-speaking ethnic groups are the Kikuyu, Chaga, and Kamba.

The economy. The economies of the eastern African countries are based primarily on agriculture. Most of the population is directly engaged in subsistence farming or pastoralism. Corn (maize), cassava, potatoes, coffee, and tea are grown in Uganda and western Kenya and Tanzania. Cereals, tubers, and other vegetables are major crops in Eritrea and Ethiopia, and livestock raising is important. Rainfall is inadequate for crop cultivation in Somalia, Djibouti, and northeastern Kenya, and pastoralism (mainly camel raising) predominates. Lake Victoria and the lakes of the rift valleys support fishing communities.

Mineral resources include scattered gold finds and deposits of lead, copper, and iron ore and coal. Diamonds mined in northwestern Tanzania have been the most valuable of the region's minerals to be exploited. The bulk of exports consist of raw materials. Import-substitution manufacturing for local markets is concentrated in the cities. Roads are the main means of transport in most of the region. The best transportation facilities are found in Kenya and Tanzania. The major ports are Dar es Salaam (Tanzania), Mombasa (Kenya), and Djibouti city.

History. Bantu-speaking peoples immigrated to eastern Africa from western Africa beginning in the 1st millennium AD. Arabs dominated the coastal areas of Kenya and Tanzania (including the island of Zanzibar)

from the 7th century until the arrival of the Portuguese in the late 15th century. Toward the end of the 17th century, Nilo-Hamitic peoples began to move into northern Uganda and, later, into northern Kenya. The Portuguese lost their holdings north of the present-day border between Mozambique and Tanzania early in the 18th century because of an alliance between the coastal Arabs and the ruler of Oman. By the early 19th century, Arab traders were traveling farther inland in search of slaves and ivory. British and German explorers also began to penetrate the interior of East Africa in the 1850s and '60s. The Anglo-German Agreement of 1886 put the northern coastal strip (Kenya) under British influence and the southern coastal strip (Tanganyika) under German influence. Uganda came under British administration in 1890. Tanganyika gained independence in 1961 and in 1964 merged with Zanzibar to form Tanzania. Uganda gained its independence in 1962, and Kenya became fully independent in 1963.

In the Horn of Africa, Cushite peoples are thought to have occupied northern and central Ethiopia in the 2nd millennium BC. According to Egyptian hieroglyphic texts, the early Punt civilization also was established about that time. The Aksum empire emerged in Ethiopia in the 2nd century AD, and in the 4th century—under the ruler Ezana—the empire converted to Christianity. Islām penetrated the Horn of Africa in the 7th century from Arab trading posts established along the coasts of the Gulf of Aden and the Indian Ocean. By the 10th century, the area inland from the gulf was occupied by Somali nomads and, to the south and west of them, by pastoral Oromo peoples. In the 1880s Britain and Italy occupied different parts of Ethiopia and Somalia, and France took possession of Djibouti. The unification of modern Ethiopia was completed during the reign of Menilek II (1889–1913); Italy invaded the country in 1935, however, and occupied most of it until being expelled by the British in 1941. British Somaliland (north) and Italian Somaliland (south) were united in 1960 to become the independent Republic of Somalia, and Djibouti became independent in 1977. After protracted warfare, Eritrea won its independence from Ethiopia in 1993.

Eastern Air Lines, Inc., former American airline that served the northeastern and southeastern United States.

Founded by Harold Frederick Pitcairn (1897–1960) in 1928 as Pitcairn Aviation, Inc., the company was sold the following year and became Eastern Air Transport, one of the nearly four dozen divisions of North American Aviation, Inc. On March 29, 1938, it was incorporated as an independent company under its current name and sold for \$3,500,000 to the former World War I ace Edward V. Rickenbacker and some associates. Rickenbacker, having been general manager for Eastern from January 1935, became president (1938–59). The airline flourished over the years and, in the 1970s and early '80s, acquired a number of other airlines. Eastern had its major operations along the East Coast of the United States and flew many travelers from the northeastern states to Florida, the Caribbean, and South America.

By the mid-1980s Eastern began suffering financial reverses, and in 1986 the airline was taken over by Texas Air Corporation. Mismanagement continued, and in 1989 Eastern's profitable northeastern shuttle service was sold, a series of large-scale union strikes began, and the company went into bankruptcy. In 1990 a U.S. federal bankruptcy court removed control from Texas Air and appointed a trustee to run Eastern Air Lines. Despite these changes, Eastern was forced into liquidation in 1991.

Eastern Cape, province, south-central South Africa. It is bordered by Western Cape province to the west, Northern Cape province to the northwest, Free State province and Lesotho to the north, KwaZulu-Natal province to the northeast, and the Indian Ocean to the southeast and south. The eastern portion of the former Griqualand East (surrounding Umzimkulu) is now an exclave of Eastern Cape province located in southern KwaZulu-Natal province. Eastern Cape province was part of former Cape of Good Hope (*q.v.*) province until 1994. Bisho is the provincial capital.

Eastern Cape province is predominantly mountainous country. It includes the southern spur of the Drakensberg, rising to more than 9,000 feet (2,700 m) in the northeast, and descends southward from the great interior plateau (Highveld) of southern Africa to form a relatively narrow coastal plain along the Indian Ocean. Southwest of the Highveld and the Great Fish River, the topography is characterized by east-west-trending mountain ranges and valleys. East of the Great Fish River, including the lower valley of the Great Kei River, perennial streams have carved deep valleys on their way to the ocean. The province's natural vegetation is largely grassveld, with some forest on the coast west of Humansdorp. Mountain Zebra National Park is located west of Cradock.

The climate along the coast is subtropical, but it is mild at higher elevations to the north. Summers are hot, and snow falls in winter on the high northern mountains. The average annual precipitation increases from 14 inches (350 mm) near Graaff-Reinet in the west to more than 35 inches (900 mm) along the coast near East London in the east.

More than three-fourths of Eastern Cape's population are black, and they are predominantly speakers of Xhosa, a Nguni language. Persons of mixed race constitute about one-tenth of the total population; whites constitute an even smaller proportion. Afrikaans is spoken by about one-tenth of the population. Several other languages, including English, are also spoken.

The raising of livestock is carried on throughout Eastern Cape province. Wheat, corn (maize), and sorghum are grown inland with irrigation, while oranges, pineapples, tobacco, and potatoes are cultivated along the coast. Port Elizabeth and East London are manufacturing centres, where the production of motors and the canning of fruit and vegetables are important. There is also a variety of seaside resorts along the Indian Ocean. Grahamstown, Fort Hare (near Alice), and Port Elizabeth have universities. The seaports of East London and Port Elizabeth are connected by road and rail with Queenstown and Umtata to the northeast and Graaff-Reinet and Middelburg to the northwest. Area 65,475 square miles (169,580 square km). Pop. (2005 est.) 7,039,300.

Eastern Chin, a phase of the Chin dynasty, ruling China from AD 317 to 420 and forming one of the Six Dynasties. *See* Chin dynasty; Six Dynasties.

Eastern Desert, Arabic AŞ-SAĦRĀ' AŞ-SĦARQĪYAH, also called ARABIAN DESERT, large desert in eastern Egypt. Originating just southeast of the Nile River delta, it extends southeastward into northeastern Sudan and from the Nile River valley eastward to the Gulf of Suez and the Red Sea. It covers an area of about 85,690 square miles (221,940 square km).

The Eastern Desert consists of a rolling sandy highland that rises abruptly from the Nile valley and merges some 50 to 85 miles (80 to 137 km) east of the Nile into the Red Sea Hills, a series of rugged volcanic, north-south-trending mountain chains that reach a maximum height of 7,175 feet (2,187 m) at Mount Shāyib al-Banāt. The desert receives

occasional rainfall and is extensively dissected by wadis (dry beds of seasonal streams). Most of the sedentary population lives in small fishing, mining, or petroleum-extracting communities along the Red Sea coastal plain east of the Red Sea Hills. Nomadic desert dwellers live by herding and trading. The Eastern Desert, relatively isolated from the rest of Egypt, is rich in natural resources including Egypt's major oil fields (located both onshore and offshore in the Gulf of Suez) and deposits of phosphate, asbestos, manganese, uranium, and gold.

Eastern Indian bronze, also called PĀLA BRONZE, any of a style of metal sculptures produced from the 9th century onward in

A Buddhist divinity, Eastern Indian painting on palm leaf, c. 12th century; in a private collection
P. Chandra

the area of modern Bihār and West Bengal in India, extending into Bangladesh. They are sometimes referred to as Pāla bronzes, after the name of one of the reigning dynasties (Pāla and Sena, 8th–12th century AD). The principal centres of production were the great Buddhist monasteries at Nālandā (near modern Patna) and Kurkihar (near Bodh Gayā). Images were distributed throughout Southeast Asia, so that the style influenced Myanmar (Burma), Siam (modern Thailand), and Java. Its impact on the Buddhist art of Kashmir, Nepal, and Tibet also is clearly recognized.

The bronzes, strictly speaking, consisted of an alloy of eight metals and were cast by the lost-wax process. They represent the various

Eastern Indian bronze Buddha, c. 9th century AD; in the Nālandā Museum, Bihār, India
P. Chandra

divinities of later Buddhism (especially Śiva and Vishnu) and, being mainly small and portable in size, were intended for private worship. In style the metal images largely continued the Gupta tradition of Sārnāth but endowed it with a certain heavy sensuousness. They differ little stylistically from contemporary stone sculptures of the region but surpass them in the precise definition of ornamental detail and in a certain elegant virtuosity.

Eastern Indian painting, also called PĀLA PAINTING, school of painting that flourished in the 11th and 12th centuries in the area of what are modern Bihār and Bengal. Its alter-

native name, Pāla, derives from the name of the ruling dynasty of the period. The style is confined almost exclusively to conventional illustration on palm leaves of the life of the Buddha and Buddhist divinities.

The style disappeared from eastern India after the conquest of the area by the Muslims in the late 12th century, but many of its features were preserved in Nepal. The style also influenced the art of Tibet, to a lesser extent that of Myanmar (Burma), and possibly even that of Sri Lanka and Java. The widespread nature of the influence is partly explainable by the travel of pilgrims who visited the great Buddhist centres of eastern India and carried back to their homes portable icons such as paintings and small bronzes.

The paintings mostly depict the numerous deities evoked by later Buddhism and were used to aid in the evocation of the deities. They had, accordingly, to conform to the same strict iconographic rules used in the production of contemporary stone and bronze icons.

The narrow leaf of the palm determined the size of the miniatures, which were approximately 2.25 by 3 inches (6 by 8 cm). The leaves were threaded together and enclosed in wooden covers, which typically were painted.

Eastern Orthodoxy, official name ORTHODOX CATHOLIC CHURCH, one of the three major doctrinal and jurisdictional groups of Christianity, characterized by its continuity with the apostolic church, its liturgy, and its territorial churches. Eastern Orthodoxy follows the faith and practices that were defined by the first seven ecumenical councils. Its adherents live mainly in the Balkans, the Middle East, and Russia.

A brief treatment of Eastern Orthodoxy follows. For full treatment, *see* MACROPAEDIA: Eastern Orthodoxy.

Eastern Orthodoxy is embodied in a family of autonomous churches that recognize the titular headship of the patriarch of Con-

stantinople (the ecumenical patriarch) and are in communion with each other. Eastern Orthodoxy maintains the same seamless institutional continuity with the earliest Christian churches that Roman Catholicism does and recognizes the same sacraments. Cultural and political factors, not theological ones, caused the separation of the two communions. Culturally, the split between Western Christianity (Roman Catholicism and Protestantism) and Eastern Orthodoxy perpetuates the Roman Empire's division into a Western half, in which Latin was the dominant language, and an Eastern half, in which Greek was dominant among literate people.

From the 4th century onward these two halves drifted apart politically. The Roman Empire in the West succumbed to barbarian invasions in the 5th century. The pope, who had long enjoyed a primacy of honour in the entire church, then emerged as the heir to much of the vanished empire's authority. In the East the Roman Empire, although weakened, survived for a thousand years more as what modern historians call the Byzantine Empire. There the patriarch of the capital, Constantinople, emerged as the head of the church, but, as a subject of an all-powerful emperor, he never assumed the independent authority of a pope. A tendency for Orthodox churches to accept a subordinate role in the nation-state is a Byzantine legacy.

The earliest Christian literature was in Greek, and Christianity, even at Rome, was long predominantly Greek. The Greek tradition ceased to predominate in the 5th century, when the majority of Christians in Egypt and Syria, who until then had accepted Greek intellectual leadership, broke with the rest of the church over the decrees of the ecumenical councils of Ephesus (431) and Chalcedon (451). The Arab conquest of those provinces further weakened Eastern Christianity and made the 5th-century schisms permanent. In the meantime, Latin Christianity was spreading beyond the bounds of the old Roman Empire to win the loyalties of the peoples of the rest of western Europe. Only in the 10th century would the conversion of Russia by missionaries from Constantinople redress somewhat the balance between Eastern and Western Christianity.

The attempt to revive the Roman Empire in the West under Charlemagne in the 9th century produced the first overt tension between Rome and Constantinople, where minor differences in doctrine and ritual became an occasion of schism. The chief of these differences was the Western belief that the Holy Spirit, one of the three persons of the Trinity, proceeds from the Son as well as the Father, rather than, as the Greeks hold, from the Father alone. Greeks took offense when Western Christians inserted words to that effect (the *Filioque* clause) in the Nicene Creed and when Westerners charged them with heretically omitting them. Such differences caused a lasting schism that dates in church history from the mutual excommunications (1054) of Pope Leo IX and Michael Cerularius, the patriarch of Constantinople; this mutual nonrecognition persisted until 1965. The infamous Fourth Crusade, which overthrew the Byzantine emperor, sacked Constantinople, and installed a Latin patriarch submissive to the pope in 1204, created such ill-feeling in the East that later attempts at reunion were doomed.

Since then Eastern Orthodoxy has maintained its identity and the loyalty of its people in the face of hostile Roman Catholic, Muslim, and (for much of the 20th century) communist domination in all or most of its territory. From the fall of the revived Byzantine Empire to the Turks in 1453 until the Revolution of 1917, the Russian church was the leader

of world Orthodoxy. Immigrants from eastern Europe and the Balkans established Orthodoxy in North American religious life in the 19th and 20th centuries. Most Orthodox in America remain organized along ethnic lines in churches that retain their European ties.

The beauty and richness of its ceremonial worship is the most striking characteristic of Eastern Orthodoxy. Icons—formal paintings of Christ, the Mother of God, and the saints—play an important role in Orthodox worship. Orthodox theologians maintain that the veneration (as distinguished from worship) of icons results necessarily from Christian belief that God became man in the person of Jesus Christ, thereby divinizing human nature. The Orthodox commemorate the promulgation of the decrees of the second Council of Nicaea (787), which validated the veneration of icons, and the end of the Iconoclastic Controversy in 843 in the Feast of Orthodoxy on the First Sunday of Lent.

Monasticism and monastic spirituality have long played a vital role in Orthodoxy. All Eastern Orthodox bishops must be monks (and, hence, celibate), although married men may become priests. Monasticism has fostered Hesychasm, a distinctively Eastern form of mysticism, which employs breathing techniques and special posture, along with continual repetition of the Jesus prayer, as aids to obtaining a vision of the so-called uncreated energies of the Godhead manifested as light. St. Gregory Palamas (fl. early 14th century), a monk of Mount Athos, the great monastic community in northern Greece, gave Hesychasm its classic theological formulation.

The Eastern Orthodox churches have participated actively in the ecumenical movement of the 20th century. Most Orthodox churches have joined with the major Protestant churches as members of the World Council of Churches and have entered into theological discussions with many churches in order to promote understanding and unity. Relations between Eastern Orthodoxy and Roman Catholicism, in particular, have improved dramatically, especially since the removal of the anathemas of 1054. At the same time, the Orthodox have shown a determination to preserve their church's integrity and not to compromise their duty as legatees of a great tradition.

Eastern Question, diplomatic problem posed in the 19th and early 20th centuries by the disintegration of the Ottoman Empire, centring on the contest for control of former Ottoman territories. Any internal change in the Turkish domains caused tension among the European powers, each of which feared that one of the others might take advantage of the political disarray to increase its own influence. This question arose periodically during the 19th century—e.g., during the Greek revolution of the 1820s, in the Crimean conflict (1853–56), the Balkan crisis of 1875–78, the Bosnian crisis of 1908, and the Balkan Wars of 1912–13. The eventual distribution of the Ottoman territories was as follows: the Balkan provinces emerged in the course of the century as independent states, often under the influence of Russia or one of the other great powers; Britain occupied Cyprus in 1878 and Egypt in 1882 and acquired Palestine and Iraq as mandates after World War I; and France took over Syria and Lebanon in 1920. Turkey, the heart of the Ottoman state, won recognition as an independent republic in 1923.

eastern red cedar, also called PENCIL CEDAR (*Juniperus virginiana*), an evergreen ornamental and timber tree of the cypress family (Cupressaceae), native to poor or limestone soils of eastern North America. An eastern red cedar is 12 to 15 m (about 40 to 50 feet) tall and 30 to 60 cm (about 1 to 2 feet) in diameter. It has needlelike juvenile foliage and dark green, scalelike mature leaves. The green, fleshy, rounded cones are about 0.7 cm (about 0.25

Eastern red cedar (*Juniperus virginiana*)
Grant Heilman

inch) in diameter. Mature dark blue cones are covered by a gray, waxy material. The fibrous bark may be reddish brown or ashy gray, and it separates into long, fringed scales. The fragrant wood is made into cabinets, fence posts, and pencils.

Eastern Rift Valley (Africa), also called GREAT RIFT VALLEY, or RIFT VALLEY, major branch of the East African Rift System (*q.v.*).

Eastern rite church, also called EASTERN CATHOLIC CHURCH, any of a group of Eastern Christian churches that trace their origins to various ancient national or ethnic Christian bodies in the East but have established union (hence Eastern rite churches were in the past often called Uniates) or canonical communion with the Roman Apostolic See and, thus, with the Roman Catholic church. In this union they accept the Roman Catholic faith, keep the seven sacraments, and recognize the pope of Rome as supreme head of the church. They retain, however, all other characteristics—e.g., liturgy, spirituality, sacred art, and especially organization—proper to themselves.

The special status of the Catholic churches of the Eastern rite was guaranteed at the time of each rite's union with Rome and was approved again by the decree of the second Vatican Council, in *De ecclesiis catholicis orientabilibus*, promulgated on Nov. 21, 1964.

In the late 20th century, the number of Eastern Catholics throughout the world numbered more than 12,000,000.

History. Eastern Catholics—in contrast to Western, or Latin, Catholics, who have a history continuous from the 1st century AD—trace their origins largely to the failure of the ecclesiastical authorities at the Council of Ferrara-Florence in 1439 to unite Christians of the East and West. Stimulated by this unsuccessful beginning, however, and encouraged also by the later missionary activities of such monastic orders as the Jesuits, Dominicans, Franciscans, and Capuchins, the proponents of the goal of the eventual reunion of Eastern and Western Christians began to achieve some elements of success.

The Brest-Litovsk Union of 1596—under which all but two Ukrainian Orthodox bishops accepted, at the demand of their Polish Catholic king, the primacy of the pope—in a substantial way signaled the effective advent of Eastern rite churches. Other smaller groups had united with Rome in previous centuries, but the Ukrainians who were united with Rome at this time were the largest branch of Eastern Catholics to move in that direction.

Prior to this event, Eastern Catholics were limited to Italo-Albanians in southern Italy and Sicily, a large number of Maronites (Lebanese Christians of the Syro-Antiochene rite) who became associated with Rome in the 12th century, and some Armenians in the Syria-Lebanon region who also trace their relationship with Rome to the 12th century. A number of Nestorians (followers of Nestorius, the 5th-century patriarch of Constantinople [now Istanbul] who was declared a heretic) were united with Rome in 1551, Ruthenians

(an east-central European people) in 1595, Romanians of Transylvania in 1698, and Melchites (Syrian Christians of the Byzantine rite) in 1724. Political factors also played a role during the reunion process; Eastern Christians have been greatly influenced by nationalistic loyalties in their respective regions. As these various groups of Eastern Catholics grew in number, Rome encouraged and established ecclesiastical hierarchies.

Relationship to other churches. Eastern Catholic churches correspond in kind to the more numerous Eastern Orthodox churches and the Eastern independent, or Oriental, churches—i.e., those that do not accept the decrees of the ecumenical Council of Chalcedon (451). Within this fuller context, Eastern Catholics as a group are the smallest segment within Eastern Christianity.

Furthermore, from the viewpoint of the Eastern Orthodox and non-Chalcedonian traditions, Eastern Catholics may be looked upon with suspicion, primarily because of the Latinizing influence found in their ranks. Hence the majority of Orthodox and Eastern independent churches characterize Eastern Catholics as "Uniate" churches. The expression *Uniate* is taken from the Slavic *uniya*, a term coined by the opponents of the Brest-Litovsk Union. "Uniatism" implies hybridism, or the tendency for Latinization, and hence a betrayal of one's ancient and nationalistic tradition. Eastern rite churches would prefer to be considered as united churches rather than Uniate, with its negative implications.

Eastern rite churches make manifest the pluralistic composition of the Roman Catholic tradition. Permission for the various Eastern rites is a concession from Roman Catholic canon law, for a rite indicates more than liturgy; it points to an entire lifestyle and discipline of a church tradition. Eastern Catholic rites permit a married clergy and the immediate admission of infants to the sacraments of Holy Communion (the Lord's Supper) and confirmation. In the "Decrees on the Catholic Churches of the Eastern Rite" adopted by the second Vatican Council (1962–65), the Roman pontiff reaffirmed the pledge of his predecessors to preserve the rites of the Eastern churches.

Organization. The supreme head of the Eastern rite churches is the pope. The central organ of the Holy See for them is the Congregation for the Eastern Churches. The prefect of this congregation is the pope himself, and a cardinal pro-prefect performs the ordinary functions of chairman. The Congregation is competent for the Eastern churches in all matters (except certain specified cases) and has exclusive jurisdiction in specified countries in eastern Europe and the Middle East. The individual Eastern Catholic churches are organized differently according to their historical and ethnic situation, the number of adherents, the degree of evolution, and so on. The following organizational units are found.

Patriarchates comprise a certain number of dioceses of a single rite, under the jurisdiction of a patriarch. The patriarchs, according to the Eastern canon law, have special rights and privileges; in the general hierarchy they rank with the cardinals according to seniority (following the titular cardinal bishops of the suburban sees of Rome) and before all other bishops. In the late 20th century there were six Eastern Catholic patriarchates, as follows: one of Alexandria, for the Copts; three of Antioch, one each for the Syrians, Maronites, and Greek Melchites; one of Babylonia, for the Chaldeans; and one of Sis, or Cilicia, for the Armenians. The patriarchs of Babylonia and of Sis are called *katholikos*.

Major archiepiscopates are those that govern a certain number of dioceses of their rite but whose territory has not yet been erected into a patriarchate.

Metropolitanates govern ecclesiastical prov-

inces independent of the patriarchates and major archiepiscopates and comprise a number of dioceses. One of them is the metropolis; and its archbishop, the metropolitan, is the head of the whole metropolitanate.

Eparchies correspond to the Latin dioceses. Although they are usually subject to one of the aforementioned higher organizations, a few are immediately subject to the Holy See or to a Latin metropolitan see.

Exarchies correspond to vicariates, and their bishops govern not by ordinary jurisdiction but by delegated authority.

Apostolic administrations concern territories whose administration the Holy See, for certain reasons, has assumed temporarily, entrusting them to the care of a neighbouring bishop or an apostolic administrator.

Ordinariates are the lowest organizational units, found either at an early stage of development, such as a mission, or in small congregations. Usually the head is not a bishop.

The rites. The term "rite" in "Eastern Catholic rite" signifies not only liturgical ceremonies but the whole organization of particular churches. In the late 20th century, there were five distinct Eastern rite traditions—the Byzantine, the Alexandrian, the Antiochene, the Chaldean, and the Armenian—each (except the last) with two or more branches.

The Byzantine rite is by far the most significant, affecting the most persons and most territories worldwide (many of the faithful are in the Americas). Its liturgy is based on the rite of St. James of Jerusalem and the churches of Antioch, as reformed by St. Basil and St. John Chrysostom. The liturgy is used by the majority of Eastern Catholics and by the Eastern Orthodox church (which is not in union with Rome). The Byzantine branches include the Albanians, Bulgarians, Belarusians, Georgians, Greeks, Greek Catholic Melchites, Hungarians, Italo-Albanians, Romanians, Russians, Ruthenians, Slovaks, Ukrainians, and Yugoslavs, Serbs, and Croatsians.

The Alexandrian rite is found among the Egyptians and the Ethiopians. Its Coptic liturgy (known as the Liturgy of St. Mark) is derived from the Greek Liturgy of Alexandria, modified by several elements, including the Byzantine rite of St. Basil. Its two branches are the Copts (of Egypt) and the Ethiopians.

The Antiochene rite can be traced to Book 8 of the *Apostolic Constitutions* and to the Liturgy of St. James of Jerusalem. Its branches include the Maronites (constituting the largest single group of Eastern Catholics in the Middle East and throughout the world), the Syrians, and the Malankarese (of India).

The Chaldean rite, though derived from the Antiochene rite, is listed as a separate and distinct rite by the Sacred Congregation for the Eastern Churches. Its branches include the Chaldeans (descended from the Nestorians) and the Syro-Malabarese (descended from the St. Thomas Christians of India).

The Armenian rite, using the liturgical language of classical Armenian, is based on the Greek Liturgy of St. Basil, as modified by elements of the Antiochene rite. It consists of one group, the Armenians, found in the Middle East, Europe, Africa, the Americas, and Australasia.

Eastern Schelde. Schelde also spelled SCHELDT, Dutch OOSTERSCHELDE, channel extending about 30 miles (50 km) northwest through the Delta Islands in southwestern Netherlands to the North Sea. A former estuary of the Schelde River (as well as of the Meuse [Maas] River before completion in 1970 of a dam on the Volkerak Channel), the Eastern Schelde consists of a main southeast-northwest channel between the islands of Tholen (northeast), Noord Beveland (southwest), and Schouwen and Duiveland (northwest) and the former island, now a peninsula, of Zuid Beveland. A smaller northeastern arm

of the channel extends northwest of Tholen Island to the Volkerak Channel. The Eastern Schelde is an area of shellfish cultivation (mussels, oysters, shrimp) and a wintering area for geese and other migratory birds.

Completed in 1986, the Oosterscheldedam (or Eastern Schelde Dam) at the mouth of the channel is a storm surge barrier that has transformed the channel into a tidal saltwater area. Secondary dams include the Oesterdam in the eastern part of the Eastern Schelde and the Philipsdam in the Volkerak Channel north of Sint Philipsland peninsula. The Oesterdam forms freshwater Lake Zoom and is connected by the Eendracht (Schelde-Rhine Canal) north to the freshwater Volkerak Channel. The dams accommodate road travel and frontage recreation areas.

The Zeelandbrug (Zeeland Bridge), extending 16,472 feet (5,022 m) between Schouwen and Duiveland and Noord Beveland, was opened in 1965.

Eastern Seaboard, also called ATLANTIC SEABOARD, region of the eastern United States, fronting the Atlantic Ocean and extending from Maine in the north to Florida in the south. Not merely a geographic term, the Eastern Seaboard is, historically, the part of the United States that was first settled by European immigrants and from which most westward American settlement originated. In popular usage, the Eastern Seaboard connotes the coastal settlements from Boston to Philadelphia, an area of heavy urbanization, in which are islands of great poverty and conspicuous wealth, business and financial centres, major educational institutions, and a high level of social and cultural sophistication.

Eastern Sudanic languages, group of languages representing the most diverse of the four subbranches of the Chari-Nile branch of the Nilo-Saharan language family. The Eastern Sudanic branch is composed, according to many scholars, of the Murle-Didinga, Nara (Barca), Mearit, Gaam (Ingassana), Daju, Nyangiya, Temcin, Nyima, Nilotic, and Nubian language groups. These languages are spoken from southern Egypt in the north to Tanzania in the south and from Ethiopia in the east to Chad in the west. Nilotic and Nubian are the two most important of the Eastern Sudanic language groups. The term Eastern Sudanic has also been applied by some scholars to the group of languages usually called Central Sudanic. *See also* Nilotic languages; Nubian languages; Central Sudanic languages.

Eastern Townships, French LES CANTONS DE L'EST, region in southeastern Quebec, Can., between the St. Lawrence lowlands and the U.S.-Canadian border and centred on Sherbrooke. It extends from Granby in the southwest to Lac-Mégantic in the southeast and from Drummondville in the northwest to the Maine border in the northeast.

The region contains parallel ranges of hills (extensions of the Appalachians), the Sutton Mountains (extensions of the Green Mountains of Vermont), the Stoke Mountains, and the Mégantic Range. A few lakes and various rivers empty into the St. Lawrence River.

Although a few loyalists from the United States had settled at Missisquoi Bay of Lake Champlain as early as 1784, after the U.S. War of Independence, it was not until 1791 that the region was surveyed and English land laws were imposed on Lower Canada, replacing the French system of seigneurial tenure. Then, although the initial settlers were British (mostly loyalists), a large influx of French Canadians filled the area, so that today nine-tenths of the population is French-speaking.

The diversified economy of Eastern Townships includes asbestos mining, traditionally

supplying about 80 percent of the world's asbestos but declining in the late 20th century because of the growing recognition of the health risks of asbestos. Agriculture includes dairy farming, sheep raising, and fruit growing. The region is also important for manufactures, especially in textiles, paper, furniture, microelectronics, and machinery.

Eastern Woodlands Indian, any American Indian of the largely wooded area stretching easterly across North America from the Mississippi River valley to the Atlantic coastline. The northern boundaries of the Eastern Woodlands Indians included the Great Lakes and extended into present-day Canada; southern boundaries included the areas that became Illinois and North Carolina. The Indians in this region spoke languages of the Iroquoian, Algonquian, and Siouan families.

A brief treatment of Eastern Woodlands Indians follows. For full treatment, see MACROPAEDIA: American Peoples, Native.

The Eastern Woodlands Indians were concentrated largely in open areas where natural resources were readily available and where agriculture could be practiced. Thus the majority of people inhabited the more southerly regions or the areas near seacoasts, rivers, lakes, and other water sources. Women took responsibility for home and child care along with tending crops and making clothing and baskets; men hunted and fished, built houses and tools, and went to war.

In addition to the larger tribe, the social organization of life among the Eastern Woodland Indians included the band. Bands comprised the people occupying a particular area who took a name and shared common interests. A tribe consisted of several bands and was a cultural as well as a political unit. Often, tribes also contained clans, whose members might include people from other communities or other tribes.

Northeastern Indian leaders were chiefs, or sachems—positions that were often inherited. Because problems were settled by unanimous agreement at often lengthy councils, leaders had to be clever, persuasive speakers.

Economic systems were relatively simple and related to the use of an abundance of natural resources. Some agriculture was practiced, particularly by the Iroquoian tribes, in the areas where the growing season was long enough for corn (maize) to mature, and principally included the cultivation of three crops: corn, beans, and squash. The Indians used the hoe and the digging stick but not animals. Other food sources were plentiful through hunting, fishing, and gathering; Indians moved to different locales as the seasons dictated.

Wigwams and longhouses were the common forms of housing, both being made of raw materials provided by the forests. Natural resources also provided the materials for canoes, snowshoes, and clothing. Clothing consisted of capes, robes, skirts, leggings, moccasins, and breechclouts for men. Jewelry, paint, and tattoos were common decorations. The belief systems of this culture involved medicine societies in conjunction with a knowledge of herbal medicines, attention to a spirit world, and an emphasis on the power of dreams.

Confederacies of Indian bands, such as the powerful League of the Iroquois, were established to counteract encroaching European settlement from the 17th century. It appears that warfare among the Indians generally increased with European influence. Europeans actively traded guns and other manufactures to Indians for beaver and other furs, and they introduced wampum as a form of currency.

The Europeans also introduced new diseases that decimated the tribes. The first Indians to be heavily affected by the European influence

were the coastal Algonquins. Uprisings against European encroachment, including the Pequot War in 1637 and King Philip's War from 1675–76, were not successful, and European ways were adopted as a means of survival; some Indians left the area altogether and moved west or north into Canada. The inland Indians, largely Iroquois, and those of the upper Great Lakes region were not affected until later, because of their inaccessibility and the desire on the part of the Europeans to maintain good relations in the interest of trade. They remained organized and formidable until the American Revolution.

Most Indians who did not adopt the white culture were gradually eradicated or were forced west or north into Canada. Some were regionally contained on reservations, and a few of these reservations remain today: Algonquin reservations are found in New England and on Long Island, Iroquois reservations exist in New York state, and upper Great Lakes Indians still live in that area. Otherwise, the culture of the Eastern Woodlands Indians has been virtually lost.

Eastham, town (township), Barnstable county, southeastern Massachusetts, U.S., extending across the northern arm of Cape Cod. In December 1620 a shore party of *Mayflower* pilgrims landed at the Cape Cod Bay site near the entrance to Wellfleet Harbor and encountered their first Indians, the Nausets, who fortunately were friendly. The meeting is commemorated by a memorial stone adjoining First Encounter Beach. In 1644, Thomas Prence (or Prince), with more than 40 other colonists from Plymouth, returned and organized a settlement known as Nauset, which was incorporated in 1651 and renamed, probably for Eastham, Eng., or for the settlement's easterly location. The town's Old Cove Burial Ground contains the graves of early Pilgrims. After the American Revolution, fishing and coastal trade flourished, but by the mid-19th century farming dominated. The town, which includes the village of North Eastham, is now a summer resort and tourist base for Nauset Beach and the Cape Cod National Seashore. Pop. (1994 est.) 4,639.

Eastlake, Charles Locke (b. March 11, 1836, Plymouth, Devon, Eng.—d. Nov. 20, 1906, London), English museologist and writer on art who gave his name to a 19th-century furniture style.

The nephew of the Neoclassical painter Sir Charles Lock Eastlake, he studied architecture at the Royal Academy of Arts, London, which in 1854 awarded him a silver medal for architectural drawing. Giving up that discipline, he studied art on the European continent, then returned to England to write and to design. In 1856 he married Eliza Bailey (d. 1911). In

"Eastlake style" ebonized wood armchair by Kimbel & Cabus, New York, c. 1876–80; in The Hudson River Museum of Westchester, New York

Collection of The Hudson River Museum of Westchester, New York (74.3)

London he was secretary of the Royal Institute of British Architects (1866–77) and keeper and secretary of the National Gallery (1878–98). There he reorganized the classification of paintings and initiated the use of glass to protect the works from the London air.

As a writer on painting and industrial arts, Eastlake made a permanent reputation. More of a reformer of furniture style than an originator, he was a leading exponent of Jacobean and Gothic Revival, and he strongly influenced furniture and architectural tastes of the late Victorian and Edwardian eras. He was against the substitution of machine manufacture for quality workmanship. (Nevertheless, after Philadelphia's Centennial Exposition [1876], American Eastlake furniture was mass-produced.)

Eastlake's influential *Hints on Household Taste in Furniture, Upholstery and Other Details* (1868) was in its 6th edition in the United States by 1881 and in its 4th in London by 1887. His *Lectures on Decorative Art and Art Workmanship* (1876) was followed by the progressively published series *Notes on the Principal Pictures* in such continental collections as the Brera (1883) of Milan, the Louvre (1883), and the Royal Gallery (1888) in Venice.

Eastlake, Sir Charles Lock (b. Nov. 17, 1793, Plymouth, Devon, Eng.—d. Dec. 24, 1865, Pisa, Italy), English Neoclassical painter who helped develop England's national collection of paintings.

Eastlake studied first under the English historical painter and writer Benjamin Robert Haydon, whose genre he chose to follow, and later at the Royal Academy of Arts, London. After 1813 he traveled extensively on the European continent, remaining in Rome from 1818 to 1830. During this period he painted the Italian peasant scenes for which he became famous in England. About 1823 he began to explore historical and classical subject matter. In 1830 he was elected to the Royal Academy.

Between 1830 and 1840 Eastlake worked devotedly on his notebooks. From 1843 to 1847 he was keeper of the National Gallery, resigning amid unjust criticism. His significant study *Materials for a History of Oil Painting* appeared in 1847. When in 1850 he became president of the Royal Academy and was knighted, Eastlake abandoned painting for administration, becoming arbiter of national and court taste. In 1855 he was appointed to the new directorship of the National Gallery, a position he held until his death.

Eastleigh, borough and district, county of Hampshire, England. It lies north and east of Southampton. The borough grew rapidly in the 19th century with the establishment of railway works. Eastleigh has become an area of contrasts, ranging from an expanding industrial annex of Southampton through residential development to a yachtmen's playground at Hamble. Area 31 square miles (80 square km). Pop. (1992 est.) 108,100.

Eastmain River, French RIVIÈRE EAST-MAIN, river in Nord-du-Québec region, western Quebec province, Canada, rising in the Otish Mountains of central Quebec, flowing nearly due west, and discharging into James Bay. Its course of about 500 miles (800 km) is interrupted by numerous falls and rapids. Known earlier under the names of Hudson, Canuse, and Slude, the river was probably discovered in 1685 when the Hudson's Bay Company established a trading post (Eastmain) at its mouth.

Eastman, George (b. July 12, 1854, Waterville, N.Y., U.S.—d. March 14, 1932, Rochester, N.Y.), American manufacturer whose introduction of the first Kodak (a coined word that became a trademark) camera helped to promote large-scale amateur photography.

After his education in the public schools

of Rochester, Eastman worked briefly for an insurance company and a bank. In 1880 he perfected a process for making dry plates for photography and organized the Eastman Dry Plate and Film Company for their manufacture. The first Kodak, placed on the market in 1888, was a simple, hand-held box camera containing a 100-exposure roll of paper stripping film. The entire camera was sent back to the manufacturer for developing, printing, and reloading when the film was used up. In 1889 Eastman introduced transparent film and in 1892 reorganized the business as the Eastman Kodak Company (*q.v.*). Eight years later he introduced the Brownie camera, intended for use by children. It sold for one dollar. By 1927 Eastman Kodak had a virtual monopoly of the photographic industry in the United States, and it has continued to be one of the largest American companies in its field.

Eastman gave away half his fortune in 1924. His gifts, which totaled more than \$75,000,000, went to such beneficiaries as the University of Rochester (of which the Eastman

George Eastman, 1926

School of Music is a part) and the Massachusetts Institute of Technology. He was also one of the first owners to introduce profit sharing as an employee incentive. Eastman died by his own hand.

Eastman, Max, in full MAX FORRESTER EASTMAN (b. Jan. 12, 1883, Canandaigua, N.Y., U.S.—d. March 25, 1969, Bridgetown, Barbados), American poet, editor, and prominent radical before and after World War I.

Eastman was educated at Williams College, Williamstown, Mass., graduating in 1905. He taught logic and philosophy at Columbia University for four years, and he was the founder of the first men's league for woman suffrage in 1910. Eastman edited and published *The Masses*, a radical political and literary journal. Its editors were brought to trial twice in 1918 because of their editorial opposition to the United States' entry into World War I, but both trials ended with hung juries. He then edited and published *The Liberator*, a similar magazine, until 1922, when he traveled to Russia to study the Soviet regime. He married Eliena Krylenko, a sister of the Soviet minister of justice, but returned to the United States believing that the original purpose of the October Revolution (1917) had been subverted by corrupt leaders. In the 1920s and '30s he wrote several books attacking developments in the Soviet Union: *Since Lenin Died* (1925), *Artists in Uniform* (1934), *The End of Socialism in Russia* (1937), and *Stalin's Russia and the Crisis in Socialism* (1939). He also translated (1932) Leon Trotsky's *History of the Russian Revolution*.

From 1941 he was a roving editor for *The Reader's Digest*, writing on almost anything that interested him. His many other books included *Enjoyment of Poetry* (23 eds., 1913–48), *Enjoyment of Laughter* (1936), and two autobiographical works, *Enjoyment of Living* (1948) and *Love and Revolution: My Journey Through an Epoch* (1965).

Eastman Kodak Company, byname KODAK, major American manufacturer of film, cameras, photographic supplies, and other imaging products and processing services. Headquarters are in Rochester, N.Y.

The company was incorporated in 1901 as the successor to a business established in Rochester in 1880 by George Eastman (*q.v.*), who perfected the newly developed method of making photographic dry plates. Before 1880, photographers had to coat a plate with fresh, wet chemicals each time they wanted to take a picture. Eastman developed a machine that mechanically produced dry, precoated plates, and he set up the company that later would become Eastman Kodak to sell his plates.

Four years later, Eastman introduced roll film, and in 1888 he introduced the Kodak camera, the first camera that was simple and portable enough to be used by large numbers of amateur photographers. The camera was sold with film sealed inside and the whole unit was mailed back to Rochester for film processing and replacement. In 1900 Eastman introduced the less-expensive Brownie, a simple box camera with a removable film container, so that the whole unit no longer needed to be sent back to the plant.

In following years, the company continued to produce innovations for the amateur photographer. Kodak was the first to make home-movie equipment and an easy-to-use colour slide film, Kodachrome. In the 1960s the company introduced the Instamatic series of still and movie cameras, all of which used cartridge-loaded film. The Disc camera series, introduced in 1982, was a technologically advanced group of cameras that automatically activate the use of the flash, if necessary, in addition to adjusting the focus and advancing the film. In 1984 the company entered the video market by introducing an 8-millimetre video-camera system and videocassette tapes. In 1994 it divested its nonimaging businesses with the sales of its clinical diagnostics, pharmaceuticals, and household-goods divisions.

Kodak also manufactures single-use and digital cameras; photographic film, paper, and plates; digital scanners and storage systems; photocopiers; and equipment for professional photographers.

Easton, city, seat (1752) of Northampton county, eastern Pennsylvania, U.S. It lies at the confluence of the Lehigh and Delaware rivers (bridged to Phillipsburg, N.J.) and is part of the Lehigh Valley industrial complex that includes Allentown, Bethlehem, Wilson, and West Easton.

Easton was laid out in 1752 by William Parsons, at the request of Thomas Penn, on land obtained from the Indians in the notorious "Walking Purchase" of 1737, a treaty that enforced Indian resettlement. The town was named for the English estate (Easton-Neston) of Penn's father-in-law, the earl of Pomfret. During the French and Indian Wars, Easton was the scene of several Indian peace councils; it served as an outpost during the American Revolution, and the Declaration of Independence was read on July 8, 1776, from the steps of the Old Courthouse (a marker in the city's "Great Square" recalls the occasion).

The surrounding area is rich in natural resources—farmland, limestone, slate, iron ore, timber, and serpentine. Factories in the locality manufacture air valves, cement, crayons, machinery, steel, textiles, paper, and transportation equipment.

Lafayette College was established (1826) in the city. The Easton home (1757) of George Taylor, signer of the Declaration of Independence, has been restored. Inc. borough, 1789; city, 1887. Pop. (1994 est.) city, 27,725; Allentown-Bethlehem-Easton MSA, 611,765.

Eastport, easternmost city of the United States, in Washington county, eastern Maine. It is situated on Moose Island along Pas-

samaquoddy Bay (bridged to the mainland) of the Atlantic Ocean, 126 miles (203 km) east of Bangor. Originally settled about 1780, it once included Lubec (*q.v.*) and was known as Moose Island but was renamed upon incorporation as a town (1798) for being the nation's most easterly port. It was captured by British troops during the War of 1812 and remained under martial law until 1818, when it was returned to the United States under the terms of the Treaty of Ghent. Eastport was the scene of considerable activity during the 1930s when the federal government began work on the Passamaquoddy Tidal Power Project to harness the exceptionally high tides (up to 27 feet [8 m]) of Passamaquoddy Bay for hydroelectric power. The project resulted in the construction of two tidal dams but was never completed.

Eastport's economy is heavily dependent on fishing. Herring, the main catch, are canned as sardines and used in making other products. Trout and salmon are farmed in offshore pens. Old Sow, said to be one of the largest whirlpools in the world, is nearby. Inc. city, 1893. Pop. (1994 est.) 1,818.

Eastwood, district, Strathclyde region, southwestern Scotland, created by the reorganization of 1975 from part of the former county of Renfrew. The district lies just south-southwest of the City of Glasgow district. It comprises predominantly upland farming country, rising to a height of 1,230 feet (375 m) in the extreme southeast. The urbanized northern area developed during rapid expansion of the cotton-textile industry in the early 19th century. The subsequent decline of this industry and the development of an efficient transport system have changed this area into a dormitory appendage of Glasgow. The seat of Eastwood district authority is at Giffnock. Area 45 square miles (116 square km). Pop. (1993 est.) 60,930.

Eastwood, Clint, in full CLINTON EASTWOOD, JR. (b. May 31, 1930, San Francisco, Calif., U.S.), American motion-picture actor who emerged as one of the most popular Hollywood stars in the 1970s and eventually became a prolific and respected director-producer as well.

After graduating from high school in California, Eastwood held various jobs and served in the U.S. Army before becoming a bit player in Hollywood. He first attracted notice as the second lead in the television western series *Rawhide* (1959–66). His international stardom was established when he played The Man With No Name—a laconic, fearless gun-

Clint Eastwood in *A Fistful of Dollars* (1964)

Personality Photos, Inc.

fighter—in three popular Spanish-Italian westerns (“spaghetti westerns”) directed by Sergio Leone: *A Fistful of Dollars* (1964), *For a Few Dollars More* (1965), and *The Good, the Bad, and the Ugly* (1966).

With the release of these films in the United States, Eastwood began playing starring roles in Hollywood pictures, most notably under the direction of Don Siegel, with whom he made *Coogan’s Bluff* (1968), *Two Mules for Sister Sara* (1970), and *The Beguiled* (1971). Their best-known collaboration was *Dirty Harry* (1971), in which Eastwood portrayed the murderously effective police inspector Harry Callahan. Eastwood capably directed himself in such films as *Play Misty for Me* (1971), *The Outlaw Josey Wales* (1976), *Bronco Billy* (1980), *Pale Rider* (1985), and *White Hunter, Black Heart* (1990). A lifelong devotee of jazz music, Eastwood directed *Bird* (1988), a film biography of saxophonist Charlie Parker, and produced the documentary *Thelonius Monk: Straight, No Chaser* (1989).

Eastwood’s style of acting was minimally expressive, and his films initially drew little praise from critics, but he had a strong, resonant screen presence that earned him success at the box office. His standard role was that of a tough, competent loner whose violent behaviour nevertheless conforms to his own understated moral principles. Eastwood’s willingness to demythologize that character and his lean, crisp directorial style eventually brought him critical acclaim. His revisionist western *Unforgiven* (1992) won the Academy Award for best picture and the best director award for Eastwood. His noted films of later years include *The Bridges of Madison County* (1995), *Space Cowboys* (2000), and *Mystic River* (2003), a dark tale of murder and revenge that many critics believed to be one of Eastwood’s finest films as a director. His boxing drama *Million Dollar Baby* (2004) won Academy Awards for best picture and best director. Eastwood received the American Film Institute’s Life Achievement Award in 1996.

Eaton, Cyrus S., in full CYRUS STEPHEN EATON (b. Dec. 27, 1883, Pugwash, Nova Scotia, Can.—d. May 9, 1979, near Cleveland, Ohio, U.S.), U.S.-Canadian industrialist and philanthropist, founder of the Republic Steel Corporation (1930).

While a student, Eaton was persuaded by John D. Rockefeller to forego joining the ministry and become a businessman instead. Starting in business in 1907, he had built several electric power plants in western Canada within a few years, and he soon diversified into other utilities, banking, and steel in the United States. He was a relentless consolidator of the many companies that at one time or another came under his control. In 1930 he amalgamated several steel companies that he owned into Republic Steel Corporation, which was the third largest steel company in the United States. Eaton lost most of his fortune in the Great Depression but subsequently made a second one with his activities in the securities industry, banking, and railroads.

Eaton became prominent in the 1950s and ’60s as an advocate of nuclear disarmament and improved U.S.-Soviet relations. In 1957 he co-founded the Pugwash Conferences (originally held at his lodge in Nova Scotia), at which leading scientists and scholars from various countries met to exchange views and promote international understanding.

Eaton, John (b. Dec. 5, 1829, Sutton, N.H., U.S.—d. Feb. 9, 1906, Washington, D.C.), American educator, commissioner of education from 1870 to 1886, and first U.S. superintendent of public schools in Puerto Rico.

Eaton was raised on a farm and worked his

way through Dartmouth College, in Hanover, N.H., graduating in 1854. He was a school principal in Cleveland and a superintendent in Toledo. He resigned his Toledo position in 1859 to enter the Andover Theological Seminary. Ordained a minister in 1861, at the outbreak of the American Civil War, he immediately enlisted as a chaplain and was stationed in Tennessee in 1862 when General Ulysses S. Grant ordered him to gather the flood of former slaves escaping to the Union Army into camps where they could work and learn to be self-supporting. In 1863 he was made colonel of a black regiment and in 1865 was promoted to brevet brigadier general.

Eaton’s handling of the escaped slaves served as a precedent for the Freedmen’s Bureau, and from March to December 1865 Eaton was assistant commissioner of the bureau. He then moved to Memphis, Tenn., where he received a two-year appointment in 1867 as state superintendent of public instruction. In 1870 President Grant appointed him commissioner of the recently created U.S. Bureau of Education. Under his administration, the bureau grew from an insignificant office in the Department of the Interior to a well-staffed, highly influential repository of educational information drawn from all over the globe. When Eaton resigned in 1886 owing to poor health, the U.S. Bureau of Education was widely regarded as a model agency.

Eaton returned to Ohio as president of Marietta College (1886–91), and he held a similar post at Sheldon Jackson College in Salt Lake City, Utah (1896–99). He left Utah to become the first U.S. superintendent of schools in Puerto Rico. He achieved several reforms there before his health compelled him to resign in 1900.

Eaton, Margaret, nee O’NEALE, byname PEGGY EATON (b. Dec. 3, 1799, Washington, D.C., U.S.—d. Nov. 8, 1879, Washington, D.C.), woman whose marriage in 1829 to a prominent Democratic politician caused the famous “cabinet crisis” of U.S. President Andrew Jackson (in which Jackson dismissed his entire cabinet) and led eventually to the succession of Martin Van Buren as head of the party.

Peggy Eaton, c. 1830

By courtesy of the Library of Congress, Washington, D.C.

The daughter of a Washington tavernkeeper, Peggy O’Neale was married to a navy purser, John B. Timberlake. Throughout the 1820s her name was linked with Tennessee Senator John H. Eaton, a close friend of Jackson. When her husband died in 1828, Eaton, with Jackson’s approval, married her, and Jackson made him secretary of war. A few weeks after the wedding, rumours about her misconduct spread in Washington, and Washington hostesses, including wives of cabinet members, snubbed her—though some observers believed that her major sin lay in her humble social origins. President Jackson was outraged when the wife of Vice President John C. Calhoun took the lead in Peggy’s ostracism. Van Buren, then secretary of state and a widower, made a point of being gracious to her, and his stock rose

with the president as Calhoun’s fell. It was the beginning of the estrangement between Jackson and Calhoun, a break that was finalized when Jackson reorganized his cabinet in 1831 and dropped three Calhoun supporters from it. Jackson chose Van Buren to run for vice president in 1832 and supported him for president four years later.

Eaton resigned from the cabinet in 1831, but he and his wife enjoyed the brilliant society of Madrid when he served there as U.S. minister (1836–40). After his death (1856) Peggy Eaton married a young Italian dancing master, Antonio Buchignani, who within a few years defrauded her of her property and ran off with her granddaughter.

Eaton, Theophilus (b. c. 1590, Stony Stratford, Buckinghamshire, Eng.—d. Jan. 7, 1658, New Haven, Conn., U.S.), merchant who was cofounder and colonial governor of New Haven colony.

As a youth, Eaton went to London as a merchant apprentice. He began his own commercial enterprise trading with Baltic seaports, and his successes in business resulted in his election as deputy governor of the East-Land Company and also in his appointment to the court of Denmark as agent for Charles I.

When he returned to London from his residence in Copenhagen, Eaton became interested in the settlement of New England. He was one of the original patentees of the Massachusetts Bay Company. Eaton had adopted firm Puritan beliefs, and in early 1637 he joined his boyhood friend John Davenport and several Puritan followers in migrating to New England. The group arrived in Boston in June, but instead of settling in Massachusetts Bay, they established an independent colony at New Haven (Quinnipiac) in April 1638. The next year Eaton was elected governor of the colony, and he was reelected annually until his death.

In 1643 Eaton became an original commissioner in the New England Confederation, and 12 years later he and Davenport drew up a new legal code for New Haven colony.

Eau Claire, city, Eau Claire and Chippewa counties, seat (1857) of Eau Claire county, west-central Wisconsin, U.S. It lies at the confluence of the Eau Claire (“Clear Water,” so named by 18th-century French trappers and traders) and Chippewa rivers, 90 miles (145 km) east of St. Paul, Minn.

Settled in 1846 and laid out in 1855, it developed a lumber economy. After local forests were exhausted in the early 20th century, it turned to manufacturing. Manufactures now include computer equipment, paper products, and electronics; food processing and health care are also important. Eau Claire is the seat of Chippewa Valley Technical College (1912) and the University of Wisconsin–Eau Claire (1916). Carson Park, a peninsula on Half Moon Lake, contains the Chippewa Valley Museum and the Paul Bunyan Logging Camp. Inc. 1872. Pop. (2004 est.) city, 62,576; Eau Claire MSA, 153,150.

Ebadi, Shirin (b. 1947, Hamadān, Iran), Iranian lawyer, writer, and teacher, who received the Nobel Prize for Peace in 2003 for her efforts to promote democracy and human rights, especially those of women and children. She was the first Muslim woman and the first Iranian to receive the award.

Ebadi earned a law degree from the University of Tehrān in 1969. She was one of the first women judges in Iran and from 1975 to 1979 was head of the city court of Tehrān. After the 1979 revolution and the establishment of an Islamic republic, however, women were deemed unsuitable to serve as judges, and she was forced to resign. She then practiced law and taught at the University of Tehrān. In court Ebadi defended women and dissidents and represented people who had run afoul of

the Iranian government. She also distributed evidence implicating government officials in the murders of students at the University of Tehrān in 1999, for which she was jailed in 2000. Found guilty of "disturbing public opinion," she was given a prison term, barred from practicing law for five years, and fined, although her sentence was later suspended. Ebadi's writings include *History and Documentation of Human Rights in Iran (2000)*.

Eban, Abba (Solomon), original name AUBREY SOLOMON (b. Feb. 2, 1915, Cape Town, S.Af.—d. Nov. 17, 2002, Tel Aviv, Israel), foreign minister of Israel (1966–74) whose exceptional oratorical gifts in the service of Israel won him the widespread admiration of diplomats and increased support for his country from American Jewry.

Brought up in England, Eban studied Oriental languages and classics and lectured at the University of Cambridge. In 1941, as a British army major, he served as an aide to the British minister of state in Cairo. In 1946 he worked with the Jewish Agency as a political information officer to establish a Jewish homeland in Palestine. He also served as the liaison officer with the UN Special Committee on Palestine in 1947 and as a member of the delegation to the General Assembly that played a critical role in the passage (1947) of the UN resolution to partition Palestine. When the new state of

Eban
Judith Gelter

Israel was admitted to membership in the UN in 1949, Eban became its permanent representative and served in that post until 1959. From 1950 to 1959 he served concurrently as ambassador to the United States.

First elected to the Knesset (Israeli parliament) in 1959, he was minister of education and culture under Prime Minister David Ben-Gurion from 1960 to 1963 and from 1959 to 1966 was also president of the Weizmann Institute of Science. He served as deputy prime minister in 1964–65 and later was Israel's foreign minister from 1966 to 1974. As foreign minister, he sought to strengthen relations with the United States and to bring about Israeli association with the European Economic Community. When Israel was threatened with an Arab blockade in May 1967, Eban traveled to Paris, London, and Washington, D.C., to seek a peaceful solution. When diplomacy proved fruitless, Eban supported the military decisions in the Six-Day War. His eloquent defense of Israel's actions before the Security Council and the General Assembly of the United Nations was widely admired. He sat in the Knesset as a member of the Israel Labour Party until 1988.

His published works include *Voice of Israel* (collection of speeches, 1957), *The Tide of Nationalism* (1959), *My People* (1969), a history of the Jews, *An Autobiography* (1977), *Personal Witness* (1992), and *Diplomacy in the Next Century* (1998).

ebb tide, seaward flow in estuaries or tidal rivers during a tidal phase of lowering water

level. The reverse flow, occurring during rising tides, is called the flood tide. *See* tide.

Ebbinghaus, Hermann (b. Jan. 24, 1850, Barmen, Rhenish Prussia [Germany]—d. Feb. 26, 1909, Halle, Ger.), German psychologist who pioneered in the development of experimental methods for the measurement of rote learning and memory.

Ebbinghaus received his Ph.D. degree from the University of Bonn in 1873. Shortly thereafter he became assistant professor at the Friedrich-Wilhelm University, Berlin, a post he held until 1894, when he was appointed professor at the University of Breslau.

Using himself as a subject for observation, Ebbinghaus devised 2,300 three-letter nonsense syllables for measuring the formation of mental associations. This invention, together with the stringent control factors that he developed and his meticulous treatment of data, brought him to the conclusion that memory is orderly. His findings, which included the well-known "forgetting curve" that relates forgetting to the passage of time, were reported in *Über das Gedächtnis* (1885; *Memory*).

After completing his work on memory, Ebbinghaus turned to research on colour vision and in 1890, with the physicist Arthur König, founded the periodical *Zeitschrift für Psychologie und Physiologie der Sinnesorgane* ("Journal of the Psychology and Physiology of the Sense Organs"). In conjunction with a study of the mental capacities of Breslau schoolchildren (1897), he created a word-completion test. That same year the first part of another work on which his reputation rests, *Grundzüge der Psychologie* (1902; "Principles of Psychology"), was published. In 1905 he left Breslau for the University of Halle, where he wrote a still more popular work, *Abriss der Psychologie* (1908; "Summary of Psychology"). Ebbinghaus' research showed that, contrary to prevailing beliefs, scientific methods could be applied to the study of the higher thought processes.

Ebbo of Reims, Ebbo also spelled EBO (b. c. 775—d. March 20, 851, Hildesheim, Saxony [Germany]), archbishop whose pioneering missions to the North helped prepare the ground for the Christianization of Denmark and who exercised significant influence on contemporary arts.

Born a royal serf, Ebbo was educated and ordained a priest in the Carolingian court, where he became a close friend of Charlemagne's son and successor, Louis I the Pious, who made him director of the imperial library at Aachen, and then counselor. In 816 Louis appointed Ebbo archbishop of Reims, where the latter commissioned (c. 817–834) the famous Ebbo gospel book, or *Evangeliarium* of Ebbo, and promoted the arts, including the building of the cathedral. Appointed apostolic legate (822) by Pope St. Paschal I, he led into Denmark a Frankish mission (822–823) that was temporarily successful. He returned to the North twice, making converts and founding a monastery in Holstein, but the evangelization of the Danes was finally accomplished later under St. Ansgar.

By 833 Ebbo, with other leading prelates, had joined the emperor's opponents who, led by his son Lothair I, accused Louis of having destroyed Frankish unity. Ebbo headed those bishops who endorsed Louis's deposition and imprisonment. For supporting Lothair, Ebbo received handsome benefices. Upon Lothair's downfall and Louis's restoration (Easter 834), Ebbo took refuge near Paris. A year later he was seized, and he was later imprisoned in the Abbey of Fulda.

On Louis's death, in 840, Lothair reclaimed his rights to the Frankish succession and unlawfully reinstated Ebbo. On June 25, 841, however, Lothair was defeated in battle by his brothers Charles II the Bald and Louis the German; thereafter, the Frankish empire was

jointly ruled by all three kings. Banished by Charles, Ebbo fled to Rome, where he pleaded his case to Pope Sergius II, who reduced him to the laity. Discarded by Lothair, he was eventually protected by Louis the German, who between 845 and 847 made him archbishop of Hildesheim.

Ebbw Vale, Welsh GLYN EBWY, industrial town, Blaenau Gwent county borough, historic county of Monmouthshire (Sir Fynwy), Wales. It first developed as a coal-mining centre. Iron was processed there beginning in the late 18th century, using local coal, ore, and limestone. Steel production began later. However, the problems of the British steel industry in the 1970s led the works to close down its steelmaking operations by about 1978, and coal mining had ceased in the area by the end of the 20th century. The collapse of the town's chief industries brought economic hardship. The town continues to produce tinplate. It has other light industries and is a shopping centre. Pop. (2001) 33,280.

Ebenales, ebony order of flowering plants, belonging to the class Magnoliopsida (dicotyledons; characterized by two seed leaves). It comprises five families, as many as 145 genera, and about 1,700 species of trees and shrubs, distributed chiefly in the tropics. Only three of the families—Ebenaceae (ebony), Sapotaceae (sapodilla), and Styracaceae (storax)—are of economic importance.

The overwhelming majority of the Ebenales grow in hot, humid forests of the tropics. Only a few members, such as the common persimmon (*Diospyros virginiana*) of the eastern United States and the Asian date plum (*D. lotus*), thrive in fairly dry soils. The order is distinguished, in part, by its woodiness, simple leaves, attachment of stamens to the petals, and the production of only a few ovules within each chamber of the ovary.

The ebony family, Ebenaceae, consists of trees and shrubs that shed their leaves in autumn and develop heartwood that often is black, red, or green in colour. Its six genera and approximately 450 species are native to the tropics of both hemispheres, with extensions into warm temperate regions.

The large Macassar ebony tree (*Diospyros ebenum*) of India and the East Indies yields the most commercially valuable ebony wood. Its black heartwood, streaked with brown, contains fibres filled with a hard gum that makes it heavy enough to sink in water. This close-grained wood is difficult to work but assumes a beautiful sheen when polished; it is used primarily for flutes, black piano keys, wood inlays, knife handles, cabinets, and sculpture.

Several persimmons produce prized fruits. These include the Japanese persimmon (*D. kaki*), grown in the Orient, the Mediterranean region, and the warmer parts of the southern United States; the black sapote (*D. digyna*), with its dark brown, highly palatable fruits; and *D. virginiana*, a seedy persimmon that is native to the United States.

The sticky, milky latex of plants of the Sapotaceae (sapodilla) family differentiates it from other families in the Ebenales. Of its approximately 126 genera and approximately 800 species, several representatives are of economic importance, including *Pouteria*, the white balata; *Manilkara*, the red balata; *M. bidentata*, the bully tree, possessing purple heartwood that is known as bulletwood; and other timber trees. The sapodilla (*Achras zapota*), native to southern Mexico, produces a luscious, fragrant fruit. Its trunk also yields chicle, a gum that serves as the base for many chewing gums. The tree is now cultivated in India, Hawaii, and parts of Africa.

Edible oils are extracted from many seeds of the sapodilla family, including those of *Buty-*

rospermum paradoxum, grown on the savannas of the Sudan and the Nile River regions, and those of *Argania spinosa*, the Morocco ironwood. Certain species of *Payena*, found in Thailand and nearby regions, are tapped for latex, which is processed into gutta-percha.

The storax family, Styracaceae, is identified by star-shaped hairs on leaves and by fleshy fruits that develop an internal stony layer (drupe). This is in contrast to the fully fleshed fruits (berries) of the other families. Trees and shrubs of its 10 genera and 150 species generally are smaller than those of the ebon and sapodilla families. Three genera native to China furnish species grown for ornament. The Malayan *Styrax benzoin* produces the resin benzoin, used as a base in perfumes, as a soothing medicine, and as an antiseptic.

Inflorescences in the Ebenales vary from small clusters (and even solitary flowers) in the ebon and sapodilla families to branched types (panicles and cymes) in the more primitive Styracaceae and Symplocaceae. An idealized flower of this order consists of four whorls. Sepals, petals, and stamens each number four or five. Sepals and petals of a whorl are joined laterally to form, respectively, an urn- or bell-shaped calyx and corolla.

The pistil consists of two to five carpels differentiated into a basal ovary, a single style, and stigma lobes corresponding in number to the chambers in the ovary. No more than two ovules are borne centrally in each chamber.

In the ebon family functional stamens and pistils seldom are developed in the same flower. Male flowers produce pollen, but the pistil is undeveloped; conversely, the female flower has a fully developed pistil, but contains abortive stamens. The flowers are borne on separate trees, but in each case a few perfect flowers develop, possessing both male and female units, thereby assuring that isolated plants may bear fruit. Following pollination and fertilization, the ovule becomes the seed and the ovary the fleshy fruit. Sepals and petals often appear in two series in the Sapotaceae and may number up to 12. Flower parts in both the Symplocaceae and the Lissocarpaceae arise from the top of the ovary, unlike the flower parts in the other families.

Eberhard (d. 939, Andernach, Ger.), duke of Franconia from 918.

The brother of Conrad I, duke of Franconia and German king (911–918), Eberhard in 915 supported his brother's ineffectual action against the rebellious duke of Saxony, Henry the Fowler. On Conrad's death Henry became king as Henry I, probably at Conrad's wish. Eberhard renounced all claim to the kingship but in exchange became almost completely independent in Franconia. Henry's son Otto I (king from 936) attempted to exercise more authority over his dukes, and in 938 Eberhard rebelled; he was defeated and fined. He allied himself with Henry of Bavaria (King Otto's brother) and Giselbert of Lorraine and in 939 launched a new rebellion. His forces were surprised by those of King Otto, and Eberhard was killed in the battle.

Eberhard I, byname BEARDED EBERHARD, German EBERHARD IM BART (b. Dec. 11, 1445, Urach, Ger.—d. Feb. 24, 1496, Tübingen), count, later 1st duke of Württemberg (from 1495), administrative and ecclesiastic reformer, who laid the foundations for Württemberg's role in German history.

Eberhard expanded his territories and in 1482 established primogeniture and settled the succession to his holdings. The towns of Stuttgart and Tübingen received charters, and Eberhard reformed convents and monasteries. Interested in Renaissance learning as a result of his travels to the Holy Land and Italy and of his having an Italian wife, he founded the

Eberhard I, stained-glass window from the studio of Peter Hemmel von Andlau, 1477; in the collegiate church at Tübingen, Ger.

Landesbildstelle Württemberg, Stuttgart, Ger.

University of Tübingen (1477). He was a leading member of the pro-Habsburg Swabian League and was created duke at the Diet (Reichstag) of Worms (1495), where the emperor Maximilian I recognized his rulings on primogeniture and territorial indivisibility.

Eberhard, Johann August (b. Aug. 31, 1739, Halberstadt, Brandenburg [Germany]—d. Jan. 6, 1809, Halle, Westphalia), German philosopher and lexicographer, who defended the views of Gottfried Wilhelm Leibniz against those of Immanuel Kant and compiled a dictionary of the German language that remained in use for a century.

After studying theology at the University of Halle, Eberhard became a Lutheran preacher in 1763 at Halberstadt. In 1774 he was a pastor at Charlottenburg but gradually became estranged from orthodox Lutheranism through the influence of the German-Jewish thinker Moses Mendelssohn and the German writer C.F. Nicolai, an opponent of Kant. Consequently, in his *Neue Apologie des Sokrates* (1772–78; "A New Apology for Socrates") and in his *Allgemeine Theorie des Denkens und Empfindens* (1776; "General Theory of Thinking and Feeling"), Eberhard advocated the free examination of religious doctrine and epistemological rationalism in the manner of Leibniz and the German thinker Christian Wolff. Kant's critical philosophy appeared to him superfluous in view of what Leibniz and Wolff had already achieved.

In 1778 Eberhard was named professor of theology at Halle by King Frederick II of Prussia. Eight years later he became a member of the Berlin Academy and in 1805 was appointed a privy counselor. His German dictionary, 6 vol. (1795–1802), was reissued in an abridged form as *Synonymisches Handwörterbuch der deutschen Sprache* (1802; "Dictionary of Synonyms in the German Language") and was republished in its 17th edition in 1910 with English, French, Italian, and Russian equivalents.

Opposed to abstract philosophical speculation, Eberhard preferred empirical studies in fields including aesthetics and ethics. Among his later works are *Theorie der schönen Künste und Wissenschaften* (1783; "Theory of the

Fine Arts and Sciences"), *Allgemeine Geschichte der Philosophie* (1788; "General History of Philosophy"), and *Handbuch der Aesthetik* (1803–05).

Eberhart, Richard, in full RICHARD GHORMLEY EBERHART (b. April 5, 1904, Austin, Minn., U.S.—d. June 9, 2005, Hanover, N.H.), American poet and teacher, who was noted for his lyric verse and for his mentorship of aspiring poets.

Educated at the University of Minnesota, Dartmouth College (B.A., 1926), the University of Cambridge (B.A., 1929; M.A., 1933), and Harvard University, Eberhart published his first book of poems, *A Bravery of Earth*, in 1930. In the 1930s he also became a tutor to the son of King Prajadhipok of Siam (now Thailand) and afterward taught at several American universities, particularly at Dartmouth (1956–71). In the early 1950s he helped found the Poet's Theatre in Cambridge, Mass., to which he contributed verse dramas.

Eberhart combined a modern style with elements of Romanticism and frequently wrote about nature and death. His works include *Collected Poems, 1930–1976* (1976; National Book Award), *Of Poetry and Poets* (1979), *New and Selected Poems* (1990), and a book of criticism. From 1959 to 1961 Eberhart was consultant in poetry to the Library of Congress (now poet laureate consultant in poetry). In 1962 he was cowinner, with John Hall Wheelock, of the Bollingen Prize for Poetry, and in 1966 he received a Pulitzer Prize for *Selected Poems, 1930–1965* (1965).

Ebers papyrus, Egyptian compilation of medical texts dated about 1550 BC, one of the oldest known medical works. The scroll contains 700 magical formulas and folk remedies meant to cure afflictions ranging from crocodile bite to toenail pain and to rid the house of such pests as flies, rats, and scorpions. It also includes a surprisingly accurate description of the circulatory system, noting the existence of blood vessels throughout the body and the heart's function as centre of the blood supply. The Ebers papyrus was acquired by George Maurice Ebers, German Egyptologist and novelist, in 1873.

Eberswalde-Finow, city, Brandenburg Land (state), northeastern Germany, in the Thorn-Eberswalder glacial valley, approximately 30 miles (50 km) northeast of Berlin. Occupation of the site from the early Bronze Age is attested by the discovery at Finow in 1913 of a gold hoard dating from about the 11th to the 10th century BC. The margraves of Brandenburg selected a fortified Slavic site in 1261 for the building of a castle, about which Eberswalde grew. Market rights were granted sometime before 1276 and city rights just prior to 1300.

Coal barges on the Finow Canal at Eberswalde-Finow, Ger.

© Cao Garubba—Madeline Grimaldi

From 1400 to 1876, the city (including annexations of nearby villages) was known as Neustadt Eberswalde.

Location at a natural ford of the Finow, together with nearby forests, bog-iron deposits, and water power, made the city an early centre for trade, woodworking, milling, and metalworking (the first iron forge dates from 1440). The Finow was canalized (1602–20), improving navigation, and although the city was sacked during the Thirty Years' War (1618–48), development continued with the construction of the Finow Canal in the 17th century. Traditional industries were given new impetus in the mid-18th century by the settlement of Thuringian cutlers and by the rise in the 19th century of what is still Europe's largest marine and industrial crane factory. The Oder-Havel Canal (completed 1914) passes just north of the city; modern industries include rolling mills, gravel and brick industries based on glacial deposits, and chemicals.

Cultural resources of the city include a forest research institute (1830) with a botanical garden, a medical school, and a local museum. Pop. (1983 est.) 53,381.

Ebert, Friedrich (b. Feb. 4, 1871, Heidelberg, Ger.—d. Feb. 28, 1925, Berlin), leader of the Social Democratic movement in Germany and a moderate Socialist, who was a leader in bringing about the Weimar constitution that attempted to unite Germany after its defeat in

Ebert, c. 1924
Archiv für Kunst und Geschichte, West Berlin

World War I. He was president of the Weimar Republic from 1919 to 1925.

Ebert was the son of a master tailor. He learned the saddler's trade and travelled through Germany as a journeyman saddler. He soon became a Social Democrat and trade unionist, representing so-called revisionist—gradualist, liberal—"trade-union" Socialism, without, however, displaying a deep interest in the ideological struggles of Marxism. His attention was always directed toward practical improvement in the living conditions of the German working class and, above all, its social and moral betterment.

In 1905 Ebert became secretary general of the German Social Democratic Party (SPD). The party had steadily increased in membership and electoral support and had accumulated physical assets and property. He updated party administration, introducing typewriters and filing systems that the party had lacked until that time due to its fear of house searches.

Ebert succeeded August Bebel as party chairman in 1913. Under his leadership, the Social Democratic movement gained increasing influence in German national politics. It was Ebert, in particular, who on Aug. 3, 1914, prevailed upon German Social Democrats to support the war appropriations. The action of the German Social Democratic Party did not differ from that of the other Socialist parties of Europe, in which nationalist feelings remained stronger than internationalist convictions. To its own detriment, Ebert's party

gave the "Fatherland" its unconditional support without requiring that Germany adopt a genuine peace policy. In consequence, it lacked the power to force the government to adopt a policy through which Germany might have escaped the crushing defeat that was to destroy the empire and also eventually Ebert's postwar policy.

Ebert could not hold the entire party to his course for long. In March 1917 a left-wing faction left the party to become the Independent Social Democratic Party of Germany (USPD), strenuously rejecting war appropriations and Germany's war policy. Another group split from the SPD to form the Communist Party of Germany (KPD). The leftists who had withdrawn from the SPD sought a social revolution, while Friedrich Ebert and his party wanted to establish a German parliamentary democracy. Even in the midst of the war, the Catholic Centre Party, the Democratic Party (previously the Progressive Party), and the Social Democrats had formed the so-called Black-Red-Gold (Weimar) coalition, named after the colours of the flag of the liberal revolution of 1848.

With Ebert's active cooperation, a new government, headed by Prince Max of Baden and consisting of the three parties of the Black-Red-Gold coalition, was organized in October 1918 through a sweeping constitutional reform that in essential respects foreshadowed the Weimar Constitution. Thus, Germany would not have needed a revolution to achieve parliamentary democratic reform, and Ebert did everything he could to prevent such a revolution from occurring. "I hate the revolution like sin," he later said to Chancellor Max of Baden. But the revolution of November 1918 was not made by Germans to bring about the advent of the republic, democracy, or even Socialism. For nearly all Germans, the revolution had only one aim: peace. Rightly or wrongly, the German people believed that Emperor William II would not secure peace for Germany.

The revolution, winning its race with peace, came three days before the armistice. It triumphed in Berlin on November 9, and on the same day Prince Max of Baden, acting on his own authority, asked Friedrich Ebert to replace him as chancellor. Ebert, who still hoped to establish a regency for the Emperor, actually held office as chancellor for one day. On November 10 he yielded to the *fait accompli* of the revolution and set up an entirely Socialist government, with representatives from the SPD and USPD. Calling itself the Council of People's Representatives, the government derived its authority from the Workers and Soldiers Council, which claimed to speak for Germany and the German Republic but in truth had been elected rather arbitrarily by the factories and regiments of Berlin alone. Ebert was determined to place the power of the Council of People's Representatives and the Workers and Soldiers Council in the hands of a freely elected German parliament as soon as possible. He wished to see a liberal coalition government rather than a Socialist regime in power.

The elections of January 1919 gave the Black-Red-Gold coalition a majority of 85 percent. The republic's first government, under Ebert's fellow party member Philipp Scheidemann, was based on this tripartite coalition, and the new German constitution, the Weimar Constitution, so called after the town in which it was drawn up, was the work of the coalition. By the votes of the three parties forming the coalition, Ebert was elected the first president of the republic.

Ebert and Hugo Preuss, a professor of constitutional law whom he had charged with the task of drafting the constitution, wished to alter the organic structure of the *Reich*. But the old German states (the *Länder*, or territories) successfully resisted the "unitary state"

(*Einheitsstaat*) of Ebert and Preuss. Prussia in particular continued to exist as a state. The groups and forces that had until then been the pillars of the old Germany also remained intact, for the first years of the Weimar Republic were taken up by the bloody civil war which the government, under Ebert's presidency, waged against the leftist Socialists and Communists, who had been Ebert's former comrades. The republic exhausted itself in the civil war against Communism and lacked the strength to carry out the basic changes in the *Reich* that might have placed the republic on a lasting foundation. The workers did not want to make an armed defense of the democratic republic. So Ebert and his friend Gustav Noske, the defense minister, had recourse to volunteer groups, the *Freikorps*, which were principally composed of officers of the old army, and suppressed the Communist uprising out of hatred of Communism rather than love of the republic. The old officer corps formed the backbone of the Reichswehr, the republic's army. Together with the officer class and the old officialdom, the Junkers—the landed gentry east of the Elbe River—with their great estates and influence in social and political life, also survived the revolution.

With the elections to the republic's first parliament on June 6, 1920, the Black-Red-Gold coalition lost its majority and was never to regain it. The Social Democratic Party thereby lost its commanding position in the *Reich*, and the political constellation on which Ebert's leadership had been based dissolved. The electoral defeat was a direct result of the Treaty of Versailles. At that time many Germans, including Ebert, were convinced that the peace of Versailles aimed at the destruction of Germany. The resulting loss of confidence in the Black-Red-Gold coalition was the death blow of the Weimar Republic, although in fact the country's strength and stability had remained untouched.

Nevertheless, the first consequence of the Treaty of Versailles was a coup d'état against the republic, the Kapp Putsch, by radical nationalists, a part of the Reichswehr, and the *Freikorps*, which were to be disbanded under the provisions of the peace treaty. The coup of March 13, 1920, led by Wolfgang Kapp, a provincial bureaucrat who planned a restoration of the monarchy, collapsed after a few days, but Ebert's dream of a reconciliation between the army and the Social Democrats was shattered.

Soon thereafter, the government was confronted by a near-fatal crisis. When, in January 1923, Germany was declared in default of coal deliveries under the reparations provisions of the Treaty of Versailles, France, wishing to settle the reparations question decisively, occupied the Ruhr territory. Ebert, like nearly all Germans, supported national resistance and the general strike in the Ruhr, which was directed toward ending foreign military control. But Germany suffered as a result of the strike, in which eventually millions became idle. Inflation assumed staggering proportions, and the country experienced its most severe social and political crisis. Adolf Hitler nearly succeeded in seizing power in Bavaria. Chancellor Wilhelm Cuno, an independent, appointed on the eve of the Ruhr struggle as a man whom Ebert particularly trusted, was helpless in the face of the crisis. Gustav Stresemann, of the right-of-centre People's Party, who succeeded Cuno, brought the crisis under control. Ebert initially appointed him only with hesitation and treated him with reserve but finally gave him his full support. He bitterly rebuked his own party when, protesting Stresemann's move to a more rightist position, it dropped out of the governing coalition and thus brought about the Chancellor's res-

ignation in November 1923. In point of fact, Ebert's party had thereby eliminated itself from active participation in German national politics for many years to come.

The unity of the *Reich* was preserved. Inflation was ended through monetary reform, and a means for resolving the reparations question was partially resolved in an American proposal providing for their reduction. The evacuation of the Ruhr district was in sight. Yet much of the German right persisted in its defamation of Friedrich Ebert. The judgment of a German court, which ruled that Ebert had committed high treason, at least in the legal sense, during the war by his support of a munition workers' strike, contributed to his early death. (M.Fre.)

Ebetsu, city, Hokkaido, Japan, on the lower Ishikari River. It originated as a colonial farm village settled by 10 families from the island of Honshu in the early Meiji period (1868–1912). It is a satellite city of Sapporo with a well-planned residential area and industries, including food processing, metal, pottery, and paper manufacturing. Pop. (2004 est.) 123,204.

Ebionite, member of an early ascetic sect of Jews who followed Jesus of Nazareth. The Ebionites were one of several such sects that originated in and around Palestine in the first centuries AD and included the Nazarenes and Elkasites. The name of the sect is from the Hebrew *ebyonim*, or *ebionim* ("the poor"); it was not founded, as later Christian writers stated, by a certain Ebion.

Little information exists on the Ebionites, and the surviving accounts are subject to considerable debate. The first mention of the sect is in the works of the Christian theologian St. Irenaeus, notably in his *Adversus haereses* (*Against Heresies*; c. 180); other sources include the writings of Origen and St. Epiphanius of Constantia. The Ebionite movement may have arisen about the time of the destruction of the Jewish Temple in Jerusalem (AD 70). Its members evidently left Palestine to avoid persecution and settled in Transjordan (notably at Pella) and Syria and were later known to be in Asia Minor and Egypt. The sect seems to have existed into the 4th century.

Most of the features of Ebionite doctrine were anticipated in the teachings of the earlier Qumrān sect, as revealed in the Dead Sea Scrolls. They believed in one God and taught that Jesus was the Messiah and was the true "prophet" mentioned in Deuteronomy 18:15. They rejected the Virgin Birth of Jesus, instead holding that he was the natural son of Joseph and Mary. The Ebionites believed Jesus became the Messiah because he obeyed the Jewish Law. They themselves faithfully followed the Law, although they removed what they regarded as interpolations in order to uphold their teachings, which included vegetarianism, holy poverty, ritual ablutions, and the rejection of animal sacrifices. The Ebionites also held Jerusalem in great veneration.

The early Ebionite literature is said to have resembled the Gospel According to Matthew, without the birth narrative. Evidently, they later found this unsatisfactory and developed their own literature—the Gospel of the Ebionites—although none of this text has survived.

Ebisu, in Japanese mythology, one of the Shichi-fuku-jin ("Seven Gods of Luck"), the patron of fishermen and tradesmen. He is depicted as a fat, bearded, smiling fisherman often carrying a rod in one hand and a *tai* (sea bream—*i.e.*, a red snapper—symbolic of good luck) in the other. He is a popular Shintō deity, and his image is frequently seen in shops

Ebisu, detail of a painting by Hokurei, 1851; in the Museum für Völkerkunde, Vienna

and places of commerce. *See also* Shichi-fuku-jin.

Ebla, modern TALL MARDĪKH, also spelled TELL MARDĪKH, ancient city 33 miles (53 km) southwest of Aleppo in northwestern Syria. During the height of its power (c. 2600–2240 BC), Ebla dominated northern Syria, Lebanon, and parts of northern Mesopotamia (modern Iraq) and enjoyed trade and diplomatic relations with states as far away as Egypt, Iran, and Sumer.

Excavation of the tell (mound) now known to be the site of Ebla started in 1964 with a team of archaeologists from the University of Rome led by Paolo Matthiae. In 1975 Matthiae's team found Ebla's archives, dating to the 3rd millennium BC. Discovered virtually intact in the order in which they had once been stored on their now-collapsed shelves were more than 17,000 clay cuneiform tablets and fragments, offering a rich source of information about Ebla.

Part of Ebla's prosperity stemmed from its agricultural hinterland, in the rich plain of northern Syria, where barley, wheat, olives, figs, grapes, pomegranates, and flax were grown and cattle, sheep, goats, and pigs were raised. Beyond, Ebla controlled a group of 17 city-states, probably in what is now Lebanon and southeastern Turkey, areas rich in silver and timber. The city proper was a manufacturing and distribution centre. Linen and wool, including damask cloth, were the main products. Metalworking, including the smelting and alloying of gold, silver, copper, tin, and lead, was the second most important activity. Woodworking and the production of olive oil, wine, and beer also were important.

Trade was the third support of Ebla's economy. Cloth, manufactured goods, and olive oil were its main exports; imports included gold, silver, copper, tin, precious stones, and sheep. Because of its geographic location, Ebla grew wealthy on transit trade. Materials from Iran, Anatolia, and Cyprus were transhipped to states as distant as Sumer and Egypt. The Egyptian trade passed through Byblos.

Mari, on the Euphrates River to the southeast, was Ebla's great commercial rival. Twice, an Eblaite army marched against it, and for a time Ebla ruled Mari through a military governor.

Nonhereditary kings governed Ebla for limited terms, and a council of elders shared in decision making.

The religion of Ebla was polytheistic and primarily Canaanite. Dabir was the city's patron god, but Dagon, Sipish, Hadad, Balatu, and Astarte were also worshiped. The language of Ebla was a hitherto unknown Canaanite dialect, most closely akin to the Northwest Semitic languages. The script of the tablets, however, is Sumerian cuneiform, with closest similarity to tablets from Adab and Abū Salābikh (now in Iraq). Vocabularies, syllabaries, gazetteers, and student exercises that have been recovered show that Ebla was a major educational centre. The completeness of Ebla's texts, which at points duplicate frag-

mentary texts from Sumer, greatly enhances the modern study of Sumerian.

The prosperity of Ebla caught the attention of the Akkadian dynasty (c. 2334–2154 BC). Although Sargon of Akkad's claim to have conquered Ebla was cast in doubt by the discoveries in the excavations, the fire that destroyed the city was probably the result of an attack by Sargon's grandson Naram-Sin (c. 2240 BC). There followed a 250-year period of impoverishment, after which an Amorite group sacked Ebla and established its own dynasty. The Amorites rebuilt the palace and a temple, and a statue representing one of their kings was excavated in the ruins. Only limited prosperity returned to the city. Ebla's final destruction occurred in the great upheavals that engulfed the Middle East about 1650–1600 BC, but many crafts and traditions that originated in the city lived on in Syrian culture.

Ebner-Eschenbach, Marie, Baroness (Freifrau) von, née DUBSKY (b. Sept. 13, 1830, Zdislavice, Moravia [now in Czech Republic]—d. March 12, 1916, Vienna, Austria-Hungary), Austrian novelist who portrayed life among both the poor and the aristocratic.

Her first literary venture was the drama *Maria Stuart in Schottland* (1860), but she found her true sphere in narrative. In *Die Prinzessin von Banalien* (1872), *Božena* (1876), and her masterpiece, *Das Gemeindegeld* (1887; *The Child of the Parish*), she graphically depicted the surroundings of her Moravian home and showed a true sympathy for the poor and an unsentimental understanding of children. *Lotti, die Uhrmacherin* (1879; "Lotti, the Watchmaker"), *Zwei Comtessen* (1885; "Two Countesses"), and *Unsühnbar* (1890; "Inexpiable," or "Not Atonable") described with equal insight the life of the Austrian aristocracy.

Ebo OF REIMS: *see* Ebbo of Reims.

Ebola, virus (family Filoviridae) responsible for a severe and often fatal hemorrhagic fever; outbreaks in primates as well as in humans have been recorded. The disease is characterized by extreme fever, rash, and profuse hemorrhaging. Fatality rates range from 50 to 90 percent.

The virus takes its name from the Ebola River in northern Congo (Kinshasa), where it first emerged in 1976. Outbreaks that year in what was then Zaire and in the Sudan resulted in hundreds of deaths, as did another outbreak in Zaire in 1995.

Ebola is closely related to the Marburg virus, which was discovered in 1967, and the two are the only members of the Filoviridae, designated a family in 1987. Viewed through an electron microscope, the Ebola virus appears as long filaments, sometimes branched or intertwined. The virion (virus particle) contains one molecule of noninfectious, single-stranded RNA (ribonucleic acid). How the Ebola virus attacks cells is not known; however, it has been postulated that the virus produces proteins that suppress the immune system, allowing reproduction of the virus to continue unhindered. Viral hemorrhagic fevers like Ebola typically are carried by arthropods and rodents; however, the natural reservoir for the Ebola virus has yet to be discovered. Ebola can be transmitted through contact with infected blood, semen, body fluids, and possibly urine and respiratory secretions. The virus has also been detected in the organs of patients after recovery from the fever. Unsanitary conditions and lack of adequate medical supplies have been a factor in the spread of the disease.

The Ebola virus has an incubation period of 4 to 16 days. The onset is sudden and harsh. Infected persons develop fever, severe headaches and muscle aches, and loss of appetite. Within a few days the virus causes a condition known as disseminated intravascular coagulation. This condition is marked by

both blood clots and hemorrhaging. In the case of Ebola fever, clots are concentrated in the liver, spleen, brain, and other internal organs, forcing capillaries to bleed into surrounding tissue. Nausea, vomiting and diarrhea with blood and mucus, conjunctivitis, and sore throat soon follow. A maculopapular rash (discoloured elevations of the skin) appears on the trunk and quickly spreads to the limbs and head. The patient is then beset by spontaneous bleeding from body orifices and any breaks in the skin, such as injection sites, and within the gastrointestinal tract, skin, and internal organs. Death is usually brought on by hemorrhaging, shock, or renal failure and occurs within 8 to 17 days.

There is no known treatment for Ebola fever. Current therapy consists of maintenance of fluid and electrolyte balance and administration of blood and plasma to control bleeding. The spread of the virus can be contained by barrier nursing, handling of infected blood and tissue in isolated laboratory units, and proper decontamination of reusable equipment.

Eboli, town, Campania *regione*, southern Italy, east of the city of Salerno. The higher and older section of the town dominates the Sele Plain. Historical monuments include a castle of the Colonna family and the small Romanesque-style Basilica of San Pietro alli Marmi (1150). Eboli is an agricultural centre, known principally for olive oil and dairy produce.

"Christ stopped at Eboli," reportedly a local saying, refers to the miserable physical and social conditions in the area to the south of Eboli; it was used as the title of a book of reminiscences by the 20th-century writer Carlo Levi. Pop. (2004 est.) mun., 36,234.

Ebolowa, town, southwestern Cameroon. It lies 70 miles (112 km) south-southwest of Yaoundé, at the intersection of roads to Kribi (west), Yaoundé (northeast), and Gabon (south). It is a centre of the cocoa trade, and an agricultural school operates experimental plantations for African food staples, cacao, and oil palms near the town. Local sawmills prepare timber for export to Kribi. Pop. (2001 est.) 79,500.

Ebonics, also called AFRICAN AMERICAN VERNACULAR ENGLISH (AAVE), formerly BLACK ENGLISH VERNACULAR (BEV), dialect of American English spoken by a large proportion of African Americans. Many scholars hold that Ebonics, like several English creoles, developed from contacts between nonstandard varieties of colonial English and African languages. Its exact origins continue to be debated, however, as do the relative influences of the languages involved. Ebonics is not as extensively modified as most English creoles, and it remains in several ways similar to current nonstandard dialects spoken by white Americans, especially American Southern English. It has therefore been identified by some creolists as a semi-creole (a term that remains controversial).

Ebonics is a vernacular form of American English used in the home or for day-to-day communication rather than for formal occasions. It typically diverges most from standard American English when spoken by people with low levels of education. It should not be confused with language varieties spoken by such specialized subgroups as urban youth, in which one will come across words and phrases not typically used in the basic vernacular.

The structural similarities between Ebonics and American Southern English (e.g., double negatives, as in "I ain seen none"; relative clauses starting with *what*, as in "everything what he told you"; and double modals, as in "he might could help you") are attributable to

their parallel development on the cotton plantations of the southeastern United States from the diverse varieties of English brought to the colonies by the original settlers. The emergence of Ebonics as a separate dialect may be correlated with the emergence of African American traditions in music, religious practices, and cooking styles, all of which developed separately from the practices of white American communities—although these other areas show less-inhibited influence from African cultures in ways that have still not been adequately explained. The influence of African languages on the structure of Ebonics has been rather elusive, limited to some features—such as copula omission, lack of subject-verb agreement, and absence of subject-auxiliary inversion in main clauses (illustrated below)—that this dialect shares with Caribbean English creoles and Gullah. The origins of these peculiarities probably should not be located exclusively in black African languages, as explained below.

Among the most commonly discussed features of Ebonics are: (1) omission of the copula *be* in such sentences as "Larry sick," "Sharon gon come," and "Glenn playin," (2) consonant cluster simplification, so that, for example, the pronunciation of *passed* or *past* is often indistinguishable from that of *pass*, (3) double negatives, as in "She don wan nothin," (4) lack of subject-verb agreement, as in "He do," (5) absence of subject-auxiliary inversion in direct questions, such as "Why you don like me?" and "Where he is?," (6) subject-auxiliary inversion in subordinate clauses, such as "He aks me did I do it?," (7) omission of the auxiliary *do* in questions such as "What you want?" (a feature germane to the absence of subject-auxiliary inversion and typologically related to the absence of the copula as a semantically empty verb), (8) consuetudinal or invariant *be*, such as "Billy don be telling lies" (different in meaning from "Billy don tell lies," because it refers to repeated processes rather than to a repeated activity), and (9) the use of *steady* to indicate persistence, in constructions such as "She steady talking" to mean "She persists in talking." Most of these features are not unique to Ebonics; they are shared, at lower frequencies, by other nonstandard varieties of English. They are said to be variable because they do not occur categorically; they alternate with their standard counterparts (when applicable), and they occur in frequencies that vary from one speaker to another—and sometimes within the same speaker, from one setting to another. Aside from the ethnic identity of its speakers, Ebonics is perhaps most distinctive in its intonation and some stress patterns, which it still shares with white American Southern English in such instances as the stress in the word *police* falling on the first rather than the second syllable. (Sa.S.M.)

ebony, wood of several species of trees of the genus *Diospyros* (family Ebenaceae), widely distributed in the tropics. The best is very heavy, almost black, and derived from heartwood only. Because of its colour, durability, hardness, and ability to take a high polish, ebony is used for cabinetwork and inlaying, piano keys, knife handles, and turned articles. It was employed by the ancient kings of India for sceptres and images and, because of its supposed antagonism to poison, for drinking cups. Herodotus states that the Ethiopians every three years sent a tribute of 200 logs of ebony to Persia.

The best Indian and Ceylon ebony is produced by *Diospyros ebenum*, which grows in abundance throughout the flat country west of Trincomalee in Sri Lanka. The tree is distinguished by the width of its trunk and its jet-black, charred-looking bark, beneath which the wood is pure white until the heart is reached. The heartwood excels in fineness and in the intensity of its dark colour. Although the

centre of the tree alone is used, reduced logs 30 cm to almost 1 m (1 to 3 feet) in diameter can be obtained. Much of the East Indian ebony is yielded by the Coromandel ebony, *D. melanoxylon*, a large tree attaining a height of 18–24 m and 2.4–3 m in circumference, with irregular branches and oblong leaves. *D. montana* of India yields a yellowish gray, soft but durable wood. *D. quesieta* is the tree from which is obtained the wood known in Sri Lanka as Calamander. Its closeness of grain, great hardness, and fine hazel-brown colour, mottled and striped with black, render it valuable for veneering and furniture making.

D. dendo, native to Angola, is a valuable timber tree with very black and hard heartwood known as black ebony, as billetwood, or as Gabon, Lagos, Calabar, or Niger ebony. Jamaica, American, or green ebony is produced by *Brya ebenus*, a leguminous tree or shrub; the heartwood is rich dark brown, very heavy, exceedingly hard, and capable of receiving a high polish.

Ebony, American monthly magazine geared to a middle-class African American readership. It was the first black-oriented magazine in the United States to attain national circulation.

Ebony was founded in 1945 by John H. Johnson of Chicago, whose first publishing venture was the pocket-size *Negro Digest* (1942). Johnson envisioned *Ebony* as a news and photo magazine patterned much after *Life* magazine but specifically designed for African American readers. *Ebony* was immediately successful. It initially highlighted African American entertainers and sports figures but has since shifted its editorial focus to include black achievement of all sorts. By the beginning of the 21st century, its circulation had reached about 1.8 million. The circulation of *Jet*, another Johnson Publishing Company magazine with an emphasis on news as well as entertainment, was about 900,000.

Éboué, Félix, in full ADOLPHIE-FÉLIX-SYLVESTRE ÉBOUÉ (b. Dec. 26, 1884, Cayenne, French Guiana—d. May 17, 1944, Cairo, Egypt), black colonial administrator who reached the highest level of the French colonial administrative system and played a crucial role in the adherence of French Equatorial Africa to Charles de Gaulle's Free France in 1940.

Éboué graduated from the École Coloniale ("Colonial School") in 1908 and was sent to Oubangui-Chari (now the Central African Republic), where he spent most of his career. During an extended leave in the early 1920s, Éboué broadened his contacts with leaders in France, including Blaise Diagne, the first African deputy to the French National Assembly. Although he eventually reached the rank of administrator in chief in 1930, his promotions were slow—not because of his colour, he believed, but because of the low status of Africa and its administrators in the French colonial empire.

In 1932 Éboué was appointed secretary-general and later acting governor of Martinique, and finally (1936) he was made a full governor in Guadeloupe, where he introduced many reforms associated with the Popular Front government in France. But he also made enemies there who probably influenced his transfer in July 1938 to Chad, one of the poorest countries in Africa. There he became the key figure in rallying to General de Gaulle that strategically located colony as well as all of French Equatorial Africa. In return, de Gaulle named him governor-general over the entire federation and further honoured him in 1944 by holding the Brazzaville Conference (to discuss postwar colonial reforms) in his capital. A few months later Éboué died while on leave in

Cairo, and in 1949 he became the only black to be buried in France's Panthéon of heroes in Paris.

BIBLIOGRAPHY. Brian Weinstein, *Eboué* (1972).

Ebro River, Spanish RÍO EBRO, Latin IBERUS, or HIBERUS, river, the longest in Spain. The Ebro rises in springs at Fontibre near Reinosa in the Cantabrian Mountains, in Cantabria *provincia* of northern Spain. It flows for 565 miles (910 km) in a southeasterly course to its delta on the Mediterranean coast in Tarragona *provincia*, midway between Barcelona and Valencia. The Ebro has the greatest discharge of any Spanish river, and its drainage basin, at 33,000 square miles (85,500 square km), is the largest in Spain; the river drains about one-sixth of the country. Because it plunges through the coastal mountain ranges by a series of deep gorges and defiles, the Ebro is only navigable upstream for 15 miles (25 km) from its delta to the city of Tortosa.

The Ebro's interior basin is arid, poor, and sparsely populated. Irrigation has been intensified there from the 1950s, though it is still limited to the main floodplains in the middle reaches of the river between Tudela and Saragossa (site of the Imperial Canal system, begun in the 16th century) and to the interfluvies on the north-central plain around Caspe. The modern networks of irrigation canals between the Bardenas project and the Monegros and Cinca valleys are impressive. The upper part of the Ebro River basin, the Rioja Alta, around Logroño, gives its name to the Rioja wine produced there.

The Ebro River receives water from more than 200 tributaries, the largest of which have been utilized for hydroelectric power and irrigation. The Ebro's system of dams, chiefly in the upper La Noguera valleys, produces a significant portion of Spain's hydroelectric power. Extensive lignite deposits in the south-eastern, or lower, part of the basin are used to produce thermo-electric power.

Ebroin, French EVROUIN (d. AD 680/683), mayor of the palace in the Frankish kingdom of Neustria for some 20-odd years, from 656.

After his Merovingian puppet king, Chlotar III, died in 673, Ebroin took it upon himself to appoint Chlotar's brother, Theodoric III, as successor. Irate at the lack of consultation, the magnates rebelled, calling upon a third brother, King Childeric II of Austrasia; Childeric assumed control in Neustria and also Burgundy and imprisoned Ebroin in the Monastery of Luxeuil in Burgundy. On the assassination of Childeric in 675, Ebroin escaped, succeeded by duplicity in luring the new mayor of the palace to his death, and eventually restored Theodoric III. Shortly afterward he accused his rival in Burgundy, St. Leodegar (or Léger), bishop of Autun, of complicity in Childeric's murder; the bishop's tongue and lips were cut off before he was finally executed.

In his last years Ebroin campaigned successfully against the Austrasians, defeating their mayor of the palace, Pepin II, at Lucofao, near Laon, in 680. His cruelty and oppression were such, however, that he was assassinated by a Frankish nobleman. His death marked the end of Neustrian predominance in Frankish affairs.

Eça de Queirós, José Maria de, Queirós also spelled QUEIROZ (b. Nov. 25, 1845, Póvoa do Varzim, Port.—d. Aug. 16, 1900, Paris, France), novelist committed to social reform who introduced naturalism and realism to Portugal. He is often considered to be the greatest Portuguese novelist and is certainly the leading 19th-century Portuguese novelist.

The illegitimate son of a prominent magis-

trate, Eça de Queirós received his degree in law in 1866 from the University of Coimbra and then settled in Lisbon. There his father helped the young man make a start in the legal profession. Eça de Queirós' real interest lay in literature, however, and soon his short stories—ironic, fantastic, macabre, and often gratuitously shocking—and essays on a wide variety of subjects began to appear in the *Gazeta de Portugal*.

By 1871 he had become closely associated with a group of rebellious Portuguese intellectuals committed to social and artistic reform and known as the Generation of '70. Eça de Queirós denounced contemporary Portuguese literature as unoriginal and hypocritical.

He served as consul, first in Havana (1872–74), then in England—in Newcastle upon Tyne (1874–79) and in Bristol (1879–88). During this time he wrote the novels for which he is best remembered, attempting to bring about social reform in Portugal through literature by exposing what he held to be the evils and the absurdities of the traditional social order. His first novel, *O Crime do Padre Amaro* (1875; *The Sin of Father Amaro*), describes the destructive effects of celibacy on a priest of weak character and the dangers of fanaticism in a provincial Portuguese town. A biting satire on the romantic ideal of passion and its tragic consequences appears in his next novel, *O Primo Basílio* (1878; *Cousin Basilio*).

Caustic satire characterizes the novel that is generally considered Eça de Queirós' masterpiece, *Os Maias* (1888; *The Maias*), a detailed depiction of upper middle-class and aristocratic Portuguese society. Its theme is the degeneration of a traditional family whose last offspring are led into a series of tangled sexual relationships by the actions of their parents, who are symbols of the decadence of Portuguese society.

His last novels are sentimental, unlike his earlier work. *A Cidade e as Serras* (1901; *The City and the Mountains*) extols the beauty of the Portuguese countryside and the joys of rural life. Eça de Queirós was appointed consul in Paris in 1888 and served until his death.

Ecbatana, ancient city on the site of which stands the modern city of Hamadān (*q.v.*), Iran. Ecbatana was the capital of Media and was subsequently the summer residence of the Achaemenian kings and one of the residences of the Parthian kings.

According to ancient Greek writers, the city was founded in about 678 BC by the semilegendary Deioces, who was the first king of the Medes. The Greek historian Herodotus described the city in the 5th century BC as being surrounded by seven concentric walls. Ecbatana was captured from the Median ruler Astyages by the Persian king Cyrus the Great in 550 BC, and it was taken from the last Achaemenian ruler by Alexander the Great in 330 BC. The site of the ancient city lies partly within the modern city of Hamadān and has never been excavated.

Eccard, Johannes (b. 1553, Mühlhausen, Thuringia [Germany]—d. autumn 1611, Berlin, Brandenburg), German composer known for his setting of the year's cycle of Lutheran chorales.

After serving the banker Jacob Fugger in Augsburg (1577–78), Eccard joined the Königsberg chapel of Prince Georg Friedrich of Preussen-Ansbach in 1579, becoming kapellmeister in 1604. From 1608 until his death in 1611, he was kapellmeister to the electors of Brandenburg. Eccard wrote in a narrow range of forms, his songs and early Masses recalling Orlando di Lasso. He favoured short sacred pieces, vocal and instrumental, and these works of his culminated in a cycle of chorale settings, *Geistliche Lieder auf den Choral*, for five voices (1597). These represent a fusion of choral song and poly-

phonic motet and avoid the stark economy advocated by some Lutherans.

Ecce Homo (Latin: "Behold the Man"), theme prevalent in western Christian art of the 15th to 17th century, so called after the words of Pontius Pilate to the Jews who demanded the crucifixion of Jesus (John 19:5). Paintings on this theme generally conform to one of two types: devotional images of the head or half-figure of Jesus, or narrative depictions of the judgment hall scene. In either

"Ecce Homo," oil painting by Hieronymus Bosch; in the Städtisches Kunstinstitut, Frankfurt am Main

type, the scourged and mocked Christ is shown wearing a crown of thorns and purple robe placed on him by the Roman soldiers. In many examples, his wrists are tied and a rope is knotted around his neck. Scourge marks are frequently emphasized, and his face expresses compassion toward his accusers. In the narrative versions, two guards are often shown supporting the suffering figure while Pontius Pilate, the Roman governor of Judea, gestures toward Christ, illustrating his words.

Eccelino III da Romano (Italian noble): see Ezzelino III da Romano.

eccentric-and-rod mechanism, arrangement of mechanical parts used to obtain a reciprocating straight-line motion from a rotating shaft; it serves the same purpose as a slider-crank mechanism and is particularly useful when the required stroke of the reciprocating motion is small in comparison with the dimensions of the driving shaft. In the figure, the eccentric disk 2 is fixed off centre to the rotating shaft at A and has an eccentricity AB. The strap and rod 3 consist of two pieces clamped together in a sliding fit in a groove on the periphery of the disk. The rod is connected to the piston 4 within a housing 1. As the eccentric rotates with the shaft, it slides inside the strap, and the piston 4 moves on a straight path of length 2AB. AB is equivalent to the crankshaft and BC is equivalent to the connecting rod of

Eccentric-and-rod mechanism

a slider-crank mechanism. Because an eccentric can be attached anywhere along a shaft it is unnecessary to form any part of the shaft into a crank. Eccentrics are seldom used to transmit large forces because friction loss would be high; they are commonly used to drive the valve gears of engines.

Ecchellensis, Abraham: see Ibrāhīm al-Hāqilānī.

Eccles, Sir John Carew (b. Jan. 27, 1903, Melbourne, Austl.—d. May 2, 1997, Contra, Switz.), Australian research physiologist, who in 1963 received (with Alan Hodgkin and Andrew Huxley) the 1963 Nobel Prize for Physiology or Medicine for his discovery of the chemical means by which impulses are communicated or repressed by nerve cells.

Working at the Australian National University, Canberra (1951–66), Eccles showed that the excitement of a nerve cell by an impulse causes one kind of synapse to release into the neighbouring cell a substance (probably acetylcholine) that expands the pores in nerve membranes. The expanded pores then allow free passage of sodium ions into the neighbouring nerve cell and reverse the polarity of electric charge. This wave of electric charge, which constitutes the nerve impulse, is conducted from one cell to another. In the same way he found that an excited nerve cell induces another type of synapse to release into the neighbouring cell a substance that promotes outward passage of positively charged potassium ions across the membrane, reinforcing the existing polarity and inhibiting the transmission of an impulse.

Eccles' work, based largely on the findings of Hodgkin and Huxley, had a profound influence on the medical treatment of nervous diseases and research on kidney, heart, and brain function. Among his books are *Reflex Activity*

reception and studied atmospheric disturbances of radio reception.

His writings include *Handbook of Wireless Telegraphy* (1915) and *Continuous Wave Wireless Telegraphy* (1921).

Ecclesia, Greek ΕΚΚΛΗΣΙΑ ("gathering of those summoned"), in ancient Greece, assembly of citizens in a city-state. Its roots lay in the Homeric agora, the meeting of the people. The Athenian Ecclesia, for which exists the most detailed record, was already functioning in Draco's day (c. 621 BC). In the course of Solon's codification of the law (c. 594 BC), the Ecclesia became coterminous with the body of male citizens 18 years of age or over and had final control over policy, including the right to hear appeals in the *hēhaia* (public court), take part in the election of archons (chief magistrates), and confer special privileges on individuals. In the Athens of the 5th and 4th centuries BC, the *prytaneis*, a committee of the Boule (council), summoned the Ecclesia both for regular meetings, held four times in each 10th of the year, and for special sessions. Aside from confirmation of magistrates, consideration of ways and means and similar fixed procedures, the agenda was fixed by the *prytaneis*. Since motions had to originate in the Boule, the Ecclesia could not initiate new business. After discussion open to all members, a vote was taken, usually by show of hands, a simple majority determining the result in most cases. Assemblies of this sort existed in most Greek city-states, continuing to function throughout the Hellenistic and Roman periods, though under the Roman Empire their powers gradually atrophied.

Ecclesiastes, Hebrew QOHELET (Preacher), an Old Testament book of wisdom literature that belongs to the third section of the biblical canon, known as the Ketuvim (Writings). In the Hebrew Bible, Ecclesiastes stands between the Song of Solomon and Lamentations and with them belongs to the Megillot, five scrolls that are read at various festivals of the Jewish religious year. The common Christian English translations follow the Septuagint in placing Ecclesiastes between Proverbs and the Song of Solomon, an order reflecting the old tradition that Solomon wrote all three.

The actual author of Ecclesiastes is unknown, but the superscription (1:1) attributes the book to *qohelet* (commonly translated "preacher," Greek *ekklēsiastēs*), who is identified as "the son of David, king in Jerusalem." Though these words can only refer to Solomon (fl. mid-10th century BC), the frequency of Aramaic forms and the book's rationalistic contents date it sometime about the second half of the 3rd century BC.

The book reflects the ideas of one who questioned the doctrine of retributive justice associated with wisdom theology. His observations on life convinced him that "the race is not to the swift, nor the battle to the strong, nor bread to the wise, nor riches to the intelligent, nor favor to the men of skill; but time and chance happen to them all" (9:11). Man's fate, the author maintains, does not depend on righteous or wicked conduct but is an inscrutable mystery that remains hidden in God (9:1). All attempts to penetrate this mystery and thereby gain the wisdom necessary to secure one's fate are "vanity," or futile. In the face of such uncertainty, the author's counsel is to enjoy the good things that God provides while one has them to enjoy.

ecclesiastical court, tribunal set up by religious authorities to deal with disputes among clerics or with spiritual matters involving either clerics or laymen. Although such courts are found today among the Jews (see *bet din*) and among the Muslims (Sharī'ah) as well as the various Christian sects, their functions have become limited strictly to religious issues and to governance of church property. During

earlier periods in history, the ecclesiastical courts often had a degree of temporal jurisdiction, and in the Middle Ages the courts of the Roman Catholic Church rivalled the temporal courts in power.

The range of spiritual matters dealt with often extended into the secular area. The ecclesiastical courts had jurisdiction over sacramental matters that included anything having to do with marriage, such as separation and legitimacy. They also had exclusive jurisdiction over cases involving wills; in England, the ecclesiastical courts, which became Anglican in the 16th century, had complete jurisdiction in matters of succession to personal property until the 16th century and then, in competition with the courts of chancery, until 1857. The courts also claimed jurisdiction over clergy accused of most types of crimes.

The wide power of the church courts caused great controversy during the Middle Ages because many persons were able to claim that they were under the protection of the church and, therefore, were permitted to seek refuge in the church courts. These claimants included crusaders, students, widows, orphans, and, in some areas of the law, anyone who could read.

Church courts had jurisdiction over all disputes concerning discipline or administration of the church, property claimed by the clergy or ecclesiastical corporate bodies, tithes and benefices, questions touching on oaths and vows, and heresy. Wherever heretics were so strongly entrenched that it was thought necessary to repress them, the special ecclesiastical court of the Inquisition (*q.v.*) was employed, and lay rulers faced excommunication if they did not carry out the most severe sentences.

Although bishops originally sat in the lower courts, they were soon replaced in most cases by archdeacons who sat as the bishops' agents. The archdeacons were assisted by special prosecutors and clerks and were replaced themselves by men learned in canon and Roman law. Appeals went to the archbishop and ultimately through papal legates to Rome.

In many areas where royal justice was insufficient, church courts assumed jurisdiction. By the 14th century, as the administration of royal justice increased, controversy between the two powers also heightened. The secular authorities found ways to diminish the powers of the ecclesiastical courts. One was through appeal by writ of error in the secular courts. Then, in more subtle ways, ecclesiastical jurisdiction was limited to spiritual matters. The civil contract of marriage was separated from the sacrament. Other contracts and wills were brought into the secular sphere. By the 16th century on the Continent, the ecclesiastical courts had largely ceased to have any secular functions. Nonetheless, vestiges remained. In parts of Germany, for example, marriage and divorce remained within the jurisdiction of the ecclesiastical courts until the German Civil Code came into force in 1900.

In England today the ecclesiastical courts exercise jurisdiction in civil cases concerning church buildings and in criminal cases in which clergymen are accused of ecclesiastical crimes.

ecclesiastical heraldry, arms associated with the church's administrative and collegiate bodies. Abbeys, priories, and dioceses have their own arms, and high ecclesiastics have always impaled these with their personal arms.

Originally, in most realms, the church assumed arms *motu proprio*. This is still the normal practice, not only in countries such as the United States or France, where there is no heraldic jurisdiction, but also in England. In the Roman Catholic Church a special commission maintains armorial jurisdiction; the arms of the Church of England and of Angli-

of the Spinal Cord (1932), *The Physiology of Nerve Cells* (1957), *The Inhibitory Pathways of the Central Nervous System* (1969), *The Understanding of the Brain* (1973), and *The Human Psyche* (1980).

Eccles, William Henry (b. Aug. 23, 1875, Barrow-in-Furness, Lancashire, Eng.—d. April 29, 1966, Oxford), British physicist who pioneered in the development of radio communication.

He received a doctorate from the Royal College of Science, London, in 1901, and then taught at South Western Polytechnic, London (1902–16), and at City and Guilds Technical College, London (1916–26).

Eccles was an early proponent of Oliver Heaviside's theory that an upper layer of the atmosphere reflects radio waves, thus enabling their transmission over long distances. He also suggested in 1912 that solar radiation accounted for the differences in wave propagation during the day and night. He experimented with detectors and amplifiers for radio

can dioceses overseas are the subject of grants of the English kings of arms.

Anglican bishops in England place over their shield a mitre; but the bishop of Durham,

Arms of Cardinal Wolsey

as a bishop palatinate (bishop of a county whose lord had royal powers), has the mitre in a ducal coronet (a coronet decorated with three strawberry leaves), and behind his shield is a sword and crosier in saltire (diagonally crossed). Archbishops have two crosiers in saltire behind the shield.

A Roman Catholic cardinal bears over his arms a red hat with 15 red tassels on each side and behind his shield an archbishop's cross (*i.e.*, a cross with two horizontal limbs) and the pallium (vestment worn as a symbol of full episcopal authority). A Western patriarch has a green hat with 15 green tassels on each side and behind the shield an archbishop's cross. The arms of an Eastern patriarch are more like those of an Anglican bishop insofar as they are surmounted by a mitre. Behind the shield there are in saltire the episcopal crosier and patriarchal baton on one side and the patriarchal cross and doctoral baton on the other. An Eastern archbishop has the same addiments as a Western patriarch but with ten green tassels; a bishop has six green tassels with an episcopal cross behind the shield. A prince-bishop has the shield surmounted by a mitre and a bishop's cross and crosier in saltire, in addition to a red state mantle with ermine surmounted by a prince's crown.

An abbot *nullius* ("of no diocese"; *i.e.*, exempt from episcopal jurisdiction) has over the shield a green hat with six green tassels on each side, a mitre over the shield and a gold cross with a white veil, usually ornamented. An ordinary abbot has a black hat with six black tassels on each side and a gold crosier with a veil behind the shield; a mitre may be used instead of the crosier. A prelate *di fiocchetto* has a purple hat with ten red tassels on each side, while a protonotary apostolic (one of seven members of the College of Protonotaries Apostolic of the Roman Curia) has the same with six red tassels on each side. A domestic prelate has a purple hat with six purple tassels on each side and a privy chamberlain a black hat also with six purple tassels on each side. A canon has a black hat with three black tassels on each side, a rector a black hat with two black tassels on each side, and a simple priest a black hat and one black tassel on each side. (This last is allowed in Scotland to a parish minister of the Church of Scotland, to a rector of the Episcopal Church, or to a Roman Catholic priest.)

Moderators of the general assembly of the Presbyterian Church are entitled to a black ecclesiastical hat with ten blue tassels on each side, and moderators of synods and of presbyteries to a hat with six and three tassels respectively on each side. The clergy of her majesty's Chapel Royal have red tassels and chaplains of a royal castle, blue. The Presbyterian dean of the Chapel Royal of Scotland has a green pastoral staff behind his shield. This is also correct for the moderator.

Ecclesiasticus, also called the WISDOM OF JESUS THE SON OF SIRACH, deuterocanonical biblical work (accepted in the Roman Catholic canon but noncanonical for Jews and Protestants), an outstanding example of the wisdom genre of religious literature that was popular in the early Hellenistic period of Judaism (3rd century BC to 3rd century AD). This book appeared in the Septuagint, the Greek translation of the Hebrew Bible, though it was later rejected as apocryphal by Jews. Like other major wisdom books (Proverbs, Ecclesiastes, Job, and Wisdom of Solomon), Ecclesiasticus contains practical and moral rules and exhortations, frequently arranged according to subject matter—*e.g.*, hypocrisy, generosity, filial respect. Wisdom, personified as Sophia, or Lady Wisdom, delivers an extended discourse on her eternal relationship with God (chapter 24) and is identified with the Mosaic Law.

The text is the only apocryphal work whose author is known. It was written in Hebrew in Palestine around 180–175 BC by Ben Sira, who was probably a scribe well-versed in Jewish law and custom.

Ben Sira's grandson, whose name is unknown, carried the book to Alexandria and translated it into Greek shortly after 132 BC for Greek-speaking Jews. The translation was probably intended to encourage adherence to ancestral beliefs and customs and to defend Jewish religious doctrines by showing the essential agreement between Judaism and Hellenistic philosophical truths. The concept of "wisdom" as an active emanation from God, for example, closely approximates the Stoic concept of the universal logos.

The book is extant in a Greek text and in Hebrew texts, some of which was discovered in 1896–97 in the *geniza* ("repository") of the Ezra Synagogue in Cairo and among the Dead Sea Scrolls (*q.v.*).

eccyclema, Greek EKKYKLĒMA, also called EXOSTRA, in classical Greek theatre, stage mechanism consisting of a low platform that rolled on wheels or revolved on an axis and could be pushed onstage to reveal an interior or some offstage scene such as a tableau. It was introduced to the Attic stage in the 5th century to provide directors a means for clarifying the action. Because violence was prohibited from the Greek stage, it is thought by some that murdered bodies may have been displayed on the device.

The eccyclema was used mainly in tragedy but was occasionally employed in comedy. In the *Acharnians* by Aristophanes, for example, a character representing the playwright Euripides is reluctant to leave his house until Di-caeopolis, who wants to borrow a costume, brings him the "scene shifter" to wheel him onstage surrounded by costumes. After violence was no longer proscribed onstage, the eccyclema still served as a scene-shifting device, eventually giving rise to modern turntables and other revolving stage mechanisms.

ecdysiotropic hormone: *see* thoracotropic hormone.

Ecevit, Bülent (b. May 28, 1925, Constantinople [now Istanbul], Tur.), Turkish poet, journalist, and politician, who served as prime minister of Turkey in 1974, 1977, 1978–80, and 1999–2002.

Ecevit was educated in Istanbul and became an embassy official in London (1946–50). Ecevit returned to Ankara as a writer and journalist with the newspapers *Halkçı* and *Ulus*, the official organ of the Republican People's Party (RPP), which his father had represented in Parliament.

Ecevit was elected to Parliament as an RPP member for Ankara (1957, 1961) and Zonguldak (1965, 1969) and joined the party council in 1959. During his service as minister of labour (1961–65), he made the strike a legal

weapon for labour, for the first time in Turkish history. In 1966 Ecevit became secretary-general of the RPP under İsmet İnönü, whose cooperation with the country's military government he opposed. Ecevit became chairman of the RPP in 1972 and prime minister in January 1974.

As head of government, Ecevit declared an amnesty for all political prisoners and authorized (July 20, 1974) Turkey's military intervention in Cyprus after the Greek-led coup on that island. His request for a vote of confidence from the parliament in September 1974 failed, and, after a severe political crisis, tenuous power passed to Süleyman Demirel of the Justice Party. After further crises in 1977, during which Ecevit briefly formed a government (June 21–July 3), he was again prime minister in January 1978. Acute economic and social difficulties, however, led to the fall of his government in October 1979. He returned to power in 1999, but in the wake of a deteriorating economy—and his own poor health—he was voted out of office in 2002.

Among Ecevit's literary works are a Turkish translation (1941) of Rabindranath Tagore's song poems, *Gītājālī*, and a translation (1963) of T.S. Eliot's play *The Cocktail Party*. His political writings include *Ortanın solu* (1966; "Left of Centre"), *Bu düzen değişmelidir* (1968; "The System Must Change"), *Atatürk ve devrimcilik* (1970; "Atatürk and Revolution"), *Demokratik Sol* (1974; "Democratic Left"), and *İşçi-Köylü Elele* (1976; "Workers and Peasants Together").

Ecgfrith, also spelled EGFRITH (d. May 20, 685, near modern Forfar, Angus, Scot.), Anglo-Saxon king of the Northumbrians from 670, who lost his wars against the Mercians on the south and the Picts on the north.

Ecgfrith was the son of King Oswiu and nephew of St. Oswald. By 674 he defeated a south English coalition under Mercian leadership and annexed the region of Lindsey. In 678, however, Ecgfrith was defeated near the River Trent by King Aethelred of Mercia. During an invasion of Pictish territory, he was killed at a place called Nechtanesmere (Duin Nechtain), and his army was destroyed.

Echegaray y Eizaguirre, José (b. April 19, 1832, Madrid, Spain—d. Sept. 4, 1916, Madrid), mathematician, statesman, and the leading Spanish dramatist of the last quarter of the 19th century. Along with the Provençal poet Frédéric Mistral, he was awarded the Nobel Prize for Literature in 1904.

A professor of mathematics in his early life, he entered government service in 1868, holding various positions. He was named minister of finance in 1874 and played a major role in developing the Banco de España.

His first play, *El libro talonario* ("The Check-book"), was not produced until 1874, when he was 42; but he had a prolific career, producing an average of two plays a year for the rest of his life. His early work is almost wholly Romantic, but, under the influence of Henrik Ibsen and others, he turned to thesis drama in his later work. He often displayed his thesis by use of a satiric reversal; in *O locura o santidad* (1877; *Madman or Saint*), he showed that honesty is condemned as madness by society. In all his plays his manner is melodramatic. Though forgotten now, he achieved tremendous popularity in his day because of his fertile imagination, which he almost invariably used to compensate for his lack of dramatic force. His use of skillfully contrived stage effects, although disastrous in much of his own work, did much to revolutionize the scope of the Spanish theatre.

Echeveria, genus of about 100 species of succulent plants, in the stonecrop family (Crassulaceae), native from Texas to Argentina. Many are popularly called hen-and-chickens because of the way new plantlets, or offsets, develop

in a cluster around the parent plant. The usually broad fleshy leaves have waxy, velvety, or powdery surfaces and are often iridescent and sometimes red-edged when in bright sunlight. Echeverias are popular with collectors of succulent plants for their compact, symmetrical leaf rosettes and for the prominent stalked inflorescence (flower cluster), which usually rises high above the leaves.

The smaller species, such as the wax rosette (*E. × gilva*), the pearl echeveria, also called Mexican snowball (*E. elegans*), and the plush plant (*E. pulvinata*), are handsome as small pot plants or in dish gardens along with other succulent species. Larger echeverias, such as *E. gibbiflora*, *E. coccinea*, and copper roses (*E. multicaulis*), are common in Mexican and southwestern American gardens.

Echeverría Álvarez, Luis (b. Jan. 17, 1922, Mexico City), president of Mexico from 1970 to 1976.

Echeverría became the private secretary of the president of the ruling Institutional Revolutionary Party (PRI) in 1940 and received a law degree from the National Autonomous University of Mexico in 1945. He rose rapidly in political circles and held several important posts in government and the PRI prior to being appointed secretary of the interior in 1964 by President Gustavo Díaz Ordaz. He was severely criticized for his harsh handling of the 1968 student demonstrations that culminated in the "Tlatelolco massacre," in which more than 300 demonstrators were killed or wounded and thousands arrested.

After becoming president, Echeverría moved sharply to the left. He released most of the prisoners arrested in 1968, redistributed millions of acres among the landless peasantry, expanded social security, housing, and transportation programs, and poured huge sums of money into public works. Reversing an earlier stand, he introduced a national family planning program to reduce population growth. His administration was plagued by runaway inflation, high unemployment, and illiteracy, and his leftist economic proposals alienated business interests, causing reduced domestic investment. A declining balance of trade forced the devaluation of the peso by 50 percent in 1976, producing insecurity and antagonism among Echeverría's middle-class supporters. In foreign policy, Echeverría opened diplomatic relations with China and supported Latin American solidarity. He served as ambassador to Australia and New Zealand from 1977 to 1980 under his successor, President José López Portillo.

Echidna (Greek: "Snake"), monster of Greek mythology, half-woman, half-serpent. Her parents were either the sea deities Phorcys and Ceto or Chrysaor, the monstrous son of Medusa, and Callirrhoe, the daughter of Oceanus. Among Echidna's progeny, by the 100-headed Typhoeus, were the dragons of the Hesperides and of the Golden Fleece, the Hydra, the goatlike Chimera, and the infernal hounds Orthus and Cerberus. The Sphinx and the Nemean lion, both sired by Orthus, were also among her offspring.

echidna, also called SPINY ANTEATER, either of two species of egg-laying mammals constituting the family Tachyglоссidae, order Monotremata. These stocky, virtually tailless, brownish-furred animals have strong-clawed feet and, on the upper part of the body, spines as well as hair. The spines vary in colour from white and yellow to black. Echidnas of the genus *Zaglossus*, the several forms of which are usually considered races of *Z. bruijnii* of New Guinea, are 45 to 78 cm (18 to 31 inches) long and rather piglike, with short, wide-set spines. The other species, *Tachyglоссus aculeatus*, found in many habitats across Australia and Tasmania (the latter population sometimes considered a separate species, *T.*

Echidna (*Tachyglоссus aculeatus*)

By courtesy of the New York Zoological Society

setosus), is 35 to 53 cm (14 to 21 inches) long and has spines like a hedgehog's. *Z. bruijnii*, which is valued for its meat, is declining in numbers as a combined result of forest clearance and unrestricted hunting.

To frustrate enemies, an echidna may roll into a ball and dig straight down in loose soil, or it may wedge itself tightly into a crack. Males have spurs on the hindlegs, presumably for combat. Both genera have a narrow, sensitive snout (longer and decurved in *Zaglossus*), a small mouth, and an extensible sticky tongue for feeding on termites and ants. An echidna can fast for a month.

The female lays a single egg, which is transferred into a pouch she developed in the breeding season. Incubation takes about 10 days. The young receives milk, exuded from the nippleless mammary openings, for about seven weeks; then the mother hides its young in a nest of leaves. An echidna may live from 30 to 50 years in captivity.

echinococcosis, also called ECHINOCOCCAL DISEASE, HYDATIDOSIS, or HYDATID DISEASE, formation of cysts, or hydatids, at the site of infestation by the larval form of *Echinococcus granulosus*, a tapeworm common in sheep, cattle, camels, dogs, and many other mammals. The disease can develop in humans upon ingestion of the eggs, which may be present in the tissues of infected animals or on food contaminated by their excreta. The emergent larvae become enveloped in a cyst, most commonly in the liver, that may grow for 5 to 20 years without being detected. Surgical excision of the cyst is the only effective treatment, but in many cases the disease recurs because the contents of the cyst may escape during the operation.

echinoderm, any of a variety of invertebrate marine animals belonging to the phylum Echinodermata, characterized by a hard, spiny covering or skin.

A brief treatment of echinoderms follows. For full treatment, see MACROPAEDIA: Echinoderms.

More than 21 classes have been identified, but only about 6,000 species of six classes are known to still exist. The six are: Crinoidea (feather stars and sea lilies), Asterozoa (starfishes), Ophiurozoa (brittle stars and basket stars), Echinozoa (sea urchins, cake urchins, and heart urchins), Concentricyclozoa (sea daisies), and Holothurozoa (sea cucumbers). Echinoderms are widely distributed in all the oceans, occurring in marine environments ranging from the intertidal zone to the deepest oceanic trenches.

The most apparent characteristics of echinoderms are the calcite skeleton and the five-rayed, or pentamerous, radial symmetry of the adult body form. The skeletal structure may be a test, a hollow structure formed of solid plates, as found in sea urchins, or it may be composed of many separate smooth or spiny ossicles held together by muscles or ligaments, which is the case in the starfishes.

Most echinoderms have numerous small appendages, called tube feet, that are contained in grooves on the animals' tentacles. Movement of the tube feet is controlled by a hy-

draulic, or water-vascular, system. Water is taken in and passes into five major canals that channel it into branches that carry it to the tube feet. Local muscle action in contracting or releasing the canals functions to extend or retract the tube feet. The tube feet themselves may be variously modified to serve in locomotion, respiration, tunneling, sensory perception, feeding, and grasping.

Reproduction among echinoderms is either sexual or asexual. In sexual reproduction, eggs are fertilized in the water by sperm and either pass through a larval stage before transforming into juvenile echinoderms or develop directly into juveniles. One kind of indirect development involves fission of the body and regeneration of the missing parts. Starfishes, for example, can regrow an entire organism from one arm if a small portion of the central disk remains attached.

Most echinoderms feed on microscopic detritus or suspended matter (either alive or dead), but many urchins and starfishes graze on plant life. Some starfishes are carnivores and eat mainly mollusks. A few of the echinoderm species are economically important. Some sea urchin roes and the warty sea cucumbers of the genus *Holothuria* are used for food in certain countries (see bêche-de-mer). Various species of starfishes, such as *Asterias vulgaris* and *A. forbesi*, that prey on clams and oysters are pests in commercial shellfish beds.

echinoid, any marine invertebrate belonging to the class Echinozoa (phylum Echinodermata). They have a hollow test (internal skeleton) of limy plates. Tube feet, modified for various functions, reach the body surface through pores in the test; all species bear spines and pedicellariae (pincerlike organs).

The body of regular (radially symmetrical) echinoids is globular, and the anus is located opposite the mouth on the underside of the body. In irregular (bilaterally symmetrical) echinoids the body is flattened, the mouth may be off-centre, and the anus may be on the same body surface as the mouth.

The 900 living species of echinoids have their centre of distribution in the Indo-Malayan region. The many extinct species are important Paleozoic and Mesozoic index fossils. For more information on echinoid species and groups, see cake urchin; heart urchin; sea urchin.

Echinospaerites, genus of cystoids, an extinct group related to the sea lily and starfish,

Echinospaerites, from the Ordovician Period

By courtesy of the trustees of the British Museum (Natural History) photograph Imitor

found as fossils in Ordovician marine rocks (between 430,000,000 and 500,000,000 years old). It is a useful guide, or index, fossil for Ordovician rocks and time.

echiurid (aquatic invertebrate): see spoon-worm.

Echmiadzin (city, Armenia): see Ejmiadzin.

Echo, in Greek mythology, a mountain nymph, or oread. Ovid's *Metamorphoses* relates that Echo offended the goddess Hera by keeping her in conversation, thus preventing her from spying on one of Zeus' amours. To punish Echo, Hera deprived her of speech, except for the ability to repeat the last words of another. Echo's hopeless love for Narcissus, who fell in love with his own image, made her fade away until all that was left of her was her voice.

According to the Greek writer Longus, Echo rejected the advances of the god Pan; he thereupon drove the shepherds mad, and they tore her to pieces. Gaia (Earth) buried her limbs but allowed her to retain the power of song.

Echo, either of two experimental communications satellites launched into orbit around the Earth by the National Aeronautics and Space Administration (NASA) during the 1960s. Consisting of aluminum-coated Mylar balloons that were inflated after launching, the Echo satellites were passive instruments—i.e., they simply reflected radio waves back to Earth rather than actively receiving, amplifying, and retransmitting them. Nevertheless, by proving the concept of relaying radio signals through space, they stimulated a great deal of interest in the development of active satellite communication.

Echo 1, launched on Aug. 12, 1960, inflated to a diameter of 100 feet (30 m). The satellite was placed in an almost circular orbit at an altitude of approximately 1,000 miles (1,600 km). At this height it circled the Earth every two hours. Echo 1 was used for experimental telephone, data, and facsimile transmissions. Signals were detected in Europe, although no messages were transmitted across the ocean. The satellite remained in orbit for almost eight years.

Echo 2, launched on Jan. 25, 1964, was 135 feet (about 40 m) in diameter. It was the focus of the first space venture involving cooperation between the U.S.S.R. and the United States. A radio signal transmitted from the Jodrell Bank Observatory, near Manchester, Eng., was reflected off Echo 2 and received at the Zimenki Observatory, near Gorky, Russia, U.S.S.R. (now Nizhny Novgorod, Russia).

echo sounder: see depth finder.

echocardiography, diagnostic technique that uses ultrasound (high-frequency sound waves) to produce an image of the internal structures of the heart. A piezoelectric transducer placed on the surface of the chest converts electrical impulses into a narrow ultrasonic beam that penetrates body tissues but is reflected off surfaces where a change in tissue density occurs. The reflected sound waves are detected by a receiver also placed on the chest, transformed back into electrical impulses, and projected on the screen of a cathode-ray oscilloscope. Echoes from varied depths produce an image of the walls and valves of the heart and of their motions. Such information can aid in diagnosing valve disease, congenital heart defects, and other cardiac abnormalities.

echoencephalography, method for detecting abnormalities within the cranial cavity, based on the reflection of high-frequency sound pulses delivered to the head through a probe held firmly to the scalp. The reflected pulses from the skin, brain ventricle, skull, and other head structures are recorded and amplified with a cathode-ray oscilloscope, giving a measure of the distance between the probe and the reflecting surfaces. The method is rapid, painless, and harmless; it is a good screening

test for mass-lesions causing brain shift and is well adapted for emergency examination of patients with brain hemorrhage. See also brain scanning.

echolocation, a physiological process for locating distant or invisible objects (such as prey) by means of sound waves reflected back to the emitter (such as a bat) by the objects. Echolocation is used for orientation, obstacle avoidance, food procurement, and social interactions.

Echolocation is known to be employed by most bats (all members of the suborder Microchiroptera and one genus, *Rousettus*, of the Megachiroptera); most, if not all, toothed whales and porpoises (*Odontoceti*), but apparently no baleen whales; a few shrews; and two kinds of birds, the oilbird (*Steatornis carpenensis*) of northern South America and certain cave swiftlets (*Collocalia*) of Southeast Asia.

Echolocation pulses consist of short bursts of sound at frequencies ranging from about 1,000 hertz in birds to at least 200,000 hertz in whales. Bats utilize frequencies from about 30,000 to about 120,000 hertz. The pulses are repeated at varying rates (often in a single individual, depending upon the situation) beginning at about one per second. The rate may reach several hundred per second (e.g., in a bat close to its target).

ēchos, plural **ēchoi**, melody type associated with early Byzantine liturgical chant. The eight *ēchoi* (hence, the collective *oktōēchos*) of the Byzantine system were probably derived from Syrian music, and the concept of *ēchos* is also found in Armenian, Russian, and Coptic chant. Tradition gives credit to St. John of Damascus (d. 749) for the invention of the eight Byzantine *ēchoi*, but the *oktōēchos* is mentioned already in an early 6th-century Syrian source.

Echternach, town, eastern Luxembourg. It lies along the Sûre River, at the German border, northeast of Luxembourg city. A vacation resort for Trier (Trèves) in Roman times, it developed around a Benedictine abbey founded in 698 by St. Willibrord. The church named for Willibrord dates from the 11th and 13th centuries, though its crypt, which contains the tomb of the saint, is somewhat older (c. 10th century). Other landmarks in Echternach are the 13th-century parish church of Saints Peter and Paul and the town hall (12th and 15th centuries), with a late Gothic colonnade (1520–30). Another notable structure is the 11th-century building that houses the Museum of Prehistory. A large portion of the town's medieval ramparts remains, and Roman ruins are also in evidence.

A busy resort and excursion centre, Echternach has mineral springs and is also an agricultural market and food-processing centre. Plastics are manufactured. Pop. (1991) 4,211.

Part of the town square of Echternach, during the annual dancing procession held in honour of St. Willibrord

Echuca, formerly HOPWOOD'S FERRY, city, northern Victoria, Australia. The name Echuca is derived from an Aboriginal term meaning "meeting of the waters," from the city's location at the junction of the Murray and Campaspe rivers. Founded in 1847 as a ferrying point, it developed as one of Victoria's largest inland river ports in the 1850s, handling wool, wheat, and timber. Echuca became a borough in 1865, but it lost its port functions in the 1870s and declined as railroads took over traffic. In 1972, however, work began on the restoration of the old port facilities as a museum and tourist attraction with restored river paddle steamers. Revived by the Goulburn River irrigation project, Echuca now serves (with the adjacent town of Moama across the Murray, in New South Wales) a large district that produces livestock, fruits, vegetables, tobacco, cotton, and timber. Secondary industries include sawmilling, flour milling, and butter, cordial, and ball-bearing manufacture. Rice mills are supplied from the Wakool-Tullakool area of New South Wales. Echuca was declared a city in 1965. Pop. (1993 est.) 9,960.

Ecija, city, Seville provincia, in the *comunidad autónoma* ("autonomous community") of Andalusia, southwestern Spain. It lies along the Genil River east of Seville. The city contains the Gothic-style Church of Santiago (15th century) and that of Santa Cruz on the site of a pre-Moorish cathedral, of which fragments survive. Originally named Astygi, the city was called Colonia Augusta Firma by the Romans and Estadja by the Moors. During the 16th and 17th centuries, it shared Seville's prosperity from the West Indian trade. Local products include soap, textiles, vegetable oil, and chocolate. Cereals, olives, and cotton are grown in the surrounding area, which is also known for horse breeding. Because of excessive summer heat, it is also called La Sartén ("The Frying Pan"). Pop. (1991 prelim.) 35,566.

Eck, Johann, original name JOHANN MAIER (b. Nov. 13, 1486, Egg, Swabia [Germany]—d. Feb. 10, 1543, Ingolstadt, Bavaria [Germany]), German theologian who was Martin Luther's principal Roman Catholic opponent.

Early in his career Maier adopted the name of his home village, Egg (or Eck), as his surname. He studied at the universities of Heidelberg, Tübingen, Cologne, and Freiburg im Breisgau. He was ordained to the priesthood in 1508 and became a doctor of theology in 1510. In that year he began a lifelong career as professor of theology at the University of Ingolstadt. Eck's early treatises attracted attention, among them one of the first theses (1514) attacking the medieval prohibition against charging interest on money.

Eck was friendly with Martin Luther until

the appearance in 1517 of the latter's Ninety-five Theses, which Eck assailed as heretical in a tract published in 1518. In the Leipzig disputation of 1519, Eck debated with Luther and his disciple, Andreas Karlstadt, on such topics as papal primacy and the infallibility of church councils. In 1520 Eck visited Rome, where he helped compose the papal bull *Exsurge Domine* (June 1520), in which Pope Leo X condemned 41 of Luther's theses and threatened the latter with excommunication. Leo X then commissioned Eck to publish and enforce the new papal bull throughout Germany.

Eck went on to write extensively in defense of papal authority and traditional doctrine. Traveling throughout Europe, he organized Roman Catholic opposition to German Protestantism, and he drafted the Catholic refutation (1530) of the Lutheran creed contained in the Augsburg Confession. He was the main Catholic polemicist in public debates with Reformers.

Eck was a prolific writer in Latin, and his works in that language are notable defenses of the Roman Catholic faith. His treatise entitled *Enchiridion Against the Lutherans* (1525) was a summary of contested Catholic beliefs, Protestant objections to them, and answers to these difficulties. The *Enchiridion* proved to be the most popular of Eck's works and went through 91 editions in various languages before 1600, making it the best-known Catholic polemical handbook of the 16th century. Eck's German-language translation of the Bible (1537) was largely unsuccessful, however.

ECKANKAR (ECK), a Westernized version of the Punjabi Sant Mat or Radha Soami Sat-sang spiritual tradition. It was founded in 1965 by Paul Twitchell (c. 1908–71).

The Sant Mat tradition was established by Param Sant Ji Maharaj (1818–78), who taught the yoga of the "Sound Current." He believed that the universe was created by sound waves emanating from the Divine and that, as the Divine Sound Current descended into the realm of matter, it became imprisoned. Humans, according to his teachings, are sparks of God trapped in a cycle of reincarnation who can return to God by listening to the Divine Sound and repeating the Divine Names. Practitioners of Sound Current yoga require the assistance of a master who has transversed the levels of reality between the world and God.

Twitchell was a student of Kirpal Singh, who claimed spiritual descent from Param Sant Ji Maharaj. Twitchell believed that Sound Current yoga had existed since antiquity and that his knowledge and his teaching authority stemmed not from Kirpal Singh but from an ancient lineage of ECK masters of which he was the 971st. He claimed that he was taught by two masters who were no longer in their bodies, Rabazar Tarzs and Sudar Singh.

Drawing on what he had learned but dropping the Indian cultural trappings, Twitchell offered students techniques that placed them in contact with the Divine Light and Sound. ECK departed from Sant Mat by multiplying the number of spiritual exercises and adding many more temporal concerns. Twitchell also rejected the Sant Mat ideal of ultimate oneness with God, suggesting that the goal of life is to become a "coworker" with God.

When Twitchell died in 1971, he was succeeded by Darwin Gross, who in 1981 passed his authority to Harold Klemp. Shortly after Klemp assumed authority, religious studies scholar David Christopher Lane charged that Twitchell had falsified much of his account of the origin of ECK. Klemp acknowledged some truth in Lane's accusations but asserted that the essential truth of ECK was unaffected. He then helped move ECK from San Francisco to suburban Minneapolis, Minn., where a headquarters and temple were built. By the late 1990s there were 367 ECK centres worldwide, of which 164 were in the United States. Estimates placed total membership at 50,000. (J.G.M.)

Eckener, Hugo (b. Aug. 10, 1868, Flensburg, Prussia [now in Germany]—d. Aug. 14, 1954, Friedrichshafen, W.Ger.). German aeronautical engineer and commander of the first lighter-than-air aircraft to fly around the world.

Eckener, 1931

By courtesy of the Staatsbibliothek Preussischer Kulturbesitz Bildarchiv, Berlin

As a member of the firm operated by Ferdinand, Count von Zeppelin, Eckener helped to develop the rigid airships of the early 1900s. During World War I, Eckener trained airship pilots and directed the construction of 88 Zeppelins for the German navy.

Returning to commercial construction in November 1918, after Zeppelin's death, Eckener succeeded in popularizing airship travel. He commanded the airship ZR-3 in its flight across the Atlantic Ocean in 1924. The ZR-3 (later named *Los Angeles*) had been built for the United States as a war reparations payment. Eckener commanded the *Graf Zeppelin* on its around-the-world flight in 1929 and on its polar-exploration flight in 1931.

Eckener was popular internationally but not within Adolf Hitler's government, which had relieved him of airship command prior to May 6, 1937, when the *Hindenburg*, successor to the *Graf Zeppelin*, burned at Lakehurst, N.J., with 36 casualties—a tragedy that ended international passenger airship flights. In 1938 Eckener was sent to the United States in an unsuccessful attempt to buy helium for German dirigibles, which had been using the dangerous hydrogen. He spent his last years as head of a machine factory.

Eckermann, Johann Peter (b. Sept. 21, 1792, Winsen, Hanover [now in Germany]—d. Dec. 3, 1854, Weimar, Prussia [now in Germany]), German writer, chiefly remembered as the assistant and close associate of the aging author J.W. von Goethe; his *Gespräche mit Goethe in den letzten Jahren seines Lebens, 1823–32*, 3 vol. (1836–48; "Conversations with Goethe in the Last Years of His Life"), is comparable in importance with James Boswell's *Life of Johnson*.

Reared in poverty, Eckermann served in the German war of liberation against Napoleon and became a clerk in the war department at

Eckermann, engraving after a drawing by Karl Eckermann, 1854

Bavaria-Verlag

Hanover, later studying for a year at Göttingen, from 1821 to 1822. At an early age Goethe became his idol. Eckermann published a book of poems in 1821 and in 1823 attracted Goethe's attention by sending him the manuscript of his *Beiträge zur Poesie mit besonderer Hinweisung auf Goethe* ("Helps Toward Understanding Poetry with Special Instructions on Goethe"), which contained appreciations of Goethe's work. Goethe invited Eckermann to Weimar, and he there gave up his ambition of becoming an original poet to become Goethe's unpaid literary assistant. Eckermann acted as tutor to the son of the grand duke of Saxe-Weimar-Eisenach and, in 1838, acquired an appointment at the Weimar court and the position of librarian.

Eckermann's *Gespräche* has been translated into every major European language. The first English translation, *Conversations with Goethe* (1839), was made by the American critic Margaret Fuller. Based on notes taken with Goethe's permission, Eckermann's *Conversations* are not mere records of interviews but an artistically selective arrangement of information on Goethe's life and thought. Eckermann also acted as Goethe's literary executor and published his posthumous works (1832–33) and, with F.W. Riemer, prepared the first complete edition of Goethe's works.

Eckert, J. Presper, Jr., in full JOHN PRES-PER ECKERT, JR. (b. April 9, 1919, Philadelphia, Pa., U.S.—d. June 3, 1995, Bryn Mawr, Pa.), American engineer and coinventor of the first general-purpose electronic computer, a digital machine that was the prototype for most computers in use today.

Eckert was educated at the Moore School of Electrical Engineering at the University of Pennsylvania, Philadelphia (B.S., 1941; M.S., 1943), where he and his professor, John W. Mauchly, made several valuable improvements in computing equipment. In 1946 the pair fulfilled a government contract to build a digital computer, which they called ENIAC (Electronic Numerical Integrator and Computer). In primitive form, ENIAC contained virtually all the circuitry used in present-day high-speed digital computers. It was used by the U.S. Army for military calculations.

In 1948 Eckert and Mauchly established a computer-manufacturing firm; a year later, they introduced BINAC (Binary Automatic Computer), which stored data on magnetic tape rather than on punched cards. Designed to handle business data, UNIVAC I (Universal Automatic Computer), Eckert and Mauchly's third model, found many uses in commerce and may have started the computer boom. Between 1948 and 1966 Eckert received 85 patents, mostly for electronic inventions.

Eckert remained at his company when it was acquired by Remington Rand, Inc., in 1950 and when that firm was, in 1955, merged into the Sperry Rand Corp. (later Unisys Corp.). Eckert was elected to the National Academy of Engineering in 1967 and was awarded the National Medal of Science in 1969.

Eckhart, MEISTER, English MASTER ECKHART, original name JOHANNES ECKHART, also called ECKHART VON HOCHEHEIM, Eckhart also spelled ECKEHART (b. c. 1260, Hochheim, Thuringia [now in Germany]—d. 1327/28?, Avignon, France), Dominican theologian who was the greatest German speculative mystic. In his sermons in German and Latin, he charts the course of union between the individual soul and God.

Eckhart entered the Dominican Order when he was 15 and studied in Cologne, perhaps under Albert the Great. In his mid-30s, Eckhart was nominated vicar (the main Dominican official) of Thuringia. Before and after this

assignment he taught theology at Saint-Jacques's priory in Paris. It was also in Paris that he received his master's degree (1302) and consequently was known as Meister Eckhart.

Eckhart wrote four works in German that are usually called "treatises." At about the age of 40 he wrote the *Talks of Instruction*, on self-denial, the nobility of will and intellect, and the obedience to God. In the same period, he faced the Franciscans in some famous disputations on theological issues. In 1303 he became provincial (leader) of the Dominicans in Saxony and, three years later, vicar of Bohemia. His main activity, especially from 1314, was preaching to the contemplative nuns established throughout the Rhine River valley.

The best-attested German work of this middle part of his life is the *Book of Divine Consolation*, dedicated to the Queen of Hungary. The other two treatises were *The Nobleman* and *On Detachment*. The teachings of the mature Eckhart describe four stages of the union between the soul and God: dissimilarity, similarity, identity, breakthrough. At the outset, God is all, the creature is nothing; at the ultimate stage, "the soul is above God." The driving power of this process is detachment.

1. Dissimilarity: "All creatures are pure nothingness." Whereas God inherently possesses being, creatures do not possess being but receive it derivatively. Outside God, there is pure nothingness. "The being (of things) is God." The "noble man" moves among things in detachment, knowing that they are nothing in themselves and yet aware that they are full of God—their being.

2. Similarity: Man detached from the singular (individual things) and attached to the universal (Being) discovers himself to be an image of God. Divine resemblance, an assimilation, then emerges: the Son, image of the Father, engenders himself within the detached soul. As an image, "thou must be in Him and for Him, and not in thee and for thee."

3. Identity: Eckhart's numerous statements on identity between God and the soul can be easily misunderstood. He never has substantial identity in mind, but God's operation and man's becoming are considered as one. God is no longer outside man, but he is perfectly interiorized. Hence such statements: "The being and the nature of God are mine; Jesus enters the castle of the soul; the soul's light is uncreated and cannot be created; the core of the soul and the core of God are one."

4. Breakthrough: To Eckhart, identity with God is still not enough; to abandon all things without abandoning God is still not abandoning anything. People must seek nothing, not even God. Such a thought leads man into the desert, anterior to God. For Eckhart, God exists as "God" only when the creature invokes him. Eckhart calls "Godhead" the origin of all things that is beyond God (God conceived as Creator). "God and the Godhead are as distinct as heaven and earth." The soul is no longer the Son. The soul is now the Father: it engenders God as a divine person. "If I were not, God would not be God." Detachment reaches its conclusion in the breakthrough beyond God. If properly understood, this idea is genuinely Christian: it retraces, for the believer, the way of the Cross of Christ.

These teachings are to be found in his Latin works too. But the Latin *Sermons, Commentaries on the Bible, and Fragments* do not reveal the originality of his thought. Nevertheless, Eckhart enjoyed much respect even among scholars. In his 60th year he was called to a professorship at Cologne. Heinrich von Virneburg—a Franciscan, unfavourable to Dominicans—was the archbishop there, and it was before his court that the now popular Eckhart was first formally charged with heresy. To a list of errors, he replied by publishing a Latin

Defense and then asked to be transferred to the pope's court in Avignon. When ordered to justify a new series of propositions drawn from his writings, he declared: "I may err but I am not a heretic, for the first has to do with the mind and the second with the will!" Before judges who had no comparable mystical experience of their own, Eckhart referred to his inner certainty: "What I have taught is the naked truth." The bull of Pope John XXII, dated March 27, 1329, condemns 28 propositions extracted from the two lists. Since it speaks of Eckhart as already dead, it is inferred that he died some time before, perhaps in 1327 or 1328. It also says that Eckhart had retracted the errors as charged.

Although Eckhart's philosophy amalgamates Greek, Neoplatonic, Arabic, and Scholastic elements, it is unique. His doctrine arises from one simple, personal mystical experience to which he gives a number of names. By doing so, he was also an innovator of the German language, contributing many abstract terms. In the second half of the 20th century, there was great interest in Eckhart among some Marxist theorists and Zen Buddhists.

(R.Sch.)

Eckhel, Joseph Hilarius (b. Jan. 13, 1737, Enzersfeld, Austria—d. May 16, 1798, Vienna), Austrian numismatist whose classification of coins by region, chronology, and type became the standard for later systems.

Eckhel was educated at the Jesuit gymnasium in Vienna, where he had entered the Jesuit order. He taught grammar at various schools, but because of poor health he gave up teaching to devote himself to numismatics. In 1772 he was sent to Italy, where he had access to coin collections in Bologna, Rome, and Florence. From 1775 he was professor of antiquities and numismatics at the University of Vienna and curator of the Austrian imperial collection of coins. His great work, through which he founded the science of numismatics, was *Doctrina numorum veterum*, 8 vol. (1792–98; "Knowledge of Ancient Coins").

Eckhof, (Hans) Konrad (Dieterich): see Ekhof, (Hans) Konrad (Dieterich).

Eckmühl, Louis-Nicolas Davout, Prince d': see Davout, Louis-Nicolas.

Eckstine, Billy, original name WILLIAM CLARENCE ECKSTEIN (b. July 8, 1914, Pittsburgh, Pa., U.S.—d. March 8, 1993, Pittsburgh), American singer and bandleader who achieved great success while fostering the careers of a number of younger jazz musicians.

Eckstine left Howard University after winning an amateur contest in 1933 and began singing in nightclubs and with dance bands. From 1939 to 1943 he sang with Earl Hines's band, and at his urging Hines hired such newcomers as Sarah Vaughan, Dizzy Gillespie, and Charlie Parker. In 1944 Eckstine formed his own band, which gave strong impetus to the new bebop style by featuring the talents of Gillespie, Parker, Miles Davis, Fats Navarro, Gene Ammons, and others. From 1947 on Eckstine was a successful popular singer; among his recordings were "Caravan," "Prisoner of Love," and "That Old Black Magic."

eclampsia: see preclampsia and eclampsia.

eclecticism (from Greek *eklektikos*, "selective"), in philosophy and theology, the practice of selecting doctrines from different systems of thought without adopting the whole parent system for each doctrine. It is distinct from syncretism—the attempt to reconcile or combine systems—inasmuch as it leaves the contradictions between them unresolved. In the sphere of abstract thought, eclecticism is open to the objection that insofar as each system is supposed to be a whole of which its various doctrines are integral parts, the arbitrary juxtaposition of doctrines from different systems risks a incoherence. In practical affairs the eclectic spirit has much to commend it.

A philosopher, no less than a statesman, may be eclectic not on principle but because he perceives the intrinsic merit of doctrines that happen to have been advanced by opposite parties. This tendency is naturally most apt to manifest itself when established systems are losing their novelty or revealing their defects as changes of historical circumstance or scientific knowledge occur. From the beginning of the 2nd century BC, for instance, a number of philosophers professing to be attached to long-established schools were ready to adopt views from other schools; and Roman philosophers, in particular, to whom all Greek philosophies were enlightening, often avoided partisan commitments. (Cicero was the eclectic par excellence.) It is pointless to group the numerous ancient eclectics together as if they formed an eclectic school. In 19th-century France, however, Victor Cousin, a proponent of Scottish metaphysics, adopted the name *éclectisme* as a designation for his own philosophical system.

eclipse, in astronomy, complete or partial obscuring of a celestial body by another. An eclipse occurs when three celestial objects become aligned.

A brief treatment of eclipses follows. For full treatment, see MACROPAEDIA: Eclipse, Occultation, and Transit.

Eclipse phenomena are of two distinctly different types. In the first, the eclipsing body comes between an observer and the eclipsed object; the latter appears to the observer totally or partly covered by the eclipsing object. Eclipses of the Sun, occultations of stars by the Moon, transits of Venus or Mercury across the Sun's disk, and eclipses of binary stars are of this kind. Eclipses of the second type affect only planets or natural satellites that are not self-luminous. In this case, the eclipsing body intervenes between the Sun and the eclipsed object. The latter remains in view of the observer, but its illumination by the Sun is interrupted, and it becomes darkened by entering into the shadow of the eclipsing object. Examples of this kind of eclipse phenomenon are eclipses of the Moon.

Solar and lunar eclipses have long been of interest, because they are readily observable to the unaided eye and offer an impressive spectacle. Accounts of such eclipses are found among the oldest records of history, and the successful prediction of eclipses constitutes one of the earliest achievements of the scientific investigation of nature.

Solar eclipses. A solar eclipse occurs when the Moon, revolving in its orbit around the Earth, moves across the disk of the Sun so that the shadow of the Moon sweeps over the face of the Earth. No sunlight penetrates the umbra, the inner part of the shadow. To observers on the Earth within the umbra, the disk of the Sun will appear completely covered by that of the Moon. Such a solar eclipse is said to be total. Because the umbra is narrow at its intersection with the Earth, a total eclipse can be observed only within a very narrow area—the zone of totality. Furthermore, because of the relative motion of the bodies, the conical shadow moves rapidly over the terrestrial surface; the totality of the solar eclipse thus lasts only a short time (less than eight minutes at any one place on the Earth). To observers located within the penumbra, the outer portion of the Moon's shadow, the disk of the Moon will appear to be projected against the Sun so as to overlap it in part. This gives rise to a partial solar eclipse. Because the Earth revolves around the Sun in an elliptical orbit, the distance of the Sun changes slightly during the course of a year. Similarly, the apparent size of the lunar disk changes to some degree during a month because of the elliptical shape of the Moon's orbit. If an eclipse occurs when the Sun is closest to the Earth and the Moon is farthest away, the Moon will not completely cover the Sun, thereby leaving the rim of the

latter all around it. This form of eclipse is known as an annular eclipse.

Eclipses of the Sun occur two to four times a year. In rare instances, more may occur, as in 1935, when there were five solar eclipses.

Partial solar eclipses yield little information of astronomical interest. Total eclipses, on the other hand, have contributed much knowledge about the nature of the chromosphere and corona, the thin external layers of the Sun that are usually lost in the brilliant glare from the shining solar surface (the photosphere). At total eclipse the Moon acts as a screen outside the Earth's atmosphere, cutting off the direct rays from the photosphere. The brilliance of the sky is decreased greatly, and the fainter appendages of the Sun become visible. The astronomical value of eclipse observation has decreased in recent years, largely as a result of the invention of the coronagraph. This instrument obscures the photosphere artificially and thereby makes it possible for investigators to conduct studies of the solar chromosphere and corona without waiting for eclipses to occur.

Lunar eclipses. A lunar eclipse occurs when the Moon travels through the shadow of the Earth and loses its bright illumination by the Sun. It can occur only at the time of the full Moon (*i.e.*, when the Moon is directly opposite the Sun), because the Earth's shadow is directed away from the Sun. A lunar eclipse can be seen from any place on the Earth where the Moon is above the horizon. Such an eclipse can be total, partial, or penumbral, depending on the Moon's position. If the Moon passes through the centre of the Earth's umbra, a total lunar eclipse occurs. Totality may extend up to 100 minutes, with the entire eclipse lasting about 3½ hours. A partial lunar eclipse is observable when only a part of the Moon passes through the umbra. The penumbral variety occurs when the Moon moves solely through the outer part of the shadow. Lunar eclipses generally occur twice a year. In some years, however, there may be none, whereas in others, one or possibly three may take place.

Lunar eclipses are of limited value for astronomical research. They have enabled scientists to study the reactions of materials on the Moon's surface to the sudden removal of solar radiation. The results of this research have led to a better understanding of the structure and heat conductivity of lunar soil.

Other eclipse phenomena. From the Earth, the Moon appears against a background of distant stars. As the Moon moves eastward across the constellations, it occasionally passes in front of one of the brighter stars or a planet, causing an occultation. At the moment when the eastern limb of the Moon reaches a star, the latter suddenly disappears (immersion). In about an hour or less, the Moon will have passed over the star and the star will reappear at the western limb (emersion). Accurately timed observations of occultations are used to study the orbital motion of the Moon. Measurements of the time required for a star to disappear also provide information about the diameters of the stars.

The two planets Mercury and Venus, which are closer to the Sun than is the Earth, occasionally pass between the Earth and the Sun. At such a time, either of these planets appears as a small, dark circular disk projected on the brilliant disk of the Sun, crossing it slowly. Transits of Venus have been of considerable importance for accurately determining the solar parallax.

Eclipsing binaries are double-star systems consisting of two stellar bodies that revolve around one another in an orbit whose plane nearly passes through the solar system. Thus, one star passes periodically in front of or behind the other as seen from the Earth, and two eclipses take place during each revolution. From the way in which the light from the

binary system varies, it is possible to calculate the orbit and relative sizes of the two components.

eclipsing variable star, pair of stars revolving about their common centre of mass in an orbit whose plane passes through or very near the Earth. An observer on the Earth thus sees one member of the binary pass periodically over the face of the other and diminish its light through an eclipse. The star Algol was the first recognized as an eclipsing binary, by John Goodricke, in 1782. Several thousand are now known. By comparing the observed duration of the eclipse to the period of the orbit, as determined spectroscopically, astronomers can find the diameters of the stars relative to the size of their orbits, and from this they can calculate the densities of the stars. *See also* variable star; binary star.

ecliptic, in astronomy, the great circle that is the apparent path of the Sun among the constellations in the course of a year; from another viewpoint, the projection on the celestial sphere of the orbit of the Earth around the Sun. The constellations of the zodiac are arranged along the ecliptic. The ecliptic is inclined about 23½° to the plane of the celestial equator; the two points of intersection of the ecliptic and the plane mark the vernal and autumnal equinoxes.

In the ecliptic system of astronomical coordinates, celestial longitude is measured in degrees east from the vernal equinox along the ecliptic. Celestial latitude is measured in degrees north (positive) or south (negative) from the ecliptic to the ecliptic poles. Each ecliptic pole is 23½° from the corresponding celestial pole.

Ecloga (from Greek *eklogē*, "selection"), compilation of Byzantine law issued in 726 by Emperor Leo III the Isaurian in his name and that of his son Constantine. It is the most important Byzantine legal work following the 6th-century Code of Justinian.

Leo issued the law code in Greek instead of the traditional Latin, so that it could be understood by more people and utilized by judges as a practical legal manual. Though the Ecloga continued to be based on Roman law, Leo revised it in the spirit of "greater humanity" and on the basis of Christian principles.

In civil law the rights of women and children were enhanced at the expense of those of the father, whose power was sharply curtailed. In criminal law the application of capital punishment was restricted to cases involving treason, desertion from the military, and certain types of homicide, heresy, and slander. The code eliminated the death penalty for many crimes previously considered capital offenses, often substituting mutilation. Equal punishment was prescribed for individuals of all social classes. In an attempt to eliminate bribery and favoritism, the code provided salaries for officials in judicial service and forbade the acceptance of gifts.

The Ecloga had a strong influence on later Byzantine legislation as well as on the development of law in the Slavic countries beyond the Byzantine frontiers.

eclogite, any member of a small group of igneous and metamorphic rocks whose composition is similar to that of basalt. Eclogites consist primarily of green pyroxene (omphacite) and red garnet (pyrope), with small amounts of various other stable minerals—*e.g.*, olivine and diopside. They are formed when volcanic or metamorphic rocks rich in such mafic minerals are subjected to extremely high pressures and moderate to relatively high temperatures. Laboratory experiments have revealed that eclogites will crystallize from basaltic magma under very high pressure conditions common to the deeper portions of the Earth's upper mantle, the mantle constituting the layer that lies between the crust and core

and that comprises about two-thirds of the planet's bulk. Many investigators believe that eclogite is representative of numerous parts of the upper mantle. In the crust eclogites generally occur as xenoliths (*i.e.*, foreign inclusions) in igneous rocks and as isolated blocks measuring as much as 100 m (328 feet) across in metamorphic rocks. Interestingly, eclogites somewhat resemble chondritic meteorites in composition (*see* chondrite).

eclogue, a short pastoral poem, usually in dialogue, on the subject of rural life and the society of shepherds, depicting rural life as free from the complexity and corruption of more civilized life. The eclogue first appeared in the *Idylls* of the Greek poet Theocritus (c. 310–250 bc), generally recognized as the inventor of pastoral poetry. The Roman poet Virgil (70–19 bc) adopted the form for his 10 *Eclogues*, or *Bucolics*.

The eclogue, along with other pastoral forms, was revived during the Renaissance by the Italians Dante, Petrarch, Boccaccio, and Battista Spagnoli (Mantuanas), whose neo-Latin *Eclogues* (1498) were read and imitated for more than a century.

Edmund Spenser's series of 12 eclogues, *The Shepherdes Calender* (1579), is considered the first outstanding pastoral poem in English. By the 17th century less formal eclogues were written by such poets as Richard Lovelace, Robert Herrick, and Andrew Marvell. Marvell's "Nymph Complaining for the Death of her Fawn" (1681) climaxed the eclogue tradition of combining rural freshness with learned imitation. In the 18th century English poets began to use the eclogue for ironic verse on nonpastoral subjects, such as Jonathan Swift's "A Town Eclogue. 1710. Scene, The Royal Exchange."

The poets of the Romantic period rebelled against the artificiality of the older pastoral, and the eclogue fell from favour. The form has occasionally been revived for special purposes by modern poets, as in Louis MacNeice's ironic eclogues in his *Collected Poems, 1925–1948* (1949). *See also* idyll.

Eco, Umberto (b. Jan. 5, 1932, Alessandria, Italy), Italian literary critic, novelist, and semiotician (student of signs and symbols).

After receiving a Ph.D. from the University of Turin (1954), Eco worked as a cultural editor for Italian Radio-Television and also lectured at the University of Turin (1956–64). He then taught in Florence and Milan and finally, in 1971, assumed a professorial post at the University of Bologna. His initial studies and researches were in aesthetics, his principal work in this area being *Opera aperta* (1962; rev. ed. 1972, 1976; *The Open Work*), which suggests that in much modern music, Symbolist verse, and literature of controlled disorder (Franz Kafka, James Joyce) the messages are fundamentally ambiguous and invite the audience to participate more actively in the interpretive and creative process. From this work he went on to explore other areas of communication and semiotics in such volumes as *A Theory of Semiotics* (1976) and *Semiotics and the Philosophy of Language* (1984), both written in English. Many of his prolific writings in criticism, history, and communication have been translated into various foreign languages.

His fantasy novel *Il nome della rosa* (1981; *The Name of the Rose*)—in story, a murder mystery set in a 14th-century Italian monastery but, in essence, a questioning of "truth" from theological, philosophical, scholarly, and historical perspectives—became an international best-seller. A film version, directed by Jean-Jacques Annaud, appeared in 1986.

École des Beaux-Arts: *see* Beaux-Arts, École des.

École Polytechnique (French: "Polytechnic School"), engineering school located originally in Paris but, since 1976, in Palaiseau, Fr., and directed by the Ministry of Defense. It was established in 1794 by the National Convention as the *École Centrale des Travaux Publics* ("Central School of Public Works") under the leadership of Lazare Carnot and Gaspard Monge. It took its present name in 1795 and absorbed the state artillery school in 1802. Originally under the direction of the Ministry of the Interior, it was transformed into a military school by Napoleon (1804). In the past, most graduates became technical officers in the military forces; today most go into government service or business. There are faculties of mathematics, mechanical engineering, physics, chemistry, economics, and humanities and social sciences.

École Spéciale Militaire de Saint-Cyr: *see* Saint-Cyr.

ecology, also called **BIOECOLOGY**, **BIONOMICS**, or **ENVIRONMENTAL BIOLOGY**, study of the relationships between organisms and their environment.

A brief treatment of ecology follows. For full treatment, *see* **MACROPAEDIA: Biological Sciences, The**.

Ecological studies may focus on the relationships between individual organisms and the physical and chemical features of their environment (physiological ecology). Ordinarily, the tolerance of an organism to a range of factors (*e.g.*, salinity or temperature) is measured in the laboratory. Attempts are then made to relate these results to the distribution of the organism in natural conditions. An ecologist may study the behaviour of individuals. Among the characteristics studied would be the food-gathering techniques of individuals, the survival adaptations against predation, and mating. This area is often referred to as behavioral ecology. An equivalent study of plants would measure the response of the form of the plant to environmental change.

Population ecology is the study of the processes that affect the distribution and abundance of animal and plant populations. The first step is to describe the population. In order to do this, the birth rate, death rate, and rates of immigration and emigration are measured. Fluctuations in the numbers of a particular species, proportions of various species in a population, and predator-prey relationships are all factors that influence population.

An essential component of population ecology is the study of population genetics (ecological genetics), which deals with the behaviour of genes in natural populations. Among areas studied are the change of gene frequencies in nature, the operation of natural selection on genetic characteristics, and the occurrence of polymorphism in species. These problems are studied in theoretical model systems, in the laboratory, and in field populations.

Community ecology is the study of the organization and functioning of communities, which are assemblages of interacting populations of the species living within a particular area or habitat. Ecologists study the ranges of species and why some occupy a larger niche than others, the stability of communities and what factors affect it, the influence of a particular component (*e.g.*, carnivores) within a community, the nutrient cycle, and the influence of climate, as well as many other variables. Sophisticated techniques are available for the description and classification of the different associations of species that compose a community. These techniques are especially well-developed for plant communities (phytosociology). Studies show that the structure of communities can change with time, often in a directional way, known as succession. A

community can be viewed as a complex machine that processes energy and nutrients. To study this machine, it is necessary to describe the food web and trace the flow of energy and nutrients through it, from the primary producers (green plants) through the herbivores, carnivores, and decomposers. One of the principles of community ecology is that the more diverse the community and the more complex the food web, the greater stability for the community.

A further important area of ecology is paleoecology—the study of the ecology of fossil organisms. The theory and techniques used in studying present-day organisms are applied to populations and communities of the past.

Ecologists frequently concentrate on particular taxonomic groups, so that there are fields of plant ecology or, more narrowly, insect ecology or the ecology of large mammals. Alternatively, ecologists may study particular environments—*e.g.*, the seashore or tropical rain forest. In applied ecology, basic ecological principles are applied to the management of populations of crops and animals, so that yields can be increased and the impact of pests reduced. Applied ecologists also study the effect of humans on their environment and on the survival of other species. Theoretical ecologists provide simulations of particular practical problems (*e.g.*, the effects of fishing on fish populations) and develop models of general ecological relevance.

econometrics, the statistical and mathematical analysis of economic relationships. Such information is used by governments to set economic policy, as well as by private business to make decisions on prices, inventory, and production.

Early econometric studies attempted to quantify the relationship between the price of a commodity and the amount sold. In theory, demand by individual consumers of particular goods and services depends on their incomes and on the relative prices of items that they intend to buy. Changes in prices and income are expected to have fairly predictable effects on the quantities sold.

Early econometricians used market statistics compiled over time to study the relationship between changes in price and demand. Others used family-budget statistics broken down by income level to estimate relationships between income and expenditure. Such studies show which commodities are elastic in demand (*i.e.*, have sales relatively responsive to changes in their prices) and which are inelastic (have sales less responsive to price changes).

On the producer side, econometric analysis examines production functions, cost functions, and supply functions. The production function is a mathematical expression of the technical relationship between the output of a firm and its various inputs (or factors of production). The earliest statistical analyses of the production function tested the theory that labour and capital are reimbursed according to their marginal productivities—*i.e.*, the amounts added to production by the "last" man hired or the "last" unit of capital employed. Later work implies that the wage rate, adjusted for price changes, is related to labour productivity.

Work in the field of cost functions originally tested the theory that marginal cost—the addition to total cost resulting from an increment in output—first declines as production expands but ultimately begins to rise. Econometric studies, however, indicate that marginal cost often remains more or less constant.

Work in estimating supply functions has been confined mostly to agriculture. Here the problem is to distinguish the effects of exogenous factors, such as temperature, rainfall, and pestilence, from those of endogenous factors, such as changes in prices and inputs.

Observations in many societies over many generations indicate that a small proportion of the population receives most of the income. Attempts have been made to describe this statistical regularity in mathematical terms as well as to explain why the distribution of income is so consistent. Distributional measures are frequently important in analyzing the effect of income inequality on aggregate demand.

After the mid-1930s the development of national income accounting and of macroeconomic theory opened the way for macroeconomic model building, involving attempts to describe an entire economy in mathematical and statistical terms.

A model developed by L.R. Klein and A.S. Goldberger in the United States after World War II was the forerunner of a large family of macroeconomic models. It was constructed on an annual basis and has been elaborated upon in a form known as the Michigan model. A later generation of models, based on quarterly data, permits the analysis of short-term movements of the economy and also permits the better estimation of the lags between different variables.

A model jointly constructed by the U.S. Federal Reserve Board, the Massachusetts Institute of Technology, and the University of Pennsylvania is specially designed to handle the entire monetary sector. It has a large number of financial equations with a detailed lag structure and supplementary equations to show the main directions of monetary influence on the economy.

Similar models have been developed in a number of advanced industrial countries, and many models have been constructed for developing economies as well.

A major purpose in the development of macro models has been to improve economic forecasting and the analysis of public policy. Models have also been applied to the analysis of economic fluctuations and economic growth.

Economic and Social Council (ECOSOC), one of the principal organs of the United Nations, responsible for the direction and coordination of the economic, social, humanitarian, and cultural activities carried out by the specialized agencies of the UN. The council was established by the UN charter, which was amended in 1965 to increase the membership of the council (which is elected by the UN General Assembly) from 18 to 27. In 1974 membership was further increased to 54.

Economic Community of West African States (ECOWAS), African organization established by the Treaty of Lagos in May 1975 to promote economic trade, cooperation, and self-reliance. The organization seeks to harmonize agricultural policies and to facilitate the free movement of peoples, services, and capital between members. The original 15 members were Benin, Côte d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, Togo, and Upper Volta (now Burkina Faso). Cape Verde joined in 1977.

ECOWAS contains four specialized commissions: (1) trading, customs, immigration, and monetary payments; (2) industry, agriculture, and natural resources; (3) transportation, telecommunications, and energy; (4) social and cultural affairs.

Economic Co-operation and Development, Organisation for (OECD), international organization founded in 1961 to stimulate economic progress and world trade. Members in the 1980s included Australia, Austria, Belgium, Canada, Denmark, Finland, France, the Federal Republic of Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, The Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland,

Turkey, the United Kingdom, and the United States.

The convention establishing the OECD was signed on Dec. 14, 1960, by 18 European countries, the United States, and Canada and went into effect on Sept. 30, 1961. It represented an extension of the Organisation for European Economic Co-operation (OEEC), set up in 1948 to coordinate efforts in restoring Europe's economy under the Marshall Plan. One of the fundamental purposes of the OECD is to achieve the highest possible economic growth and employment and a rising standard of living in member countries; at the same time it emphasizes maintaining financial stability. The organization has attempted to reach this goal by liberalizing international trade and the movement of capital between countries. A further major goal is the coordination of economic aid to developing countries.

Lacking the power to enforce its decisions, the OECD was essentially a consultative assembly which pursued its program through moral suasion, conferences, seminars, and numerous publications. Its staff, based in Paris, came to more than 1,000 persons. Although the rule of unanimity inhibited its impact, the OECD was considered to have had a significant influence as an advisory body. Maintaining contact with many governmental and international agencies, such as the International Monetary Fund and the General Agreement on Tariffs and Trade, the organization became a clearinghouse for a vast amount of economic data. It published over 10,000 pages annually on a variety of subjects. The range of its interests may be indicated by its published works on general statistics, agriculture, scientific research, capital markets, tax structures, energy resources, lumber, air pollution, educational development, and development assistance. Its bimonthly magazine, *The OECD Observer*, constituted a useful source of information on economic and related social matters. Annual evaluations of individual member countries' economies were also issued.

economic development, the process whereby simple, low-income national economies are transformed into modern industrial economies. Although the term is sometimes used as a synonym for economic growth, generally it is employed to describe a change in a country's economy involving qualitative as well as quantitative improvements. The theory of economic development—how primitive and poor economies can evolve into sophisticated and relatively prosperous ones—is of critical importance to underdeveloped countries, and it is usually in this context that the issues of economic development are discussed.

A brief treatment of economic development follows. For full treatment, see *MACROPAEDIA: Economic Growth and Planning*.

As is the case with many concepts in economics, there is no clear-cut agreement on what constitutes underdevelopment. In broad terms, however, it is generally accepted that the level of national per capita income is a good indicator of a country's prosperity and, therefore, of the level of its economic development. There are, however, very significant differences among developing countries that make it difficult to draw broad general conclusions about the reasons for their underdevelopment and the most effective methods of transforming their economies.

Some generalizations, nevertheless, are necessary to illustrate basic principles. As a rule, theories of economic development assume that existing differences in income levels between the developed and underdeveloped nations are not primarily the result of conditions outside man's control (e.g., natural resources, climate, etc.). It follows from this that all countries have the potential to attain developed status. The task, then, of development economics is to determine how this potential can best be re-

alized. This, in turn, involves the study of the principal causes and symptoms of underdevelopment. Despite the wide differences among developing countries, they share a number of characteristics. In most underdeveloped countries, primary (agricultural or extractive) production accounts for a very large proportion of national income, and, not infrequently, a disproportionate share is taken by one or two products. The level and range of secondary industrial activities tend to be very low and marked by poor technological development. Most of these countries have large quantities of surplus labour, considerable unemployment or underemployment, and fairly high rates of population growth. Another common feature is inadequate infrastructure—poor road and transportation networks, lack of sufficient irrigation, etc. Equally important are the underdevelopment of human resources in terms of skills and education and the weakness of economic and financial institutions.

Development policies followed by developed and underdeveloped nations alike since World War II have largely concentrated on changing these conditions by injecting missing elements into the economies in question. The most visible manifestation of this approach was the building of whole new industrial sectors in the belief that this would not only reduce underdeveloped countries' dependence on a limited number of primary products but would also raise their technological resources and incomes. Since domestic capital resources were generally inadequate for such large industrialization programs, large amounts of foreign funds were introduced in the form of either foreign investment or governmental loans or grants. As a result, many developing countries have seen considerable industrial development since the 1950s. Large sums of domestic and foreign capital were also injected into infrastructural development, and considerable attention was devoted to programs designed to increase the number and quality of skilled and trained personnel. At the same time, developed countries came under considerable pressure to take steps to make the world trading system more helpful to developing countries; such steps included measures to lessen fluctuations in the prices of a number of primary commodities and to provide preferential treatment for exports of manufactured goods from the newly established industries of developing economies.

Although there is little doubt that these policies have assisted economic growth, the overall results are generally regarded as disappointing. The initial emphasis on industrialization often led to the development of sophisticated manufacturing plants that could not be operated efficiently for lack of trained personnel or a sufficiently large and reliable domestic or export market. Furthermore, because such industries are capital- rather than labour-intensive, they did not have a significant employment-creating effect. Another consequence was that, by diverting resources into large-scale industrial projects (and also into such prestige infrastructural developments as superhighways and large airports), the more traditional areas of the economy, on which a large majority of the people depended, were starved for funds and saw little development. Crash programs in education not infrequently resulted in large numbers of highly qualified persons whom the economy could not absorb at an appropriate level. Another serious and continuing problem has been the failure to reduce high rates of population growth.

In sum, although the non-oil-exporting developing countries recorded reasonably good growth in national income during the 1970s, rapid population growth reduced growth in per capita income to a very modest level. At the same time, many developing countries continued to face serious structural imbalances in their economies accompanied by high unem-

ployment, balance of payment deficits, and a growing level of foreign indebtedness. It is now generally accepted that the attempt to reproduce the structure of developed economies in underdeveloped countries by means of large capital investment programs is not the most efficient means of achieving development. In fact, there is a growing consensus that rather less ambitious plans (in both size and technological content) aimed at exploiting the specific resources and natural advantages enjoyed by developing countries can lead to a faster and socially much less disruptive economic development.

economic forecasting, the prediction of future economic activity and developments. Forecasting of this nature has grown rapidly since the 1930s, largely in response to the increasing unpredictability of the economic situation, a greater involvement of governments in economic affairs, which requires the preparation of economic plans and projections, and rapid improvement in the quality and coverage of economic statistics and forecasting techniques. There is a vast array of forecasts available, ranging from short-term predictions for specific economic variables (such as interest rates) or of demand for individual products (such as steel or automobiles) to medium- and long-term forecasts of the economy as a whole. Despite their lack of certainty, such forecasts are widely used in business, government, and private affairs to help in formulating policies, strategies, legislation, and long-term plans.

A brief treatment of economic forecasting follows. For full treatment, see *MACROPAEDIA: Economic Growth and Planning*.

A useful distinction can be made between macro- and micro-economic forecasts. Macroeconomic forecasts are designed to predict the future course of the entire economy or of specific broad economic variables, whereas microeconomic forecasting is designed to project the likely development of particular economic sectors such as one industry, commodity, or firm. The best known and most widely used form of macroeconomic forecast is that of national income or gross national product (GNP). This predicts, in numerical terms, the major components of a country's economic activity—private consumption, government expenditure, private and public investment, and the balance of exports and imports. All countries devote significant resources to this type of forecasting, typically on a one- to five-year basis. These forecasts are used for a number of different purposes. Governments use them to determine future economic strategy and to predict other variables of the economy such as the likely level of inflation, industrial output, employment, etc. Based on such a forecast, the effects of various proposed government actions (a cut in taxation or an increase in government expenditure, for example) can be tested before official policy is finalized.

Macroeconomic forecasts are also used outside government as a basis for producing more detailed projections of the main components of the economy and in the preparation of microeconomic forecasts. By studying the overall forecast of private consumption, for example, a retailer might, by referring to established patterns of spending, predict the amount that is likely to be spent on foodstuffs and nonfood products and then, working in the microeconomic forecasting area, attempt to determine future expenditures in specific product categories. Similarly, an automobile manufacturer will attempt to predict demand for his product by looking at the predicted level of and trends in disposable incomes and consumption and predictions of interest and exchange rates. He will also forecast production costs from the trend of wage increases and inflation. In gen-

eral, most microeconomic forecasting starts with some forecast or assumption about the economy as a whole that is then modified or analyzed into its components in light of special factors and considerations applicable to a particular product, industry, or other concern.

Forecasts range from one month to 10 years or more. However, largely owing to the economic shocks of the last 20 years (e.g., the quadrupling of oil prices in 1972), there has been a trend away from highly numerical long-term forecasts in favour of indications of the broad direction of economic developments, based on both statistical evidence and more or less subjective judgments on such basic aspects of the economy as population growth, technological progress, and social changes. A set of long-term forecasts may be made to indicate the likely outcomes of several different but equally plausible assumptions in a technique often called scenario building.

The techniques of economic forecasting have developed rapidly in recent decades. This in part reflects the growing understanding of the ways in which numerous economic variables affect each other. Equally important reasons are the better availability of good statistics and the development of computer methods for processing large amounts of data. Computer capacity has made possible the practical development of mathematical models of the economy through which it is possible to explore the relationships between the key determinants of the economic system with a speed and to a degree of detail that were not possible before. Most governments and large forecasting organizations use computers in this technique known as econometric forecasting.

economic geology, scientific discipline concerned with the distribution of mineral deposits, the economic considerations involved in their recovery, and an assessment of the reserves available.

Economic geology deals with metal ores, fossil fuels (e.g., petroleum, natural gas, and coal), and other materials of commercial value, such as salt, gypsum, and building stone. It applies the principles and methods of various other fields of the geologic sciences, most notably geophysics, structural geology, and stratigraphy (*qq.v.*). Its chief objective is to guide the exploration for mineral resources and help determine which deposits are economically worthwhile to mine. Specialists in economic geology often assist in the extraction of the mineral commodities as well.

economic growth, the process by which a nation's wealth increases over time. Although the term is often used in discussions of short-term economic performance, in the context of economic theory it generally refers to an increase in wealth over an extended period. The term is also generally applied to developed economies. Increases in wealth in underdeveloped economies are discussed in the article economic development (*q.v.*).

A brief treatment of economic growth follows. For full treatment, see MACROPAEDIA: Economic Growth and Planning.

There are two main difficulties in discussing economic growth. The first is that, although there is considerable agreement on the main ingredients and conditions of growth, there are major differences among economists as to how these ingredients interact. The second problem is that there is no consensus on what precisely constitutes economic growth. Although the real rate of growth in a country's total output of goods and services (measured by gross national product, adjusted for inflation) is the most widely used yardstick, there are those who argue that national income per capita, consumption per capita, or some other measure is the most appropriate.

Economists and economic historians have long attempted to understand the process of economic growth and the reasons for marked differences in the growth rates of different countries. The aim has been to develop economic models to indicate the best ways of maximizing economic growth. As early as the 18th century Adam Smith attempted to define how and why the economy works, placing considerable emphasis on the role of labour and the operation of unrestricted market forces. More recently economists have developed different theories. W.W. Rostow argued that the process can be divided into stages—the traditional (largely agricultural) stage; a transitional stage, in which the human and technological conditions for a rapid advance are established; the take-off stage of rapid growth; and a mature stage marked by large-scale production and mass consumption. Other analysts have attempted to explain growth in terms of a nation's development from primary (agricultural) through secondary (manufacturing) to tertiary (service) production. A number of theories concentrate on the effects of changes in one or another of the major inputs of productive economies: labour, capital, technological change, and entrepreneurship.

There is nevertheless a large degree of consensus on the principal conditions of economic growth. These can conveniently be divided into internal and external conditions. The fundamental internal condition is the quality and extent of natural resources. These include mineral resources, sources of fuel, the fertility of land, waterways, etc. It is generally agreed that, especially in the early stages of development, natural resources exert a major influence on the rate of economic growth. Even more important are human resources: the size of the labour force as a proportion of total population; the quality of the labour force, which is dependent on the level of education as well as inherent qualities of the people (health, energy, inventiveness, etc.); and the intensity of labour, which is determined by the number of hours worked, the way in which work is organized, and the pressures and incentives exerted by the particular political and economic system.

Closely related to the value of natural and human resources is the extent of capital resources and technological development. A labour force that is equipped with modern, highly productive machinery will produce more per unit of raw materials and time than one that operates with inefficient machinery. Similarly, a labour force that is engaged in the production of high-technology products will produce more added value (the amount by which the cost of raw materials is exceeded by the final selling price) than one engaged in simple processing industries. For this reason, most economists agree that the higher the rate of capital and technological investment, the higher the rate of economic growth. There is considerable empirical evidence that suggests that countries that devote a comparatively high proportion of their resources to investment, as opposed to consumption, tend to have relatively high long-term economic growth rates. Finally, another important internal condition of economic progress is stability of the government. Everything else being equal, a country with political stability will tend to grow faster, as it will attract more investment from both internal and external sources.

There are also a number of key external conditions of national economic progress. The most important of these is the level of world economic activity. This determines the level of world trade, and, since most countries export a substantial proportion of their output, the strength of world trade is a key determinant of the strength of demand for domestic production activities. Closely allied to this are the terms of trade, which measure the value and therefore the price of one country's export

goods in terms of the value of its imported products. Thus, if the price of a country's export products exhibits a long-term decline in terms of the cost of its imported goods, its capacity to import is reduced. This can have an adverse effect on the supply of investment goods or raw materials, which will tend to inhibit economic growth.

Historically, commodity-producing countries have faced weakening terms of trade, the effect of which is to retard their economic progress and technological development. The effects of a weakening in the terms of trade, however, can be overcome by an inflow of foreign loans and investment that can enable a country to acquire import goods for domestic development that could not be acquired otherwise. The import of foreign investment is also beneficial in that it can make up for the lack of domestic technological expertise.

economic indicator, statistic used, along with other indicators, in an attempt to determine the state of general economic activity, especially in the future. A "leading indicator" is one of a statistical series that fairly reliably turn up or down before the general economy does. Common leading indicators are building permits (suggesting the future volume of new construction), common stock prices, business inventories, consumer installment debt, unemployment claims, and corporate profits. Other types of indicators normally move in line with the overall economy ("coincident indicator") or change direction after the economy does ("lagging indicator"). Many types of sales are examples of coincident indicators because they peak or bottom out as the economy does. Lagging indicators are useless for prediction; the value of construction completed, for example, is outdated, for the main economic effects of the construction occurred earlier when the plans were made and construction actually carried on.

economic planning, the process by which key economic decisions are made or influenced by central governments. It contrasts with the laissez-faire approach that, in its purest form, eschews any attempt to guide the economy, relying instead on market forces to determine the speed, direction, and nature of economic evolution.

A brief treatment of economic planning follows. For full treatment, see MACROPAEDIA: Economic Growth and Planning.

Economic planning was first attempted in the Soviet Union in the 1920s when, in order to achieve rapid industrialization of a predominantly agricultural and highly disorganized economy, the new Communist regime instituted a rigorously controlled "command" economy. About the same time, planning gained considerable appeal in noncommunist countries as a way of responding to the economic difficulties of the period between the two world wars. Later, during World War II, most governments were forced to introduce strict control of their economies, and by the 1950s the idea that governments should take a significant role in planning and influencing economic activities was widely accepted. Today, the majority of countries engage in some form of planning activity.

Currently, the extent and nature of economic planning in any country tends to be closely related to the political complexion of the government in question. At one extreme is the detailed and rigid planning practiced by some communist countries (notably China and, until recently, most eastern European countries and the former Soviet Union). This involves

government ownership of most means of production and the central allocation of resources determined in the light of the government's economic, political, and social objectives. It requires the central government's determination of what is produced, the level of individual prices, the level of wages, the level of investment, foreign trade, and all other variables of the economy. It also requires enormously detailed control of the activities of individual enterprises and a vast and expensive central-planning bureaucracy.

The theoretical justification for this approach to economic planning is that, since market forces are indifferent to social values and can be manipulated by owners of wealth, they cannot be relied on to bring about socially and politically desirable objectives. Furthermore, it is argued, because they cannot guarantee full employment, they are not even capable of ensuring the efficient use of available resources. Against this it is argued that, by eliminating competition, command planning destroys the incentive to effort and enterprise, thereby leading to inefficiency. It is also argued that, despite a vast army of planners, it is not actually possible to control or even identify the myriad activities that make up the economy and that the inevitable results are slow and erratic economic growth, shortages, and structural imbalances necessitating dramatic and wasteful readjustments from time to time.

The economic achievements of the most rigidly planned economies in the second half of the 20th century were generally disappointing and eventually resulted in deep dissatisfaction with the inflexibilities of such systems. In the 1950s some communist countries began to experiment with a less rigid variant of the original concept. The process started in Poland in 1956, and, despite strong Soviet pressure against reform, it continued throughout the 1960s and '70s in most of eastern Europe. It was taken farthest in Hungary, where, although the bulk of the factors of production continue to be in public ownership, a fair degree of private enterprise in the supply of consumer goods, services, and foodstuffs had emerged by the 1970s. At the same time, the management of publicly owned enterprises was given a degree of freedom over production and pricing decisions, and incentives were provided in the form of profit-related bonuses. This kind of planning proved relatively successful in Hungary, Yugoslavia, and China, but it met with greater resistance when introduced into the Soviet Union itself by the Soviet leader Mikhail Gorbachev in the late 1980s. The subsequent collapse of the Soviet Union in 1991 necessitated a completely revised approach to economic planning there and elsewhere where Soviet influence had recently disappeared. Most of eastern Europe began to abandon central planning and to convert to private enterprise by the early 1990s, with the mixed economies of the Western democracies as the prime model.

The mixed economies of western Europe, North America, and Japan have perhaps made the most viable use of economic planning. Although the extent of planning and government control varies from country to country, the capitalist framework and a sizable private sector are retained in virtually all cases. Furthermore, except for detailed control over one or two key publicly owned sectors, most Western governments tend to influence their economies by regulating such broad economic factors as the money supply, government expenditure, interest rates, etc. The essence of the system is that most production and pricing decisions are made by private business within a broad overall framework, which is set up by the government. The result is a greater degree of enterprise and the absence of a large and expensive planning bureaucracy.

The detailed characteristics of economic planning in the West vary widely. The United

States has traditionally been less amenable to governmental planning than western Europe, and France has tended to put greater emphasis on government control of the economy than other developed noncommunist countries. Against this general background, the position of a given country also tends to vary over time; Great Britain's Labour government of the 1960s adopted a strongly interventionist and planning-oriented approach, but the main objective of the Conservative government from 1976 was to reduce the state's role in the economy. In the late 20th century, Japan represented perhaps the most successful example of economic planning within a capitalist framework, with government and industry closely cooperating in the planning of patterns of capital investment, research and development, and export strategies.

Developing countries have also adopted the theory and practice of economic planning. Although most of them tend to prepare medium-term (five- or six-year) economic development plans, there is no common approach to such planning. While most developing nations have placed substantial sectors of their economies under government ownership or influence, in only a very few countries is there an attempt to practice detailed command planning. Generally, the basic aim of developing countries' economic planning is to mobilize sufficient funds for the development of their infrastructure and selected areas of industry and to exercise a degree of influence over those sectors of the economy (often the output of primary commodities) from which a very large proportion of the country's income flows. Economic planning in developing countries has not been an unqualified success. Not infrequently the plans are either little more than uncoordinated lists of targets, often chosen on political grounds, or overly ambitious outlines of goals determined a priori rather than on a realistic assessment of the available resources. In some cases excessive dependence on price-volatile primary commodities makes long-term planning extremely difficult, while some countries lack the administrative resources and political stability needed to implement their planning objectives.

economic stabilizer, any of the institutions and practices in an economy that serve to reduce fluctuations in the business cycle through offsetting effects on the amounts of income available for spending (disposable income). The most important automatic stabilizers include the progressive income tax, unemployment compensation and other transfer payment programs, farm price supports, and family and corporate saving.

Income tax collections, for example, decline automatically with gross taxable income during a recession; the effect is even stronger under a progressive tax system in which tax rates go down or up as the individual's income falls or rises.

Unemployment insurance benefits and other public-assistance payments, which rise automatically as unemployment increases during recessions, help maintain purchasing power. Farm price supports similarly help maintain farm income when farm product prices are falling. The reluctance of families to reduce their living standards also acts to maintain consumer demand during recessions, provided they are able to draw upon savings. Corporations also tend to maintain their ordinary dividend payments out of savings.

Some stabilizers are considerably more effective on the downswing than on the upswing. There is little evidence, for example, that consumers hesitate to increase spending in good times. Also, government payments that increase in time of recession do not always decline after economic recovery.

economic systems, ways in which the ownership and allocation of economic resources are decided and organized by society. There

are two main types of modern economic system, the private- or free-enterprise economy and the centrally controlled and planned economy. Neither of these is to be found in practice in its pure form; in reality, all economic systems contain varying degrees of each.

A brief treatment of economic systems follows. For full treatment, see *MACROPAEDIA: Economic Systems*.

The basis of the private-enterprise system is the belief that when each member is allowed to pursue his rational self-interest the maximum common good will be generated. The mechanism that assures that the pursuit of myriad private goals will produce public good is the market, which impersonally sets prices for both the factors of production—land, labour, and capital—and the products of industry. With the factors of production in private hands, the proportions in which these factors are combined to produce different goods and services are determined through the price mechanism. If something is supplied in quantities greater than are required, the price will fall or production will be reduced, or both results will occur. If something is supplied in quantities greater than the quantity demanded, the price for that good or service will fall or production will be reduced, or both results will occur. If there is, on the other hand, more quantity demanded of any product than the amount currently supplied in the market, the price will rise and, with profits in prospect, production will be stimulated. In a market economy, the availability of incentives and information guides an ongoing process of adjustment which, in turn, fosters the coordination of production plans with consumption demands.

The central-planning approach is based on the observations that the private-enterprise system accepts patterns of unequal wealth and income distribution and that, moreover, because of technological and other developments, some producers attain a size and importance that destroy the competitive conditions required for the operation of the market mechanism. The answer, for proponents of central planning, is public ownership of the means of production and the central determination and control of what is produced. In this way, inequalities of wealth and income are to be reduced or eliminated and economic activities organized according to agreed-upon social and political objectives.

The developed economies of western Europe, North America, and Japan are described as private-enterprise systems, while those few countries that are still communist have centrally planned and controlled economies. (Developing countries have no established pattern; in many the rival philosophies coexist, often uneasily, with each other.) Most developed free-enterprise countries, however, recognize the criticisms of the pure market economy and accept the need for a degree of state involvement, mainly in public utilities and some basic industries. In addition, all governments influence the nature and tempo of economic growth by controlling such key economic variables as the money supply, interest rates, and government expenditure and borrowing. In most cases, government action in these areas reflects a judgment relating to political, social, or economic objectives, but it is radically different from the prescriptions of the central-planning doctrine in stemming from the belief that freedom of enterprise is the most efficient way of maximizing economic growth. Although the extent of state involvement varies from country to country and may change with successive governments, Western countries agree that private enterprise is to be preferred on both philosophical and practical grounds.

Centrally controlled economies begin with the assumption that state determination of economic goals and detailed state control of economic activities are desirable. In centrally controlled economies, state ownership of the means of production is the rule. Resources are allocated to investment, and the output of goods and services is decided and organized in accordance with a detailed economic plan that attempts to ensure, by administrative direction rather than incentive, that all parts of the economy and every enterprise perform according to a complex set of officially determined interlocking objectives. In practice, this has proved to be impossible. Despite a vast planning and controlling bureaucracy, the fulfillment of each of thousands of objectives cannot be guaranteed, yet such is the rigidity of the system that failure in one aspect will compromise the integrity of the entire plan. After the Stalinist era, Yugoslavia, Hungary, and China were among the communist countries that experimented with limited degrees of individual enterprise and decision making to overcome the inflexibility of the system without compromising state control over the basic aims of economic development.

The collapse of the Soviet Union and its communist government in 1991 was accompanied by the complete breakdown of that country's system of central planning. New governments in Russia and other former Soviet republics then began to make the difficult transition to an economic system based largely on private ownership and market price mechanisms. After 1991, only a few nations still relied on undiluted central planning and complete state ownership of the means of production. (See also economic planning.)

economic warfare, the use of, or the threat to use, economic means against a country in order to weaken its economy and thereby reduce its political and military power. Economic warfare also includes the use of economic means to compel an adversary to change its policies or behaviour or to undermine its ability to conduct normal relations with other countries. Some common means of economic warfare are trade embargoes, boycotts, sanctions, tariff discrimination, the freezing of capital assets, the suspension of aid, the prohibition of investment and other capital flows, and expropriation.

Countries engaging in economic warfare seek to weaken an adversary's economy by denying the adversary access to necessary physical, financial, and technological resources or by otherwise inhibiting its ability to benefit from trade, financial, and technological exchanges with other countries. Economic warfare consisting of blockades and the interception of contraband among belligerents has been practiced since before the Peloponnesian War (431–404 BC) in ancient Greece. In modern times, its uses have broadened to include putting pressure on neutral countries from which enemy countries could obtain supplies and denying potential enemies goods that might contribute to their war-making ability. One of the primary types of economic warfare employed in the 20th century was the embargo, sometimes total and sometimes restricted to strategic goods (*i.e.*, those that are essential for military purposes). During the Cold War, for example, the United States and its allies attempted to deny the Soviet Union and its allies access to computers, telecommunications equipment, and other technologies of high economic and military value.

The effectiveness of economic warfare depends on a number of factors, including the capacity of the adversary to produce the restricted goods internally or to acquire them from other countries. Cuba's trade with Mexico,

Canada, and western Europe, for example, undermined efforts by the United States to oust Cuban leader Fidel Castro from power through a decades-long embargo. Although economic warfare is often considered a relatively inexpensive complement or alternative to military engagement, it imposes costs on the initiating country by denying it access to economic exchange with the targeted country. Thus consumers in the United States paid higher costs for goods that could have been imported more cheaply from Cuba or other targeted countries, such as Iran, and American businesses were denied access to goods and markets.

The effectiveness of economic warfare is also limited by the ability of the adversary's government to redistribute sufficient domestic wealth toward the military or other institutions to compensate for reductions in capability caused by the loss of the restricted goods. In the 1990s, for example, economic warfare against Iraq and North Korea did not substantially reduce the military threat posed by those countries because both were able to direct their limited economic resources toward their militaries. Critics of economic warfare have argued that it often imposes greater costs on the general population of the adversary—*e.g.*, through starvation, the spread of disease, or the denial of basic consumer goods—than it does on its political or military leaders.

(G.E.Sh.)

economics, social science that seeks to analyze and describe the production, distribution, and consumption of wealth.

A brief treatment of economics follows. For full treatment, see *MACROPAEDIA: Social Sciences: Economics*. The subject of economics is treated in a number of other articles in the *MACROPAEDIA*. For the principles of economics, see *Economic Theory*. For a comparative survey of the major modes of national economic organization, see *Economic Systems*. For treatment of the processes of economic growth as well as of economic planning and forecasting, see *Economic Growth and Planning*. For discussions of particular aspects of economic activity, see *Banks and Banking; Business Law; Business Organization; International Trade; Markets; Money; Work and Employment*.

For a description of the place of economics in the circle of learning and for a list of both *MACROPAEDIA* and *MICROPAEDIA* articles on the subject, see *PROPAEDIA: Part Five, Division III*.

The major divisions of economics include microeconomics, which deals with the behaviour of individual consumers, companies, traders, and farmers; and macroeconomics, which focuses on aggregates such as the level of income in an economy, the volume of total employment, and the flow of investment. Another branch, development economics, investigates the history and changes of economic activity and organization over a period of time, as well as their relation to other activities and institutions. Within these three major divisions there are specialized areas of study that attempt to answer questions on a broad spectrum of economic activity, including public finance, money supply and banking, international trade, labour, industrial organization, and agriculture. The areas of investigation in economics overlap with other social sciences, particularly political science, but economics is primarily concerned with relations between buyer and seller.

Economist, *The*, weekly magazine of news and opinion published in London and generally regarded as one of the world's preeminent journals of its kind. Despite its name, it gives wide-ranging coverage of general news and particularly of international political developments and prospects bearing on the world's economy. It was founded in 1843 by Scotsman

James Wilson as a voice against grain import tariffs. The publication maintains the position that free markets provide the best method of running economies and governments.

economy, law of (logic): see *Ockham's razor*.

écorché (French: "flayed," or "skinned"), anatomical figure depicting an animal or human with the skin removed to show the location and interplay of the muscles.

From roughly the 15th century, Western artists began to concern themselves with accurate representation of the body—and, in particular, the working of muscles. Often artists witnessed (and sometimes performed) dissections on cadavers to determine the position and function of anatomical structures, and they made three-dimensional écorché models. These models became an essential part of most artists' studio equipment. Many drawings were made of such models—those of Leonardo da Vinci are especially well known—and some were reproduced in textbooks devoted to art or anatomy. Andreas Vesalius published his mas-

"A Skinned Horse," pencil-drawn écorché by George Stubbs; in the Royal Academy of Arts, London

By courtesy of the Royal Academy of Arts, London

terpiece, *De humani corporis fabrica* ("On the Structure of the Human Body"), and a similar work for artists that he called *Eptome* in 1543.

One of the most remarkable series are George Stubbs's engravings for *The Anatomy of the Horse* (1766), the original pencil drawings for which are in the Royal Academy of Arts in London. An écorché statue by Jean-Antoine Houdon (1741–1828) was much copied for use in art studios.

ecosphere, the sum of the Earth's ecological systems (ecosystems), all living organisms interacting with the physical environment. It is almost equivalent to the term biosphere (*q.v.*), with the further implication of a conscious ecological management of the Earth's resources.

ecosystem, the complex of living organisms, their physical environment, and all their interrelationships in a particular unit of space.

A brief treatment of ecosystems follows. For full treatment, see *MACROPAEDIA: Biosphere*.

The principles underlying the study of ecosystems are based on the view that all the elements of a life-supporting environment of

any size, whether natural or man-made, are parts of an integral network in which each element interacts directly or indirectly with all others and affects the function of the whole. All ecosystems are contained within the largest of them, the ecosphere, which encompasses the entire physical Earth (geosphere) and all of its biological components (biosphere).

An ecosystem can be categorized into its abiotic constituents, including minerals, climate, soil, water, sunlight, and all other nonliving elements, and its biotic constituents, consisting of all its living members. Linking these constituents together are two major forces: the flow of energy through the ecosystem, and the cycling of nutrients within the ecosystem.

The fundamental source of energy in almost all ecosystems is radiant energy from the Sun. The energy of sunlight is used by the ecosystem's autotrophic, or self-sustaining, organisms. Consisting largely of green vegetation, these organisms are capable of photosynthesis—*i.e.*, they can use the energy of sunlight to convert carbon dioxide and water into simple, energy-rich carbohydrates. The autotrophs use the energy stored within the simple carbohydrates to produce the more complex organic compounds, such as proteins, lipids, and starches, that maintain the organisms' life processes. The autotrophic segment of the ecosystem is commonly referred to as the producer level.

Organic matter generated by autotrophs directly or indirectly sustains heterotrophic organisms. Heterotrophs are the consumers of the ecosystem; they cannot make their own food. They use, rearrange, and ultimately decompose the complex organic materials built up by the autotrophs. All animals and fungi are heterotrophs, as are most bacteria and many other microorganisms.

Together, the autotrophs and heterotrophs form various trophic (feeding) levels in the ecosystem: the producer level, composed of those organisms that make their own food; the primary-consumer level, composed of those organisms that feed on producers; the secondary-consumer level, composed of those organisms that feed on primary consumers; and so on. The movement of organic matter and energy from the producer level through various consumer levels makes up a food chain. Actually, in many cases the food chains of the ecosystem overlap and interconnect, forming what ecologists call a food web. The final link in all food chains is made up of decomposers, those heterotrophs that break down dead organisms and organic wastes.

As energy moves through the ecosystem, much of it is lost at each trophic level. Consequently, few food chains extend beyond five members, because the energy available at higher trophic levels is too small to support further consumers.

The flow of energy through the ecosystem drives the movement of nutrients within the ecosystem. Nutrients are chemical elements and compounds necessary to living organisms. Unlike energy, which is continuously lost from the ecosystem, nutrients are cycled through the ecosystem, oscillating between the biotic and abiotic components in what are called biogeochemical cycles. Major biogeochemical cycles include the water cycle, carbon cycle, oxygen cycle, nitrogen cycle, phosphorus cycle, sulfur cycle, and calcium cycle.

The orderly replacement of one ecosystem by another is a process known as ecosystem development, or ecological succession. Succession occurs when a sterile area, such as barren rock or a lava flow, is first colonized by living things or when an existing ecosystem is disrupted, as when a forest is destroyed by a fire. The succession of ecosystems generally occurs in two phases. The early, or growth, phase is characterized by ecosystems that have few species and short food chains. These ecosys-

tems are relatively unstable but highly productive. The ecosystems of the later, or mature, phase are more complex, more diversified, and more stable. The final, or climax, ecosystem is characterized by a great diversity of species, complex food webs, and high stability. The major energy flow has shifted from production to maintenance.

Human interference in the development of ecosystems is widespread. Farming, for example, is the deliberate maintenance of an immature ecosystem—one that is highly productive but relatively unstable. Sound management of ecosystems for optimal food production should seek a compromise between the characteristics of young and mature ecosystems, and should consider factors that affect the interaction of natural cycles.

ecoterrorism, also called **ECOLOGICAL TERRORISM** or **ENVIRONMENTAL TERRORISM**, destruction, or the threat of destruction, of the environment by states, organizations, or individuals in order to intimidate or to coerce governments. The term also has been applied to a variety of crimes committed against companies or government agencies and intended to prevent or to interfere with activities allegedly harmful to the environment.

Ecoterrorism has been practiced by groups engaged in "anti-systemic" violence (*i.e.*, violence against existing political structures). This kind of terrorism, also known as bioterrorism, includes, for example, threats to contaminate water supplies or to destroy or disable energy utilities, as well as practices such as the deployment of anthrax or other biological agents.

Kuwaiti man watching an oil well burn, March 1991
Reuters NewMedia Inc./Corbis

Another form of ecoterrorism, often described as environmental warfare, consists of the deliberate and illegal destruction, exploitation, or modification of the environment as a strategy of war or in times of armed conflict (including civil conflict within states). Modification of the environment that occurs during armed conflict and is likely to have widespread, long-lasting, or severe effects is proscribed by the Convention on the Prohibition

of Military or Any Other Hostile Use of Environmental Modification Techniques, adopted by the United Nations General Assembly in 1976. Nevertheless, such destruction has occurred with some regularity. In the 1960s and '70s, the U.S. military used the defoliant agent orange to destroy forest cover in Vietnam, and in 1991 Iraqi military forces retreating during the Persian Gulf War set fire to Kuwaiti oil wells, causing significant environmental damage. The Rome Statute of the International Criminal Court, adopted in 1998, defines such modification or destruction as a war crime.

Finally, some activities of environmental activists have been described as ecoterrorism. They include criminal trespass on the property of logging companies and other firms and obstruction of their operations, sometimes through the sabotage of company equipment or the environmentally harmless modification of natural resources in order to make them inaccessible or unsuitable for commercial use. Examples of this practice, known as "monkey-wrenching," are the plugging of factory-waste outlets and the spiking of trees so that they cannot be logged and milled. Other activities described as ecoterrorist include protest actions by animal-liberation groups, such as the destruction of property in stores that sell products made of animal fur and the bombing of laboratories that perform experiments on animals. (L.M.E.)

Écrins National Park, nature reserve located in the *départements* of Hautes-Alpes and Isère, southeastern France. The park, which was created in 1973, occupies 226,694 acres (91,740 hectares) and is the second largest national park in France. It encompasses the Alpine peaks of Barre des Écrins (13,457 feet [4,102 m]), La Meije (13,067 feet [3,983 m]), Ailefroide, and Pelvoux, as well as numerous lakes, cirques, and gorges. Forests of larch cover the park. Rarer plants include lady's slipper orchids, orange lilies, and martagon lilies. Mountain hares and foxes, marmots, and chamois are common, while ibex, reintroduced in 1977 and 1978, are rare. Birds are typically Alpine and include golden eagles, capercaillies, rock partridges, and ptarmigans.

ecstasy (Greek: *ekstasis*, "to stand outside of or transcend [oneself]"), in mysticism, the experience of an inner vision of God or of one's relation to or union with the divine. Various methods have been used to achieve ecstasy, which is a primary goal in most forms of religious mysticism. The most typical consists of four stages: (1) purgation (of bodily desire); (2) purification (of the will); (3) illumination (of the mind); and (4) unification (of one's being or will with the divine). Other methods are: dancing (as used by the Mawlawīyah, or whirling dervishes, a Muslim Sūfī sect); the use of sedatives and stimulants (as utilized in some Hellenistic mystery religions); and the use of certain drugs, such as peyote, mescaline, hashish, LSD, and similar products (in certain Islāmic sects and modern experimental religious groups). Most mystics, both in the East and in the West, frown on the use of drugs because no permanent change in the personality (in the mystical sense) has been known to occur.

In certain ancient Israelite prophetic groups, music was used to achieve the ecstatic state, in which the participants, in their accompanying dancing, were believed to have been seized by the hand of Yahweh, the God of Israel, as in the case of Saul, the 11th-century-*bc* king of Israel. The Pythia (priestess) of the Greek oracle at Delphi often went into an ecstatic state during which she uttered sounds revealed to her by the python (the snake, the symbol of

resurrection), after drinking water from a certain spring. Her "words" were then interpreted by a priest to help a suppliant find a way to avoid calamities, especially death. In primitive religions, ecstasy was a technique highly developed by shamans, religious personages with healing and psychic-transformation powers, in their "soul," or "spirit," flights.

The goal of ecstasy and its effects, however, are best known from the writings and activities of the mystics of the world's great religions.

ecstasy, also called MDMA, in full METHYLENE-DIOXY-METHAMPHETAMINE, euphoria-inducing drug and mild hallucinogen. Commonly known as "E," ecstasy has been used widely despite being banned worldwide in 1985 by its addition to the international Convention on Psychotropic Substances. It is a derivative of the amphetamine family and a relative of the stimulant methamphetamine. Ecstasy, which is taken in pill form, also has a chemical relationship to the psychedelic drug mescaline.

Developed in 1913 as an appetite suppressant and patented by Merck & Company the following year, the drug was not originally approved for release. In the 1950s and '60s, advocates of the drug, including the author and chemist Alexander T. Shulgin, claimed that it could benefit people in psychotherapy by helping to engender trust between therapists and patients, and by the late 1970s ecstasy was widely administered for this purpose. It was adopted enthusiastically by adherents of the New Age movement of the 1970s and '80s, who explored the similarities between the mental and emotional states induced by ecstasy and the mystical states of awareness described by some traditional religions. Members of this group expected MDMA to be the basis of a sweeping "neuroconsciousness revolution."

Ecstasy increases the production of the neurotransmitter serotonin and blocks its reabsorption in the brain; it also increases the amount of the neurotransmitter dopamine. Stimulation of the central nervous system gives users feelings of increased energy. Other effects include heightened self-awareness, lowering of social inhibitions, and feelings of happiness and well-being. Ecstasy generally does not produce severe sensory distortions such as those associated with LSD and other hallucinogens. Harmful effects can include increased blood pressure, dehydration, severe muscle tension, confusion, depression, and paranoia.

By the 1980s, parties and dances that featured ecstasy use (known as "raves") became popular. Despite its ban in 1985, the drug retained a huge following, and it came to play an important role in the youth subculture, similar to that of LSD during the 1960s. By the end of the 20th century, ecstasy was reportedly used regularly by 500,000 people in Great Britain, and a 1998 study found that 3.4 million Americans had tried the drug.

ECT: see shock therapy.

ecthyma, contagious (animal disease): see sore mouth.

ectoderm, the outermost of the three germ layers, or masses of cells, which appears early in the development of an animal embryo. In vertebrates, ectoderm subsequently gives rise to hair, skin, nails or hooves, and the lens of the eye; the epithelia (surface, or lining, tissues) of sense organs, the nasal cavity, the sinuses, the mouth (including tooth enamel), and the anal canal; and nervous tissue, including the pituitary body and chromaffin tissue (clumps of endocrine cells). In adult cnidarians and ctenophores, the body-covering tissue,

or epidermis, is occasionally called ectoderm. See also endoderm; mesoderm.

ectomorph, a human physical type (somatotype) tending toward linearity, as determined by the physique classification system developed by the American psychologist W.H. Sheldon. Although classification by the Sheldon system is not absolute, a person is classed as an ectomorph if ectomorphy predominates over endomorphy and mesomorphy in his body build. The extreme ectomorph has a thin face with high forehead and receding chin; narrow chest and abdomen; a narrow heart; rather long, thin arms and legs; little body fat and little muscle; but a large skin surface and a large nervous system. If well fed he does not gain weight easily, and if he becomes fat he is still considered an ectomorph, only overweight. Compare endomorph; mesomorph.

ectopic pregnancy, also called EXTRAUTERINE PREGNANCY, condition in which the fertilized ovum (egg) has become imbedded outside the uterine cavity. The site of implantation is usually designated—e.g., tubal, abdominal, or ovarian ectopic pregnancy.

In tubal ectopic pregnancy the ovum becomes implanted in one of the fallopian tubes. This condition is not uncommon, occurring about once in 250 to 300 pregnancies and more frequently in blacks than Caucasians. It may be brought about by anything that interferes with the propulsion of the fertilized ovum from the fallopian tube toward the uterine cavity—e.g., inflammation of the fallopian tube, developmental malformation of the sacs within its canal, or kinking of the tube. If transport to the uterus is sufficiently delayed, the ovum becomes too large for easy passage and becomes imbedded in the wall of the fallopian tube. Tubal ectopic pregnancy in early stages is similar in some respects to normal pregnancy; implantation of the ovum in the tubal wall is much like that which occurs in the uterus. Also, as pregnancy begins to develop, placental tissue, like that of intrauterine gestation, develops. Eventually, however, the placenta removes itself from the tubal wall, and the fetus is discharged as a whole mass or in smaller fragments if it disintegrates. The symptoms of tubal ectopic pregnancy in early stages are so minor that they might be ignored by the patient. Depending upon the part of the tube in which the ovum has become implanted, the tubal pregnancy can abort, through tubal rupture, any time from 6 to 18 weeks after cessation of menstrual periods (on occasion there will be no history of missed periods). Once the fetus begins to disintegrate or is discharged, bleeding will follow. Pain is associated at some time with nearly every tubal pregnancy. During the final stages of separation and expulsion in a tubal pregnancy, the patient experiences pain and bleeding. Surgical exploration of the abdomen and removal of the affected tube and replacement of lost blood are often essential to prevent death.

Ovarian ectopic pregnancy is a relatively rare condition in which the ovum is fertilized before its discharge from the follicle. Symptoms, termination, and treatment are similar to those of tubal pregnancy, but gestation may progress slightly further before rupture and bleeding occur.

Abdominal ectopic pregnancy occurs when the placenta is attached to some part of the peritoneal cavity other than the uterus or tube. While a few of these pregnancies are a result of implantation in the abdominal lining, most are the result of expulsion of a tubal pregnancy. The condition can be suspected in the first three months of pregnancy if pain and bleeding are experienced. Abdominal pregnancy can reach term. Prompt surgical removal of the fetus is necessary, because an unrecognized and untreated abdominal pregnancy can result in infection or calcification leading to the for-

mation of a lithopedion (calcified dead fetus) and death of the mother.

ectoplasm, in occultism, a mysterious, usually light-colored, viscous substance that is said to exude from the body of a spiritualist medium in trance and may then take the shape of a face, a hand, or a complete body. It is normally visible only in the darkened atmosphere of a séance (*q.v.*). Ectoplasm is said to be the substance involved in the materialization of spiritual bodies, and the levitation of material objects is commonly explained by the gradual buildup of columns of ectoplasm underneath the objects. At the end of a séance the ectoplasm disappears, allegedly by returning to the medium's body.

ectothermy: see cold-bloodedness.

entropion, sagging of the lower eyelid away from the eyeball. The condition sometimes is present in elderly persons as a result of relaxation of the lid's supporting structures. With the sagging of the lid, the opening into the channel that carries tears from the eye into the nasal cavity is also moved away from the eyeball; as a result, tears fail to drain properly, and chronic conjunctivitis—inflammation of the mucous membrane lining the lids and covering part of the eyeball—may develop. Compare entropion.

Ecuador, officially REPUBLIC OF ECUADOR, Spanish REPÚBLICA DEL ECUADOR, South America's fourth smallest country, lying astride the Equator on the Pacific coast. Extending about 450 miles (725 km) from north to south and 400 miles (640 km) from east to west, Ecuador is bordered by Colombia on the north and Peru on the east and south. The

Ecuador

capital is Quito. Area (including the Galapagos Islands) 105,037 square miles (272,045 square km). Pop. (2000 est.) 12,646,000.

A brief treatment of Ecuador follows. For full treatment, see MACROPAEDIA: Ecuador.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Ecuador comprises a coastal lowland (mostly below 1,000 feet [300 m]) along the Pacific and a mountainous highland (the Andes) separating it from the Ecuadorian portion of the tropical Amazon River basin. The Andes Mountains rise dramatically from the west with peaks in two mostly continuous north-south chains reaching elevations between 16,000 and more than 20,000 feet (4,900 and 6,100 m). Separating the ranges are 6,500- to 9,500-foot- (2,000- to 2,900-metre)-high intermontane valleys. Another lower-lying, more easterly range runs parallel to the main Andes at the edge of the Amazon River basin. Ecuador's highest peak is the extinct volcano Chimborazo, at 20,702 feet (6,310 m); the world's highest active volcano, Cotopaxi,

at 19,347 feet (5,897 m), is nearby. The country lies in a very active earthquake zone. Nearly one-third of Ecuador's runoff is carried by two river basins, the Guayas River in the western-coastal region and the Napo-Aguarico in the Amazon River basin to the east.

The cold Humboldt (Peru) Current induces aridity along Ecuador's coast, particularly in the south. In the highland valleys springlike temperatures often prevail year-round; Quito, located in one of these valleys in the north-central region, averages 59° F (15° C) each month of the year. The Amazon basin east of the Andes generally has a wet tropical climate. The perpetual snow line of the Andes begins at about 16,400 feet (5,000 m). Almost half of the country is forested, mostly tropical rain forests in the eastern lowlands. About one-fifth of total land area is rangeland. Wildlife is dominated by tropical species typical of South America, including the endangered jaguar and ocelot.

From the late 20th century Ecuador developed its burgeoning fossil-fuel industry, both in the Pacific coastal (natural gas) and in the Amazonian (oil) regions.

The people. Ecuador's population is ethnically mixed, with Indians (mostly Quechua speakers) comprising about 50 percent of the population and mestizos about 40 percent. Most Indians live in the Andean intermontane valleys. The Jívaro, who form the main Indian group in the Amazon basin, consist of small tribes or family units. Caucasians, comprising less than one-tenth of the population, are largely descended from Spaniards who arrived in Ecuador between the 16th and early 19th century. Blacks make up a small percentage of the population and principally live along the northern coast; their ancestors were brought from Africa as slaves during the colonial era. Mulattos also constitute a small portion of the population and generally live in the coastal region.

Spanish, the official language, is spoken by most of the population. Some Indians, however, speak only a Quechuan language. The nation is overwhelmingly Roman Catholic.

Ecuador has relatively high birth and death rates. Infant mortality is also high; the Ministry of Health has given priority to maternal and child health programs. Ecuador has a very youthful population, two-fifths of it under 15 years of age. Half of the nation's population lives in urban areas.

The economy. Ecuador has a developing mixed state and private-enterprise economy. The gross national product (GNP) is not increasing as rapidly as the population. The GNP originates primarily from trade, followed by manufacturing and agriculture.

Although only about one-tenth of the country's total land area is arable, agriculture employs about one-third of the labour force. Principal cash crops include bananas, of which Ecuador is one of the world's largest producers, and sugarcane, cacao, and coffee. Important among local food crops are corn (maize), rice, potatoes, oranges, and cassava. Range and pasture are found for the most part in the intermontane valleys; the principal livestock are pigs, beef and dairy cattle, and sheep. Lumbering in general remains underdeveloped, but Ecuador is the world's leading producer of balsa wood.

Ecuador's marine fishery ranks high in Latin America in total catch, mostly thread herring, although shrimp raised on coastal fish farms constitute a major source of export revenue. Tuna are also caught.

The mining sector employs less than 1 percent of the labour force; its importance in the GNP is largely because of petroleum and natural-gas production, along with copper mining at Chaucha in the south-central mountains.

The manufacturing sector employs about one-tenth of the labour force. The principal manufactures are food products (including raw

and brown sugar), refined petroleum products, textiles and clothing, beverages (including liquors), cement, and pharmaceuticals.

Only about one-sixth of Ecuador's road network is paved; there are four major seaports and international airports at Quito and Guayaquil. The rail system has declined, and service has become slow and antiquated.

Ecuador's exports consist primarily of crude petroleum, as well as shrimp, bananas, coffee, and cacao. The principal importers of Ecuadorian products are the United States, Germany, Singapore, Panama, and Peru. Ecuador's principal imports are industrial raw materials and machinery, transport equipment, and consumer goods. The principal sources for imports include the United States, followed by Japan, Venezuela, and Germany.

Government and social conditions. Ecuador's constitution of 1979 provides for a representative democracy with executive power vested in a president elected to a single four-year term. Legislative authority is exercised by the unicameral National Chamber of Representatives (also called National Congress), whose members are elected for either two or four years. The country has numerous political parties, and it is unusual for any single political organization to win a majority in Congress. A coalition is usually required to control the government. The judicial system is headed by a Supreme Court of Justice usually elected by the Congress.

Ecuador's social-welfare system covers all public and private employees. Health conditions in many parts of the country are poor. Many rural people continue to rely on traditional healers and midwives for all medical care. Life expectancy is 60 years for men and 64 years for women.

Education is free and compulsory at the primary level for all children ages 6 to 14. All state schools are nondenominational, but there are nondenominational and religious private schools which also receive state funds. The largest universities in the country are the Central University of Ecuador, which was established in Quito in 1586, and the University of Guayaquil, founded in 1867. The news media in Ecuador are relatively free from government interference.

History. Pre-Spanish Ecuador was inhabited by a number of diverse Indian peoples who were, for the most part, sedentary agriculturists. A kingdom established by the Caras with a capital at Quito fell to the Incas some time after 1450. After the death of the conquering Inca emperor, war over inheritance of the kingdom between two of his sons weakened the Incas on the eve of the arrival of the Spaniards (1526). From Ecuador the Spaniards marched into Inca-dominated Peru in 1532, then turned to the conquest of Ecuador in 1534 with a march on the Inca seat of Quito led by Sebastián de Belalcázar. The Indians destroyed the city and retired. On its ruins, Belalcázar founded Villa de San Francisco de Quito in late 1534. The new town thrived, becoming a cultural and artistic centre.

The Spaniards established a colony of large estates worked by Indians. The social system was hierarchical and slow to change. Under the Spaniards Ecuador was a part of the Viceroyalty of Peru (almost continuously) until 1740, when it became a part of the Viceroyalty of New Granada.

A creole middle class beginning to emerge found Spanish colonial policies discriminatory and agitated for change, declaring independence in 1809. They and a successor movement were suppressed and their leaders executed, but eventually Antonio José de Sucre routed the Spanish at the battle of Pichincha, near Quito, and Ecuador was freed of Spain as part of the republic of Gran Colombia. In 1830 Ecuador promulgated its own constitution and became a sovereign state.

For decades, the rivalry and antagonism be-

tween conservative and aristocratic Quito in the interior and the liberal and bourgeois Guayaquil on the coast dominated the political scene, encouraging instability and leading to frequent changes of government and constitution. Reaction set in with the autocratic and cleric-dominated government of Gabriel García Moreno (1860-75), which brought economic and educational progress but which aroused dissatisfaction among liberal elements. A succession of governments, each as authoritarian as the last, went on into the early decades of the 20th century. Economic hardship and social unrest prompted the military to take a strong role in the political process. Peru invaded Ecuador in 1941 and was able to seize a large tract of Ecuadorian territory in the disputed Amazonian area.

Postwar Ecuador enjoyed long periods of constitutional government and relatively free elections, but the leadership of José María Velasco Ibarra, who was elected president no fewer than five times between 1944 and 1972 but completed only one term, was so erratic and unpredictable that little progress in social and economic affairs was ever made. A new constitution was adopted in 1979.

The national governments of the 1980s and '90s also failed to solve Ecuador's most critical problems, and controversies abounded, including the legislature's dismissal in 1997 of President Abdalá Bucaram Ortíz for alleged mental incompetence. Border disputes again flared between Ecuador and Peru until the two sides approved a treaty in 1998.

Ecuador in the early 21st century continued to face economic uncertainty and inequality (including a wide gap between rich and poor), pervasive corruption, security concerns (notably drug traffic and the spillover from Colombian civil conflicts), and debates regarding the rights and cultures of indigenous peoples.

écuage (feudal law); *see* scutage.

Ecumenical Patriarchate of Constantinople, honorary primacy of the Eastern Orthodox autocephalous, or ecclesiastically independent, churches; it is also known as the "ecumenical patriarchate," or "Roman" patriarchate (Turkish: *Rum patriarkhanesi*).

According to a legend of the late 4th century, the bishopric of Byzantium was founded by St. Andrew, and his disciple Stachys became the first bishop (AD 38-54). Soon after Constantine the Great transferred the capital of the Roman Empire from Rome to Byzantium (330), renamed Constantinople and New Rome, its bishopric was elevated to an archbishopric. The metropolitan of Heraclea Perinthus, to whom Byzantium had formerly been subject, now came under the jurisdiction of Constantinople. In 381 the first Council of Constantinople recognized that the bishop of Constantinople, "being now the New Rome," had rights equal to those of the bishop of Rome. The Council of Chalcedon (451) ratified this and assigned to his jurisdiction a large area in the Balkans and Asia Minor. In the 6th century the official title of the bishop became "archbishop of Constantinople, New Rome, and ecumenical patriarch." The successful territorial conquests of the Muslims begun in the 7th century helped augment the spiritual power of the ecumenical patriarchate; Eastern patriarchs of conquered sees were often forced into exile in the capital, where their successors over a long period were selected by the ecumenical patriarch.

From Constantinople, Byzantine Orthodox Christianity spread to most of Eastern Europe, *i.e.*, Bulgaria, Serbia, Romania, and Russia. As a leader of Eastern Christianity, the patriarch of Constantinople represented a clear chal-

lenge to the universalist claims of Rome. In 867 Patriarch Photius accused Pope Nicholas I of usurpation in Bulgaria, but a reconciliation took place with Nicholas' successor, John VIII, in 879–880. Another confrontation between the two churches occurred in 1054, and not until 1964 did the ecumenical patriarch (then Athenagoras I) and the pope (Paul VI) embrace.

After the capture of Constantinople by the Latins in the Fourth Crusade (1204), the ecumenical patriarchate was transferred to Nicaea (1206), but Emperor Michael VIII Paleologus restored it to Constantinople when he took the city in 1261. When the city fell to the Turks in 1453, becoming the capital of the Muslim Ottoman Empire, the Ottoman government recognized the ecumenical patriarch Gennadius II as the ethnarch of the conquered Orthodox peoples, with increased authority over the territories of the Eastern patriarchates and over the Balkan countries, as well as farther afield.

This power began a long decline when Jeremias II declared the patriarchate of Moscow autocephalous (1593); national churches in Greece (1833), Romania (1865), Serbia (1879), Bulgaria (1870), and Albania (1937) became in their turn autocephalous. The number of dioceses subject to Constantinople was further reduced in 1922, when about 1,500,000 Greek inhabitants of Asia Minor and Thrace were driven across the Aegean by the Turks, leaving few Christians in Asia Minor.

The territory directly subject to the patriarch and his synod in Turkey is confined to the archdiocese of Constantinople itself, with four suburban dioceses of Chalcedon, Terkos, Büyükkada, and the islands of İmroz Adası and Bozca Ada. In Greece the patriarch still has nominal jurisdiction over the monastic state of Mt. Athos, the monastery of St. John the Evangelist on Pátmos, several dioceses in northern Greece, four bishoprics in the Dodecanese, and the autonomous church of Crete. Greek archbishoprics and metropolitanates of Europe, North and South America, Australia and New Zealand, as well as the autonomous church of Finland, are also dependent on the patriarch of Constantinople.

Since 1586 the patriarchate has been located in the Phanar, the northern section of Istanbul (formerly Constantinople), having lost both its cathedral of Hagia Sophia and its historic quarter to the Muslims. The small church of St. George serves as the cathedral for the patriarch, who must be a native Turkish citizen elected by the synod of metropolitans. The Turkish government considers the patriarchate as serving the religious needs of Greeks in Istanbul only. Tension between Greece and Turkey over Cyprus has made the position of the patriarchate in Turkey uneasy.

ecumenism, the movement or tendency toward worldwide Christian unity or cooperation. The term, of recent origin, emphasizes what is viewed as the universality of the Christian churches.

A brief treatment of ecumenism follows. For full treatment, see *MACROPAEDIA*: Christianity.

The word ecumenism is derived from the Greek words *oikoumenē* ("the inhabited world") and *oikos* ("house") and can be traced from the commands, promises, and prayers of Jesus. After the International Missionary Conference held at Edinburgh in 1910, Protestants began to use the term ecumenism to describe the gathering of missionary, evangelistic, service, and unitive forces. During and after the second Vatican Council (1962–65), Roman Catholics used ecumenism to refer to the renewal of the whole life of the church,

undertaken to make it more responsive to "separated churches" and to the needs of the world.

The ecumenical movement seeks to recover the apostolic sense of the early church for unity in diversity, and it confronts the frustrations, difficulties, and ironies of the modern pluralistic world. It is a lively reassessment of the historical sources and destiny of what followers perceive to be the one, holy, catholic, and apostolic church of Jesus Christ.

The possibility of an ecumenical approach, in the modern sense, to Christianity increased, somewhat ironically, in the 17th and 18th centuries, when English dissenting sects and Pietist groups on the Continent began to promote evangelistic, revivalistic, and missionary endeavour. This, along with the simultaneous effect of Enlightenment thought, broke down many of the traditional foundations that supported separate church structures. Other breakdowns in the traditional understandings of church unity led to new possibilities for experimentation in the 19th century. The separation of church and state in the United States signalled the need for civility and respect for religious rights in a land of many religions. The sending of missionaries at the beginning of the 19th century revealed the possibilities of cooperation across denominational lines at home and brought to light the scandal of competition and conflict among Christian denominations abroad.

Early 20th-century ecumenism derived impetus from the convergence of three movements: international missionary conferences (Protestant), beginning with the Edinburgh Conference (1910) and taking shape as an institution in the International Missionary Council (1921); the Faith and Order Conferences (on church doctrine and polity), commencing in the conference at Lausanne (1927); and the Life and Work Conferences (on social and practical problems), beginning with the Stockholm Conference (1925). In 1937 at the Oxford Conference of Life and Work, proposals were drawn up to unite with Faith and Order. The World Council of Churches, a consultative and conciliar agent of ecumenism, working with national, denominational, regional, and confessional bodies, was inaugurated in Amsterdam in 1948. The International Missionary Council joined the World Council of Churches in 1961.

Protest movements against the developments that led to and continued in the World Council of Churches have produced an ecumenical convergence of their own. Most participants in this convergence prefer to be called "evangelical." In the United States the National Association of Evangelicals was formed in 1943, in large part to counter the Federal Council of Churches, which began in 1908 and reorganized as the National Council of Churches in 1950. Evangelicals have many organizations that operate on an international level to channel specific cooperative energies.

In 1961 Pope John XXIII established the Secretariat for the Promotion of Christian Unity, and the Orthodox churches created the Pan-Orthodox Conference. Dialogues among the Roman Catholic, Orthodox, Pentecostal, and Protestant churches have brought general consensus on such issues as baptism, the Eucharist, and the nature of ministry.

eczema: see dermatitis.

Edam, *dorp* (village) in Edam-Volendam *gemeente* (municipality), Noord-Holland *provincie* (province), northwestern Netherlands, on the IJsselmeer (Lake IJssel). Named for the dam built on the Ye, which joined the Purmer Lake (now polder) to the Zuiderzee, it became an important harbour, fishing port, and shipbuilding centre and was chartered in 1357, when a dock was built on the Zuiderzee. The harbour silted up and industrial and commercial activity waned after the construction

in 1567 of a sluice in the dock to prevent flooding. The harbour has been sealed off as part of an inland lake preparatory to the drainage of the Markerwaard Polder (see IJsselmeer Polders).

Edam is dominated by St. Nicholas Church, rebuilt after a fire in 1602. Other landmarks

Drawbridge in Edam, Neth.
Shostal Associates

are the town hall (1737) and the tower of the former Church of Our Lady, which has one of the oldest carillons in The Netherlands (1561). The town museum (established 1895) is in an 18th-century sea captain's house with an unusual floating cellar. The Nieuwenkamp Museum has etchings and art treasures from Bali.

The town is famous for its red-coated Edam cheese; light manufactures include earthenware, textiles, packing materials, tools, and door and window furnishings. Pop. (1982 est.) including Volendam, 23,520.

Edam, semisoft cow's-milk cheese of Holland, usually molded in 2 to 4 pound (0.9 to 1.8 kilogram) spheres and coated in red paraffin; Edam is also produced in red-coated rectangular loaves. Originally the rind was brushed with vermilion to distinguish it from other Dutch cheeses, a purpose now served by the red paraffin.

The smooth-textured interior of Edam is a rich yellow-gold, with a mild but savoury flavour that makes it popular as a snack cheese. Like Gouda, it is one of Europe's oldest commercial cheeses, widely exported and imitated. True Edam bears the mark of "Holland" on its rind. Aging generally lasts for two months but may extend to a year. Prolonged aging imparts a much stronger flavour and a harder, somewhat flaky consistency.

Edaphosaurus, extinct genus of primitive and highly distinctive early reptiles found as fossils in Late Pennsylvanian to Early Permian deposits of Europe and North America

Edaphosaurus boanerges found in Texas, Early Permian age, reconstruction built on the original skeleton

By courtesy of the Royal Ontario Museum, Toronto, Canada

(the Pennsylvanian Period ended 280,000,000 years ago and was followed by the Permian Period). *Edaphosaurus* was a large herbivore more than 3.5 metres (11 feet) long, with a short, low skull and conical and rather blunt teeth. The head was very small in comparison to the massive, barrel-like body. Perhaps the most distinctive feature of *Edaphosaurus* was a large dorsal sail that was formed by elongated dorsal vertebral arches probably connected by a membrane and that had bony knobs or crossbars along its length. It is not unlikely that the sail in *Edaphosaurus* functioned as a sort of temperature-regulating device. It is possible that the sail also may have served as a storehouse for phosphates needed in cellular energy exchanges and easily mobilized from the bony processes that make up the sail structure. The sail also may have been in part a defensive structure, giving the animal a larger and more imposing appearance to frighten away predators. It is thought that the growth, development, and maintenance of the sail placed a great strain upon the resources of the animal, however.

Edbert, also spelled **EADBERT**, or **EADBERHT** (d. 768), in Anglo-Saxon England, king of Northumbrians from 737 to 758, a strong king whose reign was regarded by the contemporary scholar and churchman Alcuin as the kingdom's golden age.

Edbert succeeded to the throne on the abdication of his cousin Ceolwulf. In 750 he took the region of Kyle from the Britons of Strathclyde. In 756, with Pictish help, he forced terms on the defenders of Alcluth (Dumbarton), the capital of Strathclyde, but shortly thereafter he was defeated by the Britons.

Edbert abdicated in 758 and became a cleric at the cathedral of York, where his brother Egbert was the first archbishop. His son Osulf, who succeeded him, was assassinated within the year, and the throne passed to a nobleman named Aethelwald (or Ethelwald) Moll. Edbert's grandson Aelfwald (or Elfwald) reigned from 779 to 788.

Under King Edbert and his brother, who was bishop from 732 and archbishop from 735, the church in Northumbria was strong, and York became a notable centre of learning.

EDC: see European Defense Community.

Edda, body of ancient Icelandic literature contained in two 13th-century books commonly distinguished as the *Prose*, or *Younger Edda* and the *Poetic*, or *Elder Edda*. It is the fullest and most detailed source for modern knowledge of Germanic mythology.

The Prose Edda. The *Prose Edda* was written by the Icelandic chieftain, poet, and historian Snorri Sturluson, probably in 1222–23. It is a textbook on poetics intended to instruct young poets in the difficult metres of the early Icelandic skalds (court poets) and to provide for a Christian age an understanding of the mythological subjects treated or alluded to in early poetry. It consists of a prologue and three parts. Two of the sections—*Skáldskaparmál*, dealing with the elaborate, riddle-like kennings and circumlocutions of the skalds, and *Háttatal*, giving examples of 102 metres known to Snorri—are of interest chiefly to specialists in ancient Norse and Germanic literature. The remaining section, *Gylfaginning* (“The Beguiling of Gylfi”), is of interest to the general reader. Cast in the form of a dialogue, it describes the visit of Gylfi, a king of the Swedes, to Asgard, the citadel of the gods. In answer to his questions, the gods tell Gylfi the Norse myths about the beginning of the world, the adventures of the gods, and the fate in store for all in the Ragnarök (Doom [or Twilight] of the Gods). The tales are told with dramatic artistry, humour, and charm.

The Poetic Edda. The *Poetic Edda* is a later manuscript dating from the second half of the 13th century, but containing older materials

(hence its alternative title, the *Elder Edda*). It is a collection of mythological and heroic poems of unknown authorship, composed over a long period (AD 800–1100). They are usually dramatic dialogues in a terse, simple, archaic style that is in decided contrast to the artful poetry of the skalds.

The mythological cycle is introduced by *Völuspá* (“Sibyl’s Prophecy”), a sweeping cosmogonic myth that reviews in flashing scenes the history of the gods, men, and dwarfs, from the birth of the world to the death of the gods and the world’s destruction.

It is followed by *Hávamál* (“Words of the High One”), a group of disconnected, fragmentary, didactic poems that sum up the wisdom of the wizard-warrior god, Odin. The precepts are cynical and generally amoral, evidently dating from an age of lawlessness and treachery. The latter part contains the strange myth of how Odin acquired the magical power of the runes (alphabetical characters) by hanging himself from a tree and suffering hunger and thirst for nine nights. The poem ends with a list of magic charms.

One of the finest mythological poems is the humorous *Thrymskvida* (“Lay of Thrym”), which tells how the giant Thrym steals the hammer of the thunder god Thor and demands the goddess Freyja in marriage for its return. Thor himself journeys to Thrym, disguised as a bride, and the humour derives from the “bride’s” astonishing manners at the wedding feast, where she eats an ox and eight salmon, and drinks three vessels of mead.

The second half of the *Poetic Edda* contains lays about the Germanic heroes. Except for the *Völundarkvida* (“Lay of Völundr”; i.e., Wayland the Smith) these are connected with the hero Sigurd (Siegfried), recounting his youth, his marriage to Gudrun, his death, and the tragic fate of the Burgundians (Nibelungs). These lays are the oldest surviving poetic forms of the Germanic legend of deceit, slaughter, and revenge that forms the core of the great medieval German epic *Nibelungenlied*. Unlike the *Nibelungenlied*, which stands on the threshold of romance, the austere Eddaic poems dwell on cruel and violent deeds with a grim stoicism that is unrelieved by any civilizing influences.

Eddington, Sir Arthur Stanley (b. Dec. 28, 1882, Kendal, Westmorland, Eng.—d. Nov. 22, 1944, Cambridge, Cambridgeshire), English astronomer, physicist, and mathematician

Eddington

By courtesy of the University of Chicago, photograph Yerkes Observatory, Williams Bay, Wis.

who did his greatest work in astrophysics, investigating the motion, internal structure, and evolution of stars. He also was the first expositor of the theory of relativity in the English language.

Early life. Eddington was the son of the headmaster of Stramongate School, an old Quaker foundation in Kendal near Lake Windermere in the northwest of England. His

father, a gifted and highly educated man, died of typhoid in 1884. The widow took her daughter and small son to Weston-super-Mare in Somerset, where young Eddington grew up and received his schooling. He entered Owens College, Manchester, in October 1898, and Trinity College, Cambridge, in October 1902. There he won every mathematical honour, as well as Senior Wrangler (1904), Smith’s prize, and a Trinity College fellowship (1907). In 1913 he received the Plumian Professorship of Astronomy at Cambridge and in 1914 became also the director of its observatory.

From 1906 to 1913 Eddington was chief assistant at the Royal Observatory at Greenwich, where he gained practical experience in the use of astronomical instruments. He made observations on the island of Malta to establish its longitude, led an eclipse expedition to Brazil, and investigated the distribution and motions of the stars. He broke new ground with a paper on the dynamics of a globular stellar system. In *Stellar Movements and the Structure of the Universe* (1914) he summarized his mathematically elegant investigations, putting forward the thesis that the spiral nebulae, cloudy structures seen in the telescope, were galaxies like the Milky Way.

During World War I he declared himself a pacifist. This arose out of his strongly held Quaker beliefs. His religious faith also found expression in his popular writings on the philosophy of science. In *Science and the Unseen World* (1929) he declared that the world’s meaning could not be discovered from science but must be sought through apprehension of spiritual reality. He expressed this belief in other philosophical books: *The Nature of the Physical World* (1928), *New Pathways of Science* (1935), and *The Philosophy of Physical Science* (1939).

During these years he carried on important studies in astrophysics and relativity, in addition to teaching and lecturing. In 1919 he led an expedition to Principe Island (West Africa) that provided the first confirmation of Einstein’s theory that gravity will bend the path of light when it passes near a massive star. During the total eclipse of the sun, it was found that the positions of stars seen just beyond the eclipsed solar disk were, as the general theory of relativity had predicted, slightly displaced away from the centre of the solar disk. Eddington was the first expositor of relativity in the English language. His *Report on the Relativity Theory of Gravitation* (1918), written for the Physical Society, followed by *Space, Time and Gravitation* (1920) and his great treatise *The Mathematical Theory of Relativity* (1923)—the latter considered by Einstein the finest presentation of the subject in any language—made Eddington a leader in the field of relativity physics. His own contribution was chiefly a brilliant modification of affine (non-Euclidean) geometry, leading to a geometry of the cosmos. Later, when the Belgian astronomer Georges Lemaître produced the hypothesis of the expanding universe, Eddington pursued the subject in his own researches; these were placed before the general reader in his little book *The Expanding Universe* (1933). Another book, *Relativity Theory of Protons and Electrons* (1936), dealt with quantum theory. He gave many popular lectures on relativity, leading the English physicist Sir Joseph John Thomson to remark that Eddington had persuaded multitudes of people that they understood what relativity meant.

Philosophy of science. His philosophical ideas led him to believe that through a unification of quantum theory and general relativity it would be possible to calculate the values of universal constants, notably the fine-structure constant, the ratio of the mass of the proton to that of the electron, and the

number of atoms in the universe. This was an attempt, never completed, at a vast synthesis of the known facts of the physical universe; it was published posthumously as *Fundamental Theory* (1946), edited by Sir Edmund Taylor Whittaker, a book that is incomprehensible to most readers and perplexing in many places to all, but which represents a continuing challenge to science.

Eddington received many honours, including honorary degrees from 12 universities. He was president of the Royal Astronomical Society (1921–23), the Physical Society (1930–32), the Mathematical Association (1932), and the International Astronomical Union (1938–44). He was knighted in 1930 and received the Order of Merit in 1938. Meetings of the Royal Astronomical Society were often enlivened by dramatic clashes between Eddington and Sir James Hopwood Jeans or Edward Arthur Milne over the validity of scientific assumptions and mathematical procedures. Eddington was an enthusiastic participant in most forms of athletics, confining himself in later years to cycling, swimming, and golf.

Eddington's greatest contributions were in the field of astrophysics, where he did pioneer work on stellar structure and radiation pressure, subatomic sources of stellar energy, stellar diameters, the dynamics of pulsating stars, the relation between stellar mass and luminosity, white dwarf stars, diffuse matter in interstellar space, and so-called forbidden spectral lines. His work in astrophysics is represented by the classic *Internal Constitution of the Stars* (1925) and in the public lectures published as *Stars and Atoms* (1927). In his well-written popular books he also set forth his scientific epistemology, which he called "selective subjectivism" and "structuralism"—i.e., the interplay of physical observations and geometry. He believed that a great part of physics simply reflected the interpretation that the scientist imposes on his data. The better part of his philosophy, however, was not his metaphysics but his "structure" logic. His theoretical work in physics had a stimulating effect on the thought and research of others, and many lines of scientific investigation were opened as a result of his work. (A.V.D.)

BIBLIOGRAPHY. A biography by Allie Vibert Douglas, *The Life of Arthur Stanley Eddington* (1956), contains a list of his books and scientific papers. A popular discussion of Eddington's work is James Roy Newman, *Science and Sensibility*, 2 vol. (1961). Herbert Dingle, *The Sources of Eddington's Philosophy* (1954), treats his philosophical ideas. C.W. Kilmister, *Sir Arthur Eddington* (1966), discusses the full range of his work. The brief work by S. Chandrasekhar, *Eddington* (1983), is also useful.

eddo (tropical plant): see taro.

eddy, fluid current whose flow direction differs from that of the general flow; the motion of the whole fluid is the net result of the movements of the eddies that compose it. Eddies can transfer much more energy and dissolved matter within the fluid than can molecular diffusion in nonturbulent flow because eddies actually mix together large masses of fluid. Flow composed largely of eddies is called turbulent; eddies generally become more numerous as the fluid flow velocity increases. Energy is constantly transferred from large to small eddies until it is dissipated.

In the lee of an obstacle, eddies form only when the flow around the obstacle reaches a critical velocity; they represent a flow of fluid into the space behind the obstacle, and this inflow begins only when the general flow is fast enough to produce a lowered pressure there. Eddies or vortices (whirlpools) so produced can also cause sound. Many sounds, both natural and manmade, occur in this way.

In the Earth's atmosphere, small eddies occur in the daytime when surface air is warmed by contact with the ground and then rises. On a larger scale, the huge high- and low-pressure centres that move over the Earth may be considered eddies because they are anomalous to the general circulation. These movements include tropical hurricanes and typhoons and the less intense cyclones and anticyclones of the mid-latitude westerly wind belts; the Rossby waves in the upper levels of the westerlies also are eddies. The mid-latitude cyclones, anticyclones, and Rossby waves, by transferring angular momentum (the measure of intensity of rotational motion) from the easterly to the westerly wind belts, play an important role in maintaining the global atmospheric circulation.

In the oceans, eddies result from many causes, including wind blowing over the water's surface and upwelling along coasts.

because of illness, but she read and studied at home and began to write both prose and poetry at an early age. In 1843 she married George W. Glover, who died before the birth of their son, George. Because of her ill health, the boy was reared primarily by others and had little contact with his mother.

Suffering almost constantly from a spinal malady, she was preoccupied with questions of health. She experimented with homeopathy and in 1853 married Daniel Patterson, a dentist who shared this interest. Before their marriage ended in divorce in 1873, Mrs. Patterson sought out and was healed by Phineas P. Quimby of Portland, Maine, who performed remarkable cures without medication. She thought he had rediscovered the healing method of Jesus, and she lectured and wrote of it in regional periodicals. Despite subsequent official statements of her church denying any influence of Quimby, some scholars have considered him an important source of her views.

Soon after Quimby died her illness recurred, and in 1866 she suffered a severe fall and called her own case hopeless. She was healed that year, however, after reading in the New Testament, which she marked as the point of her discovery of Christian Science. Separated from her husband, she spent several lonely years in writing and evolving her system, dis-

cussing it with some and teaching it to Hiram S. Crafts, Richard Kennedy, and others who subsequently became successful healers. In 1875 she published *Science and Health*, revised before her death as *Science and Health with Key to the Scriptures*. Regarded by her followers as divinely inspired, this work and the Bible formed the Scripture of the new faith. She soon held public meetings in Lynn, Roxbury, and Boston, Mass., and in 1877 married one of her followers, Asa G. Eddy (d. 1882).

Steps were taken to organize the First Church of Christ, Scientist, in Boston in 1879, and two years later Mrs. Eddy founded the Massachusetts Metaphysical College, where she taught until it closed in 1889. Meetings in Boston moved in 1895 from rented halls to the newly dedicated Mother Church and then to its larger "extension," still a Boston landmark, in 1906. Branch churches, following organizational directives issued by Mrs. Eddy and collected in the *Church Manual*, were started in other cities; their members often belonged also to the Mother Church in Boston.

A self-perpetuating board of directors, set up by Mrs. Eddy, operated as the ruling authority according to the *Manual*, which is considered inspired and may not be amended. In 1883 she founded the monthly *Christian Science Journal*, in 1898 the weekly *Christian Science Sentinel*, and in 1908 *The Christian Science Monitor*, which has achieved a reputation as one of the leading daily newspapers in the United States. Other machinery created by Mrs. Eddy, such as the boards of education and of lectureship and the committee on publication, continue to promote Christian Science. Among her major works are *Miscellaneous Writings* (1896); *Retrospection and Introspection* (1892); *Unity of Good* (1887); and *Rudimental Divine Science* (1908).

first lighthouse (1696–99), built of timber, was swept away with its designer, Henry Winstanley, by the great storm of 1703. The second, of oak and iron, designed by John Ruydard (1708), was destroyed by fire in 1755. John Smeaton built (1756–59) the third Eddystone Lighthouse entirely of interlocking stone, on a plan that revolutionized the construction of such towers. It stood until replaced in 1882 by the present structure, which stands 133 feet (40 m) above water and was designed by Sir James N. Douglass.

Ede, *gemeente* (commune), Gelderland *provincie*, central Netherlands. It lies on the western edge of the wooded-heath Veluwe region. Founded in the 8th century by the Saxons, it is a garrison town with a 15th-century church, the Doesburger Mill (1507), and an open-air theatre. Nearby De Hoge Veluwe National Park has St. Hubertus Castle and the Kröller-Müller State Museum. The latter institution has an outstanding collection of paintings by the Dutch artist Vincent van Gogh. Pop. (1999 est.) 101,542.

Ede, town, Osun state, southwestern Nigeria. It lies along the Osun River at a point on the railroad from Lagos, 112 miles (180 km) southwest, and at the intersection of roads from Oshogbo, Ogbomosho, and Ife. Ede is one of the older towns of the Yoruba people. It is said to have been founded about 1500 by Timi Agbale, a hunter and warlord sent by Alafm (King) Kori of Old Oyo (Katunga, capital of the Oyo empire), to establish a settlement to protect the Oyo caravan route to Benin (127 miles [204 km] to the southeast). Ede is now a local trading centre for cotton and other produce. Pop. (1996 est.) 307,100.

Edéa, town, southwestern Cameroon, at the head of steamboat navigation of the lower Sanaga River. Aluminum from Fria in Guinea is the basis of the town's aluminum industry. Power for the aluminum plant and for other industries comes from Edéa's dam on the Sanaga. Edéa is connected by rail and road to Douala (northwest) and Yaoundé (east) and by road to Kribi (south). Pop. (1987) 50,700.

Edel, Leon, in full JOSEPH LEON EDEL (b. Sept. 9, 1907, Pittsburgh, Pa., U.S.—d. Sept. 5, 1997, Honolulu, Hawaii), American literary critic and biographer who was the foremost 20th-century authority on the life and works of Henry James.

Edel grew up in Saskatchewan, Can., and graduated from McGill University (B.A., 1927; M.A., 1928), Montreal. He received a doctorate of letters from the University of Paris in 1932. In Paris he met American author Edith Wharton, a close friend of James's, who provided

Leon Edel, 1982

© 1985 Thomas Victor

him with information that gave him a scholarly advantage over later biographers and ultimately a deeper insight into how his subject's personality related to his art. Edel taught English for two years in Montreal, but he soon returned to Paris and pursued research on James.

He served in the U.S. Army during World War II. In 1949 he published a complete edition of James's plays, and the following year he joined the faculty of New York University (1950–72; thereafter professor emeritus). In 1963 he won a Pulitzer Prize and a National Book Award for the second and third volumes (*Henry James: The Conquest of London, 1870–1883* and *Henry James: The Middle Years, 1882–1895*, both published in 1962) of a definitive five-volume biography completed in 1972. He edited James's *Complete Tales*, 12 vol. (1963–65), and *Henry James Letters*, 4 vol. (1974–84). In addition to teaching at the University of Hawaii (1972–78), Edel lectured in later years.

He also completed critical biographies of Willa Cather (1953; written with E.K. Brown) and Henry David Thoreau and edited the papers and diaries of critic Edmund Wilson. His reflections on his craft are published in *Literary Biography* (1957; reprinted 1973) and *Writing Lives* (1984).

Edelinck, Gerard (b. Oct. 20, 1640, Antwerp, Spanish Netherlands [now in Belgium]—d. April 2, 1707, Paris, France), Flemish copperplate engraver during the best period of French portrait engraving.

Edelinck learned the rudiments of the art in his native town and went to Paris in 1665. On the recommendation of the painter Charles Le Brun, he was appointed teacher at the academy established at the Gobelins to train workers in tapestry. In his engravings Edelinck excelled in rendering light and shade, colour, and the texture of surfaces. He was the first to execute prints in the lozenge shape. Among his more than 300 works are a "Holy Family" after Raphael, "Penitent Magdalene" and "Alexander at the Tent of Darius" after Le Brun, and "Combat of Four Knights" after Leonardo da Vinci. He engraved numerous portraits, including a few of Louis XIV.

His two brothers, Jean and Gaspar-François, and his son Nicolas were also engravers.

Edelman, Gerald M., in full GERALD MAURICE EDELMAN (b. July 1, 1929, New York, N.Y., U.S.), American physician, physical chemist, and neuroscientist who shared the Nobel Prize for Physiology or Medicine in 1972 with British biochemist Rodney Porter for elucidating the structure of antibodies—proteins that are produced by the body in response to infection. Edelman also made significant contributions to developmental biology and neurobiology.

Edelman received an M.D. degree from the University of Pennsylvania (1954) and served two years in the Army Medical Corps in Paris. During that time he became intrigued by questions concerning the immune system, and upon his return to the United States he enrolled at Rockefeller Institute (now called Rockefeller University) in New York City. He earned a Ph.D. in physical chemistry in 1960 and continued his immunological research as a member of the faculty at Rockefeller (1960–92).

Edelman studied antibodies as a graduate student, and by 1969 he and his colleagues had constructed a precise model of an antibody molecule. They narrowly beat a rival group of British investigators led by Porter to this goal. Both researchers were awarded the Nobel Prize for the enormous contributions they made to the field of immunology.

In the 1970s Edelman shifted his research to focus on questions outside of immunology: specifically, how the body—the brain in particular—develops. In 1975 he discovered substances called cell adhesion molecules (CAMs), which "glue" cells together to form tissues. Edelman found that, as the brain develops, CAMs bind neurons together to form the brain's basic circuitry. His work led to the construction of a general theory of brain development and function often referred to as neural Darwinism, which he explained in a number of books, including *Neural Darwinism: The Theory of Neu-*

ronal Group Selection (1987), *Topobiology: An Introduction to Molecular Embryology* (1988), *The Remembered Present: A Biological Theory of Consciousness* (1989), and *A Universe of Consciousness: How Matter Becomes Imagination* (2000; with Giulio Tononi). His *Bright Air, Brilliant Fire: On the Matter of the Mind* (1992) was written for non-scientists.

From 1981 Edelman served as director of the Neurosciences Institute, which he founded at Rockefeller University, and moved in 1993 to La Jolla, Calif. He also formed and chaired (from 1992) the neurobiology department of the Scripps Research Institute.

edelweiss (*Leontopodium alpinum*), perennial plant of the family Asteraceae, native to alpine areas of Europe and South America. It has 2 to 10 yellow flower heads in a dense cluster, and, below these flower heads, 6 to 9 lance-shaped, woolly, white leaves are

Edelweiss (*Leontopodium alpinum*)

Siegfried Eigstler—Shostal

arranged in the form of a star. An edelweiss plant is about 5 to 30 cm (2 to 12 inches) tall. There are a number of varietics, most of them ornamentals.

edema, also spelled OEDEMA, formerly called DROPSY, in medicine, an abnormal accumulation of watery fluid in the intercellular spaces of connective tissue. Edematous tissues are swollen and, when punctured, secrete a thin incoagulable fluid. This fluid is essentially an ultrafiltrate of serum but—depending on the disease with which it is associated—may also contain small amounts of other substances, such as protein. Generalized edema (also called anasarca) may involve the cavities of the body as well as the tissues with the excessive accumulation of fluid.

Edema is usually a symptom of disease, and its cause is generally traceable to a disease (such as of the kidneys or heart) that produces gross variations in the physiological mechanisms that normally maintain a constant water balance in the cells, tissues, and blood.

The treatment of edema generally consists of correcting the underlying cause.

Eden, district, administrative county of Cumbria, northwestern England, in the eastern part of the county. It is a mountainous district; the Cumbrian Mountains are in the west, the Pennines in the east, and other high moorlands in the south, all rising to elevations of 2,000 to 3,000 feet (600 to 900 m) above sea level. The Cumbrians of Eden make up the northeastern part of the Lake District National Park, a scenic resort area. The Pennines to the east are a westward-trending series of steep-scarped, bleak hills.

Cairns and stone circles in the moorlands and Roman, Viking, and Anglo-Saxon antiquities in the valley are evidence of varied historical occupation and settlement. The agri-

cultural centres of Penrith, the district seat, and Appleby experienced recurrent devastation during the medieval Scots-English border warfare. Pop. (1998 est.) 50,100.

Eden, Anthony, in full ROBERT ANTHONY EDEN, 1ST EARL OF AVON, VISCOUNT EDEN OF ROYAL LEAMINGTON SPA, also called (until 1961) SIR ANTHONY EDEN (b. June 12, 1897, Windlestone, Durham, Eng.—d. Jan. 14, 1977, Alvediston, Wiltshire), British foreign secretary in 1935–38, 1940–45, and 1951–55 and prime minister from 1955 to 1957.

After combat service in World War I, Eden studied Oriental languages (Arabic and Persian) at Christ Church, Oxford. Elected to the House of Commons in 1923, he was appointed undersecretary of state for foreign affairs in 1931, lord privy seal (with special responsibility for international relations) in 1934, and minister for League of Nations affairs (a Cabinet office created for him) in June 1935. He became foreign secretary in December 1935 but resigned in February 1938 to protest Prime Minister Neville Chamberlain's appeasement of Nazi Germany and Fascist Italy.

On the outbreak of World War II in September 1939, Eden reentered Chamberlain's government as dominions secretary. When Churchill became prime minister on May 10, 1940, Eden was named secretary of state for war, but from Dec. 23, 1940, until the defeat of the Conservatives in July 1945, he served once more as foreign secretary. On Oct. 27, 1951, after Churchill and the Conservative Party had been returned to power, Eden again became foreign secretary and also was designated deputy prime minister. In 1954 he helped to settle the Anglo-Iranian oil

Eden, photograph by Yousef Karsh

dispute, to resolve the quarrel between Italy and Yugoslavia over Trieste, to stop the Indochina War, and to establish the Southeast Asia Treaty Organization (SEATO).

In 1953 he became seriously ill, and, although he underwent several operations, he never fully regained his health. Succeeding Churchill as prime minister on April 6, 1955, he attempted to relax international tension by welcoming to Great Britain the Soviet leaders N.S. Khrushchev and N.A. Bulganin. His fall began on July 26, 1956, when Gamal Abdel Nasser, head of the Egyptian state, nationalized the Suez Canal Company, in which the British government had been a principal stockholder since 1875. This action led to an Anglo-French attack on Egypt on November 5, one week after an attack on Egypt by Israel.

British public opinion was more favourable to Eden's show of force than the Labour and Liberal parties had expected; his supporters regretted, however, that he did not fulfill his intention of occupying the key positions of Port Said, Ismailia, and Suez. By December 22, partly through U.S. pressure, British and French forces had been supplanted by UN emergency units, but the canal was left in Egyptian hands rather than subjected to inter-

national control. The next month, on Jan. 9, 1957, Eden resigned, giving ill health as his reason.

Eden was knighted (K.G.) in 1954 and created Earl of Avon in 1961. Eden's memoirs were issued in three volumes, *Full Circle* (1960), *Facing the Dictators* (1962), and *The Reckoning* (1965).

Eden, Garden of, in the Old Testament Book of Genesis, biblical earthly paradise inhabited by the first created man and woman, Adam

Adam and Eve in the Garden of Eden, oil painting by Titian, c. 1550; in the Prado, Madrid
SCALA—Art Resource

and Eve, prior to their expulsion for disobeying the commandments of God. It is also called in Genesis the Garden of Yahweh, the God of Israel, and, in Ezekiel, the Garden of God. The term Eden probably is derived from the Akkadian word *edinu*, borrowed from the Sumerian *eden*, meaning "plain."

According to the Genesis story of the creation and fall of man, out of Eden, east of Israel rivers flowed to the four corners of the world. Similar stories in Sumerian records indicate that an earthly paradise theme belonged to the mythology of the ancient Middle East.

The story of the Garden of Eden is a theological use of mythological themes to explain human progression from a state of innocence and bliss to the present human condition of knowledge of sin, misery, and death.

Eden, George: *see* Auckland, George Eden, Earl of.

Edén, Nils (b. Aug. 25, 1871, Piteå, Swed.—d. June 16, 1945, Stockholm), historian and politician who led what is generally regarded as the first parliamentary government in Swedish history.

A historian of early modern Sweden and a professor at the University of Uppsala (1903–20), Edén was elected to the Riksdag (parliament) in 1908 and quickly rose to prominence in the Liberal coalition party of Karl Staaff. Serving before and during World War I on the important defense and constitution committees, he became chairman of his party on Staaff's death in 1915.

The royal request that Edén form a government in 1917 after the Liberal and Social Democratic election victory is considered the first clear acknowledgment of the principle of parliamentary government in Swedish history. As head of the coalition government, he brought about better trade relations with the Allied powers and procured a constitutional amendment providing for woman suffrage and universal suffrage in local and lower chamber parliamentary elections. Leaving office in

1920, he served as governor of Stockholm province (1920–38) and returned to historical research. His scholarly writings include *1809 års revolution* (1911; "The Revolution of 1809") and *Den svenska riksdagen under femhundra år* (1935; "The Swedish Riksdag for 500 Years").

Eden, River, river in northern England. It rises in the fells (uplands) that connect the Lake District with the highlands of the Pennines and flows 90 miles (145 km) northwestward to its estuary in the Solway Firth, an Irish Sea inlet. From Kirkby Stephen, where its narrow, steep-sided upper valley opens out into the lowland vale, it flows in a meandering course among moraine hummocks (mounds of glacial debris) past Appleby, which is sited on a river peninsula. It receives short, swift right-bank tributaries from the great escarpment of the Pennines and longer left-bank tributaries from the Lake District and its flanking limestone hills. Its main tributary, the Eamont, entering near Penrith, collects drainage from the heart of the Lake District, including the discharge from Ullswater. Above Carlisle it receives the Irthing, which collects the drainage from the fells lying north and south of the Tyne gap near the Northumberland border. Carlisle commands the lowest bridge from a defensive site on the south bank, flanked by left-bank tributaries, the Petteril and Caldew. Even below Carlisle the Eden is not navigable. It discharges by shifting channels through tidal flats into Solway Firth.

Eden, Vale of, belt of low-lying land in the county of Cumbria, Eng., separating the northern Pennines from the Lake District massif. The River Eden drains the vale into the Solway Firth. Geologically, the Vale of Eden is developed upon Permian and younger (Keuper and Bunter) marls and sandstones (the Permian Period occurred from about 286 to 245 million years ago); it is a rich agricultural area.

Edenbridge, town ("parish"), Sevenoaks district, county of Kent, Eng., south of London near the Surrey border, on the River Eden. It was enlarged after 1970 to accommodate overspill population from London, and light industries have been introduced. Nearby Hever Castle is a moated mansion of the 15th and 16th centuries, associated with the family of Anne Boleyn, second wife of Henry VIII; another notable mansion, Chiddingstone Castle, is also located in the area. Pop. (1991) 7,196.

Edenderry, Irish ÉADAN DOIRE, market town, County Offaly, Ire., on the northern edge of the Bog of Allen. The town, including the Court House, was largely built by the marquesses of Downshire in the 18th and early 19th centuries. South of the town are the ruins of Peter Blundell's castle. There are many castles in the area, for Edenderry was located on the edge of the Pale, the medieval English enclave centred on Dublin (39 miles [63 km] east). The main industry is shoemaking. Pop. (2001 est.) 4,000.

edentate, a member of the mammalian order Edentata, which includes all the armadillos, true anteaters, and tree sloths. All these animals are members of the suborder Xenarthra, which also contains the extinct ground sloths and glyptodonts (turtle armadillos). The other suborder, Palaeamodonta, consists of two families of extinct armadillo-like forms. The edentates have been restricted to the Western Hemisphere during their entire evolutionary history; 31 living species are known, most of them in South America.

A brief treatment of edentates follows. For full treatment, *see* MACROPAEDIA; Mammals.

Although the name Edentata means without teeth, only the true anteaters (*Myrmecophagidae*) are totally toothless. Armadillos (*Dasypodidae*) and tree sloths (*Bradypodidae*)

possess peglike teeth that lack enamel; some armadillos have as many as 100 of these teeth. The tree sloths have continuously growing teeth covered with a hard cement that protects them against excessive wear from their highly abrasive herbivorous diet.

Tree sloths have a shaggy yellow-to-brown fur, which in the wild has a greenish tint from the algae that inhabit it. Their long limbs and long, curved claws are adapted to support the animals while hanging upside down from branches; on the ground they are virtually helpless, but they are excellent swimmers.

Anteaters range in size from the 37-centimetre (15-inch), 325-gram (12-ounce) silky anteater (*Cyclops didactylus*) to the 2-metre (6-foot), 25-kilogram (55-pound) giant anteater (*Myrmecophaga tridactyla*). The two arboreal anteaters, the silky and the tamandua (*Tamandua tetradactyla*), have prehensile tails. All three anteaters have elongated heads and sharp, sturdy claws. Enlarged salivary glands secrete a sticky saliva that coats the long, extrusible tongue. Silky anteaters are usually a soft golden colour; tamanduas are tan to brown, with black markings on the chest. The giant anteater is gray with a white-edged black stripe along each side. The shaggy hair is especially long and straight on the large, plumed tail.

Armadillos range in size from the tiny pink fairy armadillo (*Chlamyphorus truncatus*), which is only 16 cm long and weighs about 100 g, to the giant armadillo (*Priodontes giganteus*), a 25-kg animal that can reach 1.5 m in length. The major characteristic of armadillos is their dorsal carapace, a shield composed of several bony plates separated by movable bands. Contrary to popular belief, most species cannot roll up into a completely shielded ball; only the three-plated armadillo (*Tolypeutes tricinctus*) can do this. Some species, such as the nine-banded armadillo (*Dasypos novemcinctus*), can close up quite well, but others merely lower themselves to the ground and use the carapace as a protective shield.

The tree sloths are the only living herbivorous edentates; the two-toed sloth (*Choloepus didactylus*) eats fruits, stems, and leaves from a variety of plants, but the three-toed sloth (*Bradypus tridactylus*) has a diet restricted to the leaves of the cecropia tree. Tree sloths are found from southeastern Honduras to northern Brazil. They are solitary creatures and depend mostly on their camouflaged coloration and lack of motion for protection from predators. A cornered sloth, however, can bite savagely and use its long claws to good advantage.

Anteaters find their prey by the sense of smell. The long, sharp claws are used to rip apart ant nests and termite mounds, and the sticky tongue is highly effective in lapping up the insects. All three species can use their daggerlike foreclaws for self-defense. Myrmecophagids are found from Argentina northward into Mexico.

Armadillos are the most omnivorous members of the order, eating small reptiles and amphibians, insects and other invertebrates, carrion, and some vegetation. They have an acute sense of smell, and some can locate insects that are hidden as deep as 12 cm underground. In addition to rolling up for protection, many armadillos dive into their burrows when threatened; some species can wedge themselves firmly into the burrow, flexing the bony carapace and digging in with the claws. Armadillos are exceptionally good diggers and occasionally will try to burrow speedily into the ground when in danger. The nine-banded armadillo is the only living edentate found north of Mexico; it ranges north into Kansas, and introduced populations have established strong footholds in Florida and other southeastern states. Other armadillo species are found throughout most Central and South American habitats as far south as Argentina.

Edentate reproduction is varied. The shortest gestation period, 65 days, occurs in the hairy armadillo (*Chaetophractus villosus*) and the longest, 263 days, in the two-toed sloth. *Dasypos* exhibits both of the distinctive reproductive phenomena found in various representatives of this order: polyembryony, with 2–12 identical embryos developing from one fertilized ovum (*Dasypos* almost always bears quadruplets), and delayed implantation, with the early embryo floating freely in the uterus for as long as several months before implanting in the uterine wall and continuing its development. *Dasypos* breeds between June and September, but implantation does not occur until November, and the young are always born in early spring. Young armadillos have a leathery carapace that hardens with age, and they are able to walk shortly after birth. Young tree sloths are born with their eyes and ears open. They cling to the mother and suckle until five months of age and are on their own at nine months. Young anteaters also ride on the mother.

The North American paleanodont edentates lived from the late Paleocene into the Oligocene (about 57.8 million to 36.6 million years ago). In the Southern Hemisphere the first Xenarthra also appeared during the Paleocene. This suborder underwent a large adaptive radiation. Several families of sloths appeared and died out, as did two lines of armadillo-like creatures, including the glyptodonts (Glyptodontidae). Two of the largest edentates lived in South America during the Pleistocene Era (some 500,000 years ago). These were the ground sloth *Megatherium americanum*, which was 6 m long, and the glyptodont *Doedicurus clavicaudatus*, which reached 4 m long and stood 1.5 m high.

Edenton, town, seat of Chowan county, northeastern North Carolina, U.S., on Albemarle Sound. Settled c. 1660, it was incorporated in 1722 and named for Charles Eden, the first royal governor, and served as the unofficial capital of the colony until c. 1760; Edenton's

The Cupola House in Edenton, N.C.
Mill and Joan Mann from CameraMann

busy port exported plantation products, lumber, and fish. Joseph Hewes, a signer of the Declaration of Independence, lived there; his house and many other colonial structures are preserved, including the Cupola and Iredell houses, St. Paul's Episcopal Church, and the Chowan County courthouse. A bronze teapot marker commemorates the anti-British Edenton Tea Party (Oct. 25, 1774) staged by women of the town. The town's basic agricultural economy (peanuts [groundnuts], truck crops, and livestock) is supplemented by light manufacturing, fishing, and boating. Pop. (1990) 5,268.

Ederle, Gertrude (Caroline) (b. Oct. 23, 1906, New York City), first woman to swim the English Channel and one of the best known U.S. sports personages of the 1920s. On Aug. 6, 1926, she swam the 35 miles (56 kilometres) from Cap Gris-Nez, Fr., to Dover, Kent, Eng., in 14 hr 31 min, breaking the men's record by 1 hr 59 min.

Gertrude Ederle was a leading exponent of

the eight-beat crawl (eight kicks for each full arm stroke), and in the early 1920s she set world and U.S. women's freestyle records for distances from 100 to 880 yards. In the Olympic Games of 1924 in Paris, she won a gold medal as a member of the U.S. women's 400-metre relay team. After her channel triumph, in which her hearing was permanently impaired, she became a swimming instructor and a fashion designer.

EDES, abbreviation of Greek ΕΛΛΗΝΙΚΟΣ ΔΙΜΟΚΡΑΤΙΚΟΣ ΕΘΝΙΚΟΣ ΣΤΡΑΤΟΣ, English GREEK DEMOCRATIC NATIONAL ARMY, nationalist guerrilla force that, bolstered by British support, constituted the only serious challenge to EAM-ELAS (*q.v.*) control of the resistance movement in occupied Greece during World War II. Led by Gen. Napoleon Zervas, EDES was originally liberal and antimonarchist; but it moved steadily to the political right. It cooperated with ELAS for a time in operations against the Germans and Italians, but, between October 1943 and February 1944, the two guerrilla groups fought each other. The British hoped to build EDES into a force strong enough to rival EAM-ELAS, but it was incapable of extending its influence far beyond Epirus. During the fighting between ELAS and the British, which began in December 1944, the EDES army was destroyed by ELAS in four days.

Edes, Benjamin (b. Oct. 14, 1732, Charlestown, Mass.—d. Dec. 11, 1803, Boston), founder and co-owner with John Gill of the anti-British New England newspaper the *Boston Gazette and Country Journal*. As editor and publisher of the *Gazette*, Edes made the paper a leading voice favouring American independence.

Edes was 23 and had received only a modest education when he joined with a young Boston printer, John Gill, to found the *Gazette* as a patriots' voice in 1755. It was an immediate success. It is said that the rebellious colonists who took part in the Boston Tea Party (1773) assembled at Edes' home and then donned their Indian costumes and paint at the plant of the *Gazette*.

From mid-1774 to April 1775 Edes was circulating some 2,000 copies of the *Gazette* a week, more than any other colonial paper. British authorities offered a bounty for his arrest, intending to execute him for *Gazette* stories about alleged British atrocities. To avoid arrest Edes, in April 1775, moved his press out of Boston, resuming publication later in Watertown.

As British-colonial relations worsened, Edes began to carry articles by such famous proponents of independence as Samuel and John Adams and John Hancock. Edes published the paper until 1798, but it lost popularity after the Revolutionary War. Edes died in poverty.

Edessa, Modern Greek ΕΔΗΕΣΣΑ, chief city, *nomós* (department) of Pella, Macedonia, Greece, on a steep bluff above the valley of the Loudhiás Potamós (river). A swift, fragmented stream flowing through the town was known as the Skirtos ("leaper") in ancient times and since the Middle Ages as the Vódhas (Slavic *voda*, "water") and now as the Edhessaíof Potamós. Its waterfalls have been threatened by the building of a hydroelectric power station at Agra, 2 mi (3 km) east of the town. A prominent trading and agricultural centre, it also manufactures carpets and textiles and is the seat of the metropolitan bishop of Edessa and Pella (Pélla).

The assumption that Edessa was the location of Aigai, the first capital of ancient Macedonia, was seriously challenged by the discovery in 1977 of royal tombs of Macedonian leaders at Verghina, southeast of Véroia, including

one identified as that of Philip II. In Roman times Edessa was a stop on the Via Egnatia connecting the Adriatic Sea with the Aegean Sea, and a Roman or Byzantine bridge span of that highway survives in the town. Fought over by the Bulgarians, Byzantines, and Serbs, Edessa was taken by the Turks in the 15th century. In 1912 it passed to Greece. Pop. (2001 est.) 19,300.

Edessa (Turkey): see Urfa.

Edfu (Egypt): see Idfū.

Edgar (b. 943/944—d. July 8, 975), king of the Mercians and Northumbrians from 957 who became king of the West Saxons, or Wessex, in 959 and is reckoned as king of all England from that year. He was efficient and tolerant of local customs, and his reign was peaceful. He was most important as a patron of the English monastic revival.

Edgar, detail from the New Minster Charter, 966, in the British Library (Vesp. MS. A viii)

By courtesy of the trustees of the British Library

The younger son of Edmund I, king of the English, Edgar was made king of the Mercians and Northumbrians in place of Eadwig, his brother, who was deposed. On Eadwig's death (Oct. 1, 959), Edgar succeeded to the West Saxon throne. His ecclesiastical policy was also that of the archbishop of Canterbury, St. Dunstan, who insisted on strict observance of the Benedictine Rule. The king supported Archbishop Oswald of York and Bishop Aethelwold of Winchester in founding abbeys. Edgar's laws were the first in England to prescribe penalties for nonpayment of tithes and Peter's pence, the annual contribution made by Roman Catholics for support of the Holy See.

Edgar (b. c. 1075—d. Jan. 8, 1107, Edinburgh, Scot.), king of Scots from 1097, eldest surviving son of Malcolm III Canmore and Queen Margaret (granddaughter of King Edmund II of England) and thus the first king of the Scots to unite Celtic and Anglo-Saxon blood.

As vassal to King William II Rufus of England, he was placed on the Scottish throne to succeed the Celtic, anti-English Donald Bane, his uncle, who was deposed. In 1098 Edgar ceded the Hebrides to Magnus III, king of Norway, who had been raiding the islands. Edgar was a generous benefactor of the church; a contemporary historian (St. Aelred of Rievaulx) called him the equal of Edward the Confessor in personal merit. He died unmarried and was succeeded by his brother Alexander I.

Edgar THE AETHELING (b. Hungary—d. c. 1125), Anglo-Saxon prince, who, at the age of about 15, was proposed as king of England after the death of Harold II in the Battle of Hastings (Oct. 14, 1066) but instead served the first two Norman kings, William I, Harold's conqueror, and William II. His

title of aetheling (an Anglo-Saxon prince, especially the heir apparent) indicates he was a prince of the royal family; he was a grandson of King Edmund II Ironside.

After the Norman Conquest, Edgar submitted to William I, although the new king was occupied until 1069 in crushing rebellions in favour of the aetheling. Edgar lived in Scotland (1068–72) with his brother-in-law, King Malcolm III Canmore, and then went into exile when William and Malcolm came to terms. In 1074 he submitted to William again, and in 1086 he led a Norman force sent by William to conquer Apulia, in southern Italy.

Under William II Rufus, Edgar was deprived of his Norman lands in 1091, giving Malcolm an excuse for raiding the north of England. Edgar then mediated between the two kings. In 1097, acting on William's orders, he overthrew Malcolm's brother and successor, Donald Bane, a foe of the Normans, and installed Malcolm's son Edgar on the throne of Scotland. About 1102 he went on a crusade to the Holy Land. He sided with Robert Curthose, Duke of Normandy, against Henry I in the struggle for the English crown. Edgar was captured by Henry in the Battle of Tinchebrai (Sept. 28, 1106), was released, and spent the rest of his life in obscurity.

Edgartown, town, Dukes county, southeastern Massachusetts, U.S. It lies between Nantucket and Vineyard sounds, on the eastern tip of Martha's Vineyard Island. The oldest settlement on the island, Edgartown dates from 1642 and was incorporated in 1671 and named for Edgar, son of James II of England. At first the town was called Nunnepog (Indian for "fresh pond"). In the 18th century Edgartown was the prosperous home port of many whaling vessels. Houses built by successful whalers and merchants line the town streets. On Cooke Street are some of the oldest houses in the area, including the Thomas Cooke house (1766), now headquarters of the Duke County Historical Society. Edgartown depends greatly on summer tourists for revenue and has excellent beaches and provisions for water sports. Nearby is Martha's Vineyard State Forest. Pop. (1990) 3,062.

Edgerton, Harold E(ugene) (b. April 6, 1903, Fremont, Neb., U.S.—d. Jan. 4, 1990, Cambridge, Mass.), American electrical engineer and photographer, noted for developing techniques of high-speed photography and applying them to various scientific uses.

Edgerton earned a bachelor's degree in electrical engineering from the University of Nebraska in 1925 and received master's (1927) and doctoral (1931) degrees in the same field

Falling drop of milk photographed by Edgerton using a strobe light for illumination, c. 1938

Harold E. Edgerton

from the Massachusetts Institute of Technology (MIT). He taught at MIT from 1928, becoming a full professor there in 1948.

As a graduate student, Edgerton in 1926 began to experiment with flash tubes. He developed a tube using xenon gas that could produce high-intensity bursts of light as little as 1/1,000,000 of a second in duration. Edgerton's tube is still the basic flash device used in still photography. The xenon flash could also emit repeated bursts of light at regular and very brief intervals and was thus an ideal stroboscope. With his new flash Edgerton was able to photographically record the action of such things as drops of milk falling into a saucer, a tennis racket hitting a ball, and bullets impacting against a steel plate or traveling at speeds of up to 15,000 miles per hour (24,100 kilometres per hour). The resulting images often possessed artistic beauty in addition to their value to industry and science.

Edgerton explored many uses for his new photographic equipment. During World War II he constructed stroboscopic units to photograph the night operations of enemy troops. After the war he and his associates photographed U.S. nuclear test explosions. Later he devised methods and equipment to photograph sea life at unprecedented depths.

Edgeworth, Francis Ysidro, original name YSIDRO FRANCIS EDGEWORTH (b. Feb. 8, 1845, Edgeworthstown, County Longford, Ire.—d. Feb. 13, 1926, Oxford, Oxfordshire, Eng.), Irish economist and statistician who applied mathematics to those fields, developing new concepts.

Edgeworth was educated at Trinity College in Dublin and Balliol College, Oxford, graduating in 1869. In 1877 he qualified as a barrister. He lectured at King's College, London, from 1880, becoming professor of political economy in 1888. From 1891 to 1922 he was Drummond Professor of economics at Oxford. He played an important role as editor of the *Economic Journal* (1891–1926).

Edgeworth was an economist of formidable mathematical attainments with, however, a rather obscure style of writing. He originally hoped to use mathematics to illuminate ethical questions; and his first work, *New and Old Methods of Ethics* (1877), drew on mathematical techniques, especially the calculus of variations, which possibly deterred otherwise interested readers. His most famous work is *Mathematical Psychics* (1881), which presented his ideas on the generalized utility function, the indifference curve, and the contract curve, all of which have become standard devices of economic theory.

Edgeworth contributed to the pure theory of international trade and to taxation and monopoly theory. He also made important contributions to the theory of index numbers and to statistical theory, in particular to probability, advocating the use of data of past experience as the basis for estimating future probabilities.

Edgeworth, Maria (b. Jan. 1, 1767, Blackbourton, Oxfordshire, Eng.—d. May 22, 1849, Edgeworthstown, Ire.), Anglo-Irish writer, known for her children's stories and for her novels of Irish life.

She lived in England until 1782, when the family went to Edgeworthstown, northwest of Dublin, where Maria, then 15 and the eldest daughter, assisted her father in managing his estate. In this way she acquired the knowledge of rural economy and of the Irish peasantry that was to be the backbone of her novels. Domestic life at Edgeworthstown was busy and happy. Encouraged by her father, Maria began her writing in the common sitting room, where the 21 other children in the family provided material and audience for her stories. She published them in 1796 as *The Parent's Assistant*. Even the intrusive moralizing, attributed to her father's editing, does not

Maria Edgeworth, detail of an engraving by Alonzo Chappel, 1873

By courtesy of the Trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd

wholly suppress their vitality, and the children who appear in them, especially the impetuous Rosamond, are the first real children in English literature since Shakespeare.

Her first novel, *Castle Rackrent* (1800), written without her father's interference, reveals her gift for social observation, character sketch, and authentic dialogue and is free from lengthy lecturing. Sir Walter Scott acknowledged his debt to Edgeworth in writing *Waverley*. Her next work, *Belinda* (1801), a society novel unfortunately marred by her father's insistence on a happy ending, was particularly admired by Jane Austen.

Edgeworth never married. She had a wide acquaintance in literary and scientific circles. Between 1809 and 1812 she published her *Tales of Fashionable Life* in six volumes. They include one of her best novels, *The Absentee*, which focused attention on a great contemporary abuse: absentee English landowning.

Before her father's death in 1817 she published three more novels, two of them, *Patronage* (1814) and *Ormond* (1817), of considerable power. After 1817 she wrote less. She completed her father's *Memoirs* (1820) and devoted herself to the estate. She enjoyed a European reputation and exchanged cordial visits with Scott. Her last years were saddened by the Irish famine of 1846, during which she worked for the relief of stricken peasants.

The feminist movement of the 1960s led to the reprinting of her *Moral Tales for Young People*, 5 vol. (1801) and *Letters for Literary Ladies* (1795) in the 1970s. Her novels continued to be regularly reprinted in the 20th century. A selection of her letters, *Maria Edgeworth in France and Switzerland*, edited by Christina Colvin, was published in 1979.

Edgeworth, Richard Lovell (b. May 31, 1744, Bath, Somerset, Eng.—d. June 13, 1817, Edgeworthstown, County Longford, Ire.), Anglo-Irish inventor and educationalist who

Richard Edgeworth, engraving by A. Cardon, 1812

BBC Hulton Picture Library

had a dominant influence on the novels of his daughter Maria Edgeworth.

An estate owner in Ireland, Edgeworth did much to improve the conditions of his tenantry by land reclamation and road-improvement schemes. In 1798, when the French landed an expeditionary force in Ireland, he organized a troop of yeomanry to fight them. In 1802 he took his family to Paris and was received in scientific and literary circles. In 1806 he joined a commission of inquiry into Irish education, and from 1807 he worked on his autobiography.

Edgeworth's remarkable powers of mechanical invention are attested by his attempt at telegraphic communication, possibly the first, the creation of various sailing carriages, a velocipede (cycle), a "perambulator" (land-measuring machine), a turnip cutter, a one-wheeled chaise, and a phaeton (a four-wheeled open carriage). *Practical Education*, written in collaboration with his daughter, was inspired by the French-Swiss moralist Jean-Jacques Rousseau and by one of Edgeworth's wives, Honora. The book argued that children should be given a strong motive to learn and that the pace should be adjusted to the child's age and ability. Edgeworth discouraged learning by rote, arguing that while some things require sustained effort, others can be learned through play; children should thus be given toys that stimulate them to productive activity.

Four times married, Edgeworth had 22 children.

Édhessa (Greece): see Edessa.

Ediacara fauna, assemblage of relatively advanced multicellular Precambrian animals found as fossils in the Pound Quartzite of the Ediacara Hills, north of Adelaide, South Australia (the Precambrian began about 3.8 billion years ago and ended 570 million years ago). The discovery of the Ediacara fauna provided a glimpse into the early development of multicellular organisms and demonstrated that a far more complex level of evolution had been achieved in the Precambrian than had previously been thought. Similarly, the assemblage demonstrates that a complex, interacting biologic community existed during at least part of the Precambrian. The complexity of the organisms and of the community implies a still-longer history of development and evolution.

More than 600 specimens have been collected, including soft corals, jellyfishes, various sorts of worms, and forms of unknown affinities.

Edib Adıvar, Halide, also called (1901–10) HALIDE SALIH, original name HALIDE EDİB (b. 1883, Istanbul—d. Jan. 9, 1964, Istanbul), novelist and pioneer in the emancipation of women in Turkey.

Educated by private tutors and at the American College for Girls in Istanbul, she became actively engaged in Turkish literary, political, and social movements. She divorced her first husband in 1910 because she rejected his taking a second wife (she married again in 1917, to a Turkish politician, Adnau Adıvar).

An ardent patriot, she wrote *Yeni Turan* (1912; "The New Turan"), on the nationalistic Pan-Turkish movement. She also played a major role in the Türk Ocağı (Turkish Hearth) clubs started in 1912 that were designed to raise Turkish educational standards and encourage social and economic progress. This program included public lectures attended by men and women together, a great social innovation. During this period Halide Edib published her famous novel *Handan* ("Family"), about the problems of an educated woman.

After educational work in the Ottoman province of Syria, during World War I, she and her husband joined the Turkish nationalists and played a vital role in the Turkish War of Liberation in Anatolia. Her most famous

novel, *Ateşten gömlek* (1922; *The Daughter of Smyrna*), is the story of a young woman who works for the liberation of her country and of the two men who love her. From 1925 to 1938 Halide Edib traveled extensively, lecturing in Paris, London, the United States, and India. On her return to Istanbul in 1939, she became professor of English literature at Istanbul University and later a member of Parliament (1950–54).

Among her other important novels are *Zeyno'nun Oğlu* (1926; "Zeyno's Son") and *Sinekli Bakkal* (1936, originally written in English as *The Clown and His Daughter*, 1935). Other important works in English are *The Turkish Ordeal* (1928), *Conflict of East and West in Turkey* (1935, 1963), and *Turkey Faces West* (1930), in which she examines the ideological conflicts facing the young Turkish Republic. She also wrote two volumes of memoirs (1926).

Edinburg, city, seat of Hidalgo county, extreme southern Texas, U.S., in the Lower Rio Grande Valley, 55 miles (89 km) west-northwest of Brownsville. With McAllen and Pharr it forms a metropolitan complex. Old Edinburg (no longer existing) was founded by John Young of Scotland near the site of Hidalgo and in 1852 became the county seat. In 1908, by referendum, the seat was moved to nearby Chapin (established in 1907), which in 1911 was renamed Edinburg to commemorate the earlier town (the *h* was dropped). Edinburg developed as a cotton-ginning centre and a packing and shipping point for the valley's citrus fruits and vegetables. Oil and natural gas fields are in the vicinity. The city operates one of the nation's most scattered school districts, embracing about 945 square miles (2,450 square km) of groves and farmland and ranchland. It is the site of Pan American University (1927) and the Tropical Texas Center for Mental Health and Mental Retardation (1967). Inc. city, 1919. Pop. (2000) city, 48,465; (1999 est.) McAllen-Edinburg-Mission MSA, 534,907.

Edinburgh, Gaelic DUN IDEANN, city and capital of Scotland. It is located in southeastern Scotland near the southern shores of the Firth of Forth, an arm of the North Sea that thrusts westward into the Scottish Lowlands. The original burgh, now known as the Old Town, developed in the 12th century around the Edinburgh Castle. The city is the centre of Scottish culture, education, and national identity and the seat of the Scottish government.

A brief treatment of Edinburgh follows. For full treatment, see MACROPAEDIA: Edinburgh.

Edinburgh is situated in a rough valley punctuated by upthrusting crags. Its Old Town is dominated by the basalt cliffs of Castle Rock. The Georgian-style New Town developed in the late 18th and 19th centuries at the base of Castle Rock. The city also has expanded to the south of the Old Town, beyond the Meadows. The climate is commonly rainy or cloudy, with mild seasonal variation.

Service activities dominate the city's economy. The manufacturing sector now employs less than one-tenth of its workforce. The pre-World War II staples of brewing, baking, and book printing have all declined. Electrical and electronic research and engineering, largely related to defense and drawing on the scientific expertise of the town's two universities, have become the largest industrial employer. The main service activities are banking and financial services (especially insurance and trust management), public administration, law, medicine, education, and tourism. Edinburgh is second only to London as a British financial centre and tourist destination.

The medieval town of Edinburgh was built on the eastern part of Castle Rock below the

castle walls. The tiny chapel of St. Margaret, on the rock's highest point, the oldest surviving building, dates from the 12th century but possibly incorporates some 11th-century construction. The castle's cliff-hanging ramparts are mainly of 18th-century origin. Palace Yard, or Crown Square, occupies much of the summit of Castle Rock. Two east-west roads form the main axes of the city: the Royal Mile, which descends Castle Hill and links the castle with the Palace of Holyroodhouse; and Princes Street, along which stretch the Princes Street Gardens.

Edinburgh's institutions of higher education include the University of Edinburgh (1583), known for its schools of medicine and law; Heriot-Watt University; the Edinburgh College of Art; and Jewel and Esk Valley College. Edinburgh is home to the National Library of Scotland, the National Galleries of Scotland, the Scottish National Zoological Park, and the Royal Museum and the Museum of Scotland, both administered by the National Museums of Scotland. The city was the birthplace of Sir Walter Scott and of the *Encyclopædia Britannica* (first edition begun in 1768). Edinburgh's annual international festivals of the arts include a panoply of theatre, dance, music, cinematic, and visual arts presentations.

Local, regional, and national bus services are extensive, and the growing number of private motor vehicles has contributed to urban congestion. Edinburgh is served by Scotrail, the regional rail carrier; its Waverley railway station is the second largest in Britain. The city's port of Leith is 2 miles (3 km) north of the city centre, and its international airport is 5 miles (8 km) west at Turnhouse. Area 100 square miles (260 square km). Pop. (1999 est.) 451,710.

Edinburgh, City of, council area, southeastern Scotland. It incorporates portions of the historic counties of Midlothian and West Lothian. The council area has an area of 100 square miles (260 square km) and covers the historic city of Edinburgh, its port of Leith on the southern shore of the Firth of Forth, several suburban communities, and a section of the rural Pentland Hills. Pop. (1999 est.) 451,710.

Edinburgh, Prince Philip, duke of: *see* Philip, duke of Edinburgh.

Edinburgh, University of, coeducational, privately controlled institution of higher education at Edinburgh, one of the most noted of Scotland's universities. It was founded in 1583 as "the Town's College" under Presbyterian auspices by the Edinburgh town council under a charter granted in 1582 by King James VI, who later became King James I of England. In 1621 an act of the Scottish Parliament accorded all the rights and privileges of Scotland's three older universities to the Town's College, after which it gradually assumed the name of the University of Edinburgh. The university remained under the control of the Edinburgh town council until 1858, when it received autonomy under the Universities Act.

The university initially consisted of a liberal arts college and a school of divinity. Schools of medicine and law were established in the early 18th century, and faculties of music, science, arts, social sciences, and veterinary medicine were subsequently added.

Although its faculty of divinity has always been of singular importance to the university, its school of medicine is also renowned. The English naturalist Charles Darwin studied medicine there. The University of Edinburgh has produced a long line of eminent cultural figures, including the novelist Sir Walter Scott, the philosopher and historian James Mill, the essayist and historian Thomas Carlyle, the

novelist Robert Louis Stevenson, and the inventor Alexander Graham Bell.

Edinburgh Review, The, or The Critical Journal, Scottish magazine that was published from 1802 to 1929, and which contributed to the development of the modern periodical and to modern standards of literary criticism. *The Edinburgh Review* was founded by Francis Jeffrey, Sydney Smith, and Henry Brougham as a quarterly publication, with Jeffrey as its first and longtime editor. It was intended as an outlet for liberal views in Edinburgh. The magazine soon earned wide esteem for its political and literary criticism, and by 1818 it had attained a circulation of 13,500. Its contributors included the novelist Sir Walter Scott, the essayist William Hazlitt, the historian Thomas Babington Macaulay, the educator Thomas Arnold, and the legal historian Sir James Stephen. *The Edinburgh Review's* prestige and authority among British periodicals during the 19th century were matched only by that of *The Quarterly Review*.

Edingen (Belgium): *see* Enghien.

Edirne, formerly ADRIANOPLE, or HADRIANOPLE, city, extreme western Turkey. It lies at the junction of the Tunca and Maritsa (Turkish: Meriç) rivers near the borders of Greece and Bulgaria. The largest and oldest part of the town occupies a meander of the Tunca around the ruins of an ancient citadel. Edirne's site and turbulent history were determined by its strategic position on the main route from Asia Minor to the Balkans.

Bayezid Cami (mosque), Edirne, Tur.

Roland Michaud from Rapho/Photo Researchers—EB Inc.

Originally called Uskudama and probably first settled by Thracian tribes, the town was rebuilt and enlarged in about AD 125 by the Roman emperor Hadrian, who renamed it Hadrianopolis. In 378 the city was the site of the Battle of Adrianople, in which the Goths dealt Rome a crushing defeat. Besieged by the Avars in 586, the city was captured by the Bulgars in the 10th century and was sacked twice by crusaders until it fell to the Ottomans in 1362. It then served as the forward base for Ottoman expansion into Europe. It served as the capital of the Ottoman Empire from 1413 until 1458 and flourished as an administrative, commercial, and cultural centre. Its decline came with foreign occupations and devastation in wars. Occupied by the Russians in 1829 and 1878, it was taken by the Bulgarians during the First Balkan War in 1913. Retaken by the Turks that same year, it was captured by the Greeks in 1920 during the Turkish War of Independence and was finally restored to Turkey in 1922.

The centre of the city has several beautiful mosques. The Selimiye Cami (Mosque of Selim) is a masterpiece of the celebrated Ottoman court architect Sinan. Built between 1569 and 1575, the mosque lies on the summit of rising ground and dominates the skyline. The mosque's main structure comprises a succession of 18 small domes dominated by a huge central dome resting on 8 columns with 3-balconied minarets on 4 sides. The mosque forms an architectural whole, with adjacent complementary buildings, school, library, and

theological college, now housing archaeological and ethnographic museums. The Bayezid Cami (Mosque of Bayezid), built by Sultan Bayezid II in 1488, has a great dome supported by four walls and an elegant marble niche pointing toward Mecca. Bedesten is a restored 15th-century covered bazaar.

Edirne lies along the London-to-Istanbul railway. Major roads connect it with central Europe and Istanbul. Known for its *peynir* (white cheese), the city also produces cotton and woollens, soap, and leather goods. The surrounding agricultural area produces wheat, rice, rye, and fruits. Pop. (1997) 115,083.

Edirne, Treaty of, also called TREATY OF ADRIANOPLE (Sept. 14, 1829), pact concluding the Russo-Turkish War of 1828–29, signed at Edirne (ancient Adrianople), Tur.; it strengthened the Russian position in eastern Europe and weakened that of the Ottoman Empire. The treaty foreshadowed the Ottoman Empire's future dependence on the European balance of power and also presaged the eventual dismemberment of its Balkan possessions.

Russia, victorious on the Balkan and Caucasus fronts, preferred a weakened Ottoman Empire to one that was dismembered by other powers. The treaty allowed Russia to annex the islands controlling the mouth of the Danube River and the Caucasus coastal strip of the Black Sea, including the fortresses of Anapa and Poti. The Ottomans recognized Russia's title to Georgia and other Caucasian principalities and opened the Straits of the Dardanelles and Bosphorus to Russian shipping. Furthermore, in the Balkans, the Ottomans acknowledged Greece as an autonomous but tributary state, reaffirmed the Convention of Akkerman (1826), granting autonomy to Serbia, and recognized the autonomy of the Danubian principalities of Moldavia and Walachia under Russian tutelage.

Edison, urban township, northern Middlesex county, New Jersey, U.S., just northeast of New Brunswick. It is the site of Menlo Park (q.v.), where the inventor Thomas A. Edison established his research laboratory. Part of Woodbridge and Piscataway townships before 1870, it was known as Raritan township until 1954, when it was renamed for Edison. Edison's manufactures are diversified, and the Raritan Center, occupying most of the former Raritan Arsenal, is a planned industrial, commercial, and research complex. Middlesex County College (1964) is in Edison. Pop. (2000) 97,687.

Edison, Thomas Alva (b. Feb. 11, 1847, Milan, Ohio, U.S.—d. Oct. 18, 1931, West Orange, N.J.), American genius of technology, who held patents for more than 1,000 inventions, including the incandescent electric lamp, the phonograph, and the motion-picture projector.

A brief treatment of Thomas Alva Edison follows. For full treatment, *see* MACROPAEDIA: Edison.

Edison set up a laboratory in his father's basement when he was 10 years old. At the age of 12 he began selling newspapers and candy on the trains between Port Huron and Detroit. From 1862 to 1868 he worked as a roving telegrapher. He obtained a position as a night operator for Western Union Telegraph Company in 1868. In 1869 he decided to give up his career in telegraphy in order to pursue invention and entrepreneurship. He moved to New York City, and within a year he was successful enough to establish a workshop in Newark, N.J. During this time he produced the Edison Universal Stock Printer and other printing telegraphs. In 1876 he gave up his telegraph factory and set up a research laboratory in nearby Menlo Park. There, with the help of several highly talented associates, Edison achieved his greatest successes. In 1877 he invented the phonograph. He began work

on the light bulb in 1878 and demonstrated his carbon filament lamp in 1879. In 1883 he accidentally discovered the "Edison effect," which later became the basis of the electron tube. He also perfected motion-picture equipment.

Eḍlābād (India): *see* Ādilābād.

Edmer, also spelled **EADMER** (b. c. 1060—d. c. 1128, Canterbury, Kent, Eng.?), English biographer of St. Anselm and historian whose accounts are a uniquely accurate and credible portrait of the 12th-century monastic community at Canterbury.

Born into a wealthy family that was impoverished by the Norman conquest, Edmer was raised at Christ Church, Canterbury, where he lived as a monk until 1093. After the accession of Anselm to the archbishopric in 1093, Edmer became a member of his household, probably acting as secretary and chaplain. Until Anselm's death in 1109, Edmer accompanied him on extensive travels to Rome, Cluny, and the councils of Bari (1098) and the Vatican (1099). Between 1109 and 1114 he remained relatively inactive, but he returned to Canterbury under Archbishop Ralph in 1119.

His two greatest works are a six-book *Historia novorum in Anglia* (c. 1115), an account of events in England as seen from Canterbury, stressing Anselm's role in the Investiture Controversy between the political and clerical authorities, and the *Vita Anselmi* (c. 1124), an authoritative biography of Anselm's private life. Edmer's importance in historiography rests on his powers of critical observation and description, a novel emphasis on psychological factors in biographical writing, and a clear recognition of the implications of the Investiture Controversy.

Edmond, city, Oklahoma county, central Oklahoma, U.S., immediately north of Oklahoma City. Settled in 1889, it was named for Eddy (Edmond) Townsend, a rancher. The West Edmond Field is one of the world's largest oil fields. The city's manufactures include petroleum products, feed, flour, and concrete blocks. Central State University was established in Edmond in 1890. Pop. (2000) 68,315.

Edmondo (Italian personal name): *see* under Edmund.

Edmonton, city, capital of Alberta, Canada. It lies along the North Saskatchewan River, in the centre of the province. Edmonton traces its origin to Fort Edmonton, a Hudson's Bay Company fur-trading post built in 1795 at a site 20 miles (32 km) downstream from the present-day city and reputedly named after a former borough in London, Eng. Nearby was Fort Augustus, a North West Company trading post built on the river's opposite bank. Both posts were abandoned in 1810, and five other forts were later built along the river. A trading settlement developed at the city's site after 1864 and survived the Cree Indian Rebellion of 1885. With the arrival of the Canadian Pacific Railway at nearby Strathcona (across the river) in 1891 and the federal government's successful campaign later in that decade to lure settlers to the West, Edmonton began to prosper as an agricultural distribution and processing centre. The year 1905 saw the long-awaited arrival of the Canadian Northern Railway and the designation of the city as capital of the new province of Alberta. Edmonton and Strathcona were amalgamated in 1912. During World War II Edmonton served as the base for construction of the Alaska Highway. The discovery of petroleum in 1947 at Leduc and subsequently at several

Main Legislative Building (foreground), Edmonton, Alta.
George Hunter

other locations near Edmonton greatly stimulated the city's urban and industrial growth.

An agricultural and oil-based economy still prevails in Edmonton. The city's major industries include lumbering, flour milling, meat-packing, tanning, dairying, oil refining, and the production of petrochemicals and plastics. Oil and gas pipelines radiate from the city. Edmonton's three major rail lines, along with its international airport, have made it the wholesaling, retailing, and distribution centre of northwestern Canada.

Edmonton is the headquarters of Athabasca University (an "open university" founded in 1972) and is the site of the University of Alberta (1906), the Northern Alberta Institute of Technology, the Provincial Museum of Alberta, the Queen Elizabeth Planetarium, and the Valley Zoo. The main Legislative Building (1908–12) holds a 305-bell carillon in its dome. Ft. Edmonton Historical Park, at the south end of Quesnell Bridge, highlights a replica of the original fort. The city hosts the annual Agricultural and Industrial Exhibition, Muk-Luk Mardi Gras (a winter sports carnival), and Klondike Days (a celebration in July of the 1890s gold rush). Edmonton also has one of the world's largest shopping malls. Inc. town, 1892; city, 1904. Pop. (2001) city, 666,104; metropolitan area, 937,845.

EAST ANGLIA

• **Edmund**, byname **SAINT EDMUND THE MARTYR** (b. 841/842—d. Nov. 20, 870; feast day November 20), king of East Anglia (from 855).

Of his life little is known. In the year 870 the Danes, who had been wintering at York, marched through Mercia into East Anglia and took up their quarters at Thetford. Edmund engaged them fiercely in battle, but the Danes under their leaders Ubba and Ingvar were victorious and remained in possession of the field of battle. The king himself was slain, whether on the actual field of battle or in later martyrdom is not certain, but the widely current version of the story which makes him fall a martyr to the Danish arrows when he had refused to renounce his faith or hold his kingdom as a vassal from the heathen overlords must have arisen early, for the St. Edmund pennies afford evidence of his cult before the end of the 9th century. He was ultimately buried at Beadoricesworth (now Bury St. Edmund's, West Suffolk), where his shrine became famous. Later, fictitious versions make him a Continental Saxon, born at Nürnberg

and adopted by Offa, king of East Anglia, when on his way to Rome. They also invent names for his parents, Alkmund and Scivare. **BIBLIOGRAPHY.** Thomas Arnold (ed.), *Memorials of St. Edmund's Abbey*, vol. 1 (1890, reprinted 1965), contains Abbon of Fleury's *Passio Sancti Eadmundi*; Lord Francis Hervey (ed.), *The History of King Eadmund the Martyr and of the Early Years of His Abbey* (1929), contains both text and translation.

ENGLAND

• **Edmund I**, byname **EDMUND THE DEED-DOER**, Latin **EDMUNDUS MAGNIFICUS** (b. 921—d. May 26, 946, Pucklechurch, Eng.), king of the English (939–946), who recaptured areas of northern England that had been occupied by the Vikings.

He was the son of the West Saxon king Edward the Elder (reigned 899–924) and the half brother of King Athelstan (reigned 924–939), under whom the political unification of England had been accomplished. On Athelstan's death (939), Olaf Guthfrithson, the Norse king of Dublin, occupied Northumbria and raided the Midlands.

Edmund recovered the Midlands after Olaf died in 942, and in 944 he regained Northumbria, driving out the Norse kings Olaf Sihtricson and Raegnald. He captured Strathclyde in 945 and entrusted it to Malcolm I, king of Scots, in return for a promise of military support. Thus, Edmund inaugurated a policy of establishing a secure frontier and peaceful relations with Scotland. In addition, his reign marks the beginning of the 10th-century monastic revival in England. The king was killed in his palace by an exiled robber and was succeeded by his brother, Eadred (reigned 946–955); Edmund's sons eventually acceded to power as kings Eadwig (reigned 957–959) and Edgar (reigned 959–975).

• **Edmund II**, byname **EDMUND IRONSIDE** (b. c. 993—d. Nov. 30, 1016), king of the English from April 23 to Nov. 30, 1016, surnamed "Ironsides" for his staunch resistance to a massive invasion led by the Danish king Canute.

The son of King Ethelred II the Unready (reigned 978–1016), Edmund defied his father's orders by marrying (1015) the widow of one of the Danish lords then occupying English territory. Nevertheless, when Canute invaded England later in 1015, Edmund raised an army in northern England and ravaged regions that would not rally to his cause.

Upon Ethelred's death (April 1016), a small number of councillors and citizens of London proclaimed Edmund as their ruler, but a larger body of nobles at Southampton declared for Canute. Edmund then launched a series of offensives against his rival. He recovered Wessex and relieved London of a siege before being decisively defeated by Canute at Ashington, Essex, on October 18. In the ensuing peace settlement, Edmund retained Wessex, while Canute held the lands north of the River Thames. After Edmund died (probably of natural causes), Canute became sole ruler of England.

SICILY

• **Edmund**: *see* Lancaster, Edmund, 1st Earl of.

Edmund OF ABINGTON, SAINT, original name **EDMUND RICH** (b. Nov. 20, 1175?, Abington, Berkshire, Eng.—d. Nov. 16, 1240, Soisy, Fr.; feast day November 16), distinguished scholar, outspoken archbishop of Canterbury, one of the most virtuous and attractive figures of the English church, whose literary works strongly influenced subsequent spiritual writers in England. After studies at Oxford—where he took a vow of perpetual

chastity—and at Paris, he lectured (c. 1194–1200) in Paris and in Oxford, where he reportedly was the first to teach the philosophy of Aristotle. After further theological studies in Paris, he again taught at Oxford from about 1214 to 1222, when he became canon of Salisbury Cathedral, Wiltshire. In 1227 he preached in England for the Sixth Crusade at the request of Pope Gregory IX, who effected his elevation to archbishop of Canterbury in 1233 (consecrated April 2, 1234).

Edmund soon clashed with King Henry III of England, defending church rights and criticizing the king's continental policies. Reacting against Henry, the baronage ultimately supported Edmund. Civil war threatened. Edmund forced Henry (by threat of excommunication) to expel his wife's ambitious French relatives and allies from England and to abandon their projects. Edmund further made Henry promise to observe English law, customs, and the counsel of his native magnates. In 1236 Henry requested the pope to send him a legate, Cardinal Otho, who arrived the following year. Otho's presence helped to undermine the archbishop's power.

St. Edmund, detail from the Westminster Psalter, mid-13th century; in the British Library (Royal MS. 2A xxii)

By courtesy of the trustees of the British Library

Henry upheld the monks of Canterbury in their opposition to Edmund's authority, and Otho's silence on that issue failed to help the archbishop. Edmund finally protested before Henry and generally excommunicated all who had infringed upon the liberties of his primal see. He left for Rome, planning to appeal his case before the Curia, but poor health forced him to stop at Soisy, where he died. He was buried at Pontigny Abbey. His admirers demanded his immediate canonization, which Henry opposed until 1247. Although Edmund had been made head of the English hierarchy in a crisis for which he was not prepared, the purity of his motives and the loftiness of his ideals commanded universal respect.

Of the various writings that are ascribed to Edmund, those assuredly authentic include *Speculum ecclesiae* (Eng. trans. by F.M. Steele, 1905), a widely known devotional treatise considered a major contribution to medieval theology.

BIBLIOGRAPHY. C.H. Lawrence, *St. Edmund of Abingdon: A Study in Hagiography and History* (1960), compares the source documents in order to distinguish history from legend.

Edmunds, George Franklin (b. Feb. 1, 1828, Richmond, Vt., U.S.—d. Feb. 27, 1919, Pasadena, Calif.), U.S. senator and constitutional lawyer, who for a quarter of a century

was a participant in the most important legislative developments of the time.

Edmunds received little formal education, but he studied law and was admitted to the bar in 1849. He was a Republican member (1854–59) and speaker (1856–59) of the Vermont

Edmunds

By courtesy of the Library of Congress, Washington, D.C.

House of Representatives and a member and president pro tem (1861–62) of the Vermont Senate. He was appointed to the U.S. Senate in 1866 and served until 1891; he was president pro tem of the Senate (1883–85). Edmunds was active in the impeachment (1868) of President Andrew Johnson, was chairman of the Senate Judiciary Committee (1872–79; 1882–91), and was a founding member of the electoral commission that decided the election of 1876. The act for the suppression of polygamy (1882) bears his name, and he was principal author of the Sherman Anti-Trust Act (1890), which he insisted be so worded that it would be applicable to labour unions as well as to industry.

Edmunds resigned from the Senate in 1891 to return to the private practice of law. His many major cases include *Pollock v. Farmers' Loan and Trust Co.* (1895), in which he argued successfully before the U.S. Supreme Court that the income tax was unconstitutional.

Edmundston, city, seat (1873) of Madawaska county, northwestern New Brunswick, Canada, at the junction of the St. John and Madawaska rivers, 177 miles (285 km) northwest of Fredericton. Settled by Acadians about 1785 as Petit-Sault (Little Falls), it was renamed in 1848 to honour Sir Edmund Head, then lieutenant governor of the province. Wood pulp is conveyed through a pipeline on the bridge across the river to Madawaska, Maine. The city is known for its wood carving and hand weaving. The Cathedral of the Immaculate Conception, in stone and marble with twin spires, is a foremost example of a distinctive style of eastern Canadian ecclesiastical architecture. Edmundston is the seat of the University of Moncton—Saint-Louis-Maillet Campus (1946). Inc. town, 1905; city, 1952. Pop. (1991) 10,835.

Edo, also called BINI, peoples of southern Nigeria who speak a language of the Kwa branch of the Niger-Congo family of African languages. The Edo numbered about 3.8 million in the late 20th century. Their territory is west of the Niger River and extends from hilly country in the north to swamps in the Niger delta. Edo is also the vernacular name for the city of Benin, the centre of the Benin kingdom, which flourished between the 14th and the 17th century. See also Benin (historic kingdom).

The Edo live in compact village settlements ranging in size from small hamlets to towns of several thousand people. They subsist primarily on yams, supplemented by corn (maize), plantain, cassava, and other vegetables. Livestock includes goats, sheep, dogs, and fowl, used mainly for sacrificial offerings. Brass casting, wood carving, leatherworking, and weaving ceremonial cloth are traditional crafts.

The village is the basis of Edo political life. In each village the males are divided into three age-grades. Boys enter the junior grade in their early teens and perform communal tasks, such as clearing paths and caring for public buildings. The middle grade of adult males do more difficult tasks, such as roofing houses, and perform executive functions for the village council, which consists of the oldest age-grade. The council decides on matters related to tax collection, collective tasks, cult festivals, relations with central authorities, and other community concerns.

The nonhereditary village headman is usually the oldest man in the village; he also serves as priest of ancestral and earth spirits. A sacred king, the oba, was formerly the political, economic, and ritual head of the state; succession to this office is determined by primogeniture.

Many Edo are Christians or Muslims; traditional religion includes belief in a remote creator and in lesser gods, mythical or semimythical village heroes, and spirits of the dead.

Edo, Japanese city that was renamed Tokyo at the Meiji Restoration (1868), when the imperial capital was moved there. In the 1590s Edo became the headquarters for Tokugawa Ieyasu and the Tokugawa shogunate and henceforth was Japan's political centre. See Tokyo.

Edo, state, southern Nigeria. It is bounded by the states of Kogi to the northeast and east, Anambra to the east, Delta to the southeast and south, and Ondo to the west and northwest; the Niger River flows along the state's eastern boundary. Benin City is the state capital and largest urban centre.

Edo state was formed in 1991 from the northern portion of Bendel state, the southern portion becoming Delta state. Prior to this, in 1963, the citizens of the territory had voted to separate from what was then the Western region, and the Mid-West region was created. This became Mid-Western state following the federal reorganization in 1967; from a second reorganization in 1976 until its division in 1991, it was named Bendel state.

Edo state lies at elevations between 500 feet (150 m) in the south and more than 1,800 feet (550 m) in the north. Tropical rain forest covers most of the area. The state is inhabited largely by the Edo (Bini) people, who are linked to the historic kingdom of Benin.

Agriculture is the mainstay of the economy. Yams, cassava, oil palm produce, rice, and corn (maize) are the major subsistence crops, while rubber, timber, and palm oil and kernels are cash crops. Mineral resources include limestone and lignite. Industries produce pharmaceuticals, rubber, plywood, beer, sawn wood, and furniture. A network of trunk roads in the state and an airport at Benin City facilitate transportation. The Nigerian Institute of Oil Palm Research, the Rubber Research Institute of Nigeria, and the University of Benin (founded 1970) are located at Benin City, while a state university (founded 1981) is at Ekpoma. Pop. (1991) 2,159,848.

Edo period (Japanese history): see Tokugawa period.

Edom: see Esau.

Edom, ancient land bordering ancient Israel, in what is now southwestern Jordan, between the Dead Sea and the Gulf of Aqaba. The Edomites probably occupied the area about the 13th century BC. Though closely related to the Israelites (according to the Bible, they were descendants of Esau), they had frequent conflicts with them and were probably subject to them at the time of the Israelite kingdom (11th–10th century BC). Edom prospered because of its strategic location on the trade route between Arabia and the Mediterranean and its copper industry at Ezion-geber. Edom and Moab were later conquered by the Nabataeans, and the Edomites migrated to

southern Judaea, where they were known in New Testament times as Idumaeans.

Ered (English king): *see* Eadred.

educational psychology, theoretical and research branch of modern psychology, concerned with the learning processes and psychological problems associated with the teaching and training of students. The educational psychologist studies the cognitive development of students and the various factors involved in learning, including aptitude and learning measurement, the creative process, and the motivational forces that influence dynamics between students and teachers. Educational psychology is a partly experimental and partly applied branch of psychology, concerned with the optimization of learning. It differs from school psychology, which is an applied field that deals largely with the problems in elementary and secondary school systems.

Educational psychology traces its origins to the experimental and empirical work on association and sensory activity by the English scientist and founder of eugenics, Sir Francis Galton (1822–1911), and the American psychologist G. Stanley Hall (1844–1924), who wrote *The Contents of Children's Minds* (1883). The major leader in the field of educational psychology, however, was the American educator and psychologist Edward Lee Thorndike (1874–1949), who designed methods to measure and test children's intelligence and their ability to learn. Thorndike proposed the transfer-of-training theory, which states that "what is learned in one sphere of activity 'transfers' to another sphere only when the two spheres share common 'elements.'"

educational system, the formal institutions, agencies, and organizations of a country that

transmit knowledge and cultural heritage and that influence the social and intellectual growth of the individual. This generally includes legislation and policy making, administration, facility maintenance, curriculum planning, and teacher preparation and selection.

A brief treatment of educational systems follows. For full treatment, *see* MACROPAEDIA: Education, History of: *Education in the 20th century*.

A country's educational system typically is influenced by a variety of factors. Racial and ethnic attitudes, for example, can play an important role in policy formation and school administration. Language is a significant factor as well, especially in countries like India that have more than one official language. Political and religious ideologies also are potent influences on educational objectives and content. China's is an example of an educational system controlled by a single political party or ideological group, while religious influences are strong in Spain, Ireland, and Pakistan.

Most countries have a centralized governmental agency that organizes, administers, finances, and controls the formal and cultural aspects of education. The laws, curricula, personnel, and materials and methods of instruction generally are determined in the central office. Examples of countries with centralized systems are France, Italy, Denmark, Sweden, Norway, Belgium, The Netherlands, Greece, Argentina, Brazil, and El Salvador.

Decentralized educational systems are found in such countries as Switzerland, the United States, Germany, India, Canada, and Australia. Local administration generally is found in countries where public schooling originated in grassroots or separatist movements or where political unity was achieved through the confederation of sovereign states. Decentralized systems are characterized by the limited participation of central authorities in policy making, largely locally derived funding for education, and administrative power lodged in local boards of education. Countries such as Canada, Germany, and Australia have appointed state ministries of education and state systems of inspection. In the United States, individual states are responsible for providing education and, in the delegation of power, states may tend toward either centralization or decentralization. Most state school boards disburse funds, certify teachers, recommend curricula, and supervise the building and maintenance of schools. Actual administration, however, usually is carried out by local school boards. Members of these boards usually are elected officials who carry out the wishes of the community in formulating policy and drawing up budgets.

A third type of system is a hybrid of the other two: administration and control are shared by national and local authorities. Such is the case in England, where education laws originate in Parliament but actual administration is in the hands of local government. The Japanese system also is jointly controlled, though it differs considerably from the English system. In some cases, private schools and other educational facilities may be controlled but not financed by the central authority, while in others they may receive full or partial subsidies with varying degrees of autonomy.

Two factors increasingly have challenged educational systems during the 20th century: industrialization and population growth. The spread of industrialization and of technological advancement in many parts of the world has required a more complicated division of labour and more extensive formal educational preparation than in the past. Concurrently, worldwide population levels have risen dramatically, especially since 1950, and it has been necessary to allocate more resources in order to maintain or increase levels of educational attainment. The more industrially developed nations generally have been able to

meet this twofold challenge, but the developing countries of Africa, Asia, and Latin America—where population growth has been the greatest and educational resources less plentiful—often have encountered great difficulty raising literacy and skills levels.

Edward, name of rulers grouped below by country and indicated by the symbol ●.

Foreign-language equivalents:

Anglo-Saxon Eadward, or Eadward
Portuguese Duarte

ENGLAND: WESSEX

● **Edward**, byname EDWARD THE ELDER (d. July 17, 924, Farndon on Dee, Eng.), Anglo-Saxon king in England, the son of Alfred the Great. As ruler of the West Saxons, or Wessex, from 899 to 924, Edward extended his authority over almost all of England by conquering areas that previously had been held by Danish invaders.

Edward ascended the throne upon his father's death in October 899, and in a battle in 902 his forces killed a rival claimant, Aethelwald, who had allied with the Danes. After defeating the Northumbrian Danes at Tettenhall, he set out in August 912 to subdue the Danes of the eastern Midlands and East Anglia. From 910 to 916 he constructed a series of fortified enclosures around his Kingdom of Wessex.

At the same time, his sister, the Mercian ruler Aethelflaed, constructed a complementary series of fortresses in the northwest Midlands. In 917 Edward and Aethelflaed launched a massive offensive, quickly overwhelming the entire Danish army of East Anglia. Upon Aethelflaed's death in June 918, Edward assumed control of Mercia, and by the end of the year the last Danish armies in the Midlands had submitted. By that time Edward's kingdom included all the land south of the Humber estuary; in 920 he pacified Northumbria. Complete political unification of England was achieved during the reign of his son and successor, Athelstan (reigned 924–939).

ENGLAND AND THE UNITED KINGDOM

● **Edward**, byname SAINT EDWARD THE MARTYR (b. c. 963—d. March 18, 978, Corfe, Eng.; feast day March 18), king of England from 975 to 978. His reign was marked by a reaction against the promonastic policies of his father and predecessor, King Edgar (reigned 959–975). Upon Edgar's death a faction sought to win the throne for his younger son, Ethelred, but Edward was quickly elected king. He ev-

Saint Edward the Martyr, silver penny, 10th century; in the British Museum

Peter Clayton

idently played little part in the antimonastic reaction, which was led by Aelfhere, ealdorman of Mercia. Edward was assassinated while visiting Ethelred in Corfe. Although Ethelred succeeded to the throne, it is not known whether he had a hand in the murder of his brother. Edward was widely mourned; his remains were said to produce miracles, and he was declared a martyr in 1001.

• **Edward**, byname **SAINT EDWARD THE CONFESSOR** (b. c. 1003, Islip, Eng.—d. Jan. 5, 1066, London; canonized 1161; original feast day January 5, now October 13), king of England from 1042 to 1066. Although he was a listless, ineffectual monarch overshadowed by powerful nobles, his reputation for piety

Saint Edward the Confessor, detail of a miniature from Peter Langtoft's *Chronicle*, early 14th century; in the British Library (Royal Ms. 20 A ii)

evidently preserved much of the dignity of the crown. His close ties to Normandy prepared the way for the conquest of England by Normans under William, Duke of Normandy (later King William I the Conqueror), in 1066.

Edward was the son of King Ethelred II the Unready (reigned 978–1016) and Emma, daughter of Richard II, Duke of Normandy. When the Danes invaded England in 1013, the family escaped to Normandy; the following year Edward returned to England with the ambassadors who negotiated the pact that returned his father to power. After Ethelred's death in 1016 the Danes again took control of England. Edward lived in exile in Normandy until 1041, when he returned to the London court of his half brother (Emma was their mother), King Hardecanut. Edward succeeded to the throne in 1042 and quickly seized the property of his mother, who had plotted against his accession. Nevertheless, for the first 11 years of his reign the real master of England was Godwine, Earl of Wessex. Edward married Godwine's daughter Edith in 1045, but by 1049 a breach had occurred between the two men. In 1051 Edward outlawed the Godwine family and dismissed Edith. During this period Edward was rapidly losing popularity by giving foreigners—particularly Normans—high positions in his government. Hence in 1053 Godwine and his sons were able to gather large forces against the king. They forced Edward to restore their lands, and they exiled many of his foreign favourites. Upon Godwine's death in 1053, his son Harold became the dominant power in the kingdom. It was Harold rather than Edward who subjugated Wales in 1063 and negotiated with the rebellious Northumbrians in 1065. Consequently, Edward on his deathbed named Harold as his successor even though he allegedly had already promised the crown to William. William killed Harold at the Battle of Hastings, Sussex, in October 1066, and two months later he ascended the throne.

• **Edward I**, byname **EDWARD LONGSHANKS** (b. June 17, 1239, Westminster, Middlesex, Eng.—d. July 7, 1307, Burgh by Sands, near Carlisle, Cumberland), son of Henry III and king of England in 1272–1307, during a period of rising national consciousness. He strengthened the crown and Parliament against the old feudal nobility. He subdued Wales, destroying its autonomy; and he sought (unsuccessfully)

the conquest of Scotland. His reign is particularly noted for administrative efficiency and legal reform. He introduced a series of statutes that did much to strengthen the crown in the feudal hierarchy. His definition and emendation of English common law has earned him the name of the "English Justinian."

Early life. Edward was the eldest son of King Henry III and Eleanor of Provence. In 1254 he was given the duchy of Gascony, the French *Oléron*, the Channel Islands, Ireland, Henry's lands in Wales, and the earldom of Chester, as well as several castles. Henry negotiated Edward's marriage with Eleanor, half sister of Alfonso X of Leon and Castile. Edward married Eleanor at Las Huelgas in Spain (October 1254) and then traveled to Bordeaux to organize his scattered appanage. He now had his own household and officials, chancery and seal, with an *exchequer* (treasury) at Bristol Castle; though nominally governing all his lands, he merely enjoyed the revenues in Gascony and Ireland. He returned to England in November 1255 and attacked Llywelyn ap Gruffudd, prince of Gwynedd, to whom his Welsh subjects had appealed for support when Edward attempted to introduce English administrative units in his Welsh lands. Edward, receiving no help from either Henry or the *marcher lords*, was defeated ignominiously. His arrogant lawlessness and his close association with his greedy *Poitevin* uncles, who had accompanied his mother from France, increased Edward's unpopularity among the English. But after the *Poitevins* were expelled, Edward fell under the influence of Simon de Montfort, his uncle by marriage, with whom he made a formal pact. Montfort was the leader of a baronial clique that was attempting to curb the misgovernment of Henry.

Edward reluctantly accepted the Provisions of Oxford (1258), which gave effective government to the barons at the expense of the king. On the other hand, he intervened dramatically to support the radical Provisions of Westminster (October 1259), which ordered the barons to accept reforms demanded by their tenants. In the dangerous crisis early in 1260 he supported Montfort and the extremists, though finally he deserted Montfort and was forgiven by Henry (May 1260). He was sent to Gascony in October 1260 but returned early in

1263. Civil war had now broken out between Henry and the barons, who were supported by London. Edward's violent behaviour and his quarrel with the Londoners harmed Henry's cause. At the Battle of Lewes (May 14, 1264) his vengeful pursuit of the Londoners early in the battle contributed to Henry's defeat. Edward surrendered and became a hostage in Montfort's hands. He escaped at Hereford in May 1265 and took charge of the royalist forces, penned Montfort behind the River Severn, and, by lightning strategy, destroyed a large relieving army at Kenilworth (August 1). On August 4 he trapped and slew Montfort at Evesham and rescued Henry. Shattered and enfeebled, Henry allowed Edward effective control of government, and the latter's extreme policy of vengeance, especially against the Londoners, revived and prolonged rebel resistance. Finally, the papal legate *Ottobuono*, Edward's uncle Richard, Earl of Cornwall, and other moderates persuaded Henry to the milder policy of the *Dictum of Kenilworth* (Oct. 31, 1266), and after some delay the rebels surrendered. Edward took the cross (1268), intending to join the French king Louis IX on a crusade to the Holy Land; but was delayed by lack of money until August 1270. Louis died before Edward's arrival; and Edward, after wintering in Sicily, went to Acre, where he stayed from May 1271 to September 1272, winning fame by his energy and courage and narrowly escaping death by assassination but achieving no useful results. On his way home he learned in Sicily of Henry III's death on Nov. 16, 1272.

Accession and character. Edward had nominated Walter Giffard, archbishop of York, Philip Basset, Roger Mortimer, and his trusted clerk Robert Burnell to safeguard his interests during his absence. After Henry's funeral, the English barons all swore fealty to Edward (Nov. 20, 1272). His succession by hereditary right and the will of his magnates was proclaimed, and England welcomed the new reign peacefully, Burnell taking charge of the administration with his colleagues' support. The quiet succession demonstrated England's unity only five years after a bitter civil war. Edward could journey homeward slowly, halting in Paris to do homage to his cousin Philip III for his French lands (July 26, 1273), staying several months in Gascony and reaching Dover on Aug. 2, 1274, for his coronation at Westminster on August 19. Now 35 years old, Edward had redeemed a bad start. He had been arrogant, lawless, violent, treacherous, revengeful, and cruel; his Angevin rages matched those of Henry II. Loving his own way and intolerant of opposition, he had still proved susceptible to influence by strong-minded associates. He had shown intense family affection, loyalty to friends, courage, brilliant military capacity, and a gift for leadership; handsome, tall, powerful, and tough, he had the qualities men admired. He loved efficient, strong government, enjoyed power, and had learned to admire justice, though in his own affairs it was often the letter, not the spirit of the law that he observed. Having mastered his anger, he had shown himself capable of patient negotiation, generosity, and even idealism; and he preferred the society and advice of strong counselors with good minds. As long as Burnell and Queen Eleanor lived, the better side of Edward triumphed, and the years until about 1294 were years of great achievement. Thereafter, his character deteriorated for lack of domestic comfort and independent advice. He allowed his autocratic temper full rein and devoted his failing energies to prosecution of the wars in France and against Scotland.

Parliament and statutes. Shrewdly realistic, Edward understood the value of the "parliaments," which since 1254 had distinguished English government and which Montfort had deliberately employed to publicize government

policy and to enlist widespread, active support by summoning representatives of shires and boroughs to the council to decide important matters. Edward developed this practice swiftly, not to share royal power with his subjects but to strengthen royal authority with the support of rising national consciousness. From 1275 to 1307 he summoned knights and burgesses to his parliaments in varying manners. The Parliament of 1295, which included representatives of shires, boroughs, and the lesser clergy, is usually styled the Model Parliament, but the pattern varied from assembly to assembly, as Edward decided. By 1307, Parliament, thus broadly constituted, had become the distinctive feature of English politics; though its powers were still undefined and its organization embryonic.

Edward used these parliaments and other councils to enact measures of consolidation and reform in legal, procedural, and administrative matters of many kinds. The great statutes promulgated between 1275 and 1290 are the glory of his reign. Conservative and definitive rather than original, they owed much to Burnell, Edward's chancellor. With the vast developments and reorganization of the administrative machine that Burnell coordinated, they created a new era in English government. The quo warranto inquiry, begun in 1275, the statutes of Gloucester (1278) and of Quo Warranto (1290) sought with much success to bring existing franchises under control and to prevent the unauthorized assumption of new ones. Tenants were required to show "by what warrant" or right they held their franchises. Edward strove, unsuccessfully, to restore the feudal army and strengthen local government institutions by compelling minor landowners to assume the duties of knight-hood. His land legislation, especially the clause *de donis conditionalibus* in the miscellaneous Second Statute of Westminster (1285) and the statute *Quia Emptores* (Third Statute of Westminster, 1290), eventually helped to undermine feudalism, quite contrary to his purpose. By the Statute of Mortmain (1279) the crown gained control of the acquisition of land by ecclesiastical bodies. The Statute of Winchester (1285) codified and strengthened the police system for preserving public order. The Statute of Acton Burnell (1283) and the Statute of Merchants (1285) showed practical concern for trade and merchants. These are but the most famous of many statutes aimed at efficiency and sound administration.

Wars. Meanwhile, Edward destroyed the autonomous principality of Wales, which, under Llywelyn ap Gruffudd, had expanded to include all Welsh lordships and much territory recovered from the marcher lords. Domestic difficulties had compelled Henry III to recognize Llywelyn's gains by the Treaty of Shrewsbury (1267), but Edward was determined to reduce Llywelyn and used Llywelyn's persistent evasion of his duty to perform homage as a pretext for attack. He invaded Wales by three coordinated advances with naval support (1277), blockaded Llywelyn in Snowdonia, starved him into submission, and stripped him of all his conquests since 1247. He then erected a tremendous ring of powerful castles encircling Gwynedd and reorganized the conquered districts as shires and hundreds. When English rule provoked rebellion, he methodically reconquered the principality, killing both Llywelyn (1282) and his brother David (1283). By the Statute of Wales (1284) he completed the reorganization of the principality on English lines, leaving the Welsh marchers unaffected. A further Welsh rising in 1294-95 was ruthlessly crushed, and Wales remained supine for more than 100 years.

After 1294, matters deteriorated. Queen Eleanor had died in 1290, Burnell in 1292, and Edward never thereafter found such good advisers. The conquest and fortification of Wales had badly strained his finances; now endless

Wars with Scotland and France bankrupted him. He quarrelled bitterly with both clergy and barons, behaving as a rash and obstinate autocrat who refused to recognize his limitations. Philip III and Philip IV of France had both cheated him of the contingent benefits promised by the Treaty of Paris (1259). By constant intervention on pretext of suzerainty they had nibbled at his Gascon borders and undermined the authority of his administration there. After doing homage to Philip IV in 1286, Edward visited Gascony to reorganize the administration and restore authority. On returning to England in 1289 he had to dismiss many judges and officials for corruption and oppression during his absence. In 1290, having systematically stripped the Jews of their remaining wealth, he expelled them from England. French intervention in Gascony was now intensified; affrays between English and French sailors inflamed feelings; and in 1293 Philip IV tricked Edward's brother Edmund, earl of Lancaster, who was conducting negotiations, into ordering a supposedly formal and temporary surrender of the duchy, which Philip then refused to restore. The Welsh rising and Scottish troubles prevented Edward from taking action, and when at last, in 1297, he sailed to attack France from Flanders, his barons refused to invade Gascony, and Wallace's rising forced him to return. He made peace with Philip (1299) and by Boniface VIII's persuasion married Philip's sister Margaret, and eventually recovered an attenuated Gascon duchy.

For more than 100 years relations between England and Scotland had been amicable, and the border had been remarkably peaceful. Edward inaugurated 250 years of bitter hatred, savage warfare, and bloody border forays. The deaths of Alexander III of Scotland (1286) and his granddaughter Margaret, the Maid of Norway (1290), whom Edward planned to marry to his heir, Edward of Caernarvon (afterward Edward II), ended the line of succession. Many dubious claimants arose, and the Scottish magnates requested Edward's arbitration. Edward compelled the nobles and the claimants to recognize his suzerainty, and only then adjudged John de Balliol king (1292). Balliol did homage and was crowned, but Edward's insistence on effective jurisdiction, as suzerain, in Scottish cases eventually provoked the Scottish nobles to force Balliol to repudiate Edward's claims and to ally with France (1295). Edward invaded and conquered Scotland (1296), removing to Westminster the coronation stone of Scone. William Wallace led a revolt in 1297, and Edward, though brilliantly victorious at Falkirk (July 22, 1298), could not subdue the rebellion despite prolonged campaigning (1298-1303).

Last years. The strain of these years provoked heavy collisions between Edward and his magnates. He had quarrelled violently with his archbishops of Canterbury, John Peckham (1279-92) and Robert Winchelsey (1293-1313), over ecclesiastical liberties and jurisdiction. In 1297 Winchelsey, obeying Pope Boniface VIII's bull *Clericis Laicos* (1296), rejected Edward's demands for taxes from the clergy, whereupon Edward outlawed the clergy. His barons now defied his orders to invade Gascony and, when Edward went to Flanders, compelled the regents to confirm the charters of liberties, with important additions forbidding arbitrary taxation (1297), thereby forcing Edward to abandon the campaign and eventually to make peace with France. Although Pope Clement V, more pliant than Boniface, allowed Edward to exile Winchelsey and intimidate the clergy (1306), the barons had exacted further concessions (1301) before reconciliation. Edward renewed the conquest of Scotland in 1303, captured Stirling in 1304, and executed Wallace as a traitor in 1305; but when Scotland seemed finally subjected, Robert I the Bruce revived rebellion and was

crowned in 1306. On his way to reconquer Scotland, Edward died near Carlisle.

(R.F.Tr.)

BIBLIOGRAPHY. E.M. Barron, *The Scottish War of Independence*, 2nd ed. (1934), although not wholly objective, is a clear and readable account of the wars. J.E. Morris, *The Welsh Wars of Edward I* (1901, reprinted 1968), makes clear the impact of these wars on Edward's military organization and technique as well as on constitutional development in England. Michael Prestwich, *Three Edwards: War and State in England, 1272-1377* (1980), is a recent history of the period. D. Pasquet, *Essai sur les origines de la Chambre des Communes* (1914; *An Essay on the Origins of the House of Commons*, 1925), takes the view that the English Parliament owes more to the initiative and needs of the King than to any sense of community among his subjects. T.F.T. Plucknett, *Legislation of Edward I* (1949), is an analysis of Edward I's statutes, showing that, far from being anti-feudal, Edward's measures were intended to support his own position within the feudal hierarchy. F.M. Powicke's two works on the 13th century, *King Henry III and the Lord Edward*, 2 vol. (1947), and *The Thirteenth Century, 1216-1307* (1953), present the reign in terms of social forces at work in politics, particularly those springing from the baronage. G. Templeman, "Edward I and the Historians," in the *Cambridge Historical Journal*, 10:16-35 (1950), summarizes the changing views of Edward I from Polydore Vergil to Powicke and Plucknett. T.F. Tout, *Chapters in the Administrative History of Mediaeval England*, vol. 2 (1920, reprinted 1967), demonstrates Edward's aims with regard to administrative efficiency and royal control. Tout's *Edward the First* (1893) is still the best biography of the King.

• **Edward II**, byname EDWARD OF CAERNARVON (b. April 25, 1284, Caernarvon, Caernarvonshire, Wales—d. September 1327, Berkeley, Gloucestershire, Eng.), king of England from 1307 to 1327. Although he was a man of limited capability, he waged a long, hopeless

Edward II, detail of a watercolour manuscript illumination, mid-15th century; in the British Library (Jul. MS. E IV)

By courtesy of the trustees of the British Library

campaign to assert his authority over powerful barons.

The fourth son of King Edward I, he ascended the throne upon his father's death (July 7, 1307) and immediately gave the highest offices to Edward I's most prominent opponents. He earned the hatred of the barons by granting the earldom of Cornwall to his frivolous favourite (and possible lover), Piers Gaveston. In 1311 a 21-member baronial committee drafted a document—known as the Ordinances—demanding the banishment of Gaveston and the restriction of the King's powers over finances and appointments. Edward pretended to give in to these demands; he sent Gaveston out of the country but soon allowed him to return. In retaliation the barons seized Gaveston and executed him (June 1312).

Edward had to wait 11 years to annul the Ordinances and avenge Gaveston. Meanwhile, the Scottish king Robert I the Bruce was threatening to throw off English overlordship. Edward led an army into Scotland in 1314 but was decisively defeated by Bruce at Bannockburn on June 24. With one stroke, Scotland's independence was virtually secured, and Edward was put at the mercy of a group of barons headed by his cousin Thomas of Lancaster, who by 1315 had made himself the real master of England. Nevertheless, Lancaster proved to be incompetent; by 1318 a group of moderate barons led by Aymer de Valence, earl of Pembroke, had assumed the role of arbitrators between Lancaster and Edward. At this juncture Edward found two new favourites—Hugh le Despenser and his son and namesake. When the King supported the younger Despenser's territorial ambitions in Wales, Lancaster banished both Despensers. Edward then took up arms in their behalf. His opponents fell out among themselves, and he defeated and captured Lancaster at Boroughbridge, Yorkshire, in March 1322. Soon afterward, he had Lancaster executed.

At last free of baronial control, Edward revoked the Ordinances. His reliance on the Despensers, however, soon aroused the resentment of his queen, Isabella. While on a diplomatic mission to Paris in 1325, she became the mistress of Roger Mortimer, an exiled baronial opponent of Edward. In September 1326 the couple invaded England, executed the Despensers, and deposed Edward in favour of his son, who was crowned (January 1327) King Edward III. Edward II was imprisoned and in September 1327 died, probably by violence. His career is recounted in Hilda Johnstone's *Edward of Carnarvon* (1946).

• **Edward III**, byname EDWARD OF WINDSOR (b. Nov. 13, 1312, Windsor, Berkshire, Eng.—d. June 21, 1377, Sheen, Surrey), king of England from 1327 to 1377, who led England into the Hundred Years' War with France. The descendants of his seven sons and five

Edward III, watercolour, 15th century; in the British Library (Cotton MS. Julius E. IV)

By courtesy of the trustees of the British Library

daughters contested the throne for generations, climaxing in the Wars of the Roses (1455–85). *Early years.* The eldest son of Edward II and Isabella of France, Edward III was sum-

moned to Parliament as earl of Chester (1320) and was made duke of Aquitaine (1325), but, contrary to tradition, he never received the title of prince of Wales.

Edward III grew up amid struggles between his father and a number of barons who were attempting to limit the king's power and to strengthen their own role in governing England. His mother, repelled by her husband's treatment of the nobles and disaffected by the confiscation of her English estates by his supporters, played an important role in this conflict. In 1325 she left England to return to France to intervene in the dispute between her brother, Charles IV of France, and her husband over the latter's French possessions, Guyenne, Gascony, and Ponthieu. She was successful; the land was secured for England on condition that the English king pay homage to Charles. This was performed on the King's behalf by his young son.

The heir apparent was secure at his mother's side. With Roger Mortimer, an influential baron who had escaped to France in 1323 and had become her lover, Isabella now began preparations to invade England to depose her husband. To raise funds for this enterprise, Edward III was betrothed to Philippa, daughter of William, count of Hainaut and Holland.

Within five months of their invasion of England, the Queen and the nobles, who had much popular support, overpowered the King's forces. Edward II, charged with incompetence and breaking his coronation oath, was forced to resign, and on Jan. 29, 1327, Edward III, aged 15, was crowned king of England.

During the next four years Isabella and Mortimer governed in his name, though nominally his guardian was Henry, earl of Lancaster. In the summer of 1327 he took part in an abortive campaign against the Scots, which resulted in the Treaty of Northampton (1328), making Scotland an independent realm. Edward was deeply troubled by the settlement and signed it only after much persuasion by Isabella and Mortimer. He married Philippa at York on Jan. 24, 1328. Soon afterward, Edward made a successful effort to throw off his degrading dependence on his mother and Mortimer. While a council was being held at Nottingham, he entered the castle by night, through a subterranean passage, took Mortimer prisoner, and had him executed (November 1330). Edward had discreetly ignored his mother's liaison with Mortimer and treated her with every respect, but her political influence was at an end.

Edward III now began to rule as well as to reign. Young, ardent, and active, he sought to remake England into the powerful nation it had been under Edward I. He still resented the concession of independence made to Scotland by the Treaty of Northampton; and the death of Robert I, the Bruce, king of Scotland, in 1329 gave him a chance of retrieving his position. The new king of Scots, his brother-in-law, David II, was a mere boy, and Edward took advantage of his weakness to aid the Scottish barons who had been exiled by Bruce to place their leader, Edward Balliol, on the Scottish throne. David II fled to France, but Balliol was despised as a puppet of the English king, and David returned in 1341.

Hundred Years' War. During the 1330s England gradually drifted into a state of hostility with France, for which the most obvious reason was the dispute over English rule in Gascony. Contributory causes were France's new king Philip VI's support of the Scots, Edward's alliance with the Flemish cities—then on bad terms with their French overlord—and the revival, in 1337, of Edward's claim, first made in 1328, to the French crown. Edward twice attempted to invade France from the north (1339, 1340), but the only result of his campaigns was to reduce him to bankruptcy. In January 1340 he assumed the title of king

of France. At first he may have done this to gratify the Flemings, whose scruples in fighting the French king disappeared when they persuaded themselves that Edward was the rightful king of France. But his pretensions to the French crown gradually became more important, and the persistence with which he and his successors urged them made stable peace impossible for more than a century. This was the struggle famous in history as the Hundred Years' War. Until 1801 every English king also called himself king of France.

Edward was present in person at the great naval battle off the Flemish city of Sluis in June 1340, in which he all but destroyed the French navy. Despite this victory his resources were exhausted by his land campaign, and he was forced to make a truce (which was broken two years later) and return to England. During the years after 1342 he spent much time and money in rebuilding Windsor Castle and instituting the Order of the Garter, which became Britain's highest order of knighthood. A new phase of the French war began when Edward landed in Normandy in July 1346, accompanied by his eldest son, Prince Edward, later known as the Black Prince (born 1330). At first the King showed some lack of strategic purpose, engaging in little more than a large-scale plundering raid to the gates of Paris. The campaign was made memorable by his decisive victory over the French at Crécy in Ponthieu (August 26), where he scattered the army with which Philip VI sought to cut off his retreat to the northeast. Edward laid siege to the French port of Calais in September 1346 and received its surrender in August 1347. Other victories in Gascony and Brittany, and the defeat and capture of David II at Neville's Cross near Durham (October 1346), gave further proof of Edward's power, but Calais was to be his only lasting conquest. He ejected most of its French inhabitants, colonizing the town with Englishmen and establishing there a base from which to conduct further invasions of France. Nevertheless, in the midst of his successes, want of money forced him to make a new truce in September 1347.

Edward returned to England in October 1347. He celebrated his triumph by a series of splendid tournaments. In 1348 he rejected an offer to become Holy Roman emperor. In the same year the bubonic plague known as the Black Death first appeared in England and raged until the end of 1349. Its horrors hardly checked the magnificent revels of Edward's court, and neither the plague nor the truce stayed the slow course of the French war, though the fighting was indecisive and on a small scale. Edward's martial exploits during the next years were those of a gallant knight rather than of a responsible general. Although the English House of Commons was now weary of the war, efforts to make peace came to nothing, and large-scale operations began again in 1355, when Edward led an unsuccessful raid out of Calais. He harried the Lothians, part of southeastern Scotland, in the expedition famous as the Burned Candlemas (January and February 1356), and in the same year he received a formal surrender of the Kingdom of Scotland from Balliol. His exploits were, however, eclipsed by those of his son Edward, whose victory at Poitiers (Sept. 19, 1356), resulting in the capture of the French king, John II (who had succeeded Philip VI in 1350), forced the French to accept a new truce. Edward entertained his captive magnificently but forced him by the Treaty of London (1359) to surrender so much territory that the agreement was repudiated in France. In an effort to compel acceptance, Edward landed at Calais (October 28) and besieged Reims, where he planned to be crowned king of France. The strenuous resistance of the citizens frustrated this scheme, and Edward marched into Burgundy, eventually returning

toward Paris. After this unsuccessful campaign he was glad to conclude preliminaries of peace at Brittany (May 8, 1360). This treaty, less onerous to France than that of London, took its final form in the Treaty of Calais, ratified by both kings (October 1360). By it, Edward renounced his claim to the French crown in return for the whole of Aquitaine, a rich area in southwestern France.

The years of decline: 1360–77. The Treaty of Calais did not bring rest or prosperity to either England or France. Fresh visitations of the Black Death in England in 1361 and 1369 intensified social and economic disturbances, and desperate but not very successful efforts were made to enforce the Statute of Labourers (1351), which was intended to maintain prices and wages as they had been before the pestilence. Other famous laws enacted during the 1350s had been the Statutes of Provisors (1351) and Praemunire (1353), which reflected popular hostility against foreign clergy. These measures were frequently reenacted, and Edward formally repudiated (1366) the feudal supremacy over England still claimed by the papacy.

When the French king Charles V, son of John II, repudiated the Treaty of Calais, Edward resumed the title of king of France, but he showed little of his former vigour in meeting this new trouble, leaving most of the fighting and the administration of his foreign territories to his sons Edward and John of Gaunt, duke of Lancaster. While they were struggling with little success against the rising tide of French national feeling, Edward's want of money made him a willing participant in the attack on the wealth and privileges of the church. Meanwhile, Aquitaine was gradually lost, Prince Edward returned to England in broken health (1371), and John of Gaunt's march through France from Calais to Bordeaux (1373) achieved nothing. Edward's final attempt to lead an army abroad himself (1372) was frustrated when contrary winds prevented his landing his troops in France. In 1375 he was glad to make a truce, which lasted until his death. By it, the only important possessions remaining in English hands were Calais, Bordeaux, Bayonne, and Brest.

Edward was now sinking into his dotage. After the death of Queen Philippa in 1369 he fell entirely under the influence of his greedy mistress, Alice Perrers, while Prince Edward and John of Gaunt became the leaders of sharply divided parties in the royal court and council. John of Gaunt returned to England in April 1374 and with the help of Alice Perrers obtained the chief influence with his father, but his administration was neither honourable nor successful. At the famous so-called Good Parliament of 1376 popular indignation against John of Gaunt's ruling party came at last to a head. Alice Perrers was removed and some of Gaunt's followers were impeached. Before the Parliament had concluded its business, however, the death of Prince Edward (June 8, 1376) robbed the Commons of its strongest support. John of Gaunt regained power, and the acts of the Good Parliament had been reversed when Edward III died.

Edward's character. Edward III possessed extraordinary vigour and energy of temperament; he was an admirable tactician and a consummate knight. His court was the most brilliant in contemporary Europe, and he was himself well fitted to be the head of the gallant knights who obtained fame in the French wars. Though his main ambition was military glory, he was not a bad ruler of England, being liberal, kindly, good-tempered, and easy of access. His need to obtain supplies for carrying on the French wars made him favourable to his subjects' petitions and contributed to the growing strength of Parliament. His weak points were his wanton breaches of good faith, his extravagance, his frivolity, and his self-indulgence. His ambition ultimately tran-

scended his resources, and before he died even his subjects had sensed his failure.

McKisack, *The Fourteenth Century, 1307–1399* (1959), contains an excellent account; G. Unwin (ed.), *Finance and Trade Under Edward III* (1918), still useful; E. Perroy, *La Guerre de cent ans* (1945; *The Hundred Years War*, 1951), good for the French point of view.

• **Edward IV**, also called (until 1459) **EARL OF MARCH** (b. April 28, 1442, Rouen, Fr.—d. April 9, 1483, Westminster, Eng.), king of England from 1461 until October 1470 and again from April 1471 until his death in 1483. He was a leading participant in the York-

Edward IV, portrait by an unknown artist, in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

ist-Lancastrian conflict known as the Wars of the Roses.

Edward was the eldest surviving son of Richard, duke of York, by Cicely, daughter of Ralph Neville, earl of Westmorland. His father was descended from two sons of the 14th-century king Edward III and, in the 1450s, led a revolt against Henry VI; in 1460, Richard's supporters declared him Henry's successor. When his father was killed in December of that year, Edward gathered an army in Wales and defeated Henry's supporters (called Lancastrians because of Henry's descent from John of Gaunt, duke of Lancaster). Edward was crowned as King Edward IV in London on June 28, 1461.

Edward's struggle with Warwick. Edward at this time showed little promise, apparently caring only for fighting, drinking, women, and pageantry. He owed his throne largely to his cousin Richard Neville, earl of Warwick, who was in the first years of Edward's reign the most powerful man in England. Warwick crushed Lancastrian resistance in the far north of England between 1462 and 1464 and conducted England's diplomacy. Edward, however, was winning many friends (especially in London) by his comeliness and charm and was determined to assert his independence. On May 1, 1464, he secretly married a young widow, Elizabeth Woodville, of no great rank, offending Warwick and other Yorkist nobles who were planning to marry him to a French princess. By showering favours on Elizabeth's two sons by her first husband and on her five brothers and her seven sisters, Edward began to build up a group of magnates who would be a counterpoise to the Nevilles. Gradually Warwick lost all influence at court, and when he was negotiating an alliance with France, Edward humiliated him by revealing that he had already concluded an alliance (1467) with France's enemy Burgundy. Edward's sister Margaret was married in July 1468 with great pomp to Duke Charles the Bold of Burgundy,

and the brothers-in-law planned a joint invasion of France.

Warwick, in a countermove encouraged by Louis XI of France, seized Edward and made him a prisoner in July 1469. But Edward had by now too many supporters (especially in London) for him to be kept under tutelage for long. He regained his freedom in October; Warwick fled to France, allied himself with the Lancastrians and with Louis, and invaded England in September 1470.

Surprised, Edward fled with a few faithful supporters to the Netherlands in October. Aided by Charles of Burgundy, he and his brother, Richard, duke of Gloucester, returned to England in March 1471. Taking London, he defeated and killed Warwick at Barnet on April 14. On the same day, Queen Margaret (Henry VI's wife) belatedly landed in Dorset from France with her only son, Edward, prince of Wales. Her advisers hoped to gain Lancastrian support in Wales, and it became a race for time between Edward IV's forces and hers as to whether she could get there before he overtook her. At Tewkesbury, after some remarkable forced marches (one of more than 40 miles at a stretch), he caught up with her army on May 4. There he won another crushing victory. Nearly all the remaining Lancastrian leaders were killed on the field or executed afterward, and, after murdering Henry (May 21–22) and repelling an attack on London, Edward was secure for the remainder of his life.

The second half of Edward's reign. He was now able to revive the project of an invasion of France in concert with the Duke of Burgundy. He made great preparations in 1474 and obtained a large grant from Parliament. In 1475 he invaded France with the largest army, it was said, that had ever left England, but he found the Duke of Burgundy very ill-prepared and the French formidable and willing to buy him out. Hence the Treaty of Picquigny was made by which Edward agreed to withdraw from France in return for 75,000 gold crowns down and a pension of 50,000 gold crowns a year. These sums helped to free Edward from dependence on parliamentary grants. As he grew older, he showed considerable ingenuity in raising money by reviving obsolescent rights and using doubtfully legal devices. Commercial treaties with France (1475), Burgundy (1468), and the Hanseatic League (1474) combined with external peace and growing internal order to revive trade strikingly after 1475, and this benefitted the customs duties and other revenues. Edward became a trader himself, transporting goods in his own ships and those of foreign merchants. He began a reorganization of the revenues from the crown estates, experimenting with methods of improving yields and promoting more efficient auditing under officials of the flexible royal household treasury instead of the unadaptable Exchequer. These and other measures enabled him to leave behind a fortune; some of his improved financial administration was continued and developed by his successors Richard III and Henry VII.

The last decade of Edward's reign also saw an improvement in law enforcement. One especially disturbed area was Wales and the Welsh marches; Edward used the royal estates there as a foundation on which to base a council that acted in the name of his infant heir, the Prince of Wales, and employed the royal prerogative to make a start in repressing disorder. It was the forerunner of the council of Wales and the marches that subjugated the area to English rule.

Modern research has emphasized these administrative achievements of Edward IV, and contemporary and Tudor historians viewed his later years as a time of prosperity and success.

He rebuilt St. George's Chapel, Windsor, and collected illuminated Flemish manuscripts. He was also a friend and patron of the printer William Caxton, and his book collection became the foundation of the Old Royal Library, later one of the glories of the British Museum.

Edward's promiscuity enabled Richard of Gloucester, after his death, to question the validity of his marriage and so to ruin his sons. As a young man Edward had been trustful and openhanded, but his experiences made him increasingly suspicious, leading him in 1478 to execute his brother George, duke of Clarence, who in former years had sided with Warwick against him. In 1482, Louis XI, in order to come to terms with the rulers of Burgundy, tacitly repudiated the Treaty of Picquigny and the annual tribute that it provided. Edward contemplated a fresh invasion of France, but before it could be carried out he fell ill and died at the age of only 40. By Elizabeth Woodville he had seven children who survived him: two sons, Edward (afterward Edward V) and Richard, duke of York, who were probably murdered in the Tower of London in August 1483, and five daughters, of whom the eldest, Elizabeth, married Henry VII.

BIBLIOGRAPHY. C.L. Scofield, *The Life and Reign of Edward IV*, 2 vol. (1923), is extremely detailed, accurate, and based on original sources; but the detail often obscures the argument, and the general outlook is now somewhat out of date. Charles Ross, *Edward IV* (1974), is a more recent biography. E.F. Jacob, *The Fifteenth Century, 1399-1485* (1961), provides a more up-to-date interpretation with an annotated bibliography. J.R. Lander, *Conflict and Stability in Fifteenth Century England* (1969), puts the reign of Edward IV in its setting and has a useful annotated bibliography. A.R. Myers, *English Historical Documents, 1327-1485* (1969), provides a large number of documents, translated into English, for the reign of Edward IV, as does Sir Nicholas Harris Nicholas, *Privy Purse Expenses of Elizabeth of York: Wardrobe Accounts of Edward the Fourth* (facsimile, 1972).

• **Edward V** (b. Nov. 27, 1470, London—d. 1483?), king of England from April to June 1483, who was deposed and possibly murdered by King Richard III.

The eldest surviving son of King Edward IV and Queen Elizabeth (Woodville), Edward was born at Westminster Abbey while his father, momentarily deposed, was in exile in Holland. In June 1471, after Edward IV had crushed his foes and reclaimed his crown, young Edward was made prince of Wales. The boy was sent with his mother to Ludlow, Shropshire, in 1473 to be titular ruler of Wales and the Welsh Marches (border region between England and Wales), and he seems to have stayed at Ludlow, except for brief intervals, for the remainder of his father's reign.

Upon the death of Edward IV on April 9, 1483, the 12-year-old Edward became king, and his uncle Richard, duke of Gloucester, was made protector of the realm. Conflict between Gloucester and the Woodville nobles who dominated Edward V soon led the duke to arrest the leaders of the Woodville party and secure possession of Edward and his younger brother. The two princes were housed in the Tower of London, which at that time served as a royal residence as well as a prison.

Edward V's brief reign came to an end on June 26, when an assembly of lords and commons, accepting Gloucester's claim that Edward IV's marriage was invalid and his children illegitimate, proclaimed Gloucester King Richard III. Soon afterward the two princes disappeared from the Tower forever. It is possible they were murdered by Richard's agents in August 1483, but responsibility for the crime has also been attributed to the powerful Henry Stafford, duke of Buckingham, and to

Edward V (lower right) with his father, Edward IV, and mother, Elizabeth Woodville, illumination from *Dictes and Sayenges of the Philosophers*, 1477; in Lambeth Palace Library, London

Richard's successor, King Henry VII. Skeletons found in the Tower in 1674 are thought to be those of Edward and his brother.

• **Edward VI** (b. Oct. 12, 1537, London—d. July 6, 1553, London), king of England and Ireland from 1547 to 1553.

Edward was King Henry VIII's only legitimate son; his mother, Henry's third wife, Jane Seymour, died 12 days after his birth. Although Edward has traditionally been viewed as a frail child who was never in good health, some recent authorities have maintained that until several years before his death he was a robust, athletically inclined youth. His tutors found him to be intellectually gifted, a precocious student of Greek, Latin, French, and theology. On Jan. 28, 1547, Henry VIII died and Edward succeeded to the throne.

Henry had decreed that during Edward's minority the government was to be run by a council of regency; in fact, Edward's uncle, Edward Seymour, duke of Somerset, wielded almost supreme power as regent, with the title of protector, until he was overthrown in 1549 by the unscrupulous John Dudley, earl of Warwick (soon to be duke of Northumberland). The young king was the mask behind which Northumberland controlled the government. The measures taken by both Somerset and Northumberland to consolidate the English Reformation, however, agreed with Edward's own intense devotion to Protestantism.

In January 1553, Edward showed the first signs of tuberculosis, and by May it was evident that the disease would be fatal. Working with Northumberland, he determined to exclude his two half-sisters, Mary and Elizabeth,

Edward VI as prince, detail of a panel painting by an unknown artist, c. 1546; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

from the succession and to put Northumberland's daughter-in-law, Lady Jane Grey, and her male heirs in direct line for the throne. As a result, a power struggle erupted after Edward's death. Lady Jane Grey ruled for nine days (July 10-19, 1553) before she was overthrown by the more popular Mary I (reigned 1553-58).

Edward displayed a potential for effective administration, but many scholars have felt that, had he lived, his religious zeal and extreme obstinacy might have imprinted rigidity and narrowness on the Church of England. See W.K. Jordan, *Edward VI: The Young King* (1968), and *Edward VI: The Threshold of Power* (1970).

• **Edward VII**, in full ALBERT EDWARD (b. Nov. 9, 1841, London—d. May 6, 1910, London), king of the United Kingdom of Great Britain and Ireland and of the British dominions and emperor of India from 1901, an immensely popular and affable sovereign and a leader of society.

The second child and eldest son of Queen Victoria and the Prince Consort Albert of Saxe-Coburg-Gotha, Albert Edward, created prince of Wales and earl of Chester by his mother when he was one month old, attended the universities of both Oxford and Cambridge. His dalliance with an actress while serving with an Army unit in Ireland (June-September 1861) caused Victoria to hold him partly responsible for the death of the prince consort, who had indeed taken his son's brief liaison much to heart before succumbing to typhoid (Dec. 14, 1861). Subsequently, Victoria excluded her heir from any real initiation

Edward VII
The Bettmann Archive/BBC Hulton

into affairs of state. Not until he was more than 50 years old was he informed of Cabinet proceedings.

On March 10, 1863, the prince of Wales married Alexandra, eldest daughter of Prince Christian (later King Christian IX) of Denmark. Five children of this union survived to maturity (George, duke of York, subsequently King George V, was the second son). Alexandra was preoccupied with her immediate family, but the prince moved in a considerably wider circle, both at home and on the Continent, becoming a familiar figure in the sporting world. He was particularly given to racing, yachting, and game-bird shooting. His social activities involved him in several scandals.

He succeeded to the throne as Edward VII following Victoria's death on Jan. 22, 1901, and was crowned on Aug. 9, 1902. His reign did much to restore lustre to a monarchy that had shone somewhat dimly during Victoria's long seclusion as a widow. In 1902 he resumed his tours of Europe. His geniality and felicitously worded addresses (conducted in French) during a state visit to Paris in 1903 helped pave the way, by winning popularity among French citizens of all ranks, for the Anglo-French Entente Cordiale of 1904. Relations with his nephew the German emperor William II were not always easy, either officially or personally. Although incapable of

prolonged mental exertion. Edward was fortunate in his judgment of men. His support for the great military reforms of the secretary of state for war, Richard Burdon (later Viscount) Haldane, and for the First Sea Lord Sir John Fisher in his naval reforms did much to avert British unpreparedness when World War I started.

BIBLIOGRAPHY. Sir Sidney Lee, *King Edward VII*. 2 vol. (1925–27), is a highly detailed official biography, completed after Lee's death by his secretary, S.F. Markham. Sir Philip Magnus, *King Edward the Seventh* (1964), draws on sources that became available after Lee's death and is less reticent than Lee about Edward's private life. Gordon Brook-Shepherd, *Uncle of Europe* (1975), covers Edward's social life and diplomatic activities.

• **Edward VIII**, also called (from 1936) **PRINCE EDWARD, DUKE OF WINDSOR**, in full **EDWARD ALBERT CHRISTIAN GEORGE ANDREW PATRICK DAVID** (b. June 23, 1894, Richmond, Surrey, Eng.—d. May 28, 1972, Paris), prince of Wales (1911–36) and king of the United Kingdom of Great Britain and Ireland and of the British dominions and emperor of India from Jan. 20 to Dec. 10, 1936, when he abdicated in order to marry Wallis Warfield Simpson (*q.v.*) of the United States. He was the only British sovereign ever voluntarily to resign the crown.

The Duke of Windsor (formerly Edward VIII) and Duchess of Windsor on their wedding day, June 3, 1937, photograph by Cecil Beaton

Camera Press

The eldest child of George, duke of York (later King George V), and Princess Mary of Teck (later Queen Mary), he became heir to the throne on the accession of his father (May 6, 1910). Although trained (1907–11) for the Royal Navy, he was commissioned in the Army's Grenadier Guards after the outbreak of World War I (Aug. 6, 1914) and served as a staff officer. After the war and through the early 1920s he undertook extensive goodwill tours of the British Empire; and, after an illness that his father suffered in 1928, the prince took an increasing interest in national affairs. In 1932, after unemployment had reached unprecedented levels, he toured workingmen's clubs throughout Britain and enlisted more than 200,000 men and women in occupational schemes. During these years his popularity rivaled, if it did not exceed, that of his grandfather King Edward VII when the latter was prince of Wales.

In 1930 King George V gave him Fort Belvedere, an 18th-century house belonging to the crown, near Sunningdale. The Fort, as he always called it, gave him privacy and the sense of making a home that was entirely his own. He worked arduously in the garden and woodlands, becoming in the 1930s something of an authority on horticulture, especially on the growing of roses. He soon began to regard

the Fort as a refuge from the official world that he increasingly disliked. There he entertained a private circle of friends, not drawn from the conventional aristocracy and perhaps better characterized as part of the "high society" of the time.

In 1930 the prince's friendship with Mrs. Simpson began. Mrs. Simpson, divorced from a U.S. Navy lieutenant in 1927, married Ernest Simpson in 1928. Members of a private circle of friends, the Simpsons were frequently in the company of the prince, and by 1934 he was deeply in love with Mrs. Simpson. It was at this point, before he could discuss the matter with his father, that George V died (Jan. 20, 1936) and Edward was proclaimed king.

As king, Edward VIII set in motion drastic economies in the royal estates. In November he opened Parliament and then toured distressed areas in South Wales. Meanwhile his attempts to gain the royal family's acceptance of Mrs. Simpson, who had obtained a preliminary decree of divorce on Oct. 27, 1936, met with firm opposition, backed by the Church of England (of which he was the head) and most politicians in both Britain and the Commonwealth. (Winston Churchill, then out of power, was his only notable ally.) His affair with Mrs. Simpson evoked much lurid comment in American and continental European newspapers and journals but, until nearly the end of his kingship, was kept out of the British press through governmental persuasions and pressures.

Prime Minister Stanley Baldwin attempted to impress upon the king the peril to the integrity of the monarchy caused by the private friendship with a divorcée. Discussions of a morganatic marriage were pursued, but on December 2 Baldwin assured him that this was impracticable. It was doomed by being somewhat hurriedly and forcibly put to the dominions and by the explosion of the whole matter in the press and Parliament on December 3. On the following day the word "abdication" appeared in the newspapers for the first time. The king therefore made his final decision and submitted his abdication on Dec. 10, 1936 ("I, Edward, do hereby declare my irrevocable determination to renounce the throne for myself and my descendants"). The instrument of abdication was endorsed by Parliament on December 11, and on the same evening the former king spoke on a radio broadcast: "I have found it impossible to carry on the heavy burden of responsibility and to discharge the duties of King as I would wish to do without the help and support of the woman I love." That night he left for the Continent, where he lived several months with friends in Austria and discreetly apart from Mrs. Simpson until after her decree of divorce became final. On June 3, 1937, Edward was married to Mrs. Simpson by a clergyman of the Church of England at the Château de Candé, France. The new king, George VI, had created his older brother duke of Windsor (Dec. 12, 1936) but in 1937, on the advice of the Cabinet, refused to extend to the new duchess of Windsor the rank of "royal highness" enjoyed by her husband; this decision severely wounded the duke.

For the next two years the duke and duchess lived mainly in France, visiting various other European countries, including Germany (October 1937), where the duke was honoured by Nazi officials and had an interview with Adolf Hitler. The outbreak of World War II failed to close the breach between the duke and his family, and, after visiting London, he accepted a position as liaison officer with the French. On the fall of France he traveled to Madrid, where he was subjected to a fanciful plan of the Nazis to remake him king and to use him against the established government in England. When he reached Lisbon, he was offered by Prime Minister Winston Churchill the governorship of the Bahamas, a British

colony in the West Indies, and he remained there for the duration of the war (1940–45). After 1945 he lived in Paris. Short visits to England followed in succeeding years—notably, to attend the funerals of his brother King George VI (1952) and their mother, Queen Mary (1953)—but it was not until 1967 that, for the first time, the duke and duchess were invited to attend an official public ceremony with other members of the royal family—initially, the unveiling of a plaque to Queen Mary at Marlborough House.

After their deaths, the duke and the duchess were buried side by side at Frogmore, within the grounds of Windsor Castle.

BIBLIOGRAPHY. The duke's memoirs, *A King's Story*, were published in 1951; those of the duchess, *The Heart Has Its Reasons*, appeared in 1959. *Edward VIII: A Biography of the Duke of Windsor* (1975) is by Frances Donaldson. An excellent, but unflattering, biography of both Edward and the duchess of Windsor is *The Windsor Story* (1979) by Joseph Bryan III and Charles J.V. Murphy.

PORTUGAL

• **Edward** (b. Oct. 30, 1391, Viseu, Port.—d. Sept. 9, 1438, Tomar), king of Portugal whose brief reign (1433–38) witnessed a strengthening of the monarchy through reform of royal land-grant laws, a continuation of voyages of discovery, and a military disaster in Tangier.

A scholarly, sensitive man of high moral character, Edward was known as the philosopher-king and the author of *O Leal Conselheiro* ("The Loyal Counselor"). He ascended the throne on the death of his father, John I, well schooled in legal principles. Shortly thereafter, Edward promulgated the *lei mental* (April 8, 1434), which facilitated the recovery of certain previous royal land grants and made others subject to royal confirmation at the start of each new reign.

Edward supported the efforts of his brother Henry the Navigator to explore the west coast of Africa, and he agreed to a plan for Henry to attempt the conquest of Morocco by attacking Tangier. The expedition (1437) was a complete failure, and Edward's youngest brother, Fernando, was captured. The grief-stricken king died shortly thereafter of the plague.

SCOTLAND

• **Edward**, in full **EDWARD DE BALLIOL**, or **BALIOL** (d. January 1364, Wheatley, Yorkshire, Eng.), son of King John de Balliol of Scotland and claimant to the title of King of Scots, who was crowned in September 1332. Expelled in December 1332, he was restored in 1333–56, having acknowledged Edward III of England as his lord.

Edward inherited only the family lands in France and his father's claim to Scotland. He was kept in England from 1296 (the year of his father's death) to 1315, after which he lived mainly in France.

In 1332 Balliol led an invasion of Scotland from France by a group of English nobles whose lands in Scotland had been seized by the Scottish king Robert I the Bruce, father of David II (reigned 1329–71). On August 12, in the Battle of Dupplin Moor (*q.v.*), Edward defeated Donald, earl of Mar and regent for David II (then eight years old), and on September 24 he was crowned king at Scone. On November 23, at Roxburgh, he acknowledged Edward III of England as suzerain over Scotland.

A Scottish coalition under Sir Archibald Douglas defeated Balliol at Annan, Dumfries, on Dec. 16, 1332, but on July 19, 1333, Edward III defeated and killed Douglas in the Battle of Halidon Hill (*q.v.*) on behalf of Balliol, who in payment gave much of the Scottish lowlands to the English king. Balliol's

hold on the rest of Scotland against the adherents of David II remained precarious. He resigned his title and all his lands to Edward III on Jan. 21, 1356, and died a childless pensioner of the English sovereign.

Edward THE BLACK PRINCE, also called EDWARD OF WOODSTOCK, PRINCE D'AQUITAINE, PRINCE OF WALES, DUKE OF CORNWALL, EARL OF CHESTER (b. June 15, 1330, Woodstock, Oxfordshire, Eng.—d. June 8, 1376, Westminster, near London), son and heir apparent of Edward III of England and one of the outstanding commanders during the Hundred Years' War, winning his major victory at the Battle of Poitiers (1356). His sobriquet, said to have come from his wearing black armour, has no contemporary justification and is found first in Richard Grafton's *Chronicle of England* (1568).

Edward was created Earl of Chester (March 1333), Duke of Cornwall (February 1337)—the first appearance of this rank in England—and Prince of Wales (May 1343); he was Prince of Aquitaine from 1362 to 1372. His first campaign was served under his father in northern France (1346–47), and at the Battle of Crécy (Aug. 26, 1346) he won both his spurs and the famous ostrich plumes and with them the mottoes used by himself and subsequent princes of Wales, *houmout*; *ich dene* ("Courage; I serve"; the words are here spelled as Edward himself wrote them; later variants include *houmout* and *ich dien* or *ich diene*). One of the original Knights of the Garter, he was sent to France with independent command in 1355, winning his most famous victory over the French at Poitiers on Sept. 19, 1356. The French king John II, brought captive to England, was treated by the prince with a celebrated courtesy, but he was obligated to pay a ransom of 3,000,000 gold crowns and to negotiate the treaties of Brétigny and Calais

(1360) by which Aquitaine was ceded to the English.

Edward married his cousin Joan, the divorced and widowed Countess of Kent, in October 1361. He was created Prince of Aquitaine in July 1362 and left England in 1363 to take up his duties. His powers and his opportunities were great, but his rule was a failure, and he himself was largely to blame. His court at Bordeaux, that of a foreign conqueror, was extravagant; the 13 *sénéchaussées* into which the principality was divided administratively followed their earlier French pattern and allowed local French loyalties to subsist; his relations with the many bishops were unfriendly, while the greater nobles, Arnaud-Amanieu, sire d'Albret, Gaston II, Count de Foix, and Jean I, Count d'Armagnac, were hostile. He summoned several estates, or parliaments, but always to levy taxes. In 1367 he undertook to restore Peter the Cruel of Castile to his throne, and though he won a classic victory at Nájera on April 3, 1367, the campaign ruined his health, his finances, and any prospect of sound rule in Aquitaine, where, in 1368, the nobles and prelates appealed against him to Charles V of France as suzerain. Edward's reply to the French king's citation to answer the appellants before the *parlement* of Paris in May 1369 is well known—he would appear with 60,000 men at his back. He had, however, alienated the towns and peasantry as well as the nobles; and by March 1369 more than 900 towns, castles, and strong places had declared against him. Relying on mercenaries whom he could not afford to pay, he was powerless to quell the revolt, and the terrible sack of Limoges (October 1370) merely redounded to his discredit. He returned to England a sick and broken man in January 1371 and formally surrendered his principality to his father in October 1372, alleging that the revenues of the country were insufficient to defray his expenses. He had no successor as Prince of Aquitaine.

Edward's position in England, where, throughout his life, he was heir apparent, was that of a typical 14th-century magnate. The registers of his household from 1346 to 1348 and from 1351 to 1365 have survived and add to what is known of him from the chroniclers and from his biographer, the herald of Sir John Chandos. In one important respect all of these sources paint the same picture, that of a man constantly living beyond his means. His generosity, however, extended to his tenants as well as to his knightly companions, and faithful service was rewarded, as in 1356 when the ferry of Saltash was granted to William Lenche, who had lost an eye at Poitiers.

The prince visited Chester in 1353 and again in 1358. Cheshire furnished many of his archers, who wore a rudimentary uniform of a short coat and hat of green and white cloth with the green on the right. Despite his title, however, Edward did not visit Wales.

He appears to have shared the interests of his class—jousting, falconry, hunting, gaming. He was literate and conventionally pious, substantially endowing a religious house at Ashridge (1376). He had the customary fine presence of the Plantagenets and shared their love of jewels. The Black Prince's ruby in the present imperial state crown may or may not have been given to him by King Peter of Castile after the Battle of Nájera, but he would certainly have prized it, as a connoisseur. Similar artistic interest is shown in his seals, adorned with their ostrich feathers, and in the elegant gold coins that he issued as Prince of Aquitaine.

The last five years of the prince's life are obscure. Some contemporaries suggest that he supported the Commons when political discontent culminated in the Good Parliament of April 1376; but he knew he was dying, and he was probably seeking the best means to ensure the succession of his second—but

only surviving—son, Richard of Bordeaux (afterward Richard II). Edward was buried at Canterbury, where his tomb with his accoutrements, restored and renovated, still stands.

Edward, Lake, French LAC ÉDOUARD, one of the great lakes of the western Rift Valley in eastern Africa. It lies astride the border of Zaire and Uganda at an elevation of 2,992 feet (912 m) and is 48 miles (77 km) long and 26 miles (42 km) wide. On the northeast it is connected to the smaller Lake George. The two lakes have a combined surface area of 970 square miles (2,500 square km). From Lake George, which receives the Ruwenzori River, water flows through the 20-mile- (32-kilometre-) long Kazinga Channel to Lake Edward, also fed by the Rutshuru River (crossing a wide plain in the south). Lake Edward empties northward through the Semliki River to Lake Albert (after 1973, also called Lake Mobutu Sese Seko), the waters of which empty as the Albert Nile. Lake Edward's northern and southern shores are low plains, but most of its east and west banks are steep trough walls. To the north, the Ruwenzori Range rises to 16,795 feet (5,119 m) at Margherita Peak. The lake abounds in fish; wildlife about its shores is protected within Zaire's Virunga National Park and Uganda's Ruwenzori National Park.

Lake George was visited in 1875 by Sir Henry Morton Stanley, who named it Beatrice Gulf (for a daughter of Queen Victoria) in the belief that it was part of Lake Albert. In 1888–89 Stanley ascended the Semliki to Lake Edward, which he named after Albert Edward, Prince of Wales (later Edward VII).

Edwards, Alfred George (b. Nov. 2, 1848, Llanymawddwy, Merionethshire, Wales—d. July 22, 1937, St. Asaph, Flintshire, Wales), the first archbishop of Wales, who sought successfully to create a native church more reflective of Welsh culture than was the Anglican Church.

Edwards graduated from Jesus College, Oxford, in 1874. After a successful headmastership of Llandoverly College, he became vicar of Carmarthen in 1885, where he began the great work of his life, the defense and strengthening of the Welsh national church. An ardent believer in disestablishment, he fought his church's many enemies on every ground of fact and principle by sermons, politics, and publications, of which the most important were *The Truth About the Church in Wales* (1889) and *Landmarks in the History of the Welsh Church* (1912). In 1889 he was appointed bishop of St. Asaph, and from the disestablishment in 1920 until his retirement in 1934 he was archbishop of the Church of Wales.

Edwards, Jonathan (b. Oct. 5, 1703, East Windsor, Conn. [U.S.]—d. March 22, 1758, Princeton, N.J.), greatest theologian and philosopher of British American Puritanism, stimulator of the religious revival known as the "Great Awakening," and one of the fore-runners of the age of Protestant missionary expansion in the 19th century.

Jonathan Edwards, detail of an oil painting by Joseph Badger; in the Yale University Art Gallery

Early life and ministry. Edwards' father, Timothy, was pastor of the church at East Windsor, Conn.; his mother, Esther, was a daughter of Solomon Stoddard, pastor of the church at Northampton, Mass. Jonathan was the fifth child and only son among 11 children; he grew up in an atmosphere of Puritan piety, affection, and learning. After a rigorous schooling at home, he entered Yale College in New Haven, Conn., at the age of 13. He was graduated in 1720 but remained at New Haven for two years, studying divinity. After a brief New York pastorate (1722–23), he received the M.A. degree in 1723; during most of 1724–26 he was a tutor at Yale. In 1727 he became his grandfather's colleague at Northampton. In the same year, he married Sarah Pierrepont, who combined a deep, often ecstatic, piety with personal winsomeness and practical good sense. To them were born 11 children.

The manuscripts that survive from his student days exhibit Edwards' remarkable powers of observation and analysis (especially displayed in "Of Insects"), the fascination that the English scientist Isaac Newton's optical theories held for him ("Of the Rainbow"), and his ambition to publish scientific and philosophical works in confutation of materialism and atheism ("Natural Philosophy"). Throughout his life he habitually studied with pen in hand, recording his thoughts in numerous hand-sewn notebooks; one of these, his "Catalogue" of books, demonstrates the wide variety of his interests.

Edwards did not accept his theological inheritance passively. In his "Personal Narrative" he confesses that, from his childhood on, his mind "had been full of objections" against the doctrine of predestination—i.e., that God sovereignly chooses some to salvation but rejects others to everlasting torment; "it used to appear like a horrible doctrine to me." Though he gradually worked through his intellectual objections, it was only with his conversion (early in 1721) that he came to a "delightful conviction" of divine sovereignty, to a "new sense" of God's glory revealed in Scripture and in nature. This became the centre of Edwards' piety: a direct, intuitive apprehension of God in all his glory, a sight and taste of Christ's majesty and beauty far beyond all "notional" understanding, immediately imparted to the soul (as a 1734 sermon title puts it) by "a divine and supernatural light." This alone confers worth on man, and in this consists his salvation. What such a God does must be right; hence, Edwards' cosmic optimism. The acceptance and affirmation of God as he is and does and the love of God simply because he is God became central motifs in all of Edwards' preaching.

Under the influence of Puritan and other Reformed divines, the Cambridge Platonists, and

British philosopher-scientists such as Newton and Locke, Edwards began to sketch in his manuscripts the outlines of a "Rational Account" of the doctrines of Christianity in terms of contemporary philosophy. In the essay "Of Being," he argued from the inconceivability of absolute Nothing to the existence of God as the eternal omnipresent Being. It was also inconceivable to him that anything should exist (even universal Being) apart from consciousness; hence, material things exist only as ideas in perceiving minds; the universe depends for its being every moment on the knowledge and creative will of God; and "spirits only are properly substance." Further, if all knowledge is ultimately from sensation (Locke) and if a sense perception is merely God's method of communicating ideas to the mind, then all knowledge is directly dependent on the divine will to reveal; and a saving knowledge of God and spiritual things is possible only to those who have received the gift of the "new sense." This grace is independent of human effort and is "irresistible," for the perception of God's beauty and goodness that it confers is in its very nature a glad "consent." Nevertheless, God decrees conversion and a holy life as well as ultimate felicity; and he has so constituted things that "means of grace" (e.g., sermons, sacraments, even the fear of hell) are employed by the Spirit in conversion, though not as "proper causes." Thus, the predestinarian preacher could appeal to the emotions and wills of men.

Pastorate at Northampton. At Stoddard's death in 1729, Edwards became sole occupant of the Northampton pulpit, the most important in Massachusetts outside of Boston. In his first published sermon, preached in 1731 to the Boston clergy and significantly entitled *God Glorified in the Work of Redemption, by the Greatness of Man's Dependence upon Him, in the Whole of It*, Edwards blamed New England's moral ills on its assumption of religious and moral self-sufficiency. Because God is the saints' whole good, faith, which abases man and exalts God, must be insisted on as the only means of salvation. The English colonists' enterprising spirit made them susceptible to a version of Arminianism (deriving from the Dutch theologian Jacobus Arminius), which was popular in the Anglican Church and spreading among dissenters; it minimized the disabling effects of original sin, stressed free will, and tended to make morality the essence of religion.

Against these ideas Edwards also delivered a series of sermons on "Justification by Faith Alone" in November 1734. The result was a great revival in Northampton and along the Connecticut River Valley in the winter and spring of 1734–35, during which period more than 300 of Edwards' people made professions of faith. His subsequent report, *A Faithful Narrative of the Surprising Work of God* (1737), made a profound impression in America and Europe, particularly through his description of the types and stages of conversion experience.

In 1740–42 came the Great Awakening throughout the colonies. George Whitefield, a highly successful evangelist in the English Methodist movement, and Gilbert Tennent, a Presbyterian minister from New Jersey, drew huge crowds; their "pathetical" (i.e., emotional) sermons resulted in violent emotional response and mass conversions. Edwards himself, though he held his own congregation relatively calm, employed the "preaching of terror" on several occasions, as in the Enfield sermon, "Sinners in the Hands of an Angry God" (1741).

The Awakening produced not only conversions and changed lives but also excesses, disorders, and ecclesiastical and civil disruptions. Though increasingly critical of attitudes and practices associated with the revival, to the extent of personally rebuking Whitefield, Ed-

wards maintained that it was a genuine work of God, which needed to be furthered and purified. In defense and criticism of the Awakening he wrote *The Distinguishing Marks of a Work of the Spirit of God* (1741), *Some Thoughts Concerning the Present Revival of Religion in New England* (1742), and *A Treatise Concerning Religious Affections* (1746).

In the *Affections*, Edwards insisted, against the revival critics' ideal of sober, "reasonable" religion, that "the essence of all true religion lies in holy love," a love that proves its genuineness by its inner quality and practical results. In 1749 he edited, with "Reflections," the memoirs of David Brainerd, a young New Light revivalist who became a Presbyterian missionary to the Indians and died in 1747. The volume became a highly influential missionary biography. Edwards' *Humble Attempt to Promote Explicit Agreement and Visible Union of God's People in Extraordinary Prayer* (1747), written in support of a proposed international "concert of prayer" for "the Revival of Religion and the Advancement of Christ's Kingdom on Earth," helped to remove a major ideological barrier to missionary activity by arguing that the worst of the "great tribulations" (prophesied in the book of Revelation to John as preceding the millennium) were already past and that the church could thus look forward to an increasing success of the gospel among men.

Dismissal from Northampton. Meanwhile, Edwards' relations with his own congregation had become strained; one reason for it was his changed views on the requirements for admission to the Lord's Supper. In the Halfway Covenant, baptized but unconverted children of believers might have their own children baptized by "owning the covenant"; Stoddard had instituted the subsequently widespread practice of admitting to the Eucharist all who were thus "in the covenant," even if they knew themselves to be unconverted. Edwards gradually came to believe that the profession required for admission to full communion should be understood to imply genuine faith, not merely doctrinal knowledge and good moral behaviour.

The public announcement of his position in 1749 precipitated a violent controversy that resulted in his dismissal. On July 1, 1750, Edwards preached his dignified and restrained "Farewell-Sermon." In the course of this controversy he wrote two books, *Qualifications for Communion* (1749) and *Misrepresentations Corrected, and Truth Vindicated, in a Reply to the Rev. Mr. Solomon Williams's Book* (1752), one to convince his congregation, the other to correct what he considered misrepresentations of his views by a kinsman, the pastor at Lebanon, Conn. Though Edwards himself was defeated, his position finally triumphed and provided New England Congregationalism with a doctrine of church membership more appropriate to its situation after disestablishment.

Pastorate at Stockbridge. In 1751 Edwards became pastor of the frontier church at Stockbridge, Mass., and missionary to the Indians there. Hampered by language difficulties, illness, Indian wars, and conflicts with powerful personal enemies, he nevertheless discharged his pastoral duties and found time to write his famous work on the *Freedom of Will* (1754). The will, said Edwards, is not a separate, self-determining faculty with power to act contrary to the strongest motives, as he understood the Arminians to teach. Rather, it is identical with feelings or preference, and a volition is simply the soul's "prevailing inclination" in action: the will "is as the greatest apparent good." Men are free to do as they please, and God therefore rightly holds them

morally responsible for the quality of their volitions as expressions of their desires and intentions.

By 1757 Edwards had finished his *Great Christian Doctrine of Original Sin Defended* (1758), which was mainly a reply to the English divine John Taylor of Norwich, whose works attacking Calvinism (based on the thought of the 16th-century Protestant Reformer John Calvin) had "made a mighty noise in America." Edwards defended the doctrine not only by citing biblical statements about the corruption of man's heart but also by arguing that the empirical evidence of men's universal commission of sinful acts points to a sinful predisposition in every man. In answering Arminian objections to the notion that God "imputed" Adam's guilt to his posterity, Edwards proposed a novel theory of identity by divine "constitution" to account for men's unity with Adam and suggested that their innate corruption is not a judicial punishment for Adam's guilt but is really their own because of their participation (being one with him) in the sinful inclination that preceded Adam's sinful act. Edwards' was the first major contribution to the long debate about human nature in American theology and helped set the terms of that debate.

Edwards perceived the threat in Taylor's notion of man's innate goodness and autonomy; the whole Christian conception of supernatural redemption seemed to be at stake. He therefore planned further treatises, of which he completed two posthumously published dissertations: *Concerning the End for Which God Created the World and The Nature of True Virtue* (1765). God's glory, not human happiness, is his end in creation; but this is because God in his all-sufficient fullness must communicate himself by the exercise of his attributes. God can be said to aim at the creature's happiness, but it is a happiness that consists in contemplating and rejoicing in God's glory manifested in creation and redemption. Edwards defines true virtue as disinterested love (benevolence) toward God as Being in general and toward all lesser beings according to their degree of being. True virtue, therefore, does not spring from self-love or from any earthbound altruism (two prime 18th-century views); love to self, family, nation, or even mankind is good only if these lesser systems of being do not usurp the place of highest regard that belongs to God alone.

Edwards also projected books on other subjects, notably *A History of the Work of Redemption* (he had preached a series of sermons—posthumously published—on that subject in 1739), which was to be a complete theology combining biblical, historical, and systematic materials "in an entire new method." Late in 1757, however, he accepted the presidency of the College of New Jersey (later Princeton University) and arrived there in January. He had hardly assumed his duties when he contracted smallpox and died.

Influence. Edwards' immediate disciples, Joseph Bellamy (pastor at Bethlehem, Conn.), Samuel Hopkins (pastor at Great Barrington, Mass., later at Newport, R.I.), and Jonathan Edwards, Jr., developed some of his "improvements" into a distinct theological school; it was first called "Hopkinsianism" and later the "New England Theology." These men and their successors, in their effort to defend Calvinism against Arminians, Unitarians (those who denied the doctrine of the Trinity), and "infidels," made important modifications in some of its doctrines and thus prepared the way for later 19th-century evangelical liberalism.

Edwards' influence on the intellectual character of American Protestantism for a century after his death was very pronounced, and he

was widely read in the British Isles. In a general revolt against Puritanism and Calvinism after the U.S. Civil War (1861–65), Edwards' prestige declined, and he was remembered mainly as a hell-fire preacher or as an abstruse, absent-minded metaphysician. In the 1930s and after, he was rediscovered by theologians reacting against liberalism and by secular scholars seeking to delineate the "American mind." Edwards' ability to combine religious intensity with intellectual rigour and moral earnestness, the cosmic sweep of his theological vision, his emphasis on faith as an "existential" response to reality, his insistence that love is the heart of religion, and his uncompromising stand against all forms of idolatry are some of the reasons his life and writings are again being seriously studied.

(T.A.S.)

BIBLIOGRAPHY. John E. Smith, *et al.* (eds.), *The Works of Jonathan Edwards* (1957–), will be a complete critical edition. Ola Elizabeth Winslow, *Jonathan Edwards, 1703–1758* (1940, reprinted 1973), containing a delineation of Edwards the man; and Arthur C. McGiffert, Jr., *Jonathan Edwards* (1932, reprinted 1980), containing a good understanding of his thought, are regarded as the best biographies. Perry Miller, *Jonathan Edwards* (1949, reprinted 1973), an intellectual biography, is a brilliant interpretation that has been accused of unduly modernizing Edwards. Other interpretive studies include: Douglas J. Elwood, *The Philosophical Theology of Jonathan Edwards* (1960), which stresses the Platonic and Augustinian elements; and Conrad Cherry, *The Theology of Jonathan Edwards: A Reappraisal* (1966), an excellent theological study.

Edwards, Lewis (b. Oct. 27, 1809, Penllwyn, Cardiganshire, Wales—d. July 19, 1887), Welsh educator and minister of the Calvinistic Methodist Church of Wales whose literary and theological essays greatly influenced the development of Welsh culture.

After ordination in 1837, Edwards married the granddaughter of Thomas Charles of Bala, a Methodist clergyman and Welsh Bible editor. With his brother-in-law David Charles, he opened the Bala Calvinistic Methodist College to prepare men for the ministry; in 1867 this became the theological college for his church in North Wales. Through Edwards' influence his denomination adopted a more presbyterian form of church government on the Scottish model.

Edwards was twice moderator of the general assembly, which united the Calvinistic Methodist associations in North and South Wales. Periodicals in Welsh that he established include *Yr Esboniwr* ("The Expositor," from 1844) and *Y Traethodydd* ("The Essayist," from 1845).

A man of considerable critical faculties, Edwards produced works on Goethe and Goronwy Owen and translated a number of English hymns into Welsh, including "Onward Christian Soldiers." The best known of his children, Thomas Charles Edwards (1837–1900), was first principal of the University College of Wales, Aberystwyth, from 1872 to 1891.

Edwards, Sir Owen Morgan (b. Dec. 25, 1858, Llanuwchllyn, Merioneth, Wales—d. May 15, 1920, Llanuwchllyn), Welsh writer and educator who greatly influenced the revival of Welsh literature and the development of Welsh national consciousness.

After attending colleges in Wales and Scotland, he studied history at Oxford University until 1887. As a teacher of modern history at Oxford (1889–1907), he founded and edited three Welsh magazines for popular circulation. He was knighted in 1916.

Though a scholar himself, he wrote books in a natural, charming, lucid style that reached a universal Welsh audience. They were often descriptive works dealing informally with Welsh regions, manners, history, and character, or comparisons of Welsh life and life abroad,

such as *O'r Bala i Geneva* (1889; "From Bala to Geneva"). His major work in English was *Wales* (1901). Edwards also published inexpensive reprints of Welsh classics. As chief inspector of Welsh education (1907–20), he tirelessly worked to secure the study of Welsh culture in the Welsh schools.

Edwin (d. Oct. 12, 632, Hatfield Chase, Eng.), Anglo-Saxon king of Northumbria from 616 to 632. He was the most powerful English ruler of his day and the first Christian king of Northumbria.

The son of King Aelle of Deira, one of the two Northumbrian kingdoms, Edwin fled into exile when Aethelric, king of Bernicia, seized power in Deira in 588 or 590. In 616 King Raedwald of East Anglia defeated and killed Aethelric's son Aethelfrith and installed Edwin on the Northumbrian throne. Edwin conquered part of Wales and was recognized as overlord by all the other English rulers except the king of Kent.

Edwin's conversion to Christianity resulted from his marriage to the Christian princess Aethelburh of Kent. She brought to Northumbria the Roman missionary Paulinus, who converted Edwin and many of his subjects in 627. In 632 King Cadwallon of Gwynedd and King Penda of Mercia invaded Northumbria and killed Edwin in battle. Paulinus and Aethelburh fled, and the Northumbrian church was temporarily suppressed. The following year, Northumbria was united and ruled by St. Oswald, son of Aethelfrith.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Edwin Smith papyrus (c. 1600 BC), ancient Egyptian medical treatise, believed to be a copy of a work dating from c. 3000 BC. Apparently intended as a textbook on surgery, it begins with clinical cases of head injuries and works systematically down the body, describing in detail examination, diagnosis, treatment, and prognosis in each case. It reveals the ancient Egyptians' knowledge of the relation of the pulse to the heart and of the workings of the stomach, bowels, and larger blood vessels. The papyrus was acquired in Luxor in 1862 by the American Edwin Smith, a pioneer in the study of Egyptian science. Upon his death in 1906, the papyrus was given to the New York Historical Society and turned over to U.S. Egyptologist James Henry Breasted in 1920 for study. A translation, transliteration, and discussion in two volumes was published by Breasted in 1930.

Eeckhout, Gerbrand van den (b. Aug. 19, 1621, Amsterdam—d. Sept. 29, 1674, Amsterdam), Dutch biblical, genre, and portrait painter, a gifted and favourite pupil of Rembrandt (1635–40), to whom he remained a close friend. His usual style is based so closely on that of his master that many of his pictures have passed as works of Rembrandt himself. Eeckhout was one of the most successful of this school in adopting the broader and bolder technique of Rembrandt's mature style, though he seldom approached the master in humanity or depth of feeling.

In surprising contrast to his normal Rembrandtesque style are a number of highly finished genre subjects—guardroom scenes, backgammon players, and so on. An example of the early style, once thought to be by Rembrandt, is the "Christ Raising the Daughter of Jairus" in the Staatliche Museen Preussischer Kulturbesitz, Berlin. A good example of genre in the manner of Terborch is "The Music Lesson" of 1655, in the Statens Museum for Kunst, Copenhagen. The National Gallery in

London has a fine group portrait of "Four Officers of the Amsterdam Coopers' and Wine-Rackers' Guild" dated 1657.

Eeden, Frederik Willem van (b. April 3, 1860, Haarlem, Neth.—d. June 16, 1932, Bussum), Dutch writer and physician whose works reflect his lifelong search for a social and ethical philosophy.

Eeden studied medicine at Amsterdam and, with writers Willem Kloos and Albert Verwey, founded (1885) *De nieuwe gids*, a literary periodical devoted to modern authors and new social ideas. Later he practiced medicine at Bussum, near Hilversum, where he started a clinic for physical therapy. In 1898 he founded Walden, an agricultural colony based on the ideas of Thoreau. Van Eeden's personality was many-sided, essentially ethical in outlook, having affinities with Tolstoy. After much doubt and disappointment, he joined the Roman Catholic Church in 1922.

Although in his early days van Eeden was chiefly known outside his own country for his idealistic social theories, his fame is based on his literary work. He first attracted attention with *De kleine Johannes* (1885; *The Quest*, 1907), a symbolic fairy tale. *Het lied van schijn en wezen* ("Song of Semblance and Substance"), the first part of which appeared in 1895, is a long philosophical poem. His psychiatric experience provided material for the novel *Van de koele meren des doods* (1900; *The Depths of Deliverance*, 1902). Van Eeden's criticism and social treatises were collected in *Studies*, 6 vol. (1890–1918). He also wrote many plays and translated Rabindranath Tagore's work into Dutch.

Eekhoud, Georges (b. May 27, 1854, Antwerp—d. May 29, 1927, Schaerbeek, Belg.), one of the first important Belgian regionalist novelists.

Originally a poet, in the 1880s he worked with Max Waller's review *La Jeune Belgique* to bring new life to Belgian literature. But to express his views on the reform of society, Eekhoud turned to prose. As a novelist he lacked the ability to construct satisfactory stories, and his characters rarely came alive. His strength lay in his descriptive realism. Even his best novel, *La nouvelle Carthage* (1888; "The New Carthage"), set in Antwerp, is saved only by the brilliance of its various episodes.

Unlike many regionalists, Eekhoud was able to evoke both urban and rural scenes. His cycles of stories, *Kermesses* (1884; "Country Fair") and *Nouvelles Kermesses* (1887), graphically describe the seamy side of peasant life; his city novels explore the world of the working classes and social outcasts.

eel, any of more than 500 species of fish of the order Anguilliformes.

A brief treatment of eels follows. For full treatment, see MACROPAEDIA: Fishes.

Eels are slender, elongated, usually scaleless fish with long dorsal and anal fins that are continuous around the tail tip. Some, the snipe eels (families Nemichthyidae, Cyemidae, and Serrivomeridae), have long jaws; and others, the snake eels (family Ophichthidae), have pointed tails that enable them to burrow backward into sand or mud. Young eels are transparent, leaflike larvae (leptocephali) totally unlike the adults. Eels are found in all

American eel (*Anguilla rostrata*)

Grant Heilman—EB Inc

seas, from coastal regions to the mid-depths. One group, the freshwater eels of the family Anguillidae, live in freshwater but return to the sea to breed.

The freshwater eels are active, predacious fish with small, embedded scales. They comprise about 16 species and are found almost worldwide. They grow to maturity in fresh water and, as adults, make a single spawning migration to the sea (the Sargasso Sea in the case of the European and American species). After spawning, they die. The young hatch in the sea and drift to the coast, where they metamorphose into slender forms known as elvers and make their way upstream.

Freshwater eels are valued food fish. Species include the American eel (*Anguilla rostrata*), which grows about one metre (40 inches) long; the European eel (*A. anguilla*), a very similar species reaching a maximum length of about 1.4 metres; and the Indo-Pacific *A. marmorata*, which grows about 1.8 metres long.

There are about 19 families of true eels, including the moray and conger eel (*qq.v.*) groups, families Muraenidae and Congridae, respectively. The gulpers (*q.v.*) of the deep sea are included in this order by some authorities and separated as the order Saccopharyngiformes by others. Unrelated eel-like fish include spiny eels and the electric eel.

eelgrass, any of two different groups of ribbonlike aquatic plants. *Vallisneria* species (family Hydrocharitaceae), also called tape

grass, are native to temperate and tropical waters; *V. spiralis*, often grown in aquariums, is a favourite food of wild ducks. (For its unusual pollination see Hydrocharitales.)

The Zosteraceae, commonly called the eelgrass family, is remarkable for *Zostera marina* (grass weed or grass wrack), an important tidewater plant whose dried leaves have been used for packing glass articles and for stuffing cushions.

eelpout, any of about 80 species of elongated marine fishes of the family Zoarcidae, found in cold waters and abundant in Arctic and Antarctic regions. Eelpouts are thick-lipped, eel-shaped fishes with the dorsal and anal fins connected around the end of the tail and with small pelvic fins that, if present, are near the gills. They live on the bottom and range from shallow to deep water. Length may be up to about 90 centimetres (3 feet) but is usually half that or less. Some species lay eggs; others, including the abundant European eelpout, or viviparous blenny (*Zoarces viviparus*), give birth to live young.

eelworm, any of several worms of the class Nematoda (phylum Aschelminthes), so called because they resemble miniature eels. The term is most often applied to smaller members of the class Nematoda that are either free-living or parasitic in plants.

Most eelworms are 0.1 to 1.5 millimetres (0.004 to 0.06 inch) long. They are found in all parts of the world. Free-living forms occur in salt water, fresh water, and damp soil. Parasitic forms are found in the roots of many plant species; the potato-root eelworm, *Heterodera rostochiensis*, for example, is a serious pest of potatoes. Some species occur in both animals and plants.

Eemian Interglacial Stage, major division of Pleistocene time and deposits in Europe (the Pleistocene Epoch began about 2,500,000 years ago and ended about 10,000 years ago). The Eemian Interglacial followed the Saale Glacial Stage and preceded the Weichsel Glacial Stage; the Eemian is correlated with the Ipswichian Interglacial of Britain and the Riss-Würm Interglacial Stage of the Alpine region of Europe. The Eemian is also approximately contemporaneous with the Sangamon Interglacial Stage of North America. The Eemian was named for a stream in the eastern Netherlands.

The sediments of the Eemian are varied and include deposits formed in lakes, rivers, weathered soil zones, and shallow seas. The distribution of the marine deposits indicates that the Eemian seas made great incursions onto the land. These seas were probably higher than at present; the Eemian appears to have been a time of very moderate climate, warmer than at present. Most of the ice of the previous glacial period must have melted: it is likely that Scandinavia was ice-free, as was the Arctic Ocean. The Fennoscandia landmass was probably isolated as an island. Eemian fossil vertebrates are known from several localities and indicate a rich and varied mammalian fauna in Europe, including horse, bison, various sorts of elephants, cave bear, and others.

Eemian Sea, marine transgression during the Eemian Interglacial Stage of the Pleistocene Epoch (the Pleistocene began about 2,500,000 years ago and ended about 10,000 years ago). The Eemian Sea flooded much of northern Europe and converted Scandinavia into a virtual island. The sea also deposited a thick sequence of sediments that contains a fossil fauna indicating that water temperatures were at least as warm as those of the region today. Late in the history of the Eemian Sea, climatic conditions became more severe, as indicated by a change to a cooler water fauna.

Ems River (Germany): *see* Ems River.

Éfaté, also called VATÉ, formerly SANDWICH, most important island of Vanuatu, in the southwestern Pacific Ocean. Volcanic in origin, it occupies an area of 353 sq mi (915 sq km), and its highest peak is Mt. Macdonald, 2,123 ft (647 m). Its terrain is rugged and covered by tropical rain forest, nurtured by its warm and humid climate.

Vila (*q.v.*), capital of the Republic of Vanuatu, lies on the southwest coast of Éfaté; it has a good harbour (Mélé Bay) and an international airport. Havannah Harbour, on the north coast, also provides good anchorage. The island produces copra, coffee, cacao, cattle, and sheep and has potential for a lumbering industry. Manganese ore is mined at Forari under Australian management. Pop. (latest est.) 16,921.

effective atomic number, abbreviation EAN, number that represents the total number of electrons surrounding the nucleus of a metal atom in a metal complex. It is composed of the metal atom's electrons and the bonding electrons from the surrounding electron-donating atoms and molecules. Thus the effective atomic number of the cobalt atom in the complex $[\text{Co}(\text{NH}_3)_6]^{3+}$ is 36, the sum of the number of electrons in the trivalent cobalt ion (24) and the number of bonding electrons from six surrounding ammonia molecules, each of which contributes an electron pair ($2 \times 6 = 12$).

The English chemist Nevil V. Sidgwick made the observation, since known as the EAN rule, that in a number of metal complexes the metal atom tends to surround itself with sufficient ligands that the resulting effective atomic number is numerically equal to the atomic number of the noble-gas element found in the same period in which the metal is situated. This rule seems to hold for most of the metal complexes with carbon monoxide, the metal carbonyls. By using this rule it is possible to predict the number of ligands in these types of compounds and also the products of their reactions.

effective population size, in genetics, the size of a breeding population, a factor that is determined by the number of parents, the average number of children per family, and the extent to which family size varies from the average. The determination of the effective population size of a breeding population is necessary for studies of population growth rates and of gene flow.

Effen, Justus van (b. Feb. 21, 1684, Utrecht, Neth.—d. Sept. 18, 1735, 's-Hertogenbosch), Dutch essayist and journalist whose straightforward didactic pieces, modelled on foreign examples, had a wholesome influence on the contemporary Dutch fashion of rococo writing. His other occupations included private

Justus van Effen, engraving by J.C.G. Fritsch, 1735

By courtesy of the Iconographisch Bureau, The Hague

tutor, secretary at the Netherlands embassy in London (1715 and 1727), and clerk in the Dutch government's warehouses (1732). An admirer of the English press and of *The Spectator* in particular, he launched first *Le Spectateur Français* (1725) and then in his native language *De hollandsche spectator* (1731), a weekly that he edited for the rest of his life. The descriptive realism and homely prose of his essays on common life and customs influenced the emerging novelists of the Dutch domestic scene.

effigy mound, earthen mound in the form of an animal or bird found throughout the north-central United States. The effigy mounds are sometimes mistakenly classified with the numerous mounds that dot the area east of the Mississippi River, believed to be the work of prehistoric Indians broadly, and not accurately, designated as the "mound builders."

Less is known about the effigy mounds than about any of the others. Explorers such as Hernando de Soto (1539–42) have recorded, for example, that temple mounds in the southeastern U.S. served as earthen platforms on which the Indians built their temples and sometimes the houses of their chiefs. It is also known that the Hopewell culture (*q.v.*) was responsible for a great proliferation of mound building in the Ohio River Valley, including hundreds of burial mounds in which a treasure of artifacts, especially effigy pipes and gorgets (ornamental collars), have been found. Although it is known that most of the effigy mounds are burial sites, some are not, and their significance remains a mystery. Grave offerings are seldom found. The Effigy Mound culture has been dated from AD 300 to the mid-1600s.

Many effigy mounds are in the form of birds, but other animal forms—such as those of bears, deer, turtles, and buffalo—are common. The largest bird effigy mound has a wingspan of 624 feet (190 metres) and is located near Madison, Wis. Many other effigy mounds are found in southern and southwestern Wisconsin and in some areas of adjacent Minnesota, Iowa, and Illinois. The largest effigy mound is located in southern Ohio. In the form of an uncoiling snake holding an egg-shaped object in its mouth, the mound is more than 1,300 ft (400 m) long and 2½ to 3 ft (75 to 90 cm) high. *See also* burial mound.

Effigy Mounds National Monument, area of 1,475 ac (597 ha) containing numerous ancient Indian burial mounds, in northeastern Iowa, U.S., on the Mississippi River, a few miles north of McGregor. Established in 1949 and located on bluffs overlooking the river, the monument has 183 known mounds, some of which are in the shape of birds and bears. One mound has been dated as being about 2,500 years old, but the effigy mounds were built by a later culture (probably AD 500–1300). Many of the mounds have yielded copper, bone, and stone tools of Indian origin. One of the bear mounds is 137 ft (42 m) long and 3.5 ft high.

Effingham, city, Effingham county, east central Illinois, U.S. Settled in 1854 with the arrival of the Illinois Central Railroad and originally called Broughton, it was renamed, when it became the county seat (1859), for Thomas Howard, 3rd earl of Effingham, who had opposed British colonial policy. The community grew as pioneers moved westward along the Cumberland (National) Road, which had been extended through the area in 1831. The economy is based on agriculture, dairying, manufacturing (chiefly home appliances), and printing. Lake Sara, a recreational area, is nearby to the west. Inc. village, 1854; city, 1861. Pop. (2000) 12,384.

Effingham, Charles Howard, 2nd Baron Howard of: *see* Nottingham, Charles Howard, 1st earl of.

efflorescence, spontaneous loss of water by a hydrated salt, which occurs when the aqueous tension of the hydrate is greater than the partial pressure of the water vapour in the air. For example, because the vapour pressures of washing soda ($\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$) and Glauber's salt ($\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$) normally exceed that of the water vapour in the atmosphere, these salts effloresce (*i.e.*, lose all or part of their water of hydration), and their surfaces assume a powdery appearance. Hydrated cupric sulfate, or blue vitriol ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$), the aqueous tension of which is lower, undergoes efflorescence only if the air in contact with it is relatively dry. *See also* deliquescence.

Effon-Alaiye, also spelled EFON-ALAYE, town, Ondo State, southwestern Nigeria, in the Yoruba Hills, at the intersection of roads from Ilesha, Ondo, and Ado-Ekiti. It was probably founded in the late 19th century, when both the Ilesha and Effon belonged to the Ekiti-Parapo, a Yoruba confederation that fought against the town of Ibadan, 68 mi (109 km) west-southwest, for control of the trade routes to the coast. Now a collecting point for cocoa, cotton, and palm oil and kernels, Effon-Alaiye also serves as an agricultural trade centre (yams, cassava, corn [maize], palm produce, fruits, pumpkins, okra) for the local branches of the Yoruba people (the Ilesha [Ijesha] and Effon). The town has a teacher-training college, secondary schools, and a hospital. Pop. (1996 est.) 153,100.

Efik, people inhabiting the lower Cross River in Cross River state, Nigeria; their dialect of Efik-Ibibio (in the Kwa branch of Niger-Congo languages) has become the literary language of all educated Efik-Ibibio speakers. The Efik, an offshoot of the Ibibio, migrated down the Cross River during the first half of the 17th century and founded Creek Town, Duke Town, and other settlements. Because of a European error in confusing their territory with that of the Kalabari Ijaw (known as New Calabar), the Efik area became known as Old Calabar. Originally a community of fishermen, Old Calabar developed into a major trading centre from the 17th to the 19th centuries, exporting slaves and later palm oil in return for European goods. European ships had to pay a duty (*comey*) to Efik chiefs for the privilege of trading.

During the 20th century, a large part of the Efik population moved from the towns and settled in farming villages in the forest. The staple foods are yam and cassava, supplemented by taro, corn (maize), fruits and vegetables, and fish.

Households formerly consisted of a man, his several wives, and their children; but polygyny has become relatively rare. Groups of households related through male descent form a House, the leader of which was formerly the eldest male member but now is chosen for ability. Related Houses occupy the wards into which settlements are divided.

The Obung, or chief, elected from among the heads of various Houses, traditionally exercised his authority as head of the Ekpe (Egbo), or Leopard Society. In addition to ritual propitiation of forest spirits to ensure the well-being of the community, this graded, secret male society made and enforced laws by fines, capital punishment, or boycotts; judged cases; maintained internal peace; and served as the executive government of Efik society. The Ekpe was composed of the leading men of the community, and its higher grades were open only to those who could pay the heavy entrance fees. It also functioned as a force for tribal unity, for society members from one village were accepted by members in another village. The Ekpe continues to exist; but its dominant role in legislative, judicial, and economic affairs has been taken over by the state. Its supernatural powers have also waned.

Traditional Efik religion includes belief in a supreme creator god, ancestral and other supernatural beings, magic, sorcery, and witchcraft. Most Efik, however, are now Christians.

Efod, also spelled EFODI (Jewish philosopher): see Duran, Profiat.

efod (Judaism): see ephod.

EFTA: see European Free Trade Association.

Egadi Islands, Italian ISOLE EGADI, also called AEGADIAN ISLANDS, Latin AEGATES INSULAE, small mountainous group of islets belonging to Italy, in the Mediterranean just off the western coast of Sicily, with a total area of 15 square miles (39 square km). The principal islands are Favignana, the largest (7 square miles), Levanzo, and Marettimo. In the Battle of the Aegates in 241 BC, the Carthaginian fleet was defeated there by the Roman fleet under Gaius Lutatius Catulus, signaling the end of the First Punic War. Excavations in the Egadi have revealed traces (rare in Sicily) of Paleolithic habitation, most notably the cave paintings in the Genovese Grotto on Levanzo. The islands have important tuna fisheries and administratively comprise Favignana commune of Trapani province, Sicily. Pop. (1991 prelim.) mun., 4,335.

Égalité, Philippe: see Orléans, Louis-Philippe-Joseph, duc d'.

Egan, Pierce, THE ELDER (b. 1772, London, Eng.—d. Aug. 3, 1849, London), sporting writer whose works were considered indis-

Egan, detail of an engraving by C. Turner after a drawing by G. Sharples
BBC Hulton Picture Library

pensible reading for English men-about-town in the early 19th century.

Egan made his reputation as a boxing reporter. His best-known work is *Boxiana* (1818–24), a racy but accurate account of the lives of famous pugilists. Egan also became an authority on other sports and developed a flair for sensational literature describing the contemporary “fast” life.

Egas Moniz, António, in full ANTÓNIO CAETANO DE ABREU FREIRE EGAS MONIZ (b. Nov. 29, 1874, Avança, Port.—d. Dec. 13, 1955, Lisbon), Portuguese neurologist and statesman who was the founder of modern psychosurgery. With Walter Hess he was awarded the 1949 Nobel Prize for Physiology or Medicine for the development of prefrontal leucotomy (lobotomy) as a radical therapy for certain psychoses, or mental disorders.

As the University of Lisbon's first professor of neurology (1911–44), Egas Moniz introduced and developed (1927–37) cerebral angiography (arteriography), a method of making visible the blood vessels of the brain by injecting into the carotid artery substances that are opaque to X rays. This technique has proved to be of considerable value in the diagnosis of

Egas Moniz, c. 1950
Archiv für Kunst und Geschichte, West Berlin

intracranial diseases such as tumours of the pituitary gland.

Egas Moniz observed that certain psychoses, particularly schizophrenia and severe paranoia, involve recurrent thought patterns that dominate normal psychological processes. He reasoned that severing the nerve fibres between the frontal lobes, which are known to be closely associated with psychological responses, and the thalamus (a relay centre for sensory impulses at the centre of the brain) might force a transformation of existing thought patterns into more normal ones. In 1936 he and his associate, Almeida Lima, performed the operation known as a prefrontal leucotomy (lobotomy). The operation, though successful in eliminating the symptoms of persons suffering from apparently incurable psychoses, is now known to have serious side effects, and Egas Moniz cautioned that it was a radical procedure to be followed only after all other forms of treatment had proved to be ineffective. The use of lobotomies spread in the 1940s and '50s and then declined owing to the use of tranquilizing drugs as a means to quiet agitated or distressed patients.

Egas Moniz was also active politically. He served several times between 1903 and 1917 in the Portuguese chamber of deputies, was Portuguese minister at Madrid (1917–18), and led the Portuguese delegation at the Paris Peace Conference (1918–19).

Egbert, also spelled ECGBERHT, or ECGBRYHT (d. 839), king of the West Saxons from 802 to 839, who formed around Wessex a kingdom so powerful that it eventually achieved the political unification of England (mid-10th century).

The son of Ealhmund, king in Kent in 784 and 786, Egbert was a member of a family that had formerly held the West Saxon kingship. In 789 Egbert was driven into exile on the European continent by the West Saxon king Beorhtric and his ally, the powerful Mercian king Offa (d. 796). Nevertheless, Egbert succeeded to Beorhtric's throne in 802. He immediately removed Wessex from the Mercian confederation and consolidated his power as an independent ruler. In 825 he decisively defeated Beornwulf, king of Mercia, at the Battle of Ellendune (now Wroughton, Wiltshire). The victory was a turning point in English history because it destroyed Mercian ascendancy and left Wessex the strongest of the English kingdoms. By virtue of long-dormant hereditary claims, Egbert was accepted as king in Kent, Sussex, Surrey, and Essex. In 829 he conquered Mercia itself, but he lost it in the following year to the Mercian king Wiglaf. A year before his death Egbert won a stunning victory over Danish and Cornish Briton invaders at Hingston Down (now in Cornwall).

Ege Deniz: see Aegean Sea.

Eger (Czech Republic): see Cheb.

Eger, German ERLAU, town, seat of Heves megye (county), northern Hungary. It lies in the valley of the Eger River, which is a tributary of the Tisza, between the Mátra and the Bükk mountains. Eger is an old Magyar tribal city with a bishopric founded in the 11th century. The Tatar invasion of the 13th century leveled most of the town, which was one of the richest in early medieval Hungary. The remains of the fortress from which the town was defended from the Turks in 1551 are on the hill to the northeast. The Turks returned to take and occupy the town from 1596 to 1687. It served them as an important outpost, and the 115-foot- (35-metre-) high minaret is one of the town's landmarks. From the early 18th century Eger revived, and the number of ecclesiastical buildings that were built in the town gave rise to its name of “the Hungarian Rome.” The former Minorite Church (1758–71) is one of the finer architectural monuments of Hungary, and the observatory tower is of historical interest to astronomers. Beneath Eger lie 60 miles (96 km) of tunnels

Minaret dating from the Turkish occupation, Eger, Hung.
ZEFA

that in times past provided building stone, sanctuary against invading Turks, and, more recently, cellars to mature wine. The tunnels were dug in a soft rock, and subsidence has caused extensive surface damage. The national government has provided subsidies to save the town's many historic buildings from further destruction.

The rich soils and the favourable microclimate on the hill slopes have supported grape vines, with viticulture dating from the 13th century. Bikavér, a full-bodied red wine, is Eger's best-known wine. The town has a limited manufacturing industry (furniture, cigarettes, and precision instruments). Eger is also the tourist centre for the Mátra Mountains (*q.v.*), and there is a spa with numerous bathing facilities. Pop. (1991 est.) 62,474.

Eger River (Europe): see Ohře River.

Egeria, in Roman religion, a water spirit worshiped in connection with Diana at Aricia and also with the Camenae in their grove outside the Porta Capena at Rome. Like Diana, she was a protectress of pregnant women and, like the Camenae, was considered prophetic. Traditionally she was the wife, or mistress, and adviser of King Numa Pompilius, who established the grove at Rome and consorted with her there.

Egerton, Thomas: see Brackley, Thomas Egerton, Viscount.

Egesta (ancient Sicily): see Segesta.

Egfrith (Anglo-Saxon king): see Ecgrith.

egg, in biology, the female sex cell, or gamete. In botany the egg is sometimes called a macrogamete. In zoology the Latin term for egg, ovum, is frequently used to refer to the single cell, while the word egg may be applied to the entire specialized structure or capsule that consists of the ovum, its various protective membranes, and any accompanying nutritive materials. The human female reproductive cell is also usually called an ovum.

The egg, like the male gamete, bears only a single (haploid) set of chromosomes. The egg, however, is usually larger than its male counterpart because it contains material to nourish the embryo during its early stages of development. In many animal species a large quantity of nutritive material, or yolk, is deposited in the egg, the amount depending on the length of time before the young animal can feed itself or, in the case of mammals, begins to receive nourishment from the maternal circulation. The plant egg is never so disproportionately large, because the developing sporophyte embryo is nourished until self-supporting by the plant on which it is formed (in liverworts, mosses, and ferns by the gametophyte; in seed plants by the sporophyte on which the gametophyte is parasitic).

With the exception of those of some cnidarians (coelenterates), all animal eggs are enclosed by membranes, the innermost of which is called the vitelline membrane. The vitelline membrane is the only membrane in the eggs of various invertebrates—ctenophores, many worms, and echinoderms—and of certain lower chordates. All higher vertebrates and many invertebrates have one or more additional membranes. Insect eggs, for example, are covered by a thick, hard chorion, and the amphibian egg is surrounded by a jelly layer. The bird egg includes the vitelline membrane, the white of the egg, two egg shell membranes, and the outermost membrane, the shell. As pointed out above, this entire structure is commonly referred to as an egg.

Mature eggs remain functional for a relatively short period of time, after which fertilization cannot occur. The eggs of most invertebrates, fish, and amphibians must be fertilized a few minutes after they are shed into the water; an exception is sea urchin eggs, which are viable for about 40 hours after their release. Most other animal eggs have life spans similar to that of the human egg—i.e., 12 to 24 hours. See also ovum.

egg, the content of the hard-shelled reproductive body produced by a bird or reptile, considered as food.

A brief treatment of eggs and egg products follows. For full treatment, see *MACROPAEDIA: Food Processing*.

The egg has been a protein source for man since earliest times but was only locally important and seasonal until the domestication of fowls became widespread. In the 2nd millennium BC, Indian jungle fowls, the ancestors of the modern hen, were dispersed throughout Europe, the Middle East, and China. The birds were brought to the New World with Columbus's second voyage in 1493. These fowls, which laid year-round, were more valuable for their eggs than for their meat.

By far the preponderance of eggs eaten today are hen's eggs. The eggs of ducks, both domestic and migratory, are also widely eaten; salted and preserved duck eggs are a specialty of Chinese cuisine. Other eggs often eaten are those of geese, quail, pigeons, gulls, lapwings, plovers, pheasants, and ostriches. Local regulations govern the gathering and sale of the eggs of wild birds. The eggs of some reptiles are edible, but of these only turtle's eggs are notable.

A two-ounce (56.6-gram) egg provides 6

grams of complete protein, about 15 percent of an adult's daily requirement, and 12 grams of fat, for about 80 calories. In addition, the egg contains significant amounts of iron, vitamins A and D, thiamine, and riboflavin. The mineral and vitamin content varies with the diet of the chicken. Brown and white hen's eggs are nutritionally identical, although one is sometimes preferred over the other for aesthetic reasons.

Because the protein in the liquid albumen of the egg coagulates as it is heated, eggs are used in many foods as a structural component. Sponge and angel food cakes are leavened by the expansion with heat of the air trapped in stiffly beaten egg whites. Soufflés and meringues also exploit this characteristic. In cake batters, eggs provide leavening, moisture, and texture. Foods to be coated in bread crumbs or flour are first dipped in beaten egg, which makes the coating adhere and binds it. Soups and sauces are thickened by the addition of egg yolks. In terrines, croquettes, and other mixtures, egg contracts as the dish is cooked, helping maintain the shape. In ice cream and sherbet, egg white acts as an interfering agent that prevents the formation of large ice crystals. In both hot and cold sauces, eggs enable a stable emulsion to be formed of substances that would otherwise separate. When beaten into hot stock or coffee, egg whites trap solid particles and render the liquid clear.

In cooking eggs, a major consideration is the use of low to moderate heat. At 165° F (74° C) both the yolk and the white of the egg coagulate. Above this temperature the protein becomes tough and rubbery. In custards and meringues, high heat will cause "weeping," the loss of water. Eggs can be boiled, fried, poached, scrambled, and baked. They can be a component of any course of a meal and combine well with virtually any sweet or savoury food.

Egg, Augustus (Leopold) (b. May 2, 1816, London—d. March 26, 1863, Algiers), genre painter and actor.

Egg studied at the Royal Academy, of which he became a member in 1860. He travelled in Italy with Charles Dickens and Wilkie Collins in 1853. Egg was an excellent actor and played in Dickens' company of amateurs; one of his best parts was as John Want in Collins' *Frozen Deep*. As a painter, he was famous in his day for small anecdotal paintings, many of them on subjects from contemporary novelists, including Scott and Thackeray.

egg and dart, in architecture, design shape used in moldings. It consists of a series of bas-relief ovals alternating with pointed, narrow, dartlike carvings.

Ovulo moldings, as the Classical egg designs are called in general, are usually wider than many other styles. Their ovals may be separated by other narrow elements, shaped to resemble arrowheads, anchors, or tongues.

egg-eating snake, any of the five species of the genus *Dasypeltis* of sub-Saharan Africa and *Elachistodon westermanni* of northeastern India. These snakes comprise the subfamily Dasypeltinae, family Colubridae. They eat only eggs. The mouth is enormously distensi-

Egg-eating snake (*Dasypeltis*)

E. S. Ross

ble and the teeth greatly reduced, to accommodate a bird's egg as large as a chicken's. Ventral spines on the neck vertebrae extend into the esophagus and serve to rip open the eggshell. Contents of the egg are pressed into the stomach and the bits of shell are regurgitated.

Egg-eating snakes are primarily arboreal, and they are oviparous (egg laying), laying each egg in a separate place. All are slender and about 76 centimetres (30 inches) long.

egg-laying topminnow (fish): see killifish.

egg tooth, tooth or toothlike structure used by the young of many egg-laying species to break the shell of the egg and so escape from it at hatching. Some lizards and snakes develop a true tooth that projects outside the row of other teeth, helps the young to hatch, and then is shed. Turtles, crocodilians, and birds have an analogous horny structure that performs a similar function. The only mammal to hatch from an egg, the duck-billed platypus, also develops an egg tooth before birth.

Eggert Ólafsson (Icelandic poet and anti-quarian): see Ólafsson, Eggert.

Eggjum Stone, inscribed stone that bears 200 runic characters. It is the longest known text in the old-style futhork (runic alphabet) and was discovered inside a tomb in western Norway in 1917. The runes are arranged in three unequal lines, separated by an engraving of a stylized horse's head. The date is uncertain; archaeologists place it in the 7th century, whereas runologists, citing transitional rune forms and the relatively modern language of the sample, estimate the 8th or even the 9th century.

Parallel constructions and alliterations appear in the text, which remains enigmatic. Only a few passages are clear; among these is a statement that the stone is not illuminated by the Sun and has not been carved with a knife. There is also a probable conjuration and an explanation of the death of the person in the tomb.

Eggleston, Edward (b. Dec. 10, 1837, Vevay, Ind., U.S.—d. Sept. 4, 1902, Lake George, N.Y.), clergyman, novelist, and historian who realistically portrayed various sections of the U.S. in such books as *The Hoosier Schoolmaster*.

By the age of 19, Eggleston had become an itinerant preacher, but circuit riding broke his health. He held various pastorates, serving from 1874 to 1879 in Brooklyn; he was an editor of the juvenile paper, *Little Corporal* (1866–67), the *National Sunday School Teacher* (1867–73), and other periodicals.

In all of his work he sought to write with "photographic exactness" of the real West. The most popular of his books for adults was *The Hoosier Schoolmaster* (1871), a vivid study of backwoods Indiana. His other novels include *The End of the World* (1872), *The Mystery of Metropolisville* (1873), *The Circuit Rider: A Tale of the Heroic Age* (1874), *Roxy* (1878), and *The Graysons* (1888). His later novels and children's books are considered less significant. After a trip to Europe in 1879 he turned to the writing of history. His *Beginners of a Nation* (1896) and *Transit of Civilization from England to America* (1900) contributed to the growth of social history.

eggplant, also called **AUBERGINE**, or **GUINEA SQUASH** (*Solanum melongena*), tender perennial plant of the nightshade family (Solanaceae), closely related to the potato. Eggplant requires a warm climate and is grown extensively in eastern and southern Asia and in the United States. It is native to southern and eastern Asia, where it has been cultivated since remote antiquity for its fleshy fruit. For this purpose it is usually grown as an annual. It has an erect, bushy stem, sometimes armed with a few spines; large ovate, slightly lobed

Eggplant (*Solanum melongena*)
Ingmar Holmason

leaves; and pendant, violet, characteristically solitary flowers, approximately two inches across. The fruit is a large, egg-shaped berry, varying in colour from dark purple to red, yellowish, or white (the colour and shape of the white variety is the source of the common name); it is sometimes striped and has a glossy surface.

A staple in cuisines of the Mediterranean region, the eggplant figures prominently in such classic dishes as the Greek moussaka, Italian eggplant parmigiana, and the Middle Eastern relish *baba gannoush*.

eggshell porcelain, also called TAN-P'I BODILESS, or T'Ō T'AI, WARE, Chinese porcelain whose body is excessively thin under the glaze and often has decoration engraved on it before firing that is visible, like a watermark in paper, only when held to the light; such decoration is called *an hua*, literally "secret language."

Eggshell porcelain bowl, a copy of a Yung-lo period bowl, Ch'ing dynasty, K'ang-hsi reign (1661–1722); in the Victoria and Albert Museum, London
By courtesy of the Victoria and Albert Museum, London

Eggshell porcelain was a refinement introduced in the Ming dynasty during the reign of the emperor Yung-lo (1402–24); it reappeared in the reign of the emperor Ch'eng-hua (1464–87), and later Yung-lo wares were copied under the emperor Wan-li (1572–1620). The paper-thin porcelain again occurred during the Ch'ing dynasty (1644–1911/12), especially in the reign of the emperor K'ang-hsi (1661–1722), in *famille verte* and *famille rose* porcelain, chiefly in bowls and plates.

Egill SKALLAGRÍMSSON, Skallagrímsson also spelled SKALLA-GRÍMSSON (b. c. 910, Borg, Ice.—d. 990), one of the greatest of Icelandic skaldic poets (see skaldic poetry), whose adventurous life and verses are preserved in *Egils saga* (c. 1220), attributed to Snorri Sturluson. The saga portrays Egill as having a dual nature derived from his mixed descent from fair, extroverted Vikings and dark, taciturn Sami (Lapps). He was headstrong, vengeful, and greedy for gold, but also a loyal

friend, a shy lover, and a devoted father. As a young man he killed the son of King Erik Bloodax and placed a curse upon the king, which he inscribed on a pole in magic runes. Later, shipwrecked off the coast of Northumbria, Eng., he fell into Erik's hands (c. 948) but saved his own life by composing in a single night the long praise poem *Hofuthlausn* ("Head Ransom"), praising Erik in a unique end-rhymed metre. Another long praise poem, *Arinbjarnakvitha* ("Lay of Arinbjörn"), is also attributed to him.

Shortly after the death of two of his sons, Egill locked himself in his enclosed bed and refused food. His daughter coaxed him into writing a poem; so he composed (c. 961) the deeply personal lament *Sonatorrek* ("Loss of Sons," or "Revenge Denied"). The poem is also a family portrait in which he recalls the deaths of his parents as well; in it desire for revenge and hatred of the gods overwhelm him, but gradually he bows his head in resignation. After finishing the poem, Egill resumed his normal life. He lived to be old and blind and to write a lament on his senility.

Egisheim und Dagsburg, Bruno, Count von: see Leo IX under Leo (papacy).

Egk, Werner, original name WERNER MAYER (b. May 17, 1901, Auchsesheim, near Donauwörth, Ger.—d. July 10, 1983, Inning, W.Ger.), German composer primarily of music for the theatre.

Egk studied composition with Carl Orff in Munich, where he settled and composed music for puppet plays and radio plays. He conducted his own first opera for the stage, *Die Zaubergeige* (1935), in Frankfurt am Main.

His operas and ballets, often satirical, usually portray historical or legendary figures, and he wrote his own librettos. The immediate appeal of Egk's music was due largely to its neo-romantic spirit. His primary influence was Igor Stravinsky. In 1938, while in Berlin, he conducted his highly successful opera, *Peer Gynt* (after Henrik Ibsen), one of his most popular stage works. His ballets, such as *Abraxas* (1948) and *Casanova in London* (1969), also attracted wide attention. *Abraxas* was banned, after five sold-out performances, on grounds of obscenity. Egk also wrote instrumental music.

Eglevsky, André (b. Dec. 21, 1917, Moscow, Russia—d. Dec. 4, 1977, Elmira, N.Y., U.S.), Russian-born American ballet dancer and teacher widely regarded as the greatest male classical dancer of his generation.

Though he left Russia as a child during the Revolution, Eglevsky acquired the traditional style and technique of the Imperial Russian Ballet by studying in Paris (from age eight) with such outstanding émigré dancers as Lubov Egorova, Mathilde Kschessinska, and Alexandre Volinine and with Nicholas Legat in London. At 14 he became premier danseur with Colonel W. de Basil's Ballet Russe de Monte Carlo, in which he introduced his characteristic and spectacular series of slow, controlled pirouettes in *Les Présages*.

He danced with such companies as the René Blum-Michel Fokine Ballets de Monte Carlo, the American Ballet, and the Ballet (now American Ballet) Theatre before joining the New York City Ballet (1951–58), where he created leading roles in several George Balanchine ballets, including *Scotch Symphony* (1952) and *Caracole* (1952; now called *Divertimento No. 15*). Among his other well-known roles were Albrecht in *Giselle* and Prince Siegfried in *Swan Lake*; principal parts in Fokine's ballets *Les Sylphides*, *Prince Igor*,

Le Spectre de la Rose, and *Petrushka*; the burlesque Paris in David Lichine's *Helen of Troy*; and the title role of Léonide Massine's surrealist *Mad Tristan*. Eglevsky, a U.S. citizen

Eglevsky in *Apollo*, 1944
Fred Fehl

from 1937, established a school and small performing group in Massapequa, N.Y., in 1958, which grew into the Eglevsky Ballet Company that survived him.

Egmond, Lamoraal, Count (graaf) van, Egmond also spelled EGMONT (b. Nov. 18, 1522, La Hamaide, Hainaut—d. June 5, 1568, Brussels), leader in the early opposition to the policies of Philip II of Spain in the Netherlands. Although Egmond did not favour the overthrow of Spanish sovereignty, he became one of the first and most illustrious victims of the Duke d'Alba's repressive regime (1567–73). He is the hero of J.W. von Goethe's drama *Egmont*.

Belonging to a powerful family of the Netherlands, Lamoraal succeeded to the countship, in Holland, in 1541 and three years later married Sabina of Bavaria, daughter of John II, count palatine of Simmern. A trusted adviser of the emperor Charles V, Egmond represented the

Count van Egmond, painting by an unknown artist, 16th century; in the German National Museum, Nürnberg
By courtesy of Germanisches Nationalmuseum, Nürnberg

Emperor's son, Philip II, in asking for the hand of Mary I, the Roman Catholic queen of England. He had a distinguished military record, most notably in the victories over the French at Saint-Quentin (1557) and Gravelines (1558). In 1559 he was named stadtholder (chief provincial executive) of Flanders and Artois and a member of the advisory council

of the regent, Margaret of Austria, duchess of Parma.

Egmond and other leading noblemen represented Philip II's policy of encroachment on local privileges and religious liberties and to the elevation of Cardinal Antoine Perrenot de Granvelle to virtual head of the government. Together with William, prince of Orange (William I the Silent), and Filips van Montmorency, graaf van Hoorne, Egmond successfully petitioned Philip to remove Granvelle from office (1564).

When Philip, despite Egmond's personal appeal in Spain (1565), maintained his harsh decrees against Protestants, Egmond, along with William and Hoorne, withdrew from the Council of State (November 1565); but he remained loyal to the sovereign, giving only limited support to a league of lesser nobles formed in 1566 to petition Margaret for greater religious toleration. He then withdrew to his government of Flanders, where he severely repressed Calvinist uprisings.

After the appointment of the Duke of Alba as captain general in 1567, William appealed to Egmond to join him in armed resistance. Egmond's refusal troubled William, who vacillated for several months before seeking aid from German Protestant princes. Egmond meanwhile took the oath of allegiance demanded by Margaret in the spring of 1567 and ignored William's warning of danger on Alba's arrival. He was seized by Alba on Sept. 9, 1567, and, with others, beheaded for high treason after appeals by high nobles and princes had been ignored.

Egmont, John Perceval, 2nd earl of, 1st Baron Lovel and Holland (b. Feb. 24, 1711, Westminster, near London—d. Dec. 4, 1770, London), eccentric British politician and pamphleteer, a confidant of George III.

Perceval sat in the Irish House of Commons from 1731 to 1748, when he succeeded to his father's earldom in the Irish peerage. His interests, however, were in British politics. Elected in 1741 to represent Westminster in the British House of Commons, he became a critic of Sir Robert Walpole's administration. In 1748 he threw his support to Frederick Louis, prince of Wales, and soon became the principal adviser for the Prince's Leicester House faction as well as opposition leader in the Commons. In conjunction with the Prince, who regarded Perceval as his prospective prime minister, he drafted the Glorious Plan, a blueprint to take control of the government at Frederick's accession. After the Prince died unexpectedly on March 20, 1751, Perceval drew closer to Frederick Louis's son and successor, Prince George (the future George III). In May 1762 Perceval moved from the Commons to the Lords after his elevation to the English peerage as Baron Lovel and Holland. In the ministry of George Grenville, he was appointed 1st Lord of the Admiralty (September 1763), and by 1765 he had become known as a leader of the "King's Friends." Egmont resigned from Pitt's administration in August 1766, when, as a proponent of an Austro-British alliance, he opposed Pitt's plan to ally with Prussia. His enmity to Pitt was such that in the summer of 1767 he refused office in any government in which Pitt served.

Egmont was a gifted pamphleteer, and his *Faction Detected* (1743) is an elaborate vindication of opposition politics. His seventh son was the prime minister Spencer Perceval.

Egmont, Lamoraal, graaf van (count of); *see* Egmond, Lamoraal, graaf van.

Egmont, Mount, Maori TARANAKI, mountain, west central North Island, New Zealand, on the Taranaki Peninsula. Named after the British earl of Egmont, the symmetrical vol-

canic cone rises from sea level to 8,260 ft (2,518 m) and has a subsidiary cone, 6,438-ft Fathams Peak, 1 mi (1½ km) south of the main crater. Both have been dormant since the early 17th century. Streams issuing from the snowfields at the summit have carved deep gorges down the slopes. Dense forests clothe

Part of the ringplain and Mt. Egmont, New Zealand
G.R. Roberts, Nelson, N.Z.

the mountain, giving way to the fertile plain at its base. Mt. Egmont is the youngest and most southerly of a group of volcanoes, including Pouakai and Kaitake, that are within Egmont National Park. The peak was sighted (1770) by the British navigator Capt. James Cook and was first climbed in 1839.

ego, in psychoanalytic theory, that portion of the human personality which is experienced as the "self" or "I" and is in contact with the external world through perception. It is the part which remembers, evaluates, plans, and in other ways is responsive to and acts in the surrounding physical and social world. The ego coexists, in psychoanalytic theory, with the id and superego (*qq.v.*), as one of three agencies proposed by Sigmund Freud in attempting to describe the dynamics of the human mind. Ego (Latin for "I") comprises, in Freud's term, the executive functions of personality; it is the integrator between the outer and inner worlds, as well as between the id and the superego. The ego gives continuity and consistency to behaviour by providing a personal point of reference, which relates the events of the past (retained in memory) and actions of the present and of the future (represented in anticipation and imagination). The ego is not coextensive with either the personality or the body, although body concepts form the core of early experiences of self. The ego, once developed, is capable of change throughout life, particularly under conditions of threat, illness, and changes in life circumstances.

Ego development. The newborn human infant reacts to but cannot control, anticipate, or alter sources of stimulation, whether external or internal. Perception is primitive and diffuse, motor activity gross and uncoordinated, and self-locomotion impossible. Learning is limited to the simplest type of stimulus-response conditioning.

The infantile ego develops in relation to the external world and reflects, as psychoanalysis has emphasized, the helpless and dependent infant's efforts at altering and alleviating painfully intense stimuli. Such a possibility being inconceivable, mechanisms evolve for controlling tension while seeking means by which gratifications can be obtained, and these mechanisms in time develop into increasingly complex forms of mastery.

At the outset, perception and motor activity are closely tied. Immediately on stimulation there is motor discharge. To delay action, while tolerating the consequent tension, is the basis for all more advanced ego functions and is prototypic of the ego's role in later personality functioning. The learned separation of stimulation and response allows the interposition of more complex intellectual activities such as thinking, imagining, and planning.

Instead of reacting directly, the ego has the capacity to test reality vicariously, to fantasize the consequences of one or another course of action, and to decide upon future directions to achieve its ends. The accumulation and retention of memories of past events is necessary for internal processes of thought and judgment. The acquisition of language, started during the second and third years, provides a powerful tool for the development of logical thought processes as well as allowing communication and control of the environment.

As the individual continues to develop, the ego is further differentiated and the superego develops. The superego represents the inhibitions of instinct and the control of impulses through the incorporation of parental and societal standards. Thus, moral standards as perceived by the ego become part of the personality. Conflict, a necessary ingredient for the growth and maturity of the personality, is introduced. The ego comes to mediate between the superego and the id (agency of primitive drives) by building up what have been called defense mechanisms (*see* defense mechanism).

Since the concept and structure of the ego were defined by Freud and explored by Jung, other theorists have developed somewhat different conceptualizations of the ego.

Ego strength. Progress from immediate to directed behaviour, from pre-logical to rational thinking, is slow and moves through a number of intermediate stages during childhood. Even in physical maturity, persons differ considerably in the forms and effectiveness of ego functioning. An important dimension has been characterized as ego strength. The person of strong ego has the following characteristics: he is objective in his apprehension of the external world and in self-knowledge (insight); his activity is organized over longer time spans and he is thus able to maintain schedules and plans; he can follow resolves, and choose decisively among alternatives; he is not overwhelmed by his drives and can direct them into socially useful channels; he can resist immediate environmental and social pressure while contemplating and choosing a self-selected course. On the other hand, the ego-weak person is more like the child: behaviour is impulsive and immediate; perception of reality and self is distorted; he is less capable of productive work because his energy is drained into the protection of warped and unrealistic self-concepts; he may be burdened by neurotic symptoms. *See also* psychoanalysis.

ego, transcendental (philosophy): *see* transcendental ego.

egoism (from Latin *ego*, "I"), in philosophy, an ethical theory holding that the good is based on the pursuit of self-interest. The word is sometimes misused for egotism, the over-stressing of one's own worth.

Egoist doctrines are less concerned with the philosophic problem of what is the self than with the common notions of a person and his concerns. They see perfection sought through the furthering of a man's own welfare and profit—allowing, however, that sometimes he may not know where these lie and must be brought to recognize them.

Many ethical theories have an egoist bias. The hedonism of the ancient Greeks bids each man to seek his own greatest happiness; in the 17th century, Thomas Hobbes, a Materialist, and Benedict de Spinoza, a Rationalist, held in different ways that self-preservation is the good; and those who stress the tending of one's own conscience and moral growth are likewise egoists in this sense. In contrast with such views is an ethics that is governed more by man's social aspects, which stresses the importance of the community rather than that of the individual. Under this head come such theories as Stoic cosmopolitanism, tribal soli-

darly, and utilitarianism, which are all forms of what the positivist Auguste Comte called altruism. The distinction, however, cannot always be neatly drawn.

Egorevsk (Russia): see Yegoryevsk.

egret, any member of several species of herons (family Ardeidae, order Ciconiiformes), especially members of the genus *Egretta*. Most egrets have white plumage and develop long ornamental nuptial plumes for the breeding season. Their habits are generally like those

Common egret (*Egretta alba*)

R.F. Head from The National Audubon Society Collection/Photo Researchers

of other herons, but some perform elaborate mating displays involving the plumes. The name egret, or egret, is also used to refer to these plumes; they are highly prized as ornaments in Oriental ceremonial dress and were formerly used in the Western millinery trade. The high prices paid for the plumes, along with the vulnerability of the birds, who nest in large breeding colonies, resulted in the near extinction of egrets because of unscrupulous hunters. Changes in fashion and strict conservation measures have since allowed their numbers to increase.

Egrets typically frequent marshes, lakes, humid forests, and other wetland environments. They are wading birds and catch small fishes, amphibians, reptiles, mammals, and crustaceans in shallow waters. They build large, untidy nests in trees and bushes or on the ground.

The great white egret, *Egretta* (sometimes *Casmerodius*) *alba*, of both hemispheres, is about 90 cm (35 inches) long and bears plumes only on the back. The American populations of this bird are sometimes called American, or common, egrets.

The cattle egret, *Bubulcus* (sometimes *Ardeola*) *ibis*, spends much of its time on land and associates with domestic and wild grazing animals, feeding on insects that they stir up and sometimes removing ticks from their hides. It is a compactly built heron, 50 cm long, white with yellowish legs and bill and short, fluffy nuptial plumes. It has extended its range from Europe, Africa, and Asia to Australia and the Americas.

The little egret (*E. garzetta*), of the Old World, about 55 cm long, is white with firm plumes on the head and lacy plumes on the back.

The reddish egret, *Hydranassa* (or *Dichromanassa*) *rufescens*, of warm coastal regions

of North America, has two colour phases: white and dark. The snowy egret, *E.* (or *Leucophoyx*) *thula*, ranging from the United States to Chile and Argentina, is white, about 60 cm long, with filmy recurved plumes on the back and head.

Eguren, José María (b. July 7, 1874, Lima, Peru—d. April 19, 1942, Lima), poet considered one of the leading post-Modernist poets of Peru.

His first book of poetry, *Simbólicas* (1911; "Symbolisms"), signaled a break with the Modernismo tradition, while still maintaining contacts with the Romantic and early French Symbolist poets who had influenced the Modernist movement. Eguren's often fantastic creations reflect his desire to escape to an imagined medieval world of adventure peopled with knights and princesses. The language of these poems is musical and highly pictorial. His second book, *La canción de las figuras* (1916; "The Ballad of the Figures"), highly personal and hermetic poems, continues in the same tradition.

With the appearance of César Vallejo's *Trilce* (1922), poets like Eguren, who wrote isolated in their ivory towers, were censured by the left for not being in tune with the pressing social problems of the day. The communist editor José Carlos Mariátegui, who published a collection of Eguren's poems, *Poesías* (1929; "Poetry"), admired his technical mastery but considered him out of touch with reality. After 1929 Eguren wrote mostly prose criticism, collected in *Motivos estéticos* (1959; "Aesthetic Motifs").

Egwanga (Nigeria): see Ikot Abasi.

Egypt, officially ARAB REPUBLIC OF EGYPT, Arabic MIṢR, or JUMHŪRĪYAT MIṢR AL-ʿARABĪYAH, country located in the northeastern corner of Africa. The capital is Cairo. Egypt extends about 655 miles (1,055 km) from north to south and about 780 miles (1,250 km) from east to west at the country's widest extent along its southern boundary. Egypt is bordered to the east by Israel, the Gulf of Aqaba, and the Red Sea; to the south by The Sudan; to the west by Libya; and to the north by the Mediterranean Sea. Area 385,230 square miles (997,740 square km). Pop. (2003 est.) 68,185,000.

A brief treatment of Egypt follows. For full treatment, see MACROPAEDIA: Egypt.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

Egypt

The land. Egypt is divided into two unequal, extremely arid regions by the landscape's dominant feature, the northward-flowing Nile River. The larger of the desert areas, the Western Desert, is a low-lying plateau without wadis (often-dry riverbeds, or arroyos);

the smaller Eastern Desert is a limestone and sandstone plateau area that is extensively dissected by wadis and fringed by rugged mountains in the southeast. The Sinai, northeast of the Eastern Desert, is a peninsula similarly marked by wadis. The mountains in the south of the Sinai, containing the country's highest peak, Mount Catherine (Jabal Kātrīnā), rise to 8,668 feet (2,642 m). The Red Sea Hills, in the Eastern Desert, have a number of peaks exceeding 6,000 feet (1,800 m) above sea level.

The Nile River has no significant tributaries in Egypt and forms a flat-bottomed valley, generally 5 to 10 miles (8 to 16 km) wide, that is bordered by precipitous scarps until it fans out into the delta lowlands north of Cairo. The Nile delta, which is 100 miles (160 km) long and 150 miles (240 km) wide, is densely populated and perennially irrigated. Natural vegetation varies throughout the country. The arid Western Desert is generally devoid of life, but, where moisture is available at all, desert perennials and grasses do grow. The Eastern Desert, which is less arid than the Western, receives sporadic rainfall and supports some vegetation, including tamarisk and acacia and a great variety of thorny shrubs, small succulents, and aromatic herbs. The Nile valley and delta—and scattered oases—support all of Egypt's agriculture and are home to more than 99 percent of its population.

Egypt's climate consists of two seasons, with short transitional periods separating them. Winter lasts from November to March and summer from May to September. The winters are cool and mild (mean January minima and maxima vary between 48° F [9° C] and 65° F [18° C] at Alexandria), and the summers are generally hot (Cairo's July temperature averages 85° F [29° C]). Annual rainfall varies from about 7 inches (175 mm) at Alexandria to about 1 inch (25 mm) at Cairo and only about 0.1 inch (2.5 mm) near Aswān in southern Egypt. The Red Sea coastal plain is almost rainless. Egypt's modest mineral reserves include iron ore, petroleum, natural gas, gypsum, and phosphates.

The people. The population of Egypt forms a fairly homogeneous group whose dominant physical characteristics are the result of the admixture of Hamitic and Semitic peoples. The inhabitants of the Nile delta have had greater contact with the rest of the Middle East and Europe than have the inhabitants of Upper Egypt (*i.e.*, southern Egypt, which lies along the "upper" course of the Nile), who are generally more conservative. Minority groups include the Nubians, in the southern part of the Nile valley; the Hamitic Beja, in the southern part of the Eastern Desert; and peoples of mixed Arab and Berber stock, in the Western Desert. The European communities in Cairo and Alexandria are not numerically significant.

For almost 13 centuries, Arabic has been the written and spoken language of Egypt. Before the Arab invasion in AD 639, Coptic, which descended directly from the ancient Egyptian language, was the language of both religious and daily life. By the 12th century, however, it had been almost entirely replaced by Arabic, Coptic continuing only as a liturgical language in the Coptic church.

Islām is the official religion of Egypt, and about nine-tenths of the population is Muslim, nearly all of whom are Sunnites. Most of the Christian minority are Copts.

The average birthrate is slightly above the world average; the death rate is half the world average. The annual rate of population increase is relatively high, as is the infant mortality rate. About one-third of Egyptians are less than 15 years old. Priority is given to providing and upgrading health services for mothers and children, especially school age children,

in order to reduce the high infant and child mortality rates. Immigration and emigration traditionally have been very slight. There has, however, been an increase in the number of persons emigrating or seeking temporary employment abroad.

The population is concentrated largely in the highly fertile Nile delta (Lower Egypt), where, including the urban *muḥāfaẓah* of Cairo, more than half of the total population lives. Half of all Egyptians, however, still live in rural areas. There has been a steady increase in urbanization during the 20th century. Part of the apparent increase, though, is due to administrative changes designating some villages as urban units or towns, even though they retain much of their rural character.

The economy. Egypt has a developing, mainly socialist but partly free-enterprise economy. Although the gross national product (GNP) is increasing more rapidly than the population, the GNP per capita remains relatively low in comparison with other countries. The GNP originates primarily from industry (including petroleum production), followed by agriculture, public administration and defense, and trade and finance.

Agriculture accounts for about 20 percent of the gross domestic product (GDP) but employs more than 40 percent of the labour force. Arable land in Egypt is nearly entirely confined to the Nile valley and delta, and irrigation is essential. The Aswān High Dam (completed 1970) has allowed the annual Nile flood to be totally controlled for the first time in history. Cash crops occupy about three-fourths of the arable land; sugarcane, tomatoes, cotton, watermelons, oranges, onions, and potatoes yield the largest harvests. Domestic food crops include corn (maize), rice, wheat, millet, pumpkins and squashes, and especially dates. Because of the rapidly growing population and the amount of land devoted to cash crops, much of the country's food must be imported.

Although there is virtually no pastureland, livestock are kept on farms and in villages. Commonly found animals include water buffalo, cattle, asses, sheep, and goats. Chickens, ducks, and pigeons are raised, and milk is obtained from both the water buffalo and dairy cows, which are also used in rural areas as draught animals; asses are used widely for transport.

Fishing is well-developed; the total catch is about four-fifths freshwater and the rest marine. Mediterranean coastal fishing has declined, because the Aswān High Dam has cut off river-borne nutrients; but Lake Nasser, behind the Aswān High Dam, has been stocked with fish.

The mineral industry, dominated by petroleum and natural gas, and manufacturing together produce about 22 percent of the GDP. Mining employs 0.3 percent of the labour force, and manufacturing employs about 16 percent of the labour force. The principal industrial products are refined petroleum products, cement, cotton and woolen textiles and clothing, and wheat flour.

Ancient and medieval monuments, a mild winter climate, and beaches and resorts along the Mediterranean coast all attract tourists.

About 70 percent of Egypt's industry is nationalized. The government manages the economy through five-year plans and encourages free enterprise and foreign investment. As the Suez Canal resumed operations (in 1975) and petroleum and natural gas came into production, the economy improved. Foreign investments began to aid development projects. The labour force totals about one-fourth of the population; trade unions are legal. Because of high population growth, Egypt has continued to suffer from underemployment.

The national budgetary revenue is primarily derived from taxes. Expenditures generally have exceeded the national revenue.

The railway network is operated by Egyptian Railways, a state-owned company. More than two-thirds of the road network is paved. There are more than 2,000 miles (3,200 km) of inland waterways, all but the more than 100-mile- (160-kilometre-) long Suez Canal being on the Nile. Some 20,000 vessels annually transit the canal. Government-owned Egypt Air provides international and domestic service.

Egypt's exports consist primarily of crude petroleum and refined products and cotton-textile products and fibre. The leading importer of Egyptian products is Italy. The value of imports is traditionally much higher than that of exports. Principal imports are foodstuffs and machinery and electrical equipment, transport equipment, and chemical products. The major sources of imports are the United States, Germany, and France. Remittances from Egyptian workers abroad help reduce the large trade deficit.

Government and social conditions. A strong executive dominates the Egyptian political system. The president is nominated by the national legislature and elected to a six-year term (renewable) by national referendum. He serves as the head of state and the supreme commander of the armed forces; he also appoints the vice president, the prime minister, the Cabinet, and 10 members of the 454-member unicameral legislature, the People's Assembly. The assembly, whose primary responsibilities are reviewing and approving governmental policy, is elected to five-year terms by popular vote. Egypt has a limited multiparty system; the government party, the National Democratic Party, encourages the existence of loyal opposition parties but prohibits communists and Islāmic fundamentalists from organizing into political groups and competing for political power. Egypt's constitution, adopted in 1971, vests highest judicial authority in the Supreme Constitutional Court.

The social-welfare system covers most employed persons and provides benefits for work injury, unemployment, old age, death, maternity, disability, and sickness. The system also operates a large network of facilities that offer free health care. Despite these programs, Egypt continues to be plagued with such health problems as poor sanitary conditions, inadequate nutrition, chronic debilitating diseases, and a shortage of medical personnel in rural areas. These problems have kept life-expectancy rates low, at only 59 years for men and 62 years for women.

There are three stages of state general education in Egypt—primary (six years), preparatory (three years), and secondary (three years). Primary education between the ages of 6 and 12 is compulsory. Students who are successful in examinations have the opportunity to continue their education. Alongside the government's system of general education there is that provided by Muslim institutes. Al-Azhar University (founded in 970) is a principal centre of Islāmic and Arabic learning in the world. In spite of an advance in the provision of education services, Egypt's illiteracy rate still stands as high as 55 percent of the population over age 15.

The press in Egypt has been relatively free to critically discuss political and economic issues since censorship was lifted in 1973. The broadcast media are operated by the government.

Although its sociocultural tradition is unquestionably Arabic and Islāmic, Egyptian culture is cosmopolitan in certain respects and betrays much Western influence. The impact of the West is one of the recurring themes in the modern Egyptian novel. One of Egypt's most notable writers is novelist and screenplay writer Naguib Mahfouz, who in 1988 won the

Nobel Prize for Literature. The modern theatre in Egypt is a European importation. Two dramatists, both born at the turn of the century, have dominated its development—Mahmūd Taymūr and Tawfiq al-Hakim. Popular Egyptian music consists of a blend of classical Arabic music, folk songs, and Western music. Muḥammad 'Abd al-Wahhāb has been one of the leading figures in the development of this genre, as both composer and singer. Umm Kulthūm was the leading vocalist not only of Egypt but also of the whole Arab world for almost 50 years.

History. Egypt is one of the world's oldest continuous civilizations. Sometime about 2925 bc, Upper and Lower Egypt were united, perhaps by a king named Menes. This unification ushered in an efflorescence of cultural achievement and began an almost unbroken line of native rulers that lasted nearly 3,000 years. Historians divide the ancient history of Egypt into Old, Middle, and New kingdoms, spanning 31 dynasties and lasting to 332 bc. The Pyramids date from the Old Kingdom; the cult of Osiris and the refinement of sculpture, from the Middle Kingdom; the era of empire and the Exodus of the Jews, from the New Kingdom. (See also Egyptian art; Egyptian religion; Egyptian law.)

An Assyrian invasion occurred in the 7th century, and the Persian Achaemenids established a dynasty in 525 bc. The invasion by Alexander III the Great in 332 inaugurated the Macedonian Ptolemaic period, during which the rulers of Egypt remained firmly planted in the Hellenic world. The city of Alexandria, founded by Alexander, developed into a centre not only of Hellenism but of Semitic learning as well and was soon a focal point of the highest developments of Greek scholarship and science.

The Romans held Egypt from 30 bc to ad 395; after the latter date it was administratively placed under the control of Constantinople, the capital of the East Roman (later, Byzantine) Empire. The granting of tolerance in 313 to the Christians by the emperor Constantine the Great gave impetus to the development of a formal Egyptian church. Alexandria was the scene of the labours of such early Christian figures as Arius, Athanasius, Origen, and Clement. The Byzantine Empire's control of Egypt came to an end in 642, when Byzantine forces evacuated Egypt after three years' armed conflict with invading Arabs. Within a few hundred years, Egypt was transformed into an Arabic-speaking state, with Islām as the dominant religion. Egypt was part of the Umayyad and 'Abbāsīd caliphates. It later became the centre of the Fāṭimid caliphate, in 969, and achieved a significant degree of independence and importance. In 1171 it was returned to the 'Abbāsīds.

The collapse of the 'Abbāsīd caliphate brought the Mamlūks into ascendancy in 1250. The Mamlūks were slaves of non-Arab and non-Muslim origin who had been used to augment the armies of the Arab world. They established a dynasty in Egypt that lasted until 1517 and made Egypt the centre of the eastern Arabic-speaking zone of the Muslim world. By this time, the Arabization of Egypt was almost complete.

In 1517 Egypt fell to the Ottoman Turks, and the country reverted to the status of a province governed from Istanbul (old Constantinople). The economic decline that began under the late Mamlūks continued, and with it came a decline in Egyptian culture.

A French invasion in 1798 lasted only a few years but brought Egypt into the world of European politics. After the departure of the French, the government passed into the hands of Muḥammad 'Alī, probably an Albanian, who created a dynasty and an empire nominally under Ottoman control. His accumulation of wealth and his expansionist policies and those of his successors left Egypt in debt

to the British, who occupied the country in 1882 during a period of civil unrest.

Egypt became a British protectorate in 1914 and received nominal independence in 1922, when a constitutional monarchy was established. A coup overthrew the monarchy in 1952, and Gamal Abdel Nasser emerged as the first native Egyptian ruler in more than 2,000 years. He nationalized the Suez Canal, briefly attempted a federation with Syria and Yemen, built the Aswān High Dam, and fought two unsuccessful wars against Israel (1956 and 1967). His successor, Anwar el-Sādāt, attempted to reverse some of Nasser's more socialist policies, attacked Israel (1973) and regained a foothold in the Sinai, and ultimately played a leading role in Middle East peace talks, until his assassination by Muslim extremists in October 1981. Sādāt was succeeded by Hosnī Mubārak, who followed the slain leader's peace policies, and in 1982 Egypt regained sovereignty over the Sinai Peninsula, lost to Israel in the 1967 war. Mubārak continued Sādāt's policy of close ties with the United States, and Egyptian forces joined the U.S.-led coalition against Iraq in the 1991 Persian Gulf War. Mubārak was reelected in 1987, 1993, and 1999.

Egyptian art, the ancient architectural monuments, sculptures, paintings, and decorative crafts produced mainly during the dynastic periods of the first three millennia BC in the Nile valley regions of Egypt and Nubia. The course of art in Egypt paralleled to a large extent the country's political history, but it depended as well on the entrenched Egyptian social system. A hierarchical class structure, sustained by official religion, demanded obedience to authoritarian laws and adherence to obligatory ethics. Egyptian art, perhaps more than any other art, served those in power as a forceful propaganda instrument that perpetuated the existing framework of society.

A brief treatment of ancient Egyptian art follows. For full treatment, see *MACROPAEDIA: Egyptian Arts and Architecture, Ancient*.

Ancient Egyptian art reflected the culture's religious beliefs and grew from the conviction that life on earth is merely a brief interlude compared with the eternal life to come. Persons of all classes collected useful and decorative objects to accompany them in the afterlife, and they lavished as much care on their burial sites as means permitted. Consequently, a large portion of the artworks that have survived are associated with ancient tombs.

Archaeological excavations have turned up artistic remains from Predynastic Egypt (to c. 2925 BC) including rock carvings, decorated vases, terra-cotta figurines, and toilet articles. Wood was scarce, and buildings were constructed of Nile mud and reeds until builders learned how to make sun-dried bricks. The best-known object from the Early Dynastic Period (c. 2925–c. 2575 BC) is the "Palette of Narmer," a carved slate object that depicts King Narmer defeating his enemies and symbolizes the unification of Upper and Lower Egypt. In its clarity of individual scenes and glorification of the pharaoh, it marks a style that was to persist over the long course of Egyptian art.

During the period of the Old Kingdom (c. 2575–c. 2130 BC), stone began to be used for monumental construction. Great pyramids were built to contain the burial chamber of the ruler and were surrounded by an architectural complex of tombs and temples. The so-called step pyramid at Saqqarah is the earliest-known pyramid. The famous monuments at Giza represent the most classic form of pyramid construction. Nobles were buried in rectangular structures called mastabas close to the king's pyramid, and the Great Sphinx, carved in the form of a lion with the ruler's head, lies near the pyramid of Khafre. Temples were

built for worship of the dead pharaohs and the various Egyptian gods. Within the tombs furniture, jewelry, and other crafted objects have been preserved through the ages.

The stone tombs and temples of the Old Kingdom were decorated with brightly painted reliefs illustrating with vigour and realism the daily life of the Egyptian people. Large and small statues carved in wood or stone presented convincing portraits of the deceased. During this period, rules for depicting the human figure were established, specifying correct proportions, postures, and placement of details. Rulers and officials were always portrayed in certain dignified postures befitting their status. Servants and labourers, shown performing their various tasks, were represented in a freer manner. This canon of sculpture lent a continuity of style and a high standard of workmanship.

At the end of the Old Kingdom civil war and general economic depression made elaborate tomb building impossible, and artistic quality declined. A revival in the arts accompanied the more stable political climate of the Middle Kingdom (1938–c. 1600 BC). Particularly notable were the portrait sculptures of the kings, with faces that displayed feelings of worry or pessimism in contrast to the majestic serenity of Old Kingdom figures. The royal funerary pyramids and temples, built near the Fayyūm oasis, were smaller during this time and were mainly of dried brick with a stone facing. Relief sculpture and painting, however, attained a high level of artistry and precision of execution.

After another interval of political turmoil, the prosperous New Kingdom (1539–1075 BC) brought a magnificent flowering of the arts. Temples, chapels, rock-cut tombs, and inscribed stones were erected along the entire length of the Nile valley in Egypt and Nubia. Great granite statues and wall reliefs glorified rulers and gods. Painting became an independent art, and the decorative crafts reached new peaks. The treasures found in the tomb of King Tutankhamen typify the variety of luxury articles created for both royalty and persons of lesser rank.

During the 18th dynasty particularly, painting and sculpture displayed elegance and refinement, following the classical canon of representation a bit more freely. Human figures were light and graceful, and details were precisely rendered. A brief revolutionary episode, the Amarna style, accompanied the reign of King Akhenaton (Amenhotep IV). Complete freedom of expression was allowed, and members of the royal family were depicted with unblinking realism in their informal daily activities.

The most notable architectural works of the New Kingdom were the great stone temples for worship of the gods. In both their interior layout and their monumental size, they attested to the rising power of the priesthood. A typical structure might include a massive gateway, a colonnaded courtyard, a hall of columns, a shrine chamber, and one or more chapels. The innermost regions were accessible only to the pharaoh and the high priest. The design of columns and capitals was based on plants, such as the palm and papyrus, and plant motifs embellished the walls. Huge statues of gods and rulers served to inspire awe and dread. Burial at this time took place in tombs cut into the rock face of desert cliffs. New Kingdom rulers built elaborate complexes of tombs and mortuary temples in the Valley of the Tombs of the Kings at Thebes. Imposing temple remains can be seen today at Luxor, Karnak, Abydos, Tell el-Amarna, and Abu Simbel.

In the late centuries BC and early centuries AD, Greece and Rome dominated the Mediterranean world, and in Nubia their artistic traditions were fused with those of Roman Egypt. A distinctively Egyptian contribution to art, however, was made by the coffin por-

traits of Roman Egypt (30 BC–AD 642), which marked the emergence of a new painting style that was to culminate in Byzantine icons.

Egyptian calendar, dating system established several thousand years before the Christian era, the first calendar known to use a year of 365 days, approximately equal to the solar year, or year of the seasons. Until the creation of the Julian calendar, about 46 BC, the Egyptian was also the only civil calendar in which years and months were of fixed duration rather than being established by ad hoc proclamations. Twelve months of 30 days each plus 5 additional days, belonging to no month and grouped at the end of the year, made up the year. The months were numbered within the year but were not named until the 6th century BC, when they came to be called after their various festivals.

Egyptian language, extinct language of the Nile valley. Egyptian belongs to the Hamito-Semitic language family, along with the Semitic, Cushitic, Chadic, and Berber language groups. On the basis of texts in the language, scholars generally divide the history of Egyptian language into five periods: Old Egyptian (from before 3000 to c. 2200 BC), Middle Egyptian (c. 2200–c. 1600 BC), Late Egyptian (c. 1550–c. 700 BC), Demotic (c. 700 BC–c. AD 400), and Coptic (c. 2nd century AD until at least the 17th century).

The main sources for knowledge of Old Egyptian are the biographical texts (beginning at the end of the 3rd dynasty, c. 2575 BC), the royal decrees of the 4th to 6th dynasties (c. 2575–c. 2150 BC), and the pyramid texts, which were magic spells for the well-being of the king's soul after death, from the 5th and 6th dynasties (c. 2465–c. 2150 BC). Some passages of the pyramid texts are believed to have been composed before the 1st dynasty (c. 2925–c. 2775 BC).

Scholars consider Middle Egyptian to be the classical stage of the language. The literary language was based on the spoken language of about 2200 BC. Although the Late Egyptian written language replaced Middle Egyptian as the official language during the reign of Akhenaton (1353–36 BC), Middle Egyptian continued to be used for most monumental inscriptions and for some literary compositions into Christian times. The hieroglyphic text of the Rosetta Stone, which dates from about 196 BC, was an attempt to write the classical language.

Late Egyptian texts are mainly manuscripts, although a small number of inscriptions also exist. There are several important differences between Late Egyptian and earlier stages of the language. Among these are the use of definite and indefinite articles and the occurrence of a number of phonetic changes.

Demotic was the language in use throughout the periods of Persian, Greek, and Roman dominance. Many Demotic texts are legal documents, although literary and religious texts also exist. The middle section of the Rosetta Stone is a good example of demotic script. There are also a few demotic inscriptions written in hieroglyphs. The latest demotic inscriptions date from the end of the 5th century AD; they are from the Temple of Isis on the island of Philae (in Egypt), where worship of the goddess was permitted to continue until the time of the emperor Justinian I (reigned from 527 to 565).

With the change from paganism to Christianity, Coptic, used primarily for Christian religious writings, completely replaced Demotic. It differs from Demotic chiefly in substituting Greek religious terms and expressions for the native pagan terms. Coptic is the only stage of the Egyptian language in which the spellings of words give a clear idea of their pronuncia-

tions. The latest Coptic writing dates from the 14th century.

Egyptian was originally written in hieroglyphs. Monumental hieroglyphic was used from about 3000 BC until the 3rd century AD. Written hieroglyphs developed into two scripts, hieratic and demotic. The earliest hieratic writing dates from the 1st dynasty (c. 2925–c. 2775 BC). The demotic script was used for writing the language during its Demotic stage; after the 26th dynasty (664–525 BC), the use of hieratic was largely confined to copying religious and other traditional texts on papyrus, while the demotic script was used for all other purposes. Coptic was written in a Greek alphabet modified by the addition of seven characters taken from the demotic script.

In all stages of Egyptian, nouns were classified as being either of masculine or of feminine gender. In earlier stages of Egyptian, verbs were conjugated by the addition of suffixes; by late Egyptian times, however, verbal phrases that included verbal nouns were used instead of suffixes for indicating the different verb forms. *See also* Coptic language.

Egyptian law, the law that originated with the unification of Upper and Lower Egypt under King Menes (c. 2925 BC) and grew and developed until the Roman occupation of Egypt (30 BC). The history of Egyptian law is longer than that of any other civilization. Even after the Roman occupation, elements of Egyptian law were retained outside the major urban areas.

No formal Egyptian code of law has been preserved, although several pharaohs, such as Bocchoris (?722–715? BC), were known as lawgivers. After the 7th century BC, however, when the Demotic language (the popular form of the written language) came into use, many legal transactions required written deeds or contracts instead of the traditional oral agreement; and these extant documents have been studied for what they reveal of the law of ancient Egypt.

The ultimate authority in the settlement of disputes was the pharaoh, whose decrees were supreme. Because of the complex nature of legal administration, the pharaoh delegated powers to provincial governors and other officials. Next to the pharaoh, the most powerful individual was the vizier, who directed all administrative branches of the government. He sat in judgment on court cases and appointed magistrates as part of his legal duties.

In a legal proceeding, the plaintiff was required to bring suit. The tribunal then ordered the defendant to appear in court if a point of law seemed to be involved in the dispute. Scribes employed in the legal system supplied procedural information; the parties were not represented by legal advocates. Both parties spoke for themselves and presented any pertinent documentary evidence. Witnesses sometimes were called, but usually the judge ruled on the grounds of the documents and the testimony of each party. The judgment included recommendations for preserving the written record of the trial—possibly the main reason why many of these documents are extant.

Although masculine primogeniture dominated in some periods of Egyptian history, there are records of property being divided equally among the children, male and female. Even with masculine primogeniture, the other children and the surviving spouse usually received a share of the estate. The usual law of succession could be circumvented by a special unregistered document: a parent, for example, could favour a daughter by guaranteeing her rights over the family property. Legal judgments pertaining to the family and rights of succession clearly demonstrate that women as

well as men were granted full rights under the laws of ancient Egypt. Women owned and bequeathed property, filed lawsuits, and bore witness in court proceedings without the authority of their father or husband. The working class also had some legal rights; even slaves were allowed to own property under certain circumstances.

Property transfers and contractual agreements were conducted as if they were the same type of legal transaction. Rental of slaves, for example, was regarded as a sales agreement. Work was often bartered for various commodities. The individual parties were allowed to determine restrictions and guarantees in their transaction concerning possible defects in the property or service as well as defects in the law.

Criminal justice necessitated a hierarchy in the judicial system, depending on the severity of the charge. The most heinous criminals could be judged only by the pharaoh, often with the vizier conducting the investigation and turning to the pharaoh for final judgment. In some cases, the pharaoh appointed a special commission with full authority to pass judgment. Punishment for serious crimes included penal servitude and execution; mutilation and flogging were often used to punish lesser offenders.

Although punishment for criminal offenders could be severe—and, in the modern viewpoint, barbaric—Egyptian law nevertheless was admirable in its support of basic human rights. The pharaoh Bocchoris, for example, promoted individual rights, suppressed imprisonment for debt, and reformed laws relating to the transferral of property. His legal innovations are one example of the far-reaching implications of Egyptian law: the Greek lawgiver Solon (6th century BC) visited Egypt and adapted aspects of the legal system to his own ideas for Athens. Egyptian law continued to influence Greek law during the Hellenistic period, and its effects on Roman imperial law may still be felt today.

Egyptian Museum, Arabic AL-MATHIF AL-MISRI, museum of Egyptian antiquities in Cairo, founded in the 19th century by the French Egyptologist Auguste Mariette and housing the world's most valuable collection of its kind. The museum was founded in 1858 at Bülâq, moved to Giza, and moved to its present site in 1897–1902. It is unique in its presentation of the whole history of Egyptian civilization, especially of antiquities of the Pharaonic and Greco-Roman periods. The more than 100,000 items in the museum include some 1,700 items from the tomb of Tutankhamen, including the solid-gold mask that covered the pharaoh's head. Other treasures include reliefs, sarcophaguses, papyri, funerary art and the contents of various tombs (including that of Queen Hetepheres), jewelry, ornaments of all kinds, and other objects. There is a block statue of Queen Hetepheres, one of the earliest examples of its type, and also a black granite sculpture of Queen Nefertiti. A sculpture of Amenhotep II shows him as the god Tenen, and there are also two granite figures of Queen Hatshepsut and colossal figures of Amenhotep IV from Karnak.

Egyptian religion, religion of ancient Egypt from the Late Neolithic period to the first centuries AD, including both folk traditions and the court religion.

A brief treatment of Egyptian religion follows. For full treatment, *see* MACROPAEDIA: Middle Eastern Religions, Ancient.

Egyptian religion is characterized by numerous deities having both animal and human forms. This diversity reflects the vast number of local cult centres that sprang up all along the Nile valley prior to political unification (c. 2925 BC). Once a central government arose, national deities and cults came into existence as well as the cult of the living king. The king

came to be represented by the falcon deity Horus as the son of the gods and as the god-king ruling the universe.

With the advent of national cults a number of theological concepts developed to define the world for the Egyptians. Foremost of these was the concept of *ma'at*. *Ma'at* signified the correct world order as given to man by the gods. This concept included the ideas of truth, justice, and correct social behaviour. The king was the administrator of *ma'at* and is frequently shown presenting *ma'at* to the gods, showing that he has properly maintained Egypt on their behalf.

The Egyptians developed a concept of syncretism to reconcile the divergent and contradictory features of the various local cults. For example, Ptah was the creator god in the Memphite cosmogony, while Atum created the world in the Heliopolitan cosmogony. The Egyptians reconciled these views by associating one deity with another, such that the features of one became part of another. Deities with common features were combined to form composite deities. The sun god Re was frequently associated with many deities because of his universal nature. The Egyptians did not feel that the various features or powers of their gods contradicted each other but felt that they were simply different aspects of that deity. This resulted in male (or female) deities acquiring characteristics of the opposite sex, whereby the deity became self-creating and self-sustaining.

The Egyptians developed a belief in the continuity of life. Life upon earth was only one aspect of a person's existence. Death did not destroy the individual, it merely transformed him into a further facet of the universe. The dead were active agents in the world of the living, and preparations for death were actually preparations for a new life in association with the gods. In the Old Kingdom only the king could be initiated into that spiritual world. As time went on, private individuals, by means of ritual, could achieve the same mystical aspects as the king.

The Egyptians felt that time was cyclical. When the king died, he became Osiris, the dead king and ruler of the netherworld, and his son became the new Horus, administrator of *ma'at*. After a living king had ruled for 30 years, he underwent a series of rituals whereby he ritually died, became the dead Osiris, and was mystically rejuvenated. This was a symbolic rejuvenation for the entire land and perhaps was associated with the yearly inundation of the land by the Nile.

The temple at all periods remained the focus of Egyptian community worship. With time the temples acquired major economic and political roles. By the end of the New Kingdom the temple of Amon-Re at Karnak was the chief political power in all of Upper Egypt. At different periods local temples came to national prominence, such as the temple of Re at Heliopolis during the Old Kingdom and the temple of Neith at Sais during the 26th dynasty. While the king in theory acted as high priest for all the gods, in practice he appointed others to carry on his daily ritual functions.

In the sanctuary of each temple the image of the local deity resided. Only the ritually pure attended to the daily needs of the god. During festivals the god emerged from the temple carried on a sacred bark and could be viewed by the general populace. Private individuals could worship the deities at shrines or chapels in their homes. Most temples had areas at their rear walls where the general public could worship.

On a miniature scale, temples represented the Egyptian cosmos. The sanctuary was normally higher than any other portion of the temple and represented the primordial mound where the universe was created. The ceilings were decorated with the stars and the pillars

were in the forms of lotus and papyrus plants, also symbolic of the primordial marsh at creation. The rituals in the temple reenacted this creation and aided in the rejuvenation of the land.

The majority of archaeological evidence from Egypt comes from the funerary monuments. Beginning with small pits in the predynastic era, they developed into a variety of structures from the small, excavated cave tomb to the massive pyramids at Giza. Each served as the eternal resting place of the soul. In the Old Kingdom the major tombs were congregated near that of the king. Individuals believed that they could achieve safe passage to the netherworld by association with the king. Later, individuals obtained entrance by their own means, usually by elaborate rituals and magic. The Coffin Texts and the Book of the Dead (derived from the royal Pyramid Texts) provided a series of spells to purify the deceased, protect him from evil creatures, and give him the requisite passwords and magical spells to enter the netherworld.

With the advent of periods of political instability, pessimistic trends crept into the Egyptian view of the world and greater emphasis was placed on the importance of the individual cult. Along with the rise of the personal cults, greater evidence of the use of magic is found. The Egyptians began to believe that they could control a portion of their mystical environment. Scarabs, wadjet eyes, and other potent symbols became common by the New Kingdom as means of protection from, and identification with, the gods.

The most significant aspect of all of Egyptian religion was its ability to remain a unifying force for the Egyptian culture, despite the fact that there was often a lack of any systematic grouping of the deities.

Egyptology, the study of pharaonic Egypt, spanning the period c. 4500 BC to AD 641. Egyptology began when the scholars accompanying Napoleon Bonaparte's invasion of Egypt (1798–1801) published the *Description de l'Égypte* (1809–28), which made large quantities of source material about ancient Egypt available to European scholars.

Written Egyptian documents date back to c. 3350 BC, when the first pharaohs developed the hieroglyphic script in Nubia (southern Upper Egypt). The documents of these kings and their successors and of their subjects, as well as the archaeological material of their culture, well preserved by Egypt's arid climate, provide the source material for Egyptological study.

After the Roman conquest (31 BC) the knowledge of pharaonic Egypt was gradually lost as Hellenism infused Egyptian culture. The temples alone preserved pharaonic religion and the hieroglyphic script. Christianity, introduced by St. Mark in the 1st century, slowly eroded this last bastion of pharaonic culture. By c. 250 AD the Greek alphabet with six added letters from the demotic (cursive hieroglyphic script) replaced the hieroglyphic system. The last known hieroglyphs were carved in 394 at Philae, where the worship of Isis survived until c. 570. Some observations about pharaonic Egypt had passed into Greco-Roman civilization through such Classical authors as Herodotus and Strabo. The worship of Isis and Osiris had also spread throughout the Roman Empire; and Manetho, an Egyptian priest, had compiled a list of kings for Ptolemy I that preserved the outline of Egyptian history in Greek. These factors helped keep a dim memory of ancient Egypt alive in Europe.

With the Arabic conquest (641) only the Christian Egyptians, the Copts, kept alive the ancient language, written in Greek characters. In Europe, the Coptic texts taken from Egypt during the Renaissance awakened interest in the Egyptian language. Athanasius Kircher, a German Jesuit, published a Coptic gram-

mar (1643), and European travellers to Egypt returned with antiquities and stories of wondrous ruins. The first known scholar to engage in scientific work, the 17th-century English astronomer John Greaves, measured the pyramids of Giza.

In 1799, when a French engineer found the Rosetta Stone, a trilingual stela with Greek, hieroglyphic, and demotic texts, knowledge of Coptic permitted the stone's decipherment, a work completed in 1822 by Jean-François Champollion. He and an Italian scholar, Ippolito Rosellini, led a combined expedition to Egypt in 1828 and published their research in *Monuments de l'Égypte et Nubie*. Karl Richard Lepsius followed with a Prussian expedition (1842–45), and the Englishman Sir John Gardner Wilkinson spent 12 years (1821–33) copying and collecting material in Egypt. Their work made copies of monuments and texts widely available to European scholars. Muhammad 'Ali's government (1805–49) opened Egypt to Europeans and consular agents, and adventurers began to collect antiquities, often in ways that amounted to plunder. From this arose the great European Egyptian museum collections. Auguste Mariette went from the Louvre in 1850 and began excavations at Memphis, where he found the Serapeum. He convinced Sa'ïd Pasha, viceroy of Egypt, to found the first Egyptian museum at Bū-lāq (1858; moved to Cairo 1903) and also to found the Service des Antiquités (1863), whose first director he became. This organization checked the hitherto uncontrolled digging and collection of antiquities.

The researches of Emmanuel de Rougé in France, Samuel Birch in England, and Heinrich Brugsch established Egyptology as an academic discipline. In 1880 Flinders Petrie brought to Egypt his technique of controlled, scientifically recorded excavation, which revolutionized archaeology; he pushed back the origins of Egyptian culture to 4500 BC. The British Egypt Exploration Fund (later Society), founded in 1882, promoted excavations using Petrie's principles, and other professional associations of Egyptologists spread these standards of excavation. Adolf Erman and Hermann Grapow published in Berlin the *Wörterbuch der ägyptischen Sprache*, an exhaustive dictionary of hieroglyphic Egyptian. The Germans Eduard Meyer, Erman, and Kurt Sethe, the English scholars Francis Llewellyn Griffith and Sir Alan H. Gardiner, and the Czech Egyptologist Jaroslav Černý conducted research that shaped the currently accepted outlines of Egyptian history. James Henry Breasted founded the Oriental Institute at the University of Chicago and pioneered American Egyptology with his survey of Egypt and Nubia (1895–96). He started the Epigraphic Survey (1924) to record scientifically and publish reliefs and paintings on standing monuments that are more subject to rapid deterioration. American museums opened Egyptian collections in the late 19th and early 20th centuries, and excavations in Egypt helped enlarge their exhibits. The University of Pennsylvania, the Metropolitan Museum of Art, the Museum of Fine Arts (Boston), the Brooklyn Museum, and the Institute of Fine Arts of New York University all have conducted work in Egypt. The discovery of Tutankhamen's tomb (1922), as well as Pierre Montet's excavations of the intact royal tombs at Tanis, heightened public awareness of Egyptology.

The building of the Aswān dams (1902 and 1970) led to international salvage excavations in Nubia, the results of which have further refined Egyptian history. The worldwide UNESCO-sponsored effort to raise the temples of Nubia and Philae above the waters of Lake Nasser (1960–75) and the Egyptian government-sponsored tours of objects from Tutankhamen's tomb have spurred international interest in Egypt. Expeditions that worked in Nubia gained access to Egyp-

tian sites, especially in the poorly explored Delta. In the 1970s, excavation of ancient Avaris-Per Ramessu (biblical Raameses) and Mendes yielded important evidence.

Hans J. Polotsky, an Israeli Egyptologist, made wide advances in understanding of the Egyptian verb system, starting in the 1940s; Janet Johnson-Whitcomb began work on a demotic dictionary in 1978 at the Oriental Institute in Chicago; and in Germany, the *Lexikon der Ägyptologie*, a multivolume encyclopaedia of Egyptology was underway in the 1980s. In the 1970s Egyptologists began cooperative work with specialists from other disciplines. Among the first such ventures was the joint project of the University of Michigan, the Egyptian Department of Antiquities, and the Oriental Institute, involving dentists, geneticists, and Egyptologists in studying the royal mummies in the Cairo Museum, using advanced technology.

In 1976 the First International Congress of Egyptology convened in Cairo; reconvening at three-year intervals it brought closer contacts among scholars from the whole world. Since 1952 Egyptians themselves became more involved in Egyptology. Regional museums opened at Alexandria, Al-Minya, Mallawi, Luxor, and Aswān, as increasing numbers of tourists visited Egypt. Still, despite 200 years of excavation and research, many little-explored sites remain in Egypt.

Eh-pH diagram, any of a class of diagrams that illustrate the fields of stability of mineral or chemical species in terms of the activity of hydrogen ions (pH) and the activity of electrons (Eh). Consequently, the reactions illustrated on Eh-pH diagrams involve either proton transfer (e.g., hydrolysis) or electron transfer (oxidation or reduction) or both. In natural environments, pH values extend from 1 to 9.5, and Eh values from -500 to +800 millivolts. Rarely are temperatures and pressures other than those normally encountered on the Earth's surface considered.

The area on an Eh-pH diagram that represents the range of these variables within which a particular mineral is stable is called the stability field of that mineral. Such a representation enables a geochemist to determine whether a mineral is in equilibrium with its surroundings or subject to chemical transformation. See also geochemical facies.

Ehime, prefecture (*ken*), northwestern Shikoku, Japan, facing the Inland Sea (north) and Bungo-suidō (Bungo Strait; west). It oc-

Terraced farmland near Uwajima, Ehime Prefecture, Japan

Photos Pack—EB Inc

cupies an area of 2,190 square miles (5,672 square km). The interior is mountainous, and most of the population is grouped on the shallow coastal plains. Crops grown on terraced farmland include rice, wheat, tea, soybeans, and mandarin oranges. The cities of Niihama, Saijō, Hashihama, and Imabari are industrial centres. In an effort to counteract air pollution, chemical factories were established in Niihama to produce fertilizer from sulfur dioxide gas emitted from the copper refineries. Fishing and forestry support Uwajima and other west coast cities. The prefectural capital of Matsuyama (*q.v.*) is Shikoku's largest city, and Ehime University (1949) is located there. Pop. (1990) 1,515,027.

Ehlsheimer, Adam (German painter): see Ehlsheimer, Adam.

Ehrenberg, Christian Gottfried (b. April 19, 1795, Delitzsch, Saxony [Germany]—d. June 27, 1876, Berlin, Ger.), German biologist, microscopist, scientific explorer, and a founder of micropaleontology—the study of fossil microorganisms.

Ehrenberg studied at the University of Berlin (M.D., 1818) and was associated with the university throughout his career. He took part in a scientific expedition (1820–25) to Egypt, Libya, the Sudan, and the Red Sea under the auspices of the university and the Prussian Academy of Sciences. The expedition's only survivor, he collected about 34,000 animal and 46,000 plant specimens. With Alexander von Humboldt, he participated in 1829 in an expedition, sponsored by Tsar Nicholas I of Russia, to Central Asia and Siberia.

Ehrenberg identified and classified a number of terrestrial and marine plants, animals, and microorganisms collected on expeditions. He proved that fungi come from spores and demonstrated the sexual reproduction of molds and mushrooms. He was the first to study in detail the anatomy, habits, and life history of coral, and he identified planktonic microorganisms as the cause of phosphorescence in the sea. Ehrenberg discovered the microscopic fossil organism content of various geologic formations and noted that certain rock layers are composed of such single-cell fossils.

Ehrenberg advanced the view that all animals, from the most minute to the largest, possess complete organ systems, such as muscles, sex organs, and stomachs; he believed his concept of "complete organisms" (later refuted by Félix Dujardin) disproved both the theory of spontaneous generation and the validity of the traditional arrangement of animals in a simple-to-complex series. Arguing that a single "ideal type" may be applied to all animals, he worked toward a comprehensive system of classification, in which he used social behaviour as an important criterion, but he placed humans apart from other animals on the basis of intelligence.

Ehrenberg's most important works include *Reisen in Aegypten, Libyen, Nubien und Dongola* (1828; "Travels in Egypt, Libya, Nubia and Dongola") and *Die Infusionsthierchen als volkommene Organismen* (1838; "The Infusoria as Complete Organisms").

Ehrenburg, Ilya Grigoryevich (b. Jan. 15 [Jan. 27, New Style], 1891, Kiev, Ukraine, Russian Empire—d. Aug. 31, 1967, Moscow), prolific writer and journalist, one of the most effective Soviet spokesmen to the Western world.

Born into a middle-class Jewish family that later moved to Moscow, Ehrenburg became involved as a youth in revolutionary activity and was arrested in his early teens. He emigrated to Paris, where he began publishing poetry in 1910. During World War I he was

a war correspondent at the front, returning to Russia in 1917. He experienced the civil war in Ukraine and, between 1917 and 1921, wavered between supporting and rejecting the Bolsheviks. He returned to Europe, living in France, Belgium, and Germany, and published his first novel—generally considered his best work—the philosophical-satirical *Neobychaynyye khozhdeniya Khulio Khurenito i yego uchenikov* (1922; *The Extraordinary Adventures of Julio Jurenito and His Disciples*). By 1924, however, his attitude had changed again, and he was granted permission to return to the Soviet Union. He participated in writers' meetings and other literary activities in Moscow, and soon afterward was sent back to Europe, this time as foreign editor of several Soviet newspapers. Most of the period from 1936 to 1940 Ehrenburg spent in Spain and France as war correspondent for the newspaper *Izvestiya*. In 1941 he returned to the Soviet Union, where his *Padeniye Parizha* (*The Fall of Paris*)—a bitter attack on the West—was published that year, winning the 1942 Stalin Prize.

Besides his activities as a journalist and novelist, Ehrenburg wrote poetry, short stories, essays, travelogues, and memoirs. After his acceptance of the Soviet regime, he adapted his writing to Soviet literary demands and was successful in avoiding the political purges that destroyed the careers of many other writers and artists. In 1946–47 he won a second Stalin Prize with *Burya* (*The Storm*), and in 1951–52 another major novel was published, *Devyat' val* (*The Ninth Wave*). Shortly after Joseph Stalin's death Ehrenburg produced the novel *Otpepel* (1954; *The Thaw*), which provoked intense controversy in the Soviet press, and the title of which has become descriptive of that period in Soviet literature. It dealt with Soviet life in a more realistic way than had the officially approved literature of the preceding period. In succeeding years he devoted himself to promoting new and different tendencies in writing. In his autobiography, *Lyudi, gody, zhizn* ("People, Years, Life"), Ehrenburg ranged over many topics (*e.g.*, Western art) and people (*e.g.*, writers lost in the purges of the 1930s) normally not considered proper material for Soviet authors. This attitude brought official censure upon him in 1963 when the "thaw" began to reverse. But Ehrenburg survived and remained prominent in Soviet literary circles until his death.

Ehrenfels, Christian, Freiherr von (baron of), in full MARIA CHRISTIAN JULIUS LEOPOLD KARL, FREIHERR VON EHRENFELS (b. June 20, 1859, Rodaun, Austria—d. Sept. 8, 1932, Lichtenau), Austrian philosopher remembered for his introduction of the term *Gestalt* ("figure") into psychology and for his contribution to value theory.

As a student at the University of Vienna, Ehrenfels came under the influence of Franz Brentano and Alexius Meinong. Ehrenfels, who was licensed to teach at Vienna in 1888, moved to Prague in 1896 as extraordinary professor of philosophy at the German uni-

versity there and served as ordinary professor (1900–29).

Ehrenfels' article "Über Gestaltqualitäten," which appeared in the *Vierteljahrsschrift für wissenschaftliche Philosophie*, xiv (1890; "Quarterly Journal for Scientific Philosophy"), was the starting point of Gestalt psychology. He used the term *Gestalt* to refer to the complex data that require more than immediate sense experience in order to be perceived. For example, an immediate sense experience of sound is insufficient to signify a melody to the hearer. Recollection and sometimes other components are also necessary for apprehension. All the components taken together form a Gestalt, or whole structure. He extended the same principle to logic and number theory.

In his *System der Werttheorie*, 2 vol. (1897–98; "System of Value Theory"), also a pioneer work, Ehrenfels treated the concept of value psychologically, as a function of desire. The value placed by persons on various objects thus became the basis of both his social and his individual ethics. Ehrenfels' other writings include plays, choral dramas, two pamphlets on the composer Richard Wagner (1896 and 1913), *Grundbegriffe der Ethik* (1907; "Foundations of Ethics"), *Sexualethik* (1907; "Sexual Ethics"), *Kosmogonie* (1916), and *Die Religion der Zukunft* (1929; "The Religion of the Future").

Where the same name may denote a person, place, or thing, the articles will be found in that order

Ehrlich, Eugen (b. Sept. 14, 1862, Czernowitz, Austrian Empire [now Chernovtsy, Ukraine]—d. May 2, 1922, Vienna, Austria), Austrian legal scholar and teacher generally credited with founding the discipline of the sociology of law.

Educated in law at the University of Vienna, Ehrlich taught there for several years and then (1899–1914) served as associate professor of Roman law at the University of Czernowitz. As a young man he was converted from Judaism to Roman Catholicism, but late in life he devoted much attention to Jewish problems. Anti-Semitism prevented him from teaching after World War I.

Ehrlich's sociology of law was based in part on the free-law, or sense-of-justice, conception formulated in Germany by Hermann Kantorowicz. He recognized two complementary sources: first, legal history and jurisprudence (*i.e.*, precedents that seem useful and their written explications); and, second, "living law" as shown in current social custom. Because the second component was more novel, readers of Ehrlich tended to overlook the first, and some believed mistakenly that he had dismissed formal law entirely. His major work was *Grundlegung der Soziologie des Rechts* (1913; *Fundamental Principles of the Sociology of Law*).

Ehrlich, Paul (b. March 14, 1854, Strehlen, Silesia, Prussia [now Strzelin, Pol.]—d. Aug. 20, 1915, Bad Homburg vor der Höhe, Ger.), German medical scientist known for his pioneering work in hematology, immunology, and chemotherapy and for his discovery of the first effective treatment for syphilis. He received jointly with Élie Metchnikoff the Nobel Prize for Physiology or Medicine in 1908.

Early life. Ehrlich was born into a Jewish family prominent in business and industry. Although he lacked all formal training in experimental chemistry and applied bacteriology, he did independent work even as a medical student at the University of Leipzig, writing about the distribution of foreign substances in the body and proving, with the aid of early discoveries in colour analysis, that the chemical mechanism that operates in therapeutic and toxic processes also determines cell

Ehrenfels

nutrition. As a result of this work, Ehrlich was invited to do research at the famous Charité Hospital in Berlin, where he invented

Paul Ehrlich

a new staining technique for the tuberculosis bacillus discovered by the German bacteriologist Robert Koch. This was an advance that proved to be of decisive importance to the microscopic diagnosis of tuberculosis. While developing new methods for the dyeing of live tissue, he discovered the uses of methylene blue in the treatment of nervous disorders. In other diagnostic advances, he traced a specific chemical reaction in the urine of typhoid patients, tested various medications for reducing or removing fever, and made valuable suggestions for the treatment of eye diseases. Of the 37 scientific contributions that he published between 1879 and 1883, Ehrlich considered the last as the most important: "The Requirement of the Organism for Oxygen." In it he established that oxygen consumption varies with different types of tissue and that these variations constitute a measure of the intensity of vital cell processes. In 1883 he married Hedwig Pinkus, with whom he had two daughters.

Immunity and the side-chain theory. A bout with tuberculosis forced Ehrlich to interrupt his work and to seek a cure in Egypt. When he returned to Berlin in 1889, the disease had been permanently arrested. After working for some time in a tiny and primitive private laboratory, he transferred to Koch's Institute for Infectious Diseases, where he concentrated on the problem of immunity. Very little was known at this time about the precise manner in which bacteria bring about disease, and even less was known about the body's defenses and about therapeutic effects. The working hypothesis that Ehrlich developed and by which he proceeded was the side-chain theory, according to which each cell has a vital centre of protein substance and a series of side chains, or receptors, which absorb and assimilate nutrients and certain toxic substances as well. Only if the haptophore group of a toxic molecule combines with the side chain of the cell can a bacterial toxin act upon a cell. The affected organism then produces great quantities of side chains, all of them "gauged" to the disease-producing toxic agent. These immune bodies prevent a renewed infection, so that the organism is actively immunized.

This much-debated hypothesis in all its ramifications was destined to have a profound influence on Ehrlich's later work and on that of his successors. Thus Ehrlich was able to show experimentally that rabbits subjected to a slow and measured increase of toxic matter were able to survive 5,000 times the fatal dose. In the end, he established the precise quantitative

patterns of immunity. These findings assumed great importance in 1890, when he met Emil von Behring, who had succeeded in creating an antitoxin against diphtheria. Behring had tried to prepare a serum that could be used in clinical practice, but it was only by adopting Ehrlich's technique of using the blood of live horses that the preparation of a serum of optimum antitoxic effectiveness became possible. Ehrlich developed a way of measuring the effectiveness of serums that was soon adopted all over the world for the standardization of diphtheria serum.

On the basis of these achievements Ehrlich was made director of a government-supported institute in Berlin, which was transferred to Frankfurt am Main in 1899 as the Royal Institute for Experimental Therapy. No restrictions of any kind were placed upon the direction of his research. While this corresponded to Ehrlich's own talents and inclinations, it did not please Behring, who endeavoured to have his colleague specialize in immunology and serum therapy. The strained relationship between the two men was exacerbated by personality differences. Ehrlich, utterly indifferent to monetary rewards, had no ambition to become an industrialist like Behring; he was content to do his research in study and laboratory.

He had by now recognized the limitations of serum therapy. Many infectious disorders, in particular those caused by protozoa rather than bacteria, failed to respond to serum treatment. The recognition of this fact marks the birth of chemotherapy. Ehrlich started experimenting with the identification and synthesizing of substances, not necessarily to be found in nature, that could kill parasites or inhibit their growth without damaging the organism. He began with trypanosomes, a species of protozoa that he unsuccessfully attempted to control by means of coal-tar dyes. There followed compounds of arsenic and benzene; other compounds proved to be too toxic. Instead of declaring himself vanquished by these difficulties, Ehrlich now turned his attention to the spirochete *Treponema pallidum*, the causal organism of syphilis.

Syphilis studies. He had at this time several institutes at his disposal as well as sizable research funds. He also had a staff of highly competent collaborators; in fact, his colleague, Sahachiro Hata, contributed much to Ehrlich's eventual success in combating syphilis. His preparation 606, later called Salvarsan, was extraordinarily effective and harmless despite a large arsenic content. The first tests, undertaken in the spring of 1910, proved to be surprisingly successful in the treatment of a whole spectrum of diseases; in the case of yaws, a tropical disease akin to syphilis, a single injection was sufficient. It seemed, indeed, as if a "magic bullet," to use a favourite expression of Ehrlich's, had been found.

Given the devastation wrought by syphilis, a worldwide demand soon arose for a new weapon against the disease. Ehrlich, however, would not yet release his discovery for general use, believing as he did that the usual few hundred clinical tests did not suffice in the case of an arsenic preparation, the injection of which required special precautions. In an unheard-of transaction, the manufacturer with whom Ehrlich had collaborated closely, Farbwerke-Hoechst, released a total of 65,000 units gratis to physicians all over the globe. Although harmful side effects remained nominal in number, some envious competitors did not hesitate to attack Ehrlich. Eventually he was forced to sue the most slanderous among them, and this detractor was given a jail sentence. The greatest distinction bestowed by the Prussian state was the title "Wirklicher Geheimer Rat," or Privy Councillor, with the predicate of "Exzellenz." Along with numerous other honours, Ehrlich was presented with honorary doctorates by the universities of Ox-

ford, Chicago, and Athens, and an honorary citizenship by Frankfurt am Main, where the institute that he founded still bears his name.

Having suffered a first stroke in December 1914, Ehrlich succumbed to a second stroke in August of the following year. In its obituary the London *Times* acknowledged Ehrlich's achievement in opening new doors into the unknown, saying, "the whole world is in his debt." (H.Sa.)

Ehrlich, Paul R(alpha) (b. May 29, 1932, Philadelphia, Pa., U.S.), American biologist and educator who in 1990 shared Sweden's Crafoord Prize (established in 1980 and awarded by the Royal Swedish Academy of Sciences, to support those areas of science not covered by the Nobel Prizes) with biologist E.O. Wilson.

Ehrlich received early inspiration to study ecology when in his high school years he read William Vogt's *Road to Survival* (1948), an early study of the problem of rapid population growth and food production. Ehrlich graduated in zoology from the University of Pennsylvania (B.A., 1953) and took M.A. and Ph.D. degrees from the University of Kansas (1955, 1957). He held a few research positions before accepting (1959) a position at Stanford University, where he became a full professor of biology from 1966 and Bing professor of population studies from 1976. Though much of his research was done in the field of entomology, Ehrlich's overriding concern became unchecked population growth. He was concerned that humanity treat the Earth as a spaceship with limited resources and a heavily burdened life-support system; otherwise, he feared, "mankind will breed itself into oblivion." He published a distillation of his many articles and lectures on the subject in *The Population Bomb* (1968) and wrote hundreds of papers and articles on the subject.

Ehrlichman, John D(anicl) (b. March 20, 1925, Tacoma, Wash., U.S.—d. Feb. 14, 1999, Atlanta, Ga.), U.S. presidential assistant for domestic affairs during the Nixon administration, best known for his participation in the Watergate Scandal.

Ehrlichman grew up in Washington and California and held several jobs before enlisting in the U.S. Army Air Corps in 1943. He was discharged a first lieutenant in 1945. He graduated from the University of California, Los Angeles (UCLA), in 1948, received a law degree from Stanford University (Stanford, Calif.) in 1951, and with associates established a law firm in Seattle.

In 1969 Ehrlichman was appointed Nixon's domestic affairs adviser. With H.R. Halde- man, he formed the so-called palace guard to insulate the president from the public and from other members of the government. The two exercised authority in the president's name and filtered information from all levels of government.

Early in the Nixon administration, Ehrlichman established a group, known as the "plumbers," with the aim of acquiring political intelligence and repairing "information leaks." In an attempt to obtain damaging information on the supplier of the "Pentagon Papers" to *The New York Times*, the plumbers burglarized the office of Daniel Ellsberg's psychiatrist. Five members of the group were apprehended at the headquarters of the Democratic National Committee in the Watergate complex on June 17, 1972.

Ehrlichman initially counseled a confession of White House involvement, but he later became an active participant in the cover-up. When his complicity became clear, Ehrlichman resigned from the administration in April 1973. He went on trial the following year,

charged with conspiracy, perjury, and obstruction of justice. He was convicted and served 18 months of his 2½- to 5-year sentence before being released in April 1978.

Ehrlichman wrote several books based on his experiences as a presidential aide during the Nixon administration: *The Company* (1976), *The Whole Truth* (1979), and *Witness to Power: The Nixon Years* (1982).

Ehud, also spelled AOD, in the Old Testament (Judges 3:12–4:1), son of Gera, the Benjaminite, Israelite hero who delivered Israel from 18 years of oppression by the Moabites. A left-handed man, Ehud tricked Eglon, king of Moab, and killed him. He then led the tribe of Ephraim to seize the fords of the Jordan, where they killed about 10,000 Moabite soldiers. As a result, Israel enjoyed peace for about 80 years.

EIA (animal disease): see equine infectious anemia.

Eibar, city, Guipúzcoa province, in the autonomous Basque Country, northern Spain, lying east of Bilbao on the Bilbao–San Sebastián railway. The city was chartered by Alfonso XI of Castile in 1346. Its chief industry since the 16th century has been the manufacture of armaments, particularly finely engraved small arms. Other metallurgical products are sewing machines, auto parts, and surgical instruments. Its armament works made it a target of heavy Nationalist aerial bombardment during the Spanish Civil War of 1936–39. Pop. (1998 est.) 29,700.

Eichelberger, Robert L(awrence) (b. March 9, 1886, Urbana, Ohio, U.S.—d. Sept.

Eichelberger

By courtesy of the U.S. Army

26, 1961, Asheville, N.C.), U.S. Army general who during World War II retrieved strategic Japanese-held islands in the Pacific, thus helping end the war in the Far East.

A 1909 graduate of the U.S. Military Academy at West Point, N.Y., Eichelberger served with the American Expeditionary Force in Siberia (1918–20) and later was superintendent of West Point (1940–42).

Eichelberger first saw action in World War II when he was summoned (December 1942) to revitalize the U.S. front in Buna, on the island of New Guinea. The following month he directed a successful attack on this strongly fortified enemy position—one of the first ground victories against the Japanese in the war. In September 1944 he took command of the newly activated U.S. 8th Army in Netherlands New Guinea. The following months saw him effectively employing amphibious tactics to lead his forces through many severe island engagements, particularly New Guinea and New

Britain. In 1945 he launched the Philippines reoccupation campaign, cleaning up Japanese resistance on such strongholds as Mindanao by August. With the total Japanese surrender that month, Eichelberger shortly landed a small detachment at Atsugi Air Field to begin the Allied occupation of Japan. For the next three years he directed all 8th Army military government units throughout that country.

Eichelberger retired in 1948 and published his memoirs, *Our Jungle Road to Tokyo*, in 1950.

Eichendorff, Joseph, Freiherr von (baron of) (b. March 10, 1788, near Ratibor, Prussia—d. Nov. 26, 1857, Neisse), poet and novelist, considered one of the great German Romantic lyricists.

From a family of Silesian nobility, Eichendorff studied law at Heidelberg (1807), where he published his first verse and became acquainted with the circle of Romantics. Continuing his studies in Berlin (1809–10), he met the leaders of the Romantic national movement. When the Prussian war of liberation broke out in 1813, Eichendorff enlisted in the Lützowsche Freikorps and fought against Napoleon.

The French Revolution appears in the novella *Das Schloss Dürande* (1837; "Castle Dürande") and in the epic poem *Robert und Guiscard* (1855). The Napoleonic Wars, which brought about the decline of the Eichendorff family and the loss of the Lubowitz castle, are the sources of nostalgia in his poetry. During these war years he wrote two of his most important prose works: a long Romantic novel, *Ahnung und Gegenwart*, (1819; "Premonition and Present"), which is pervaded by the hopelessness and despair of the political situation and the need for a spiritual, rather than a political, cure for moral ills; and *Novellen des Marmorbilds* (1819; "Novellas of a Marble Statue"), which contains supernatural elements and is described by Eichendorff as a fairy tale. After the war he held posts in the Prussian civil service in Danzig and Königsberg and, after 1831, in Berlin. Eichendorff's poetry of this period (*Gedichte*, 1837), particularly the poems expressing his special sensitivity to nature, gained the popularity of folk songs and inspired such composers as Schumann, Mendelssohn, and Richard Strauss. In 1826 he published his most important prose work, *Aus dem Leben eines Taugenichts* (*Memoirs of a Good-for-Nothing*, 1955), which, with its combination of the dreamlike and the realistic, is considered a high point of Romantic fiction. In 1844 he retired from the civil service to devote himself entirely to his writing, publishing his history of German literature and several translations of Spanish authors.

Eichhorn, Johann Gottfried (b. Oct. 16, 1752, Dörrenzimmern, Württemberg—d. June 27, 1827, Göttingen, Hannover), Ger-

Eichhorn, engraving by Christian Gottlieb Geysler after a painting by Ernst Gottlob
Archiv für Kunst und Geschichte, West Berlin

man biblical scholar and orientalist who taught at Jena and Göttingen, one of the first commentators to make a scientific comparison between the biblical books and other Semitic writings. A pioneer in distinguishing the various documentary and cultural sources of the Old Testament law, traditionally considered a Mosaic composition, he also questioned the Pauline authorship of the New Testament letters to Timothy and Titus, challenged the genuineness of the Second Letter of Peter, and suggested that the four Gospels derived from a single Aramaic text. His chief works included *Historisch-Kritische Einleitung ins Alte Testament* (3 vol., 1780–83; "Historical and Critical Introduction to the Old Testament"), and a corresponding work for the New Testament (5 vol., 1804–12). Although only partially accurate, they stimulated research and criticism in biblical literature.

Eichler, August Wilhelm (b. April 22, 1839, Neukirchen, Hesse, Ger.—d. March 2, 1887, Berlin), German botanist who developed one of the first widely used natural systems of plant classification.

Eichler studied mathematics and natural science at the University of Marburg (Ph.D., 1861). He then went to Munich, where he became a private assistant to the naturalist Karl Friedrich Philipp von Martius, with whom he edited *Flora Brasiliensis* (15 vol., "The Flora of Brazil"), the first volume of which had appeared in 1861. After the death of Martius in 1868, Eichler worked on the *Flora* unassisted, issuing 46 of 100 parts. In 1865 he became a lecturer at the University of Munich and, six years later, professor of botany at the Technische Hochschule (Technical University) at Graz. In 1872 he received an appointment at the University of Kiel, where he remained until 1878, when he became director of the herbarium at the University of Berlin. That same year, the second and last volume of his *Blütendiagramme* appeared (first vol., 1875; "Diagrams of Flowers"), his principal contribution to the study of the comparative structure of flowers.

Eichler's system of plant classification, developed in 1886, eventually won worldwide acceptance. He divided the plant kingdom into four divisions: Thallophyta (the algae and fungi), Bryophyta (the liverworts and mosses), Pteridophyta (the club mosses, horsetails, and ferns), and Spermatophyta (the seed plants), the last of which were in turn divided into two major categories: the angiosperms (the flowering plants) and gymnosperms (such as pines, spruces, and firs). Eichler's system was eventually modified into a more natural system of classification.

Eichmann, (Karl) Adolf (b. March 19, 1906, Solingen, Ger.—d. May 31, 1962, Tel Aviv, Israel), German war criminal hanged by the state of Israel for his part in the Nazi extermination of Jews during World War II.

During World War I, Eichmann's family moved from Germany to Linz, Austria, and in April 1932 he joined the then secret Nazi Party there. In November 1932 he became a member of Heinrich Himmler's SS (Schutzstaffel) elite organization and, on leaving Linz in 1933, joined the terrorist school of the "Austrian Legion" at Lechfeld, Bavaria. From January to October 1934 he was attached to an SS unit at Dachau and then was appointed to the SD (Sicherheitsdienst) central office in Berlin, where he was attached to the section that dealt with Jewish affairs. He advanced steadily in the SS hierarchy and, after the annexation of Austria (March 1938), was sent to Vienna with the mission of ridding the city of Jews. One year later, with a similar mission, he was sent to Prague. When in 1939 Himmler formed the Reichssicherheitshauptamt (RSHA), Eichmann was transferred to its Jewish section in Berlin. In January 1942, at Wannsee, near Berlin, a conference of Nazi

high officials was convened to organize schedules and logistics arrangements necessary to implement the "final solution" of the Jewish problem. Eichmann was to coordinate these arrangements; thus, although the fact that the "final solution" was mass execution had not become generally known, Eichmann had in effect been named chief executioner. Thereupon he organized the identification, assembly, and transportation of Jews from all over occupied Europe to their final destinations at Auschwitz and other death camps.

Following the war, Eichmann was captured by U.S. troops, but in 1946 he escaped from the prison camp. After dodging in and out of the Middle East for several years Eichmann finally settled in Argentina in 1958. He was arrested by Israeli secret service agents near Buenos Aires on May 11, 1960; nine days later he was smuggled out of the country and taken to Israel. Following the settlement of the controversy that arose over this Israeli violation of Argentine law, the Israeli government arranged his trial before a special three-judge court in Jerusalem. The trial lasted from April 11 to Dec. 15, 1961, and Eichmann was sentenced to be hanged.

Eichrodt, Walther (b. Aug. 1, 1890, Gernsbach, Ger.—d. May 20, 1978, Basel, Switz.), German scholar who showed the importance to biblical studies of an understanding of the theology of the Old Testament.

After studying theology at Bethel, Greifswald, Heidelberg, and Erlangen, Eichrodt taught at Bethel and Erlangen, then became professor of Old Testament at the University of Basel (1922), where he was later rector (1953–55). His chief work, *Theologie des Alten Testaments*, 2 vol. (1933–35, 4th ed. 1957; *Theology of the Old Testament*), marked the beginning of a new epoch in Old Testament studies. Without reducing the theology of the Old Testament to the history of Israelite religion, Eichrodt made extensive use of the results of literary and comparative analysis to envisage the religion of the Old Testament as a unity of permanent reality throughout the vicissitudes of history. The triple aspect of God's covenant, with his people, with the world, and with man, formed the plan of Eichrodt's book. By this method he presented the great dogmatic realities in a dialectic appropriate to the Old Testament, preserving both the historical character of the revelation and the unity of the Old and the New Testaments. Eichrodt's other principal works include *Die Quellen der Genesis* (1916; "The Sources of Genesis"), *Die Hoffnung des ewigen Friedens im alten Israel* (1920; "The Hope of Eternal Peace in Ancient Israel"), *Das Menschenverständnis des Alten Testaments* (1946; *Man in the Old Testament*).

Eichstätt, city, Bavaria Land (state), southern Germany. It lies along the Altmühl River, south of Nürnberg.

Originally a Roman station, it developed after St. Boniface founded a bishopric there in 741. Chartered in 908, the town was ruled by its prince-bishops until the see was secularized in 1802. In 1817 the king of Bavaria gave it, with the landgraviate of Leuchtenberg, to his son-in-law Eugène de Beauharnais. An episcopal see was reestablished in Eichstätt in 1821, and the town reverted to Bavaria in 1855. Among Eichstätt's notable churches are included the Cathedral of St. Willibald (consecrated 1060; incorporating numerous styles); the church of the former Benedictine abbey (founded 870), with the tomb of St. Walburga; and the Capuchin Church (1189), with a copy of the Holy Sepulchre. Other landmarks include the 15th-century town hall; the partially restored 14th- and 17th-century Willibaldsburg, the residence of the bishops until 1730, now housing a museum; and the Baroque palace of the bishops and later of the dukes of Leuchtenberg. A railroad junction, Eichstätt

is a lively trading centre with little industry. Pop. (1989 est.) 12,118.

Eider, any of several large sea ducks variously classified as members of the tribe Mergini or placed in a separate tribe Somateriini (family Anatidae, order Anseriformes). Eiders are heavy and round-bodied, with humped bills that produce the bird's characteristic sloping profile. They are the source of eiderdown—down feathers the hen plucks from her breast to line the nest and cover the eggs in her absence. Eiderdown is used as warm filling for jackets, pillows, quilts, and sleeping bags; in Iceland, where the birds are rigidly protected,

a pound of down can be harvested from every 35–40 nests without interrupting the breeding cycle. Hens are mottled dark brown, but drakes of the four species are strikingly patterned and show a peculiar green pigment on the head. In the common eider (*Somateria mollissima*), with four or five races, differing mainly in length and colour of bill, the drake is mostly white above with black crown, belly, and tail. Like all eiders, this species is at home in the far north. It breeds along icy coasts south to The Netherlands and the Gulf of St. Lawrence; it winters at sea south to France, New England, and the Aleutians.

Eider Program (1848–64), the domestic and foreign policy cornerstone of Denmark's National Liberal governments during the Schleswig-Holstein crises. The program, which called for the incorporation of the duchy of Schleswig into Denmark, was brought to an end by the German occupation of both duchies in 1864.

Along with Holstein, Schleswig—separated from its sister duchy by the Eider River—had long been affiliated with Denmark through personal, rather than national, union under the Danish kings. The National Liberal government sought to have Schleswig made part of Denmark by the provisions of the constitution of 1849 and fought for this end in the Schleswig War (1848–50) against rebels in Schleswig-Holstein, who were helped by Prussian armed intervention. When the war came to an end in 1850 with an international agreement to maintain the affiliation of the two duchies with the Danish crown, but to maintain as well the constitutional separation of Schleswig from Denmark, the National Liberals were turned out of office and the Eider Program was set aside. International tensions engendered by the status of the duchies continued, however, and the National Liberals returned to power in 1857. In 1863, with Prussia preoccupied with the Polish rebellion, the Danes thought the time right to incorporate Schleswig into Denmark. But Prussia invaded the duchies, and in the Danish-German war

of 1864 Denmark lost Schleswig. See also Schleswig-Holstein.

Eider River, river, Schleswig-Holstein Land (state), northern Germany. It rises in the hills south of Kiel, flows through Westensee (West Lake) northward to a point northwest of Kiel, and then bends westward and flows across the low peninsula in a sluggish, winding course of 117 miles (188 km) to the North Sea. Tönnings stands at the head of the river's long, shallow estuary. It is navigable up to Rendsburg and is embanked through the marshes along its lower course. The Eider was regarded as *Romani terminus imperii* (the [northern] "limit of the Roman Empire") from the reign of the Frankish king Charlemagne (768–814) on, was recognized as the boundary of the Holy Roman Empire in 1027 by the emperor Conrad II, and formed the traditional frontier between Schleswig and Holstein. The Eider Canal (built 1777–84) makes the river navigable above Rendsburg and connects it with Kiel Bay at Holtenau. The canal was hampered by six sluices, but, as the only direct connection between the North and Baltic seas, it was heavily used. In 1887–95 it was converted into the Kaiser-Wilhelm, later the Nord-Ostsee Canal, or Kiel Canal.

eidetic image, an unusually vivid subjective visual phenomenon. An eidetic person not only can imagine an absent object but behaves as if he really can see it, either with closed eyes or while looking at some surface that serves as a convenient background for the image. A particular object may be recalled eidetically either immediately after its disappearance or removal from sight or after a lapse of several minutes, days, or even years; spontaneously appearing eidetic images have also been reported. In some instances, eidetic images and the objects they represent differ in colour, form, apparent size, position in space, richness of detail, and many other characteristics; in other instances, objects may be eidetically reproduced with almost photographic fidelity. Phenomena corresponding to eidetic images in the visual field are believed to exist in other sense fields as well. Investigations have revealed little about the nature, causes, and significance of eidetic images.

eidetic reduction, in phenomenology, a method by which the philosopher moves from the consciousness of individual and concrete objects to the transempirical realm of pure essences and thus achieves an intuition of the eidos (Greek: "shape") of a thing—i.e., of what it is in its invariable and essential structure, apart from all that is contingent or accidental to it. The eidos is thus the principle or necessary structure of the thing. Being a science of essences, phenomenology finds this reduction important for its methodology.

Because the eidetic reduction uses the method of free variation, it is not dependent on either mental constructs or concrete factual objects, although it takes its starting point in the knowledge of facts. Beginning with a concrete object, the philosopher can imaginatively vary its different aspects. The limitations of the fanciful variation are the effectively given—i.e., that which is given immediately and indubitably—and the eidos itself. The series of variations overlap, and the aspect in which they overlap is the essence. By thus moving from evidence in the perceptual sphere to evidence in the imaginative sphere, he can arrive at the invariable and essential structure of the object.

Thus, the eidetic reduction is neither a form of induction nor an abstraction. In accordance with the phenomenological reduction, it abstains from any sort of positing of the actual existence of its objects, and it brackets,

or holds in suspense, the concrete and factual content. On the other hand, it is not an empirical generalization that takes place at the level of man's natural attitude.

Eiermann, Egon (b. Sept. 29, 1904, Neuen-dorf, near Berlin, Ger.—d. July 20, 1970, Baden-Baden, W.Ger.), one of the most prominent German architects to emerge after World War II, whose wide variety of buildings have been admired for their elegant proportions, precise detail, and structural clarity.

Eiermann studied at Berlin Technical University under Hans Poelzig, later working in the building department of the Karstadt department store company. Beginning in 1930 he practiced architecture in Berlin and, from 1947, in Karlsruhe, where he also served on the faculty of the university. Adhering to an aesthetic of making order visible, Eiermann created a number of major achievements in functional design, including the textile mill at Blumberg (1951), the West German pavilion at the Brussels World Exhibition (with Sep Ruf, 1958), the West German embassy in Washington, D.C. (1958–64), and the IBM-Germany Headquarters in Stuttgart (1967).

Perhaps his most popular work is the Kaiser Wilhelm Memorial Church (1956–63), a symbol of postwar Berlin. Originally, a medieval revival building constructed in the late 19th century stood on the site, but after a World War II bombing raid only the bell tower remained. This ruin was incorporated by Eiermann into his strikingly simple design for a modern church.

Eifel, plateau region of western Germany, lying between the Rhine, the Mosel (French: Moselle), and the Luxembourg and Belgian frontiers. Continuous with the Ardennes and the Hohes Venn (French: Haute Fagnes) of Belgium, the German plateau falls into three sections: Schneifel or Schnee-Eifel, Hocheifel, and Voreifel. In the Schneifel (German: "Snow Eifel"), near the Belgian frontier, scrub and forest are common, with cultivation only on the richer soils. The Hocheifel ("High Eifel"), which includes the highest point in the plateau, Hohe Acht (2,451 feet [747 m]), is a dissected highland drained to the east by the Ahr River, which flows through a vine-growing region. The Voreifel ("Fore-Eifel") slopes south to the Mosel, the tributaries of which dissect its smooth surface. Evidence of volcanic action can be seen in the explosion craters and small cones. Igneous rocks such as basalt, tuffs, and pumice are quarried in the area.

The plateau from Bitburg to Cologne shows signs of ancient habitation; in the Middle Ages, iron, lead, and zinc were mined. The Maifeld was settled early by the Germans, and near Lake Laacher an abbey was founded in the 11th century. The current sparse population dates mainly from the clearing of the forest in medieval times, when monasteries and castles were established. The three-field and common-pasture systems still show the remains of this period. Metalworking industries have disappeared, and many people have emigrated since 1870 to the Ruhr and Aachen.

Eifelian Stage, all those rocks deposited worldwide during the Eifelian Age (387 to 380 million years ago). The top of the Eifelian Stage is defined by the base of an overlying subdivision, the Givetian Stage. Together the two subdivisions constitute the Middle Devonian Series.

The name is derived from the Eifel Hills in western Germany, near Luxembourg and Belgium. As formally defined in 1985 under the authority of the International Commission on Stratigraphy, the global stratotype section and point (GSSP) for this boundary is established in a trench section across pastureland

near the town of Schönecken-Wetteldorf. The trench exposes siltstones and mudstones in the upper part of the Heisdorf Formation and alternating limestones and mudstones in the overlying strata of the Lauch Formation. The boundary point is situated 1.9 m (6.25 feet) below the base of the Lauch Formation, which is fixed by the first occurrence of the conodont *Polygnathus costatus partitus*. This conodont is the second subspecies in a documented conodont phyletic lineage, the predecessor subspecies being *P. costatus patulus* and the successor subspecies being *P. costatus costatus*. The intermediate species is known from the Eifelian strata in Morocco, Spain, Germany, Austria, the Czech Republic, Central Asia, China, Malaysia, Australia, Nevada, Alaska, and the Canadian Arctic. A parastratotype sequence with conodonts typical of the *Polygnathus* biofacies is established in the Trebotov Limestone of the Barrandian region in the Czech Republic.

Eiffel, Gustave, in full ALEXANDRE-GUSTAVE EIFFEL (b. Dec. 15, 1832, Dijon, France—d. Dec. 28, 1923, Paris), French civil engineer renowned for the tower in Paris that bears his name.

After graduation from the College of Art and Manufacturing in 1855, Eiffel began to specialize in metal construction, especially bridges. He directed the erection of an iron bridge at Bordeaux in 1858, followed by several others, and designed the lofty, arched Gallery of Machines for the Paris Exhibition of 1867. In 1877 he bridged the Douro River at Oporto, Port., with a 525-foot (160-metre) steel arch, which he followed with an even greater arch of the same type, the 540-foot (162-metre) span Garabit viaduct over the Truyère River in southern France, for many years the highest bridge in the world, 400 feet (120 m) over the stream. He was one of the first engineers to employ compressed-air caissons in bridge building. He designed the movable dome of the observatory at Nice and the framework of the Statue of Liberty in New York Harbor.

Eiffel startled the world with the construction of the Eiffel Tower (1887–89), which brought him the nickname "magician of iron." It also directed his interest to problems of aerodynamics, and he used the tower for a number of experiments. At Auteuil, outside Paris, he built the first aerodynamic laboratory, where he continued to work throughout World War I; in 1921 he gave the laboratory to the state.

Eiffel Tower, French TOUR EIFFEL, Parisian landmark and technological masterpiece in building-construction history. When the French government was organizing the Cen-

tennial Exposition of 1889 to commemorate the French Revolution, a competition was held for designs for a suitable monument. More than 100 plans were submitted, and the Centennial Committee accepted that of the noted bridge engineer Gustave Eiffel. Eiffel's

The Eiffel Tower, Paris, designed by Gustave Eiffel, 1887–89

Graudon—Art Resource

conception of a 984-foot (300-metre) tower of open-lattice wrought iron aroused amazement, skepticism, and no little opposition on aesthetic grounds.

Nothing remotely like it had ever been built; it was twice as high as the dome of St. Peter's in Rome or the Great Pyramid of Giza. In contrast to such older monuments, Eiffel's tower was raised in a matter of months, with a small labour force, at slight cost. Making use of advanced knowledge of the behaviour of metal arch and metal truss forms under loading, including wind forces, the structure presaged a revolution in civil engineering and architectural design. And despite protests, it ultimately vindicated itself aesthetically.

The tower's base, of four semicircular arches, dictated partly by engineering considerations but also partly by Eiffel's artistic sense, required elevators to ascend on a curve; the glass-cage machines designed by the Otis Elevator Company of the United States became one of the principal features of the building, helping establish it as one of the world's premier tourist attractions. The Eiffel Tower remained the tallest building in the world until completion of the Chrysler Building in New York City in 1930.

Eigen, Manfred (b. May 9, 1927, Bochum, Ger.), German physicist who was corecipient, with R.G.W. Norrish and George Porter, of the 1967 Nobel Prize for Chemistry for work on extremely rapid chemical reactions.

Eigen was educated in physics and chemistry at the University of Göttingen (Ph.D., 1951). He worked at the university's Institute of Physical Chemistry from 1951 to 1953, when he joined the Max Planck Institute for Biophysical Chemistry, Göttingen, where he became director in 1964 and later chairman.

By means of a variety of methods known as relaxation techniques, involving the application of bursts of energy to a solution, Eigen was able to study many high-speed reactions in

the state of equilibrium. Among specific topics thus investigated were the rate of hydrogen ion formation through dissociation in water, diffusion-controlled protolytic reactions, and the kinetics of keto-enol tautomerism.

eigenvalue, one of a set of discrete values of a parameter, k , in an equation of the form $P\psi = k\psi$, in which P is a linear operator (that is, a symbol denoting a linear operation to be performed), for which there are solutions satisfying given boundary conditions. The symbol ψ (psi) represents an eigenfunction (proper or characteristic function) belonging to that eigenvalue. The totality of eigenvalues is a set. In quantum mechanics P is frequently a Hamiltonian, or energy, operator and the eigenvalues are energy values, but operators corresponding to other dynamical variables such as total angular momentum are also used. Experimental measurements of the proper dynamical variable will yield eigenvalues.

Eight, The, group of American painters who exhibited together only once, in New York City in 1908, but established one of the main currents in 20th-century American painting. The original Eight included Robert Henri, leader of the group, Everett Shinn, John Sloan, Arthur B. Davies, Ernest Lawson, Mau-

"Sunday, Women Drying Their Hair," oil painting by John Sloan, one of the members of a group of American painters called The Eight, 1912; in the Addison Gallery of American Art, Andover, Mass.

rice Prendergast, George Luks, and William J. Glackens. Later the group was joined by George Bellows. Their contribution to American art was not a style held in common but a determination to bring art into closer touch with life.

Reacting against an academic and aesthetic tradition that was subservient to European aesthetics, The Eight established their own artistic society in the bustling neighbourhoods of New York City and set out to create a native American painting. Luks, Sloan, Glackens, and Shinn worked as newspaper illustrator-cartoonists; the teeming life they found in New York became the subject of their art, as well as the art of the other four, which presented unidealized views of city life—the saloons, tenements, pool halls, and slums. Most of The Eight adopted a rough, realistic style, flashy brushwork on a dark ground reminiscent of Édouard Manet, Gustave Courbet, and the German Düsseldorf school, where Henri had studied. Some of the group took other directions: Prendergast utilized the decorative patterns of colour he found in the work of the French Nabi group in his translations of the American landscape; Arthur Davies painted dreamy twilight scenes evolving from lyrical allegories rather than contemporary life; Lawson's style was lyrically atmospheric. In spite of these deviations from realistic views of city life, their 1908 exhibition at the Macbeth Gallery, a direct reaction against slights by the National Academy of Design, gained all eight the reputation of "apostles of ugliness."

A few years after their single joint exhibition, the eight painters were absorbed into a larger group called the Ashcan School, which included Bellows, Edward Hopper, Glenn Coleman, Eugene Higgins, and Jerome Myers. The Ashcan School, whose principles and aims were similar to those of The Eight, paved the way for the development of a vital and native trend in American painting of the 20th century.

eight ball, U.S. pocket-billiards game in which 15 balls numbered consecutively and a white cue ball are used. Those numbered 1–7 are solid colours; 9–15 are circled in white; and the eight ball is black. To begin, the balls are racked in a pyramid with the eight ball in the centre. One player or a side plays numbers 1–7, while the other plays 9–15; but choice of group is not made until a ball is legally pocketed. Once a side has pocketed all of its group, that side tries to pocket the eight ball and thus win the game. Should a player pocket the eight ball before all of his group is sunk, or misplay the eight ball (as by playing it into a pocket other than the pocket designated before the shot), that player loses.

Eight Eccentrics of Yang-chou, Pinyin YANGZHOU, Chinese painters who worked in the area of Yang-chou, in Kiangsu Province, during the Ch'ien-lung era (1735–96) of the Ch'ing dynasty (see Ch'ing dynasty). The group includes Cheng Hsieh, Chin Nung, Huang Shen, Kao Hsiang, Li Fang-ying, Li Shan, Lo P'ing, and Wang Shih-shen. Other artists, such as Hua Yen, are sometimes included. Although the grouping is more a geographical than a stylistic one, certain similarities are discernible: generally, the paintings are rather briefly sketched, small-scale renditions of the less monumental aspects of nature, and a certain creative independence of style is perceptible—thus the appellation *pa-kuai*, "eight eccentrics," or "eight strange ones."

Eight Immortals (Chinese mythology): see Pa Hsien.

Eight Masters of Nanking, Wade-Giles romanization CHIN-LING PA-CHIA, Pinyin JIN-LING BAJIA, group of Chinese artists who lived and worked during the late 17th century in Nanking (known as Chin-ling during the early T'ang dynasty, 618–907). Although their group identity derives largely from the locale in which they worked, certain aesthetic similarities are discernible: their paintings, usually landscapes, are often uneven in quality and rather rustic.

The outstanding artist of the group, Kung Hsien (*q.v.*), is known particularly for his dense, moist landscapes, which are virtually unique in the history of Chinese painting. Others of the group include Fan Ch'i, Kao Ts'en, Tsou Che, Wu Hung, Hu Tsao, Yeh Hsien, and Hsieh Sun. Little is known of most of these artists, and relatively few paintings survive.

"River Landscape," detail of a hand scroll by Fan Ch'i, one of the Eight Masters of Nanking, 17th century, Ch'ing dynasty, ink and colour on silk; in the Museum für Ostasiatische Kunst, in the Staatliche Museen Preussischer Kulturbesitz, West Berlin

Eight Saints, War of the (1375–78), conflict between Pope Gregory XI and an Italian coalition headed by Florence, which resulted in the return of the papacy from Avignon to Rome. In 1375, provoked by the aggressiveness of the Pope's legates in Italy, Florence incited a widespread revolt in the Papal States. The Pope retaliated by excommunicating the Florentines (March 1376), but their war council, the Otto di Guerra (popularly known as the Eight Saints), continued to defy him. In 1377 Gregory sent an army under Cardinal Robert of Geneva to ravage the areas in revolt, while he himself returned to Italy to secure his

possession of Rome. Thus ended the papacy's 70-year stay in France. The war ended with a compromise peace concluded at Tivoli in July 1378.

1801, Concordat of, agreement reached on July 15, 1801, between Napoleon Bonaparte and papal and clerical representatives in both Rome and Paris, defining the status of the Roman Catholic Church in France and ending the breach caused by the church reforms and confiscations enacted during the French Revolution. The Concordat was formally promulgated on Easter day, 1802.

In the agreement the First Consul (Napoleon) was given the right to nominate bishops; the bishoprics and parishes were redistributed; and the erection of seminaries was allowed. The Pope (Pius VII) condoned the actions of those who had acquired church property, and by way of compensation the government engaged to give the bishops and curés suitable salaries. The government added to it unilateral provisions of Gallican tendencies, which were known as the Organic Articles. After having been the law of the church of France for a century, it was denounced by the French government in 1905, when by the "Separation Law" church and state were sundered.

1812, War of (June 18, 1812–Dec. 24, 1814), inconclusive British–U.S. conflict arising chiefly out of U.S. grievances over oppressive maritime practices during the Napoleonic Wars. The long struggle between Great Britain and France, fought intermittently between 1793 and 1815, led both belligerents to infringe on the rights and impair the interests of neutrals. Napoleon averted hostilities by agreeing not to interfere with U.S. trade to Britain. Britain, on the other hand, confident in its naval supremacy, continued to enforce its order in council of 1807, which led to the blockade of all French ports, and insisted that neutral vessels first call at British ports and pay duties. In addition, U.S. sensibilities were offended by the British practice of stopping U.S. ships on the high seas and impressing seamen alleged to be deserters from the Royal Navy. The new nation reacted with the Embargo Act (1807) and the Non-intercourse Act (1809). A third measure (1810) removed trade restrictions but provided for revival of nonintercourse against whichever belligerent should fail to revoke its blockade. This Great Britain failed to do in time to prevent a declaration of war signed by Pres. James Madison on June 18, 1812.

International tension was increased by U.S. resentment of British actions along the Canadian frontier. British authorities were supplying arms and encouragement to the Shawnee leader, Tecumseh, in an effort to check the advance of white settlers into Indian country. After a Shawnee attack led to the pitched Battle of Tippecanoe (Nov. 7, 1811), Westerners raised the cry that the British must be expelled from Canada to ensure frontier security. This theme was espoused vigorously by a group of expansionist congressmen called War Hawks, who also included Florida in their territorial ambitions.

The U.S. entered the war ill-prepared. Ambitious plans to invade Canada were never realized. American warships won three notable victories in duels with British frigates in 1812, including that of the USS "Constitution" against the "Guerrière," though the three later frigate duels of the war were won by the British. Numerous naval skirmishes were fought for control of Lakes Erie, Ontario, and Champlain. Despite limited U.S. success, including the recapture of Detroit, by the summer of 1814 the British still controlled access to Lake Michigan and occupied the northern Mississippi River. An amphibious British

force ravaged the shores of Chesapeake Bay and, after winning the Battle of Bladensburg, burned public buildings in Washington, D.C., in retaliation for similar U.S. acts in York (Toronto). U.S. morale was lifted when U.S. ships hindered British commerce, but this action failed to disturb Britain's control of the sea and its blockade of the American coast.

Weary of futile warfare, both sides signed the Treaty of Ghent in Belgium on Dec. 24, 1814, restoring prewar conditions. This settlement forestalled a New England separatist movement, proposed at the Hartford Convention (December 1814–January 1815) in response to the extremely unpopular war. Though the U.S. gained none of its avowed aims, popular legend soon converted defeat into the illusion of victory. Several circumstances contributed to this process: the series of military successes in the war's closing months created a sense of victory (the most imposing of which, the Battle of New Orleans, was won before news of the peace treaty reached that part of the U.S.); the end of war in Europe brought an end also to the issues of impressment and paper blockades; and finally, the war did actually subdue Indian resistance with the death of Tecumseh in battle and the crushing of the Creek confederacy in the South by Maj. Gen. Andrew Jackson in 1814. (This led indirectly to the acquisition of Florida in 1819.) The war also marked a decline of U.S. dependence on Europe and stimulated a sense of nationality.

1830, revolutions of, rebellions against conservative kings and governments by liberals and revolutionaries in different parts of Europe in 1830–32.

The movement started in France, prompted by Charles X's publication on July 26 of three ordinances dissolving the Chamber of Deputies, abolishing freedom of the press, and modifying the electoral laws so that three-fourths of the electorate lost their votes. Strikes and protests were followed by armed confrontations. The royal forces were unable to contain the insurrection; and, after three days of fighting (July 27–29), Charles fled to England. The radicals wanted to establish a republic, and the aristocracy were loyal to Charles, but the upper-middle class were victorious in their decision to offer the crown to the Duke of Orléans, Louis-Philippe, who had fought for the French Republic in 1792. Louis agreed to be "King of the French." When the "July Revolution" was over, the Chamber had been transformed from a hereditary body into a nominated house, special tribunals were abolished, the alliance of throne and church ended, and the white flag of the Bourbons was replaced by the tricolour. (See also July Revolution.)

Liberals throughout Europe were encouraged to hope for a general war of liberation, but most were disappointed. Louis-Philippe did not want a war and, contrary to expectations, did not support the Poles, who had revolted against the Russian tsar. Their revolt was ruthlessly suppressed, and Poland was incorporated into the Russian Empire. Revolts in Italy and the German kingdoms were equally unsuccessful. Belgium declared its independence from The Netherlands, and it was recognized in 1831 as a separate nation. For several years the Greeks had been fighting for their independence from the Ottoman Empire, and in 1832 the European powers recognized Greece as an independent sovereign state.

1848, Revolutions of, series of republican revolts against European monarchies, beginning in Sicily, and spreading to France, Germany, Italy, and the Austrian Empire. They all ended in failure and repression, and were followed by widespread disillusionment among liberals.

The revolutionary movement began in Italy with a local revolution in Sicily in January 1848; and, after the revolution of February 24 in France, the movement extended through-

out the whole of Europe with the exception of Russia, Spain, and the Scandinavian countries. In Great Britain it amounted to little more than a Chartist demonstration and a republican agitation in Ireland. In Belgium, The Netherlands, and Denmark it manifested itself in peaceful reforms of existing institutions; but democratic insurrections broke out in the capitals of the three great monarchies, Paris, Vienna, and Berlin, where the governments, rendered powerless by their fear of "the revolution," did little to defend themselves. The revolution was successful in France alone; the Second Republic and universal suffrage were established, but the quarrel between the supporters of the *république démocratique* and the partisans of *république démocratique et sociale* culminated in a workers' insurrection in June 1848.

In Austria, where the new ministers promised to grant constitutions, the monarchy withstood the storm; and in Prussia King Frederick William IV, who led the movement for the unification of Germany, hoisted the black, red, and gold flag that had become the symbol of German unity. The German governments agreed to the convocation of three constituent assemblies at Berlin, Vienna, and Frankfurt by which democratic constitutions were to be drafted for Prussia, Austria, and Germany.

In Italy, at first, the revolution only took the form of a nationalist rising against Austria led by the king of Sardinia under the Italian tricolour, the "white, red and green." The republic was proclaimed in 1849, and then only in Rome and Tuscany. Within the Austrian empire the nationalities subjected to the German Government of Vienna agitated for a national government, and Hungary succeeded in organizing itself on an autonomous basis.

This upheaval seemed to indicate a redistribution of the territories of Europe. In the name of the Provisional Government in France, Alphonse de Lamartine declared that the treaties of 1815 were no longer valid in the eyes of the French Republic, but he added that he accepted the territorial delimitations effected by those treaties. France did not lend its support to the revolutionaries in Europe.

The restoration had commenced even before the revolution was over, and it was accomplished by the armies that had remained faithful to their respective governments. Military repression was first employed in Paris by Louis-Eugène Cavaignac against the insurgents in June, and by Alfred, prince von Windischgrätz, on June 17 against the Czechs in Prague, and later by the Austrian Army in Lombardy and in Vienna; then in Berlin in December, and in 1849 by the Prussian Army in Saxony and Baden. Order was restored in Rome only by French intervention, and in Hungary with the help of the Russian Army. The king of Prussia, having refused the title of emperor offered to him by the Frankfurt Assembly, sought to achieve the unity of Germany by a union between the German princes. Austria and Russia, however, compelled him to abandon his design by the Convention of Olmütz in 1850. The immediate result of the reaction became manifest in the withdrawal of liberal democratic or nationalist concessions which had been made during the revolution: universal suffrage, liberty of the press and of assembly. Absolute monarchy was reestablished in Germany, Austria, and Italy; and the governments, in alliance with the middle classes and the clergy, who were terrified by the Socialist proposals, strengthened the police forces and organized a persecution of the popular press and associations that paralyzed political life. In France the reaction led to the coup d'état against the assembly on the part of Prince Louis-Napoléon on Dec. 2, 1851, and the reestablishment of the hereditary empire under Napoleon III in 1852.

The restoration, however, was not complete, for universal suffrage was not abolished in

France; in Prussia, the Constitution of January 1850, which established an elective assembly, and, in Sardinia, the Constitution of March 1848 were retained; the signorial rights were not restored in Austria.

1850, Compromise of, series of compromise measures passed by the U.S. Congress in an effort to settle several outstanding slavery issues and to avert the threat of dissolution of the Union. The crisis arose from the request of the territory of California (Dec. 3, 1849) to be admitted to the Union with a constitution prohibiting slavery. The problem was complicated by the unresolved question of slavery's extension into other areas ceded by Mexico the preceding year.

To maintain an even balance between free and slave states, a series of measures was offered by the "great compromiser," Senator Henry Clay of Kentucky. In an attempt to give satisfaction to both proslavery and antislavery forces, the important sections of the omnibus bill called for the admission of California as a free state, the organization of the territories of New Mexico and Utah with the slavery question left open (*see* popular sovereignty), settlement of the Texas–New Mexico boundary dispute, a more rigorous provision for the return of runaway slaves, and the prohibition of the slave trade in the District of Columbia.

With the influential support of Senator Daniel Webster and the concerted unifying efforts of Senator Stephen A. Douglas, the five compromise measures were enacted in September. These measures were accepted by moderates in all sections of the country, and the secession of the South was postponed for a decade. The Compromise, however, contained the seeds of future discord. The precedent of popular sovereignty led to a demand for a similar provision for the Kansas Territory in 1854, causing bitterness and violence there (*see* Bleeding Kansas). Furthermore, the application of the new Fugitive Slave Law triggered such a strong reaction throughout the North that many moderate antislavery elements became determined opponents of any further extension of slavery into the territories. While the Compromise of 1850 succeeded as a temporary expedient, it also proved the failure of compromise as a permanent political solution when vital sectional interests were at stake.

1898, Generation of: *see* '98, Generation of eighteen schools, the division of the Buddhist community in India in the first three centuries following the death of the Buddha in c. 483 BC. Although texts speak of the "18 schools," the lists differ considerably; and more than 30 names are mentioned in various chronicles.

The first division in the Buddhist community occurred as a result of the second council, held 100 years after the Buddha's death, at Vaiśālī (Bihar state), when the Acariyavādins (followers of the traditional teaching) split away from the Sthaviravādins (followers of the Way of the Elders) and formed their own school, known as the Mahāsaṅghikas. The Mahāsaṅghikas' views on the nature of the Buddha and the arhat ("saint") foreshadowed the development of the Mahāyāna form of Buddhism. Further subdivisions of the Mahāsaṅghikas over the next seven centuries included the Lokottaravādins, the Ekavyāvahārikas, and the Kaukkuṭikas.

A subdivision within the Sthaviravādins emerged in the 3rd century BC, when the Sarvāstivādins (followers of the Doctrine That All Is Real) broke away from the Vibhajyavādins (Those Who Make Distinctions). Other prominent offshoots of the Sthaviravādins were the Sammatīyas and the Vātsīputriyas, both known for their theory of *puḍgala* ("person"); the Sautrāntikas, who recognized the authority of the sutras (words of the Buddha) but not of the *Abhidharma*, the more schematic

part of the canon; the Mahīśāsakas and the Dharmaguptas, whose names probably reflect their place of origin and founding teacher; and the Theravādins (Pāli form of Sthaviravādins), the school that traveled to Sri Lanka and gave origin to the modern Theravādins, now prevalent in Sri Lanka, Myanmar (Burma), Thailand, and Cambodia.

Eightfold Path, Pāli Aṭṭhaṅgika-magga, Sanskrit Aṣṭāṅgika-marga, doctrine taught by Gautama Buddha in his first sermon at the deer park near Benares (Vārāṇasī), in India. Together with the Four Noble Truths, of which it forms a part, it sums up the whole of Buddhist teaching. It is also called the Middle Path, as it steers a course between the sensual pleasures of the materialists and the self-mortification of the ascetics. Those who follow the noble Eightfold Path are freed from the suffering that is an essential part of human existence and are led ultimately to Nirvāṇa, or Enlightenment. Some Buddhist teachings have held that to enter this path in itself implies an experience of Nirvāṇa.

The Eightfold Path consists of: (1) right understanding—faith in the Buddhist view of the nature of existence in terms of the Four Noble Truths; (2) right thought—the resolve to practice the faith; (3) right speech—avoidance of falsehoods, slander, or abusive speech; (4) right action—abstention from taking life, stealing, and improper sexual behaviour; (5) right livelihood—rejection of occupations not in keeping with Buddhist principles; (6) right effort—avoidance of bad and development of good mental states; (7) right mindfulness—awareness of the body, feelings, and thought; and (8) right concentration—meditation.

Consult the INDEX first

Eightfold Way, classification of subatomic particles known as hadrons into groups on the basis of their symmetrical properties, the number of members of each group being 1, 8 (most frequently), 10, or 27. The system was proposed in 1961 by the American physicist Murray Gell-Mann and the Israeli physicist Yuval Ne'eman. It is based on the mathematical symmetry group SU(3); however, the name of the system was suggested by analogy with the Eightfold Path of Buddhism because of the centrality of the number eight. One of the early triumphs of the Eightfold Way was the prediction of the existence of a heavy subatomic particle required to complete one of the groups. The particle, called omega-minus, was discovered in 1964. That same year, Gell-Mann set forth the concept of quarks as the physical basis for the classification system, thereby establishing the foundation for the modern quark model of hadrons. *See also* quark.

eighth cranial nerve: *see* vestibulocochlear nerve.

Eighth Route Army, larger of the two major Chinese communist forces that fought the Japanese from 1937 to 1945. The 8th Route Army also engaged in political and propaganda work, helping to increase communist support among the populace. The army grew from 30,000 troops in July 1937 to 156,000 in 1938 and 400,000 in 1940. Reduced to about 300,000 by the fierce fighting between 1941 and 1944, its size almost doubled to a total of 600,000 men in 1945.

Formed in 1937 at the time of the second United Front (the anti-Japanese alliance between the Chinese Nationalists under Chiang Kai-shek and the Chinese Communists), the 8th Route Army was headed by Mao Zedong's old comrade in arms Chu Teh but was placed under the overall direction of the Nationalist government. In 1938 the 8th Route Army was reorganized as the 18th Army Group under the Nationalist commander Yen Hsi-shan. In

practice, however, the army remained under Chu Teh's control and operated independently of the Nationalists, especially after 1941, when relations between the Communists and Nationalists had deteriorated.

Following the end of World War II, the 18th Army Group was incorporated into the new People's Liberation Army. Units from the former 8th Route Army were active in the 1948 capture of Manchuria (Northeast Provinces) from the Nationalists, which placed the communist forces in a position to take North China and turn the civil war in their favour.

Eighty Mile Beach, coastal edge of the arid, sedimentary Great Sandy Desert and the Canning Basin (*qq.v.*), northwestern Western Australia, bordering the Indian Ocean. Extending in a curve northeast from Cape Keraudren (east of the De Grey River mouth) to Cape Bossut, it is about 85 miles (140 km) long. The beach, generally low and sandy but with an expanse of dunes in the area around Anna Plains, experiences a tidal range as great as 28 feet (9 m). It is bordered with salt and samphire (plant) marshes with a dreary waste region extending inland. Formerly called Ninety Mile Beach, it was renamed in 1946 to avoid confusion with a beach of the same name in Victoria. In 1887, a large pearling fleet was wrecked by a cyclone off the harbourless beach. The Great Northern Highway parallels the beach from Port Hedland to Broome.

Eighty Years' War (1568–1648), the war of Netherlands independence from Spain, which led to the separation of the northern and southern Netherlands and to the formation of the United Provinces of the Netherlands (the Dutch Republic). The first phase of the war began with two unsuccessful invasions of the provinces by mercenary armies under Prince William I of Orange (1568 and 1572) and foreign-based raids by the Geuzen, the irregular Dutch land and sea forces. By the end of 1573 the Geuzen had captured, converted to Calvinism, and secured against Spanish attack the provinces of Holland and Zeeland. The other provinces joined in the revolt in 1576, and a general union was formed.

In 1579 the union was fatally weakened by the defection of the Roman Catholic Walloon provinces. By 1588 the Spanish, under Alessandro Farnese (the Duke of Parma), had reconquered the southern Low Countries and stood poised for a death blow against the nascent Dutch Republic in the north. Spain's concurrent enterprises against England and France at this time, however, allowed the republic to begin a counteroffensive. By the Twelve Years' Truce, begun in 1609, the Dutch frontiers were secured.

Fighting resumed in 1621 and formed a part of the general Thirty Years' War. After 1625 the Dutch, under Prince Frederick Henry of Orange, reversed an early trend of Spanish successes and scored significant victories. The Franco-Dutch alliance of 1635 led to the French conquest of the Walloon provinces and a sustained French drive into Flanders. The republic and Spain, fearful of the growing power of France, concluded a separate peace in 1648 by which Spain finally recognized Dutch independence.

Eijkman, Christiaan (b. Aug. 11, 1858, Nijkerk, Neth.—d. Nov. 5, 1930, Utrecht), Dutch physician and pathologist whose demonstration that beriberi is caused by poor diet led to the discovery of vitamins. Together with Sir Frederick Hopkins, he was awarded the 1929 Nobel Prize for Physiology or Medicine.

Eijkman received a medical degree from the University of Amsterdam (1883) and served as a medical officer in the Dutch East Indies (1883–85). He then worked with Robert Koch

in Berlin on bacteriological research and in 1886 returned to Java to investigate the cause of beriberi. In 1888 Eijkman was appointed director of the research laboratory for pathological anatomy and bacteriology and of the Javanese Medical School in Batavia (now

Eijkman

By courtesy of the World Health Organization

Jakarta). Eijkman sought a bacterial cause for beriberi. In 1890 polyneuritis broke out among his laboratory chickens. Noticing this disease's striking resemblance to the polyneuritis occurring in beriberi, he was eventually (1897) able to show that the condition was caused by feeding the fowl a diet of polished, rather than unpolished, rice.

Eijkman believed that the polyneuritis was caused by a toxic chemical agent, possibly originating from the action of intestinal microorganisms on boiled rice. He maintained this theory even after his successor in Batavia, Gerrit Grijs, demonstrated (1901) that the problem was a nutritional deficiency, later determined to be a lack of vitamin B₁ (thiamine). Eijkman returned to The Netherlands in 1896 to serve as a professor at the University of Utrecht (1898–1928).

Eileithyia, pre-Hellenic goddess of childbirth, who hindered or facilitated the process according to her disposition. The earliest evidence for her cult is at Amnisus, in Crete, where excavations indicate that she was worshipped continuously from Neolithic to Roman times. In Homer's writings she appears, sometimes in the plural, as a personification of birth pangs and is described as the daughter of Hera, the consort of Zeus. In later times Eileithyia tended to be identified with Hera or Artemis, goddesses who were also associated with marriage and childbirth.

Eilhart von OBERG (fl. late 12th century AD), German poet important in the history of the court epic and the development of the Tristan and Isolde story in Romance literature. Eilhart was a member of a Brunswick family mentioned in the records of Henry III of Saxony. His epic, *Tristrant und Isalde*, a laboured version of an Old French source now lost, dates from the last quarter of the 12th century. Uncertainty about his chronological position in relation to Heinrich von Veldeke (the Flemish author of *Eneit*, a retelling of the story of Aeneas), the corruptness of the early fragment, and later complete but modified versions of his epic make it difficult to assess Eilhart's importance. His epic was popular, for it provided the basis of a 15th-century prose novel, *Tristan und Isalde*, and a tragedy by Hans Sachs. Its relationship to the classic epic by Gottfried von Strassburg (fl. 1210) is clear but less significant.

Eimeria, genus of parasitic protozoans of the spore-producing phylum Apicomplexa (previously Sporozoa). *Eimeria*, which causes coccidiosis in livestock and wild animals, infects mainly the cells of the digestive tract, although it also attacks cells of the liver and the bile

duct. Symptoms of infection are diarrhea, weight loss, and general weakness. *Eimeria* is characterized by spore cases that contain four spores, each with two infective sporozoites. Among the common pathogenic species are *E. necatrix* and *E. tenella* (in poultry); *E. stiedae* (in rabbits); and *E. bovis*, *E. ellipsoidalis*, and *E. zuernii* (in cattle).

Ein Gedi (Israel): see 'En Gedi.

Einar Benediktsson (Icelandic poet): see Benediktsson, Einar.

Einar Hjörleifsson Kvaran (Icelandic writer): see Kvaran, Einar Hjörleifsson.

Einaudi, Luigi (b. March 24, 1874, Carrù, Italy—d. Oct. 30, 1961, Rome), Italian economist and statesman, the first president (1948–55) of the Republic of Italy.

After graduating from the University of Turin (1895), Einaudi contributed economic articles to *La Stampa*, Turin's leading newspaper. Between 1900 and 1935, his articles also appeared in *Corriere della Sera* and *Riforma Sociale*, of which he became director in 1908. He served on the faculty of the University of Turin from 1900 to 1943 and also taught at Milan.

In 1919 Einaudi was nominated to the Italian Senate, an honorary body. In 1936–43 he was the editor of *Rivista di Storia Economica* ("Review of Economic History"), which was suppressed by the Fascists, of whom he was an unwavering opponent. In 1943 he fled to Switzerland.

Returning to Italy in 1945, Einaudi was appointed governor of the Bank of Italy (1945–48). He was a member of the Constituent Assembly (1946–48), becoming deputy prime minister and minister of the budget (1947), a new post in which he successfully curbed inflation and stabilized the currency. In 1948 Einaudi became a member of the Senate of the Italian republic and on May 11 its first president. His term lasted until 1955.

Eindhoven, gemeente (commune), Noord-Brabant provincie, southern Netherlands. It lies along the Dommel River, 68 miles (109 km) southeast of Rotterdam.

Eindhoven was chartered in 1232 by Henry I, duke of Brabant. It developed after 1900 from a small village into one of the largest industrial centres of The Netherlands. In 1920 five adjoining municipalities were annexed, thereby increasing Eindhoven's population from 6,000 to 45,000 and vastly increasing its area. Since then the town's population has more than quadrupled. Much of this growth was due to Philips' Gloeilampenfabrieken, NV (1891), a major Dutch electronics manufacturer that was founded in Eindhoven and built several factories there. Though the corporation moved its headquarters to Amsterdam in the late 1990s, the city remained important to Philips as a centre of technology, with research and development laboratories. Eindhoven makes electronic and electrical products, and the manufacture of trucks is also important. It is a rail junction and is served by the Eindhoven and Beatrix canals and by an airport.

Eindhoven has a technical university (1956), the Van Abbe Museum of modern art (1936),

The Evolution, Eindhoven, Neth.

J. Allan Cash

Evolution (1966; a museum of science and technology), an astronomical observatory (1938), and a neo-Gothic church (1868). The city centre was badly damaged in World War II and was subsequently rebuilt. Pop. (1999 est.) 199,877; metropolitan area, 412,707.

Einem, Gottfried von (b. Jan. 24, 1918, Bern, Switz.—d. July 12, 1996, Oberdürnbach, Austria), Austrian composer whose operas and orchestral works combine Romantic elements with the more contemporary styles of jazz and atonality.

The son of an Austrian military attaché, Einem was educated in Germany and England. He helped several people escape from Nazi Germany, and in 1938 he was arrested by the Gestapo and was imprisoned for four months. After his release he became a conductor and coach at the Berlin State Opera and the Bayreuth Festival. He studied (1941–43) under the composer Boris Blacher, who later wrote the librettos for four of his operas.

Einem's first stage work, the ballet *Prinzessin Turandot* (1944), established his musical credentials. In 1945 he moved to Salzburg in Austria. *Dantons Tod* (*Danton's Death*), his first opera, with a text by Blacher based on Georg Büchner's play, was produced in 1947 at the Salzburg Festival. The opera *Der Prozess* (*The Trial*), which was inspired by Einem's arrest in 1938 and by Franz Kafka's novel, was first performed in 1953. Einem composed several symphonic works for American orchestras, including the *Philadelphia Symphony* (1960). His opera *Der Besuch der alten Dame* (1970; *The Visit of the Old Woman*), with a libretto by Friedrich Dürrenmatt based on his play, is considered to be his greatest operatic success. His other works include the *Piano Concerto* (1955) and the opera *Kabale und Liebe* (1975; *Cabal and Love*), based on Friedrich von Schiller's play.

Einem's best-known operas reflect the dark atmospheres of the stories that inspired them. His works combine the influence of late 19th-century Romantic composers with later styles, such as jazz, various kinds of dissonance, and atonality, in which the key or tonal centre of traditional music is rejected.

Einhard, also spelled EGINHARD (b. c. 770, Maingau, Franconia [Germany]—d. March 14, 840, Seligenstadt, Franconia), Frankish historian and court scholar whose writings are an invaluable source of information on Charlemagne and the Carolingian Empire.

Einhard was educated after 779 in the monastery of Fulda; his brilliance was soon recognized, and he was sent to Charlemagne's Palace School at Aachen in 791. He quickly became the trusted friend and adviser of the king and even proved to have a good deal of architectural skill, which he applied to the construction of the royal palace at Aachen. His political prominence increased after Charlemagne's death in 814 and the succession of Louis I the Pious, whom Einhard had been influential in raising to the throne. At that time Einhard was made abbot of several monasteries and was granted extensive lands.

Einhard probably wrote his *Vita Karoli Magni* ("Life of Charles the Great") about 830–833, after he had left Aachen and was living in Seligenstadt. Based on 23 years of service to Charlemagne and research in the royal annals, the book was expressly intended to convey Einhard's gratitude for Charlemagne's aid in his education. Following the model of Suetonius' *Lives of the Caesars*, and particularly the "Life of Augustus," the work was composed in an excellent Latin style and analyzed Charlemagne's family, his foreign and domestic achievements, his personal tastes, the administration of his kingdom, and his death.

The *Vita Karoli Magni* is brief and limited in scope and detail, but it provides a generally accurate and direct account of the period. As an example of the classical renaissance at the

Carolingian court and as the first medieval biography of a lay figure, the work was highly admired and copied in its own time.

Einsiedeln (German), French NOTRE-DAME-DES-ERMITES, town, Schwyz canton, northeast central Switzerland, on the right bank of the Alp stream, northeast of Schwyz city. It developed around the Benedictine abbey, founded in 934. The abbey became a principality of the Holy Roman Empire in 1274 and belonged

Benedictine abbey, Einsiedeln, Switz.
Beringer and Pampaluch

to Schwyz after 1386. Its wooden statue, the "Black Virgin" (which owes its name to the discoloration caused by the candles burned before it through the centuries), became a sacred object of European pilgrims from the 14th century. Huldrych Zwingli, the religious reformer, was the parish priest from 1516 to 1518, and the Renaissance physician Paracelsus was born near the town. In addition to being the largest and most famous Swiss pilgrimage resort, Einsiedeln is a winter sports centre and has printing, machinery, and furniture industries. The population is largely German speaking and Roman Catholic. Pop. (1998) 12,200.

Einstein, Albert (b. March 14, 1879, Ulm, Württemberg, Ger.—d. April 18, 1955, Princeton, N.J., U.S.), German-American physicist who developed the special and general theories of relativity, the equivalence of mass and energy, and the photon theory of light.

A brief account of the life and works of Albert Einstein follows; for a full biography, see MACROPAEDIA: Einstein.

Einstein earned a doctorate at the Polytechnic Academy in Zürich in 1905, and in the same year he published four research papers, each containing a great discovery in physics. International fame came to Einstein in 1919 with the announcement that a prediction of his general theory of relativity was verified. Two years later he was awarded the Nobel Prize for Physics for his photoelectric law and work in theoretical physics.

During the winter of 1933 Einstein joined the Institute for Advanced Study in Princeton, N.J., and became a U.S. citizen in 1940. At the institute Einstein continued his work on general relativity, the unified field theories, and the critical discussion of the interpretation of quantum theory. He also cooperated with charitable and social organizations to help the large number of refugees who were arriving in the United States from Nazi Germany.

In 1939 it became known that two German physicists had discovered the fission of uranium. Enrico Fermi, an Italian physicist who at that time had arrived in the United States, became aware of the fact that if the fission could be made into a self-perpetuating chain reaction, enormous quantities of energy could be released. Fermi and the Hungarian physicist Leo Szilard decided to point this out to the U.S. government. Szilard and Eugene Wigner, another Hungarian physicist, asked Einstein to appeal directly to Pres. Franklin D. Roosevelt, pointing out the dangers if Germany succeeded in developing a bomb based on these principles. Einstein's letter to President

Roosevelt resulted in the Manhattan Project and in the development of the atom bomb. In 1945 Einstein retired from his position at the institute but continued to work there until his death.

Einstein, Alfred (b. Dec. 30, 1880, Munich—d. Feb. 13, 1952, El Cerrito, Calif., U.S.), eminent German-American musicologist and critic.

Einstein was born into a family of scholars (Albert Einstein was his cousin), and, as a young man, studied law for a year before completing his doctorate (1903) in musicology and composition at the University of Munich. As the first editor (1918–33) of the *Zeitschrift für Musikwissenschaft* ("Journal of Musicology"), he held a position of considerable authority in his field. Einstein lived in Munich until 1927, where he was also the music critic of the *Münchner Post*. From 1927 to 1933 he was music critic for the *Berliner Tageblatt*. After the advent of the Nazi regime, he settled first in London and then near Florence. In 1939 he came to the United States, which became his permanent home, and taught music at Smith College until his retirement in 1950. He also taught at Columbia University, Princeton, the University of Michigan, and Yale. His writings include *Geschichte der Musik* (1917; *A Short History of Music*, 1936) and many valuable papers for the publications of the International Music Society and other learned editions; his articles for the *Musical Quarterly* are especially notable. A skilled editor, Einstein revised Riemann's *Musik Lexicon* (1919–29) and Köchel's catalogue of Mozart's works (1937) and produced new editions of Mozart's last 10 string quartets and a biography, *Mozart, His Character, His Work* (1945). His most significant work, however, is considered to be *The Italian Madrigal*, 3 vol. (1949), which was the first comprehensive study of this subject in any language.

einsteinium (Es), synthetic chemical element of the actinide series in Group IIIb of the periodic table, atomic number 99. Not occurring in nature, einsteinium (as the isotope einsteinium-253), produced by intense neutron irradiation of uranium-238, was identified in December 1952 by Albert Ghiorso and co-workers at Berkeley, Calif., in debris taken from the first thermonuclear or hydrogen-bomb explosion, in the South Pacific (November 1952).

The material was first collected on filter paper by drone airplanes flying through the radioactive-explosion clouds; later, einsteinium and element 100 (fermium) were positively identified in coral gathered from Eniwetok Atoll. Einsteinium metal has not yet been prepared.

All einsteinium isotopes are radioactive. Mixtures of the isotopes einsteinium-253 (20.5-day half-life), einsteinium-254 (276-day half-life), and einsteinium-255 (38.3-day half-life) can be produced by intensive slow-neutron irradiation of elements of lower atomic number, such as plutonium. Tracer studies indicate that the +3 oxidation state exists in aqueous solution, presumably as the Es³⁺ ion; there is also some evidence for a +2 state. Einsteinium has chemical properties very similar to those of the other actinide elements in the tripositive state. Einsteinium-255 and einsteinium-256 eject electrons (beta particles) to form isotopes of fermium (atomic number 100), and einsteinium-253 was used to produce mendelevium (atomic number 101).

atomic number	99

Einstein's mass-energy relation, relationship between mass (*m*) and energy (*E*) in the special theory of relativity of Albert Einstein,

embodied by the formula $E = mc^2$, where *c* equals 300,000 kilometres (186,000 miles) per second—i.e., the speed of light.

In physical theories prior to that of special relativity, mass and energy were viewed as distinct entities. Furthermore, the energy of a body at rest could be assigned an arbitrary value. In special relativity, however, the energy of a body at rest is determined to be mc^2 . Thus, each body of mass *m* possesses mc^2 of "rest energy," which potentially is available for conversion to other forms of energy. The mass-energy relation, moreover, implies that if energy is released from the body as a result of such a conversion, then the mass of the body will decrease. Such a conversion of rest energy to other forms of energy occurs in ordinary chemical reactions, but much larger conversions occur in nuclear reactions. This is particularly true in the case of nuclear-fusion reactions that transform hydrogen to helium, in which 0.7 percent of the original rest energy of the hydrogen is converted to other forms of energy.

Einthoven, Willem (b. May 21, 1860, Semarang, Java, Dutch East Indies—d. Sept. 29, 1927, Leiden, Neth.), Dutch physiologist who was awarded the 1924 Nobel Prize for Physiology or Medicine for his discovery of the electrical properties of the heart through the electrocardiograph, which he developed as a practical clinical instrument and an important tool in the diagnosis of heart disease.

Einthoven
Archiv für Kunst und Geschichte, West Berlin

Einthoven was graduated in medicine from the University of Utrecht and served as professor of physiology at the University of Leiden from 1886 until his death. In 1903 he devised the first string galvanometer, known as the Einthoven galvanometer; with this instrument he was able to measure the changes of electrical potential caused by contractions of the heart muscle and to record them graphically. He coined the term electrocardiogram for this process. Einthoven recognized differences in the records or tracings obtained from different kinds of heart disease. From 1908 to 1913 he studied the patterns of records of normal heart activity in order to gain precision in recognizing and interpreting deviations.

Einthoven continued to develop electrode arrangements, and the present-day standard limb leads were originally described and used by him.

Eirik (Norwegian personal name): see under Erik.

Eiseley, Loren (Corey) (b. Sept. 3, 1907, Lincoln, Neb., U.S.—d. July 9, 1977, Philadelphia), U.S. anthropologist, educator, and author who wrote about anthropology for the lay person in eloquent, poetic style.

Eiseley was educated at the University of

Nebraska (B.A., 1933) and the University of Pennsylvania (M.A., 1935; Ph.D., 1937) and began his academic career at the University of Kansas (1937–44) and Oberlin College (1944–47). In his long association with the University of Pennsylvania he served as professor of anthropology (1947–61), curator of early man at the University Museum (1947–77), provost of the university (1959–61), and professor of anthropology and the history of science (1961–77). He also served as a consultant to museums, foundations, and the U.S. government and was the host–narrator of the television series *Animal Secrets* (1966–67). He received numerous honours, including membership in the National Institute of Arts and Letters and the American Academy of Arts and Sciences.

Eiseley's scientific research centred on the dating of index fossils of the Pleistocene Epoch and the extinction of Ice Age fauna. His writings, however, covered the wide range of the question of evolution and its implications for humanity. He published more than a dozen books, including *The Immense Journey* (1957), *Darwin's Century* (1958), *The Firmament of Time* (1960; reprinted 1970), *The Unexpected Universe* (1969), and *The Night Country* (1971). He also published an autobiography, *All the Strange Hours* (1975), and a collection of poetry, *Another Kind of Autumn* (1977). A collection of his poems and selected essays, *The Star Thrower*, was published in 1979.

Eiselsberg, Anton, Freiherr von (baron of) (b. July 31, 1860, Schloss Steinhaus, Austrian Empire—d. Oct. 25, 1939, near St. Valentin, Austria), Austrian surgeon, teacher, and researcher who carried out important studies in the physiology of the thyroid gland and surgery of the central nervous system.

Eiselsberg studied medicine at Vienna, Würzburg, Zürich, and Paris. In 1884 he received his M.D. from Vienna, where he was a pupil of and assistant to the brilliant Viennese surgeon Theodor Billroth. He was professor of surgery at Utrecht (1893), Königsberg (1896), and Vienna (1901). In 1890 he made note of the frequent occurrence of tetany cramps after goiter operations and two years later produced tetany experimentally by removal of the parathyroid glands. He later studied thyroid cancer and did important work in pituitary surgery.

It was while he was a professor at Vienna that Eiselsberg achieved a reputation as the leader of neurosurgery in Austria. He was one of the founders of modern gastrointestinal surgery and the first surgeon in Europe to remove a spinal column tumor. He pioneered in brain surgery and also performed studies on streptococcal infections.

Eiselsberg received honorary degrees from universities at Athens, Budapest, Debrecen, Edinburgh, Geneva, Leiden, Paris, and Vienna.

Eisenach, city, Thuringia *Land* (state), central Germany, on the northwestern slopes of the Thüringer Wald, at the confluence of the Hösels and Nesse rivers, west of the city of Erfurt. Founded by the landgraves of Thuringia c. 1150, Eisenach fell to the Saxon House of Wettin in 1264 and was chartered in 1283. It was intermittently the seat of a separate Saxon duchy between 1596 and 1741, when it fell to Saxe-Weimar. In 1817 the festival of the national political student movement took place there; in 1859 the German Nationalverein (National Society) to promote unification was founded there; and in 1869 the Social Democratic Workers' Party was founded at the Congress of Eisenach.

Notable landmarks include the Romanesque Church of St. Nicholas; the Gothic St. George's Church; the Thuringian Museum in the for-

The Wartburg, on a hill above Eisenach, Ger.

mer ducal palace (1742–45); the 13th-century Dominican Church; the Lutherhaus, where Martin Luther stayed as a schoolboy; museums in memory of the composers Johann S. Bach (born at Eisenach in 1685) and Richard Wagner and the novelist Fritz Reuter; and a botanical garden. On a hill above the city is the Wartburg, an ancient castle of the landgraves, where Martin Luther began his translation of the Bible.

Tourism thrives, and industries include the manufacture of motor vehicles (the Wartburg cars), machinery, metal and wood products, chemicals, and electrotechnical goods. Eisenach is a centre of the important Werra potash field. Pop. (2001 est.) 43,400.

Eisenberg, Cora (puppeteer): see Baird, Bil and Cora.

Eisenerz, town, *Bundesland* Steiermark (federal province of Styria), Austria, in the Erzbach Valley, at the northern foot of the Erzberg (Ore Mountain; 5,033 ft [1,534 m]), northwest of Leoben. Iron has been mined on the Erzberg by terraced open-pit methods since Roman times, and Eisenerz ("iron ore") is the principal centre of Austrian iron mining, supplying most of the nation's total output. Notable landmarks include the fortified St. Oswald's Church (1279–1517), the old mining Shift Tower with a bell that signaled changes of shifts in the mine (1581), and a mining museum. A few miles northwest of Eisenerz are the castle of Leopoldstein and the Leopoldsteiner See, a lake 1½ mi (2.4 km) long. Pop. (1991) 7,800.

Eisenhower, Dwight D(avid) (b. Oct. 14, 1890, Denison, Texas, U.S.—d. March 28, 1969, Washington, D.C.), 34th president of

Eisenhower, 1952

Fabian Bachrach

the United States (1953–61), who had been supreme commander of the Allied forces in western Europe during World War II.

Early career. He was the third of seven sons of David Jacob and Ida Elizabeth (Stover) Eisenhower. In the spring of 1891 the Eisenhowers returned to Abilene, Kan., where their ancestors had settled as part of a Mennonite colony. Dwight's father worked in a creamery; the family was poor, and Dwight and his brothers were introduced to hard work and a strong religious tradition at an early age.

"Ike," as Dwight was called, was a fun-loving youth who enjoyed sports, while taking only a moderate interest in his studies. He graduated from Abilene High School in 1909, supported a brother's college education for a year, and then entered the U.S. Military Academy at West Point. He excelled in football but injured a knee in his second year at the academy and was forced to stop playing. In the remarkable class of 1915—which was to produce 59 generals—he ranked 61st academically and 125th in discipline out of the total of 164 graduates.

He was commissioned a second lieutenant and was sent to San Antonio, Texas, where he met Mamie Geneva Doud, daughter of a successful Denver meat packer. They were married in 1916 and had two sons: Doud Dwight, born in 1917, who died of scarlet fever in 1921, and John Sheldon Doud, born in 1922.

During World War I, Eisenhower commanded a tank training centre, was promoted to captain, and received the Distinguished Service Medal. The war ended just before he was to be sent overseas. From 1922 to 1924 he was assigned to the Panama Canal Zone and there came under the inspiring influence of his commander, Brig. Gen. Fox Conner. With Conner's assistance, Eisenhower was selected to attend the army's command and general staff school at Ft. Leavenworth. Then a major, he graduated first in a class of 275 in 1926 and two years later graduated from the Army War College. He then served in France, writing a guidebook of World War I battlefields, and in Washington, D.C., before becoming an aide to army chief of staff Gen. Douglas MacArthur in 1933. Two years later he accompanied MacArthur to the Philippines to assist in the reorganization of the commonwealth's army and while there was awarded the Distinguished Service Star of the Philippines and the rank of lieutenant colonel. He returned to the United States shortly after Germany's invasion of Poland initiated the European phase of World War II and in March 1941 became a full colonel. Three months later he was made chief of staff of the 3rd Army and soon won the attention of army chief of staff Gen. George C. Marshall for his role in planning war games involving almost 500,000 troops.

Supreme commander. When the United States entered World War II in December 1941, Marshall appointed Eisenhower to the army's war plans division in Washington, where he prepared strategy for an Allied invasion of Europe. He was made a brigadier general in September 1941, and he was promoted to major general in March 1942 and named head of the operations division of the War Department. In June, Marshall selected him over 366 senior officers to be commander of U.S. troops in Europe. Eisenhower's rapid advancement, after a long army career spent in relative obscurity, was due not only to his knowledge of military strategy and a talent for organization but also to his ability to persuade, to mediate, and to be agreeable. Men from a variety of backgrounds and nationalities, impressed by his friendliness, humility, and persistent optimism, liked and trusted him.

Eisenhower was promoted to lieutenant general in July 1942 and named to head Operation Torch, the Allied invasion of French North Africa. This first major Allied offensive

of the war was launched on Nov. 8, 1942, and successfully completed in May 1943. Eisenhower's decision to work during the campaign with the French admiral Jean-François Darlan, who had collaborated with the Germans, aroused a storm of protest from the Allies; but his action was defended by Pres. Franklin D. Roosevelt. A full general since February, Eisenhower then directed the amphibious assault of Sicily and the Italian mainland, which resulted in the fall of Rome on June 4, 1944.

During the fighting in Italy, Eisenhower participated in plans to cross the English Channel for an invasion of France. On Dec. 24, 1943, he was appointed supreme commander of the Allied Expeditionary Forces, and the next month he was in London making preparations for the massive thrust into Europe. On June 6, 1944, he gambled on a break in bad weather and ordered the Channel crossed. About 1,000,000 men in nearly 4,000 ships landed in Normandy and began to fight their way into the heart of France. On August 25 Paris was liberated. After overcoming a fierce German counterattack in the Ardennes in December, the Allies crossed the Rhine on March 7, 1945. Germany surrendered on May 7, and the war in Europe was over. In the meantime, in December 1944, Eisenhower had been made a five-star general.

He was given a hero's welcome upon returning to the United States for a visit in June 1945. His intended retirement was delayed by Pres. Harry S. Truman when he was named in November to replace General Marshall as chief of staff. For more than two years Eisenhower directed demobilization of the wartime army and worked to unify the armed services under a centralized command. In May 1948 he left active duty, the most popular and respected soldier in the United States, to become president of Columbia University. His book *Crusade in Europe*, published that fall, made him a wealthy man.

Eisenhower's brief career as an academic administrator was not especially successful. His technical education and military experience prepared him poorly for the post, and his distrust of intellectuals made relations with faculty members difficult. In the fall of 1950 President Truman asked him to become supreme commander of the North Atlantic Treaty Organization (NATO), and in early 1951 he flew to Paris to assume his new position. For the next 15 months he devoted himself to the task of creating a united military organization in western Europe to be a defense against the possibility of Communist aggression.

First term as president. As early as 1943 Eisenhower was mentioned as a presidential candidate. His personal qualities and military reputation prompted both parties to woo him. As the campaign of 1952 neared, Eisenhower let it be known that he was a Republican, and the eastern wing of the party, headed by Gov. Thomas E. Dewey of New York, made an intensive effort to persuade him to seek the Republican presidential nomination. His name was entered in several state primaries against the more conservative Sen. Robert A. Taft of Ohio. Although the results were mixed, Eisenhower decided to run. In June 1952 he retired from the army, after 37 years of service, returned to the United States, and began to campaign actively. At the party convention in July, after a bitter fight with Taft supporters, Eisenhower won the nomination on the first ballot. His running mate was Sen. Richard M. Nixon of California. Democrats nominated Gov. Adlai E. Stevenson of Illinois for president and Sen. John Sparkman of Alabama for vice president.

Despite his age, Eisenhower campaigned tirelessly, impressing millions with his warmth and sincerity. He urged economy and honesty in government and promised to visit Korea to explore the possibilities for ending the Korean War, which had broken out in 1950 between

Communist North Korea and pro-Western South Korea and soon involved United Nations (mainly United States) and Communist Chinese forces. Many Republicans, including Nixon, spoke of pro-Communist disloyalty within the Truman administration and called for stringent anti-subversive measures. The Eisenhower-Nixon ticket won handily, carrying 39 states, winning the electoral vote, 442 to 89, and collecting more than 33,000,000 popular votes. The Republican Party won control of Congress by a slim margin but lost both houses two years later.

Unlike his two Democratic predecessors, Eisenhower did not believe in strong executive leadership of the federal government. Because of his military background and limited knowledge of government, he delegated authority to his advisers and Cabinet members and did not participate actively in the detailed work of the executive departments. His assistant, former New Hampshire governor Sherman Adams, was a powerful figure in the administration. The Chief Executive, Adams wrote,

expected me to manage a staff that would boil down, simplify and expedite the urgent business that had to be brought to his attention and to keep as much work of secondary importance as possible off his desk.

Eisenhower's basically conservative views on domestic affairs were shared by his secretary of the treasury, George M. Humphrey. The administration's domestic program, which came to be labelled "modern Republicanism," called for reduced taxes, balanced budgets, a decrease in government control over the economy, and the return of certain federal responsibilities to the states. Controls over rents, wages, and prices were allowed to expire, and in 1954 there was a slight tax revision. At Eisenhower's insistence, Congress transferred title to valuable tideland oil reserves to the states. But there was no sharp break with policies inherited from previous Democratic administrations. The needs of an expanding population (from 155,000,000 to 179,000,000 during the Eisenhower era) and the country's overseas commitments caused budget deficits during five out of eight years. The minimum wage was increased to \$1 per hour, the Social Security System was broadened, and in the spring of 1953 the Department of Health, Education, and Welfare was created.

The right wing of his party clashed with the President more often than did the Democrats during his first term. In part to preserve party unity, he refused to condemn publicly Sen. Joseph R. McCarthy's irresponsible charges of Communist influence within the government. Although privately Eisenhower expressed his distaste for the Senator, at times he seemed to encourage the attacks of McCarthyites. Hundreds of federal employees were fired under his expanded loyalty-security program. With his approval, Congress passed a law designed to outlaw the American Communist Party. Following the sensational hearings on McCarthy's charges against army and civilian officials, televised nationally for five weeks in the spring of 1954, McCarthy's popularity waned, as did the anti-Communist hysteria.

Foreign affairs drew much of Eisenhower's attention; he and his secretary of state John Foster Dulles worked hard at achieving peace and constructing collective defense agreements designed to check the spread of Communism. Eisenhower visited Korea shortly after his inauguration. Partly, perhaps, because of Joseph Stalin's death in March, the President was able to negotiate a truce for the Korean War in July 1953. In December of that year, he proposed that the countries of the world pool atomic information and materials under the auspices of an international agency. This "Atoms for Peace" suggestion bore fruit in 1957, when 62 countries formed the International Atomic Energy Agency.

In July 1955 the President met with leaders of Great Britain, France, and the Soviet Union at a summit conference in Geneva. His "open-skies" proposal, by which the United States and the Soviet Union would permit continuous air inspection of each other's military installations, was welcomed by world opinion but was rejected by the U.S.S.R. In September 1954, Eisenhower and Dulles succeeded in creating the Southeast Asia Treaty Organization (SEATO) to prevent further Communist expansion in that part of the world. It was composed of the United States, France, Great Britain, Australia, New Zealand, the Philippines, Thailand, and Pakistan. NATO was strengthened in 1955 by the inclusion of West Germany.

Critics contended that there were frequent disparities between the administration's words and deeds in the field of foreign relations. While threatening to "unleash" Nationalist Chinese leader Chiang Kai-shek, the United States signed a defense treaty with Nationalist China in December 1954 that inhibited Chiang's ability to attack the Communist Chinese. Dulles spoke of "liberating" captive peoples in Communist countries, but the administration limited itself to protests when uprisings occurred in East Germany (1953) and Hungary (1956). While the Secretary of State promised "massive retaliation" against Communist aggression, the President made the decision to limit America's role in the Indochina crisis between France and Ho Chi Minh's guerrillas to financial and military aid.

Second term. A heart attack in September 1955 and an operation for ileitis in June 1956 raised considerable doubt about Eisenhower's ability to serve a second term. But he recovered quickly, and the Republican Convention unanimously endorsed the Eisenhower-Nixon ticket on the first ballot. Democrats again selected Adlai E. Stevenson and named Sen. Estes Kefauver of Tennessee as his running mate. Eisenhower's great personal popularity turned the election into a landslide victory, the most one-sided race since 1936. The Democrats, however, once more captured both houses of Congress, a feat they were to duplicate in 1958. Eisenhower was the first president to serve with three Congresses controlled by the opposition party.

The election campaign of 1956, however, had been complicated by a crisis in the Middle East over Egypt's seizure of the Suez Canal. The subsequent attack by Great Britain, France, and Israel on Egypt and Egypt's support by the Soviet Union prompted the President to go before Congress in January 1957 to urge adoption of what came to be called the Eisenhower Doctrine, a pledge to send U.S. armed forces to any Middle Eastern country requesting assistance against Communist aggression.

When the U.S. Supreme Court, on May 17, 1954, declared racial segregation in public schools unconstitutional, controversy and violence broke out, especially in the South. In September 1957 Eisenhower dispatched 1,000 federal troops to Little Rock, Ark., to halt an attempt by Gov. Orval E. Faubus to obstruct a federal court order integrating a high school. This action was the most serious challenge of his presidency. On several occasions Eisenhower had expressed distaste for racial segregation, though he doubtless believed that the process of integration would take time. The Civil Rights Act of 1957 was the first such law passed since 1875.

On Oct. 4, 1957, the Soviet Union launched Sputnik I, the first man-made satellite to orbit the Earth. Americans were shocked by the achievement, and many blamed Eisenhower for the administration's insistence on low military budgets and its failure to develop a space

program. Steps were taken to boost space research and to provide funds to increase the study of science. The National Aeronautics and Space Administration was created in July 1958. The administration again came under fire in the fall of 1957 for an economic recession that lasted through the following summer. Eisenhower refused to lower taxes or increase federal spending to ease the slump for fear of fueling inflation.

Following the death of Dulles in the spring of 1959, Eisenhower assumed a more personal role in the direction of American foreign policy. He traveled to Europe, Africa, and Asia in December 1959 and toured Latin America in February and March 1960. To improve relations with the Soviet Union, he invited Premier Nikita S. Khrushchev to visit the United States. Khrushchev toured parts of the country in September 1959 and held private talks with Eisenhower. Another summit meeting was planned, and a new era of personal diplomacy seemed at hand. But when a United States U-2 reconnaissance plane was shot down over the U.S.S.R. in May 1960, Khrushchev scuttled the talks and angrily withdrew his invitation to Eisenhower to visit the Soviet Union. Eisenhower admitted that the flights had gone on for four years and shouldered much of the blame for the ill-timed affair. In January 1961, during the last weeks of the Eisenhower administration, the United States broke diplomatic relations with Cuba, which for two years had been under the control of Fidel Castro.

Though his administrations had a great many critics, Eisenhower remained extraordinarily popular with the American people. When he left office, Congress restored his rank as general of the army. He retired to his farm in Gettysburg, Pa., and devoted much of his time to his memoirs. In 1963 he published *Mandate For Change*, which was followed in 1965 by *Waging Peace*. A lighter work, *At Ease: Stories I Tell to Friends*, appeared in 1967.

(T.C.R.)

BIBLIOGRAPHY. Eisenhower's entire career is presented in Marquis William Childs, *Eisenhower: Captive Hero* (1958), a convincing interpretation; Stephen E. Ambrose, *Eisenhower*, 2 vol. (1983-84); and Robert F. Burk, *Dwight D. Eisenhower, Hero and Politician* (1986). Michael R. Beschloss and Vincent Virga, *Eisenhower: A Centennial Life* (1990), is extensively illustrated. David Eisenhower, *Eisenhower at War* (1986-), is by his grandson. His presidency is examined in Emmet John Hughes, *The Ordeal of Power* (1963, reissued 1975), a brilliant critique of the first term; Charles C. Alexander, *Holding the Line: The Eisenhower Era, 1952-1961* (1975); Dean Albertson (ed.), *Eisenhower As President* (1963), containing first-rate assessments; and Chester J. Pach, Jr., and Elmo Richardson, *The Presidency of Dwight D. Eisenhower*, rev. ed. (1991).

Eisenhower Doctrine (Jan. 5, 1957), in the Cold War period after World War II, U.S. foreign-policy pronouncement by President Dwight D. Eisenhower promising military or economic aid to any Middle Eastern country needing help in resisting communist aggression. The doctrine was intended to check increased Soviet influence in the Middle East, which had resulted from the supply of arms to Egypt by communist countries as well as from strong communist support of Arab states against an Israeli, French, and British attack on Egypt in October 1956. Eisenhower proclaimed, with the approval of Congress, that he would use the armed forces to protect the independence of any Middle Eastern country seeking American help. The Eisenhower Doctrine represented no radical change in U.S. policy; the Truman Doctrine had pledged similar support to Greece and Turkey 10 years earlier. It was a continuation of the U.S. pol-

icy of containment of or resistance to any extension of the Soviet sphere of influence.

Eisenhower Trophy, golf trophy awarded to the winner of a biennial international amateur competition open to teams of three or four players from all nations. The competition was first held, under sponsorship of the World Amateur Golf Council, in 1958, and the trophy was named for President Dwight D. Eisenhower, a golf enthusiast. The contest consists of 72 holes of stroke play (the team with the lowest number of strokes wins). The three low scores of each national team for each 18-hole round are totaled to give the team score for that round.

Eisenhüttenstadt, city, Brandenburg *Land* (state), eastern Germany. The city lies along the Oder River at the Polish border, southeast of Frankfurt an der Oder. It was formed in 1961 by the union of Fürstenberg, Stalinstadt, and Schönfliess. Stalinstadt was a planned-residence town for workers employed in a metallurgical complex established in 1951 just west of the old town of Fürstenberg. Now one of the chief industrial cities of eastern Germany and a principal producer of pig iron and steel products, Eisenhüttenstadt is a rail junction with an inland harbour (the eastern terminus of the Oder-Spree Canal) and shipyards. Glass, briquettes, and coal-tar dyes are manufactured, and the city is an important frontier trade centre. Pop. (1994 est.) 47,545.

Eisenstadt, city, capital (since 1925) of Burgenland *Bundesland* (federal state), eastern Austria. It lies at the southern end of the Leitha Mountains, south of Vienna. Mentioned in 1264, it was a free city of Hungary from 1648 until Burgenland was ceded to Austria in 1920. Eisenstadt's notable landmarks include the former castle of the Esterházy princes (14th century; rebuilt 1663-72); the Mount Calvary Church (Kalvarienbergkirche), with

Mount Calvary Church (Kalvarienbergkirche), housing the tomb of the composer Joseph Haydn in Eisenstadt, Austria

H.R. Schneider—ZEFA

the tomb of the composer Joseph Haydn; the house where Haydn lived from 1766 to 1790, now a museum; the parish church (1450-1522); and the Franciscan church (1625-30), with the Esterházy family vault. The castle of Forchtenstein, former seat of the counts von Mattersdorf, is nearby. Eisenstadt has orchards and vineyards, and its manufactures include textiles, ski equipment, and metal kitchenware. Pop. (1991) 10,349.

Eisenstaedt, Alfred (b. Dec. 6, 1898, Dirschau, West Prussia [now Tczew, Pol.]—d. Aug. 23, 1995, Oak Bluffs, Mass., U.S.), pioneering German photojournalist whose widely printed pictures vividly chronicled the period beginning with the early 1930s.

Eisenstaedt served in the German army in World War I from 1916 to 1918, sustaining

injuries in both legs. After becoming an enthusiastic amateur photographer, he decided in 1929 to turn professional, thus becoming a part of the active photojournalism field that was developing in Germany during the 1920s and early '30s. In this period he was particularly influenced by Erich Salomon, a pioneer in candid photography.

In the early 1930s he developed skill in the use of the 35-mm Leica camera, and his work began to appear in many European picture magazines. He covered the rise of Adolf Hitler and in 1935 made a notable series on Ethiopia, just before the Italian invasion. Also in 1935 he left Germany for the United States, and in April 1936 he became one of the first four photographers hired by the new picture magazine *Life*. One of his pictures appeared on the cover of the second issue, and they continued to appear in following issues. He became the leading *Life* photographer, eventually with some 2,500 picture stories and 90 cover photos to his credit.

Eisenstaedt made outstanding portraits of kings, dictators, and motion-picture stars, but he also sensitively photographed ordinary people in workaday situations. Characterizing his work, Eisenstaedt once said that all a photojournalist has to do is "to find and catch the storytelling moment." He described his life and work in *The Eye of Eisenstaedt* (1969). Other anthologies of his photographs include *Witness to Our Time* (1966), *People* (1973), and *Eisenstaedt: Germany* (1981).

Eisenstein, Ferdinand Gotthold Max (b. April 16, 1823, Berlin, Prussia [Germany]—d. Oct. 11, 1852, Berlin), German mathematician whose work on the theory of elliptic functions and on quadratic and cubic forms led to theorems for quadratic and bi-quadratic residues, a reciprocity theorem for cubic residues, cyclotomy, and quadratic partition of prime numbers.

Eisenstein entered the University of Berlin in 1843 and the following year published 25 papers in August Leopold Crelle's prestigious mathematical journal. Crelle introduced him to the German naturalist Alexander von Humboldt, who became his lifelong mentor and sponsor. Humboldt encouraged an exchange of correspondence with German mathematician and physicist Carl Friedrich Gauss, on whose work Eisenstein elaborated. He became a professor of mathematics at the University of Berlin in 1847, and later that year his *Mathematische Abhandlungen* ("Mathematical Treatises") was published. He was elected to the Berlin Academy shortly before his death.

Eisenstein, Sergey Mikhaylovich (b. Jan. 23, 1898, Riga, Latvia, Russian Empire—d. Feb. 11, 1948, Moscow, Russia, U.S.S.R.), Russian film director and theorist whose work includes the three film classics *Potemkin* (1925), *Alexander Nevsky* (1938), and *Ivan the Terrible* (released in two parts, 1944 and 1958). In his concept of film montage, images, perhaps independent of the "main" action, are presented for maximum psychological impact.

Eisenstein, who was of Jewish descent through his paternal grandparents, lived in Riga, where his father, Mikhail, a civil engineer, worked in shipbuilding until 1910, when the family moved to St. Petersburg. After studying in 1916-18 at the Institute of Civil Engineering, Eisenstein decided on a career in the plastic arts and entered the School of Fine Arts.

With the outbreak of the Russian Revolution of 1917, he enlisted in the Red Army and helped to organize and construct defenses and to produce entertainment for the troops. Having now found his vocation, he entered, in 1920, the Proletkult Theatre (Theatre of the People) in Moscow as an assistant decorator. He rapidly became the principal decorator and then the codirector. As such, he designed the costumes and the scenery for sev-

Eisenstein, on location for *October* in 1927
Sovfoto

eral notable productions. At the same time, he developed a strong interest in the Kabuki theatre of Japan, which was to influence his ideas on film. For his production of *The Wise Man*, an adaptation of Aleksandr Ostrovsky's play, he made a short film, "Glumov's Diary," which was shown as part of the performance in 1923. Soon afterward the cinema engaged his full attention, and he produced his first film, *Strike*, in 1924, after having published his first article on theories of editing in the review *Lef*, edited by the great poet Vladimir Mayakovsky. He said there that in place of the static reflection of an event, expressed by a logical unfolding of the action, he proposed a new form: the "montage of attractions"—in which arbitrarily chosen images, independent of the action, would be presented not in chronological sequence but in whatever way would create the maximum psychological impact. Thus, the filmmaker should aim to establish in the consciousness of the spectators the elements that would lead them to the idea he wants to communicate; he should attempt to place them in the spiritual state or the psychological situation that would give birth to that idea.

These principles guided Eisenstein's entire career. In the realistic films that he undertook, however, such a technique is effective only when it utilizes the concrete elements implicit in the action; it loses validity when its symbols are imposed upon reality instead of being implied by it. Thus, in *Strike* (1924), which recounts the repression of a strike by the soldiers of the tsar, Eisenstein juxtaposed shots of workers being mowed down by machine guns with shots of cattle being butchered in a slaughterhouse. The effect was striking, but the objective reality was falsified.

Possessed by his theory, Eisenstein was bound to succumb often to this failing. *Potemkin*, also called *The Battleship Potemkin*, happily escaped it. Ordered by the Central Executive Committee of the U.S.S.R. to commemorate the Revolution of 1905, the film, made in the port and the city of Odessa in 1925, had a momentous impact and still remains among the masterpieces of the world cinema. (In 1958 it was voted the best film ever made, by an international poll of critics.) Its greatness lies not merely in the depth of humanity with which the subject is treated, nor in its social significance, nor in the formal perfection of its rhythm and editing; but rather, it is each of these magnified and multiplied by the others.

Having by this accomplishment earned recognition as the epic poet of the Soviet cinema, Eisenstein next made a film entitled *October*, or *Ten Days That Shook the World*, which in the space of two hours dealt with the shifts of power in the government after the 1917 Rev-

olution, the entrance on the scene of Lenin, and the struggle between the Bolsheviks and their political and military foes. If the film was sometimes inspired, it was also disparate, chaotic, and often confused.

Also uneven, but better balanced, was *Old and New* (originally titled *The General Line*), filmed in 1929 to illustrate the collectivization of the rural countryside. Eisenstein made of it a lyric poem, as calm and as expansive as *Potemkin* had been violent and compact.

In 1929, putting to profit a visit to Paris, he filmed *Romance sentimentale* (*Sentimental Melody*), an essay in counterpoint of images and music. Engaged by Paramount studios in 1930, he left for Hollywood, where he worked on adaptations of the novels *L'Or* ("Sutter's Gold"), by Blaise Cendrars, and *An American Tragedy*, by Theodore Dreiser. Refusing to modify his scripts to meet studio demands, however, he broke the contract and went to Mexico in 1932 to direct *Que viva Mexico!*, with capital collected by the novelist Upton Sinclair.

The film never was completed. After disagreements between Eisenstein and Sinclair, some of the negatives were sold and released as the films *Thunder over Mexico*, *Eisenstein in Mexico*, and *Death Day* (1933–34). In 1939 a fourth film, entitled *Time in the Sun*, was made from the footage. None of these films bears more than a distant resemblance to the original conception.

After his return to Moscow in 1933, Eisenstein undertook *Bezhin Meadow*. Several weeks before its completion, however, he was ordered to suspend its production. The scenes already shot were put together by Eisenstein, but the film, which was never released, was attacked as "formalistic" because of its poetic interpretation of reality. Eisenstein thus suffered from the same governmental policies toward art that had embroiled the composer Sergey Prokofiev, the writer Isaac Babel, and many other artists in difficulties with Soviet officialdom.

Having expressed contrition for the errors of his past works, Eisenstein was able to make a film recounting the medieval epic of *Alexander Nevsky*, in accordance with Stalin's policy of glorifying Russian heroes. Made in 1938, this film transfigured the actual historical events, majestically leading to a final resolution that represented the triumph of collectivism. As in medieval epics, the characters were the strongly stylized heroes or demigods of legend. Produced in close collaboration with Prokofiev, who wrote the score, the film represented a blend of images and music into a single rhythmic unity, an indissoluble whole.

During World War II Eisenstein achieved a work of the same style as *Alexander Nevsky* and even more ambitious—*Ivan the Terrible*—about the 16th-century tsar Ivan IV, whom Stalin admired. Begun in 1943 in the Ural Mountains, the first part was finished in 1944, the second at the beginning of 1946. A third part was envisaged, but Eisenstein, suffering from angina pectoris, had to take to his bed for several months. He was about to return to work when he died, only a few days after his 50th birthday.

Most critics would agree that though Eisenstein's three greatest films stand far above the others, all of his work is significant; their flaws are those common to artists probing the limits of their craft. It may be that in the entire history of motion pictures, no other filmmaker has surpassed him in his understanding of his art. (Je.M.)

MAJOR WORKS. *Films*. *Strike* (1924); *Potemkin* (1925); *October* (*Ten Days That Shook the World*; 1928); *Old and New* (*The General Line*; 1929); *Alexander Nevsky* (1938); *Ivan the Terrible, Part One* (1944); *Ivan the Terrible, Part Two* (1958).

Collections of writings. *The Film Sense* (1942); *Film Form* (1949); *Notes of a Film Director* (1958); *Film Essays* (1968).

Eisleben, city, Saxony-Anhalt *Land* (state), central Germany, in the eastern foothills of the Harz Mountains. First mentioned in 994 as a market, called Islebia, and in 1180 as a town, it belonged to the counts of Mansfeld until it passed to Saxony in 1780 and was assigned to Prussia in 1815. It is divided into the old and new towns (Altstadt and Neustadt), the latter having originated as a residential district for miners in the 14th century. The houses where Martin Luther was born (1483) and where he died (1546) have been preserved, and the SS. Peter and Paul's Church (1486–1513) contains his baptismal font. The town has a mining-engineering school and a training institute for miners. The centre of the Mansfeld copper-slate-mining region, Eisleben manufactures textiles, clothing, machinery, and furniture and has important seed nurseries. Pop. (1990 est.) 26,530.

Eisner, Kurt (b. May 14, 1867, Berlin—d. Feb. 21, 1919, Munich), German Socialist journalist and statesman who organized the Socialist Revolution that overthrew the monarchy in Bavaria (1918).

Eisner studied literature and philosophy at Hermann Cohen's neo-Kantian school at Marburg. In 1892 he published *Friedrich Nietzsche und die Apostel der Zukunft* ("Friedrich Nietzsche and the Apostles of the Future"). He began his journalism career by working on the *Frankfurter Zeitung* (1892–93); later he wrote for several Berlin journals and from 1898 was editor of *Vorwärts*, the official Social Democratic paper. After Eisner became a Bavarian citizen, he worked as a free-lance writer in Munich.

In 1914 he opposed German aid to Austria-Hungary against Serbia. During the early stages of World War I, however, Eisner supported the government; but in 1917, influenced by pacifist principles, he joined the Independent Social Democratic Party (USDP) of which he later became the leader. Eisner was arrested in 1918 as a strike leader but was shortly released and resumed his leadership of the USDP. In November 1918 he successfully organized a revolution that overthrew the monarchy, proclaimed the Bavarian Republic, and demanded peace. Eisner became first prime minister and minister of foreign affairs of the new republic. He strove to bring about internal security, to reconcile and unite the various Socialist parties in Bavaria, and to effect economic and social reform. In February 1919 he was assassinated by a zealous reactionary student.

Eisner's collected works were published in two volumes in 1919.

Eissner, Clara: see Zetkin, Clara.

Eisstockschiessen (German: "ice-stock shooting"), also called EISSCHIESSEN, or GERMAN CURLING, a game played on ice in the winter and on asphalt or other surfaces during the rest of the year, similar to curling and shuffleboard. The game became popular in Bavaria and Austria by the late 19th century.

Teams consist of four players and one substitute. The rink is 28 metres (30.8 yards) long and 3 m (3.3 yd) wide. Players slide (shoot) cylindrical *Eisstöcken* ("ice stocks") down the rink, aiming to come as close as possible to a *Rundtaube* ("rubber ring") inside a 6-m (6.6-yd-) long area called a house. The stock

weighs from 4.5 to 6 kg (about 10 to 13 pounds), is about 30 to 38 cm (12 to 15 inches) high and 35.5 cm (14 inches) in diameter, and consists of a solid plastic body (*Stockkörper*) fitted with a stainless steel ring and a bottom of pressed plywood and reinforced steel; a wooden handle (*Stiele*); and a sole (*Laufsohle*), made of rubber for use on ice or of hardwood and plastic for use on other surfaces. The composition of the rubber determines the speed stocks attain on the ice. Players switch soles depending on the kind of shot they need to make. Tournaments consist of 19 teams and have three parts: regular team competition; individual skills competition in which a player tests his ability to place the stock in precise spots; and long shooting, in which maximum distance is the goal and the rink is not used.

Eisstockschiessen was a demonstration sport in the 1936 and 1964 Winter Olympic Games. Men, women, and children compete in the sport, which is most popular in Austria and Germany, where more than 200,000 participate. There are clubs in more than 18 countries, including Canada and the United States. There are national championships and an annual European championship. The sport is governed by the Internationale Föderation für Eisstockschiessen (IFE), with headquarters in Frankfurt, Ger.

eisteddfod (Welsh: "session"), plural EISTEDDFODS, or EISTEDDFODAU, formal assembly of Welsh bards and minstrels that originated in the traditions of court bards of medieval times. The modern National Eisteddfod, revived in the 19th century and held each summer alternately in a site in North or South Wales, has been broadened to include awards for music, prose, drama, and art, but the chairing and investiture of the winning poet remains its high point.

Earlier assemblies were competitions of musicians (especially harpists) and poets from which new musical, literary, and oratorical forms emerged. The assembly at Carmarthen (1451) is famous for establishing the arrangement of the strict metres of Welsh poetry in forms that are still authoritative. In the 17th century the custom fell into disuse, though poetry remained a popular art and a form of eisteddfod survived in informal gatherings of rhymesters who met to compose verses on impromptu subjects. In the 18th century, when local eisteddfods were revived, it was apparent that many ordinary farmers and workingmen were still sufficiently skilled in the complicated craftsmanship of bardic versification to win prizes. In the 19th century the eisteddfod exerted a dominant influence on Welsh poetry through its annual national assembly and a number of local competitions. Though it succeeded in preserving the bardic forms, the quality of eisteddfod poetry was normally mediocre and degenerated to its lowest level in the late 19th century. The subjects assigned for the competition were celebrations of Welsh history or the Welsh countryside, biblical subjects such as the Creation or the Resurrection, or abstract subjects, such as almsgiving. Such poetry was necessarily impersonal and resulted in lengthy, descriptive compositions in which form was the major concern and content and emotional depth were secondary. With World War I and the Depression, in which Wales was particularly hard hit, many Welsh poets turned to more personal and relevant poetry, and the eisteddfod became primarily a forum for a youthful poet to gain a hearing. *See also* awdl.

ejaculation, the release of sperm cells and seminal plasma from the male reproductive system. Ejaculation takes place in two phases: in the first, or emission, stage, sperm are

moved from the testes and the epididymis (where the sperm are stored) to the beginning of the urethra, a hollow tube running through the penis that transports either sperm or urine; in the second stage, ejaculation proper, the semen is moved through the urethra and expelled from the body.

Sperm cells that are stored in the male body are not capable of self-movement because of the acidity of the accompanying fluids. When the sperm receive fluids, called seminal plasma, from the various internal accessory organs (prostate gland, ejaculatory ducts, seminal vesicles, and bulbourethral glands [*qq.v.*]), the acidity decreases. As they leave the body, the sperm receive oxygen, which is vital to motility. Unable to leave the male body by their own motivation, the sperm cells are transported by muscular contractions. During the emission phase, the muscles around the epididymis and ductus deferens (the tube extending from the epididymis) contract to push the sperm into the prostate and urethra. During ejaculation, the semen is expelled by strong spasmodic contractions of the bulbocavernosus muscle, which encircles the corpus spongiosum (the structure in the penis that encloses the urethra). The whole process of ejaculation is accomplished by nerve impulses received from the penis; once ejaculation is started it becomes a reflex reaction that cannot be voluntarily interrupted.

The seminal fluid is not passed from the various accessory glands simultaneously. A small amount of mucuslike secretion is first passed from the bulbourethral and urethral glands to flush out the urethra and prepare it for the sperm. Next follows the fluid from the prostate gland, and then that from the seminal vesicles. Finally, the fluid actually containing the sperm is ejaculated. After the bulk of the sperm cells have passed, more fluids follow and again flush out the urethra. The total volume of the ejaculate averages between 2 and 5 millilitres (0.12 to 0.31 cubic inch) in the human; of this, only about 1 to 5 percent are actually sperm cells. The other constituents of semen include nutrients, water, salts, waste products of metabolism, and cellular debris. The secretions of the testes and accessory glands are produced under the influence of the male hormone testosterone; without sufficient testosterone the glands degenerate and cannot secrete fluids. *See also* erection.

ejaculatory duct, either of two hollow tubes, each formed by union of the ampulla of a ductus deferens (*q.v.*) and the excretory duct of a seminal vesicle (*q.v.*). The ducts, which open into the urethra about halfway through the prostate gland (*q.v.*), function to mix the sperm stored in the ampulla with fluids secreted by the seminal vesicles and to transport these substances to the prostate.

ejectment, in Anglo-American property law, legal action for recovery of land from one wrongfully in possession and monetary compensation for his unlawful detention of the land.

The action, traceable to the Roman law, had its early development in feudal England. By the second half of the 16th century, ejectment was in common use to adjudicate title to any real property. In its technical operation it was highly fictitious, primarily because it was a personal action and not a real action and could be maintained only to right a wrong done to the person. The action of ejectment was preferred against the various forms of real action because of legal complexities that left many landowners either without a remedy or at the mercy of hairline technical procedures

in pleading and proof. Thus landowners who wanted to establish their rightful titles would often use fictitious tenants to maintain the ejectment action; because a determination of the legal validity of the landlord's title was necessary to establish a tenant's right to possession, the important outcome of the action, in many cases, was the court's recognition of the landlord's lawful title.

As a form of action, ejectment fell into disuse in England as a result of the Common Law Procedure Act of 1852. In the United States, ejectment had become part of the law of the colonies but was early reformed to abolish the technical fictions attending the law, thereby making it a title action that could be used directly by any landowner. Today there are ejectment statutes in most U.S. states.

ejido, in Mexico, village lands communally held in the traditional Indian system of land tenure that combines communal ownership with individual use. The ejido consists of cultivated land, pastureland, other uncultivated lands, and the *fundo legal* (townsite). In most cases the cultivated land is divided into separate family holdings, which cannot be sold although they can be handed down to heirs.

Measures taken during the reform period that began in 1855 abolished the landownership rights of civil and religious corporations. Although the primary purpose of this reform was to dissolve the large ecclesiastical estates, the law also forced the Indians to give up their village lands. The land reform measures in the 1917 constitution restored land that had been taken from ejidos, made land grants to landless villages, and divided large estates into smaller private land holdings. Today ejidos constitute some 55 percent of Mexico's cultivated land.

The increasing fragmentation of the land caused by the family inheritance pattern has in some cases resulted in an inefficient scale of operation. This result, together with a lack of capital and limited educational attainment, has retarded progress in ejido agriculture. Some cooperatively run ejidos, however, particularly in the cotton-raising areas, have shown great success.

Ejmiadzin, formerly ECHMIADZIN, or (until 1945) VAGARSHAPAT, city, west-central Armenia. It lies on the plain of the Aras River, 12 miles (20 km) west of Yerevan. Ejmiadzin is the seat of the supreme catholicos, or primate, of the Armenian Catholic Church.

Originating in the 7th century BC as the town of Vardkesavan, it was renamed Vagarshapat about AD 140, when the Parthian king Vologases III made it his capital. Upon the conversion of Armenia to Christianity about AD 300, Vagarshapat became the residence of the Armenian patriarch. In 344 the town ceased to be the Armenian capital, and in 453 the patriarchal seat was removed elsewhere, but in 1441 the catholicos Kirakos brought back the seat to Vagarshapat, which thereafter remained the home of the "catholicos of all Armenians."

The monastery, founded in the 6th century AD and called Echmiadzin from the 10th century, consists of a complex of buildings surrounded by a brick wall 30 feet (10 m) high; it includes a modern college and seminary. The present cathedral, on the site of the original church, goes back to the 7th century but was considerably restored after 1441. In the cathedral treasury is the hand (relic) of St. Gregory the Illuminator.

The city itself is the centre of a rich region of orchards and vineyards and manufactures plastics, wine, and canned food. Pop. (1987 est.) 53,040.
